# PHYSICAL SETTING SOURCE RECORDS SEARCHED

## TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Source: U.S. Geological Survey

## HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA

Telephone: 877-336-2627

Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Source: Department of Fish and Wildlife

Telephone: 916-445-0411

## HYDROGEOLOGIC INFORMATION

AQUIFLOW<sup>R</sup> Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

## GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

## LOCAL / REGIONAL WATER AGENCY RECORDS

### FEDERAL WATER WELLS

#### PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

#### PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

#### USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

## OTHER STATE DATABASE INFORMATION

### Groundwater Ambient Monitoring & Assessment Program

State Water Resources Control Board

Telephone: 916-341-5577

The GAMA Program is California's comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Health Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

### Water Well Database

Source: Department of Water Resources

Telephone: 916-651-9648

### California Drinking Water Quality Database

Source: Department of Public Health

Telephone: 916-324-2319

The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

### Geothermal Wells Listing

Department of Conservation

Telephone: 916-445-9686

Geothermal well means a well constructed to extract or return water to the ground after it has been used for heating or cooling purposes. Geothermal wells in California (except for wells on federal leases which are administered by the Bureau of Land Management) are permitted, drilled, operated, and permanently sealed and closed (plugged and abandoned) under requirements and procedures administered by the Geothermal Section of the Department of Conservation's Geologic Energy Management Division (CalGEM, formerly DOGGR).

### California Oil and Gas Well Locations

Source: Dept of Conservation, Geologic Energy Management Division

Telephone: 916-323-1779

Oil and Gas well locations in the state.

# PHYSICAL SETTING SOURCE RECORDS SEARCHED

## California Earthquake Fault Lines

Source: California Division of Mines and Geology

The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

## RADON

### State Database: CA Radon

Source: Department of Public Health

Telephone: 916-210-8558

Radon Database for California

### Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

### EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

## OTHER

Airport Landing Facilities: Private and public use landing facilities

Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater

Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

**Search Results:**

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting [www.edrnet.com/sanborn](http://www.edrnet.com/sanborn).

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Sanborn® Library search results

Certification #: 70AF-4EF1-A041

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- Library of Congress
- University Publications of America
- EDR Private Collection

*The Sanborn Library LLC Since 1866™*

## Limited Permission To Make Copies

Ninyo & Moore (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

## EXECUTIVE SUMMARY

### DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at approximately five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through current. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

Summary information obtained is provided in the text of this report.

### RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

### RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

---

Alameda County Department of Environmental Health's (ACDEH) Local Oversight Program (LOP), which includes Onsite Wastewater Treatment Systems (OWTS), is in receipt of your records request dated May 22nd, 2024. ACDEH does not have any records of open/closed environmental cleanup cases relating to soil and groundwater contamination or septic systems at 401 Santa Clara Ave in Oakland (APN: 10-823-15-5).

LOP recommends contacting Alameda County Public Works Agency for information regarding water wells at the site.

Thank you,  
Alameda County Land Use and Local Oversight Program (LOP)

33: View of St Maarten Apartments (400 Santa Clara Ave) to the east of the Site.

34: View of 396 Santa Clara Avenue to the east of the Site.

35: View of 404-412 Santa Clara Avenue to the east of the Site.

36: View down Santa Clara Avenue, facing north.

37: View down Santa Clara Avenue, facing south.

**Appendix G -  
Vapor Encroachment Screening Matrix**

## Vapor Encroachment Screening Matrix

Phase I ESA Vapor Encroachment Conditions (VEC) matrix includes a (1) Search Radius Test, (2) Chemicals of Concern Test (COC), and (3) a Critical Distance Test [1].

**(1) Search Radius Test:** Are there any known or suspect contaminated properties in the primary area of concern within the corresponding search radii (including the site)?

- Yes  No      If **No**, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If **Yes**, then:

**(2) Chemicals of Concern Test:** Are COC likely to be present within the area of concern for those known or suspect contaminated sites identified based on the Search Distance Test?

- Yes  No      If **No**, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If **Yes**, then:

**(3) Critical Distance Test\*:** A plume test to determine whether or not COC in the contaminated plume(s) may be within the critical distance.

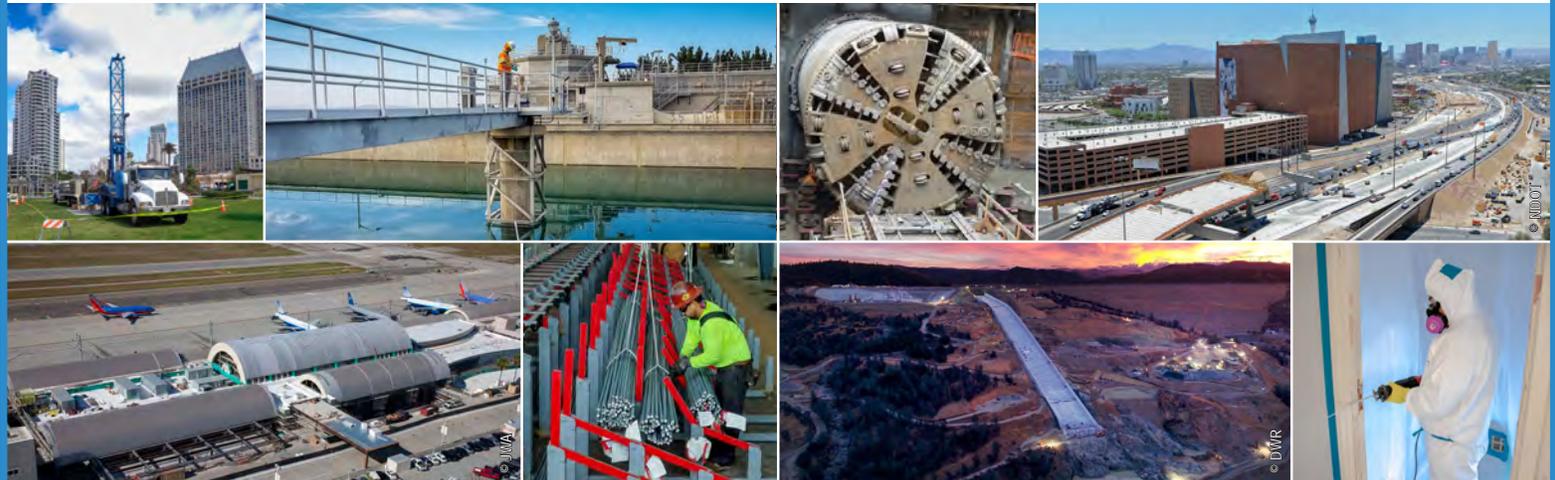

- Yes  No      (3a) Is information related to the contaminated(s) plume available (i.e. iso-concentration maps, site drawings, etc.)?  
(3b) If **No**, then a VEC cannot be ruled out; check **Yes** in #4 below indicating it is likely a VEC exists. If **Yes**, then:  
(3c) Is the site less than 100 feet to the nearest edge of a contaminated [non-petroleum hydrocarbon] plume(s)? If **Yes**, then check **Yes** in #4 below indicating it is likely a VEC exists.  
(3d) Is the site less than 30 feet to the nearest edge of a dissolved petroleum hydrocarbon plume(s)? If **Yes**, then check **Yes** in #4 below indicating it is likely a VEC exists.

\*If the distance from the nearest edge of a contaminated plume to the nearest existing or planned structure on the site is less than 100 feet for non-petroleum hydrocarbon COC, or less than 30 feet for dissolved petroleum hydrocarbons, then it is presumed that a VEC *currently* exists beneath the site. If the distance from the nearest edge of the contaminated plume is greater than or equal to 100 feet for non-petroleum hydrocarbons, or 30 feet for dissolved petroleum hydrocarbon chemicals of concern, then it is presumed unlikely that a VEC *currently* exists beneath the site.

**(4) Is it likely that a VEC *currently* exists beneath the site?**

- Yes  No      If **No**, then the VEC screening is complete and no further investigation is recommended at this time. If **Yes**, Ninyo & Moore recommends performing additional assessment, such as a Tier 2 VEC assessment according to ASTM E 2600-10.

[1] Based on guidance presented in the ASTM E 2600-10 Standard.

APPENDIX D  
ASBESTOS AIR SAMPLING REPORT

---

---

5655 LINDERO CYN RD., STE 701 • WESTLAKE VILLAGE • CA 91362

August 23, 2023

**AEG Project No: 112387**

Reliance Building Services  
Attn: Andrew Harshman  
12714 Hoover Street  
Garden Grove, CA 92841

## **POST ASBESTOS ABATEMENT AIR CLEARANCE SAMPLING REPORT**

### **SUBJECT PROPERTY**

**Grand Lake Gardens  
401 Santa Clara Avenue  
Oakland, CA 94610**

### **Introduction**

American Environmental Group, Inc. (AEG) performed Post-Asbestos-Abatement Air Clearance Sampling at the Subject Property referenced above. The sampling was conducted on August 21, 2023, by Anthony Smith, under the supervision of Chris Heffernan (CSST - 16-5656) a California Division of Occupational Safety and Health (DOSH) Certified Technician and representative of AEG. *Technician certifications attached for reference.*

### **Methodologies**

A total of twenty-one (21) clearance air samples were collected from inside the 5<sup>th</sup> Floor: East Wing – South End, East Wing – South Hallway, East Wing – Elevator Lobby, East Wing – North Side, 4<sup>th</sup> Floor: East Wing – South Hallway, Elevator Lobby, West Wing – South Hallway, West Wing – Main Hallway, 3<sup>rd</sup> Floor: East Wing – South Hallway, Elevator Lobby, West Wing – South Hallway, West Wing – Main Hallway, 2<sup>nd</sup> floor: East Wing – South Hallway, Elevator Lobby, West Wing – South Hallway, West Wing – Main Hallway, 1<sup>st</sup> Floor: East Wing – South Hallway, Elevator Lobby, West Wing – Main Hallway containment(s). Two (2) additional blank (field and laboratory) samples were added in compliance with National Institute for Occupational Safety and Health (NIOSH) Method 7400 for the determination of “Asbestos and Other Fibers by Phase Contrast Microscopy (PCM)”, Issue 2 (15, August 1994) guidelines.

#### Proprietary Note:

This report contains CONFIDENTIAL INFORMATION and cannot be duplicated or copied under any circumstances without the express permission of American Environmental Group, Inc. The purpose of the report is to allow the CLIENT(s) listed above to evaluate the potential environmental liabilities at the Subject Property. Any unauthorized reuse of American Environmental Group reports or data will be at the unauthorized user’s sole risk and liability.

*“Providing Solutions... Put Us to the Test”*

**Results:**

**Asbestos Clearance Results are Acceptable**

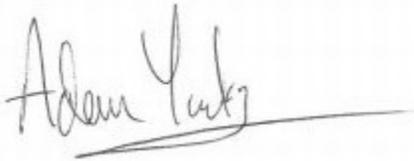

All air sample results were consistent at a level of less than or equal to ( $\leq$ ) 0.01 fibers per cubic centimeter of air (f/cc), the level recommended by the Environmental Protection Agency (EPA) for the re-occupancy of non-protected personnel following an asbestos response action. **Because these samples were below the recommended regulatory concentrations of fibers in the air, the containment may be removed and non-protected personnel may reoccupy the area.** A copy of the PCM analytical results is included in Attachment A.

If you have any questions concerning the information within this report, please contact our Reports Department at 866-251-5157. Thank you very much for choosing American Environmental Group, Inc. We appreciate the opportunity to be of service.

Sincerely,

**AMERICAN ENVIRONMENTAL GROUP, INC.**

**PURPOSE & SCOPE OF SERVICES**

The purpose of this service was to conduct an Asbestos Survey, aiding the client/owner-operator in assessing the presence or absence of Asbestos Containing Materials (ACM) for planned renovations and/or demolitions of the designated areas. Samples were collected in a manner sufficient to determine asbestos throughout the designated areas to be disturbed and are listed herein

**ANALYTICAL RESULTS**

**The following results are based on the samples collected from the site; the Pipe Wrap determined to be disturbed are positive for asbestos.** The location of ACM/ACCM, type, percent, category, and amount can be found in the attached analytical report.

**SAMPLING & ANALYSIS**

This inspection was completed in compliance with the EPA's Asbestos National Emission Standard for Hazardous Air Pollutants (NESHAP) Regulations (40 CFR Part 61, Subpart M), In-Schools Rule; 40 CFR 763.85 (Inspection and Re-Inspection), including regional and local air quality district rules and regulations. EPA currently regulates Asbestos Containing (ACM) as materials containing greater than one percent (>1%) asbestos. Cal-OSHA currently regulates Asbestos Containing Construction Materials (ACCM) to 1/10th of 1% (0.1%) by weight. Cal-OSHA currently requires DOSH certified asbestos workers to conduct all asbestos related work. Samples were submitted to MicroTest Laboratories Inc., Concord, CA. (NVLAP 600389-0)

Destructive sampling was not conducted during the site visit. If in the course of work, additional suspect building materials are discovered (i.e.: inaccessible areas), the renovation and/or demolition activities must cease until further sampling is conducted.

Included at the end of this letter, you will find a table containing the analytical results for the various area(s) sampled today.

## RESULTS TABLE

The location and results from this sampling are as follows:

Sample ID:	Material	Location	Estimated Quantity	Condition Assessment	Lab Results	Category Pt. Ct.
<b>MECHANICAL</b>						
401-1.1 A	Insulation	Parking Garage, SW Area Parking Garage, S. Area Parking Garage, SE Area Parking Garage, NE Area Parking Garage, E. Area	~1,200 LF		6% Chrysotile 2% Amosite	Friable/RACM
401-1.1 B	Insulation				None Detected	Homogeneous
401-1.1 C	Pipe Wrap				None Detected	Homogeneous
401-1.2	Pipe Wrap				SFP	Homogeneous
401-1.3	Pipe Wrap				SFP	Homogeneous
401-1.4	Pipe Wrap				SFP	Homogeneous
401-1.5	Pipe Wrap				SFP	Homogeneous
<b>LEGEND   KEY</b>						
PACM-Presumed Asbestos Containing Material   ND-Non-Detected   SFP-Stop First Positive   PT.CT. – Point Count RACM-Regulated Asbestos Containing Material   NH-Non-Hazardous   HM-Homogeneous Material Cat 1-Category 1   Cat 2-Category 2   SF-Square Feet   LF-Linear Feet   CF-Cubic Feet G-Good (5-7)   D-Damaged (2-4)   SD-Significantly Damaged (1)						

## **REGULATIONS**

Federal and state regulations require that asbestos abatement must be performed by a licensed asbestos abatement contractor with current certifications, respiratory protection, and proper Personal Protective Equipment (PPE), adhering to all EPA and OSHA requirements. Containment and disposal of ACM/ACCM must be in accordance with EPA requirements. An Asbestos Abatement Work plan can be provided upon request. In some counties, Procedure 5 may be required.

## **RECOMMENDATIONS**

RegasGroup recommends on-site monitoring be conducted during the removal of asbestos containing materials (ACM), to verify proper protocols and worker safety in accordance with federal, state, and local rules and regulations. Upon completion of asbestos work, RegasGroup recommends a visual inspection and air sampling in compliance with federal, state, and local rules and regulations. The visual and air sampling will confirm that the abatement contractor has completed the removal of ACM, and the area is safe for employees and/or sub-contractors to enter the area for repairs and build back of the specific areas tested, without any health or safety concerns regarding the exposure of airborne asbestos fibers.

## ASSUMPTIONS & LIMITATIONS

The results, findings, conclusions, and recommendations expressed in this report are based only on conditions that were noted during RegasGroup's inspection of the specific areas noted herein.

The selection of sample locations and frequency of sampling was based on observations and the assumption that like materials in the same area are homogeneous in content. This report is not to be utilized as a bidding document or as a project specification document since it does not have all the components required to serve as an Asbestos Abatement Project Design document or an Asbestos Abatement Work plan.

Our professional services have been performed, our findings obtained, and our conclusions and recommendations prepared in accordance with customary principles and practices in the fields of environmental testing and consulting. This report does not warrant against undiscovered hazards and locations not investigated.

If you have any questions regarding this report or if I can be of further assistance, please feel free to contact me.

This analytical data sheet constitutes a final report. Due to the limitation of Polarized Light Microscopy (PLM), some samples classified as containing no asbestos in materials, NoneDetected (ND), such as floor tiles or like materials, warrant a recommendation for further analysis by Transmission Electron Microscopy (TEM). Results apply only to the sample as received. This report must not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government. All Samples will be held for not less than 30 days, upon which they will then be disposed of. This report shall not be reproduced except in full without written authorization from MicroTest Laboratories, Inc. Soil and rock matrices are considered problematic matrices and MicroTest recommends sample homogenization prior to PLM analysis. Thermal decomposition of asbestos fibers can yield non-asbestiform mineral properties. The reporting limit for calibrated visual area estimation quantitation procedures is 1%. The reporting limit for 400/1000 point count quantitation procedures is 0.25% or 0.1% respectively. The sample is considered acceptable unless otherwise noted. Layers are analyzed separately except when manufactured with multiple layers (i.e. Linoleum, Drywall, etc.) or requested contrarily by the client.

## **APPENDICES**

A – Certifications

B – Lead-Containing Material Laboratory Analytical Report and Chain-of-Custody Records

C – CDPH Form 8552 - Lead Hazard Evaluation Report

# 1 INTRODUCTION

Ninyo & Moore was retained by the Oakland Housing Authority (OHA/Client) to conduct a limited paint survey within the Grand Lake Gardens (GLG) facility located at 401 Santa Clara Avenue in Oakland, California (Figures 1 and 2). Our services included the performance of a suspect lead-containing materials (LCMs) survey. For the purposes of this assessment, LCM refers to both lead-based paint (LBP), as defined by the California Department of Public Health (CDPH) and U.S. Department of Housing and Urban Development (HUD) and other potential LCMs (including ceramic tile).

The sampling activities were performed in accordance with established guidelines for the assessment of LCMs, and are based upon conditions at the GLG facility at the time of the sampling activities. This sampling event is not intended as a risk assessment. It is a summary of identified LCMs at the GLG facility. No dust wipe sampling or soil sampling were conducted as part of this scope of work. Our objective and scope of work for the sampling activities are presented below.

## 1.1 Involved Parties

The sampling activities were performed on June 10 and 11, 2024 by Mr. Nathan Eubanks of Ninyo & Moore. Mr. Eubanks is a State of California Department of Public Health (CDPH) Lead-related Construction Lead Sampling Technician (No. LRC-00010612). Mr. William Larkin provided principal-level oversight and quality review and is a State of California Division of Occupational Safety and Health (DOSH)-Certified Asbestos Consultant (No. 99-2688) and a CDPH Lead-related Construction Lead Inspector/Assessor and Project Monitor (Nos. 1284/1285). Professional certifications are presented in Appendix A.

## 1.2 User Reliance

This report may be relied upon (and is intended exclusively for use) by the OHA. Any use or re-use of the findings, conclusions, and/or recommendations of this report by parties other than the OHA is undertaken at said parties' sole risk.

# 2 OBJECTIVE AND SCOPE OF SERVICES

The purpose of this study is to provide information regarding current conditions within the GLG buildings to assist the OHA related to the proposed renovation of the buildings. Ninyo & Moore personnel performed the following services:

- Visual reconnaissance of the GLG buildings to document and locate suspect LCMs.

- Collection of 108 suspect LCM samples and submittal of these samples to a certified, independent laboratory for analysis of lead content (EPA Method SW-846 3050B/7000B and Total Threshold Limit Concentration analysis).
- Preparation of this sampling report, which presents our data and summarizes the assessed suspect LCMs. The report includes a site description, laboratory testing information, findings, conclusions, and recommendations, sample/site location maps, tables summarizing the LCMs assessed, and estimated quantities.

### **3 SITE DESCRIPTION**

The GLG facility encompasses approximately 77,000 square feet (SF), and is of reinforced concrete construction with exterior concrete/stucco walls and wood roofing. A parking garage, basement, lobby, kitchen, dining room, restrooms, and apartments are all located within the building. Finishes for the parking garage and basement include stucco/concrete wall assemblies (with some wood walls located within the basement office), concrete flooring, and stucco ceilings. Finishes within the lobby area include wood/stucco wall assemblies, wood floors, and wood ceilings. Finishes for the kitchen and dining room areas include wood/stucco wall assemblies, wood/vinyl flooring, and wood ceilings. Finishes for the apartments included wood/stucco wall assemblies, wood/ceramic flooring, and wood ceilings. Finishes for the bathrooms included wood/stucco wall assemblies, ceramic tile flooring, and wood ceilings.

### **4 PHYSICAL LIMITATIONS**

No physical limitations were encountered within the GLG facility during our sampling activities.

### **5 SAMPLE COLLECTION AND ANALYSES**

On June 10 and 11, 2024, the GLG facility was assessed for the presence of LCMs. The LCM survey followed United States Environmental Protection Agency (EPA) guidelines, or industry standards, within the limitations of the scope of this assessment. Survey activities are discussed below.

#### **5.1 Lead-Containing Materials Survey**

After collection, the suspect LCM samples were transferred to EMSL for analysis of total lead content by Flame Atomic Absorption Spectroscopy (Flame AAS/SW 846 3050B/7000B). The ceramic tile and fixtures (toilets, etc.) were analyzed by Total Threshold Limit Concentration analysis (7000B). EMSL is an American Industrial Hygiene Association-accredited Environmental Lead Laboratory (AIHA ELLA). Currently, the EPA stipulates what concentrations of lead in non-volatile components of surface coatings or materials indicate whether a material is considered to be lead-containing. The EPA stipulates that paint containing an amount equal to, or in excess of,

1 milligram per square centimeter (1.0 mg/cm<sup>2</sup>), or more than half of one percent (0.5%) by weight (or 5,000 milligrams per kilogram [mg/kg]), constitute a lead-based paint (LBP). Per the Occupational Safety and Health Administration (OSHA), coatings with any detectable amount of reported lead would be considered lead-containing paint (LCP).

Paint that is chipping or peeling, or that may be readily removed from surfaces, and has a lead content equal to, or more than, 1,000 mg/kg, would require handling as a California Title 22 hazardous waste. The analytical results associated with the suspect LCM samples collected from the GLG buildings are summarized in Table 1 and copies of the laboratory analytical report and chain-of-custody record are presented in Appendix B.

## 6 FINDINGS

A limited HBMS was performed within the GLG facility to evaluate if potential hazards associated with the paint or other suspect LCMs may exist.

### 6.1 Lead-Containing Materials

Ninety-nine paint chip samples and nine ceramic tiles/fixtures were collected for analysis of lead content. Five of the paint chip samples were reported with a lead concentration at greater than 0.5% by weight (or 5,000 mg/kg). Sample LBP-14 (green paint located on railing in the lobby garage) was reported with a lead concentration of 0.6% by weight (or 6,000 mg/kg). Sample LBP-15 (green paint on the lobby garage entrance door) was reported with a lead concentration of 0.97% by weight (or 9,700 mg/kg). Samples LBP-66 and LBP-68 (both black paint on sixth floor exterior metal pillars) were reported with lead concentrations of 1.9% by weight (or 19,000 mg/kg) and 4.8% by weight (or 48,000 mg/kg), respectively. Sample LBP-85 (black paint on a basement level stairwell metal ceiling) was reported with a lead concentration of 0.63% by weight (or 6,300 mg/kg). These samples are considered LBP.

Fifty-six of the 99 paint samples were reported at less than their associated lead detection limits. The nine ceramic tiles/fixture samples were also reported at less than their associated lead detection limits. The other 38 paint samples were reported with lead concentrations ranging from 0.0081% by weight (or 81 mg/kg) to 0.48% by weight (or 4,800 mg/kg). These paint samples are considered LCP. Please see Figures 3 through 10 for the locations of the LBP and LCP samples.

Occupational Health and Safety Administration (OSHA) regulations apply whenever materials with any detectable amounts of lead are disturbed. A copy of the CDPH form 8552 "Lead Hazard Evaluation Report" for the GLG facility is included in Appendix C.

## 7 RECOMMENDATIONS

Since LCMs have been reported within the GLG facility, the following recommendations and precautions are provided:

- The identified LCMs reported within the GLG facility should not be disturbed. Any LCMs found in a damaged or non-intact condition should be abated and/or stabilized. Prior to renovation or demolition work that would disturb the identified LCMs, a licensed lead abatement removal contractor should stabilize and/or remove the identified LCMs in compliance with the most recent and applicable federal, state, and local laws, regulations, standards, and/or codes governing abatement, transport, and disposal of LCMs. All lead waste must be properly characterized prior to disposal to determine waste classification, packaging, transportation, and disposal requirements. ***While Ninyo & Moore provided an estimate of the quantity of LCMs present within the GLG facility (Table 1), it is the abatement contractor's responsibility to assess the actual LCM quantities present.***
- It is recommended that dust wipe sampling be performed at the GLG facility to ensure that no lead dust hazards (lead concentrations in dust greater than 10 micrograms per square foot [ $>10 \mu\text{g}/\text{ft}^2$ ]) are encountered on site. The dust wipe sampling should occur after the planned renovations have occurred at the GLG facility, but prior to re-occupancy by future residents (to ensure that the building is safe for re-occupancy).
- There is a possibility that additional suspect LCMs (as well as other suspect hazardous building materials) may be discovered during building renovation activities. Therefore, Ninyo & Moore recommends that, should additional suspect LCMs not sampled or assessed in this report be uncovered during renovation activities, (a) samples of the suspect LCMs should be collected for laboratory analysis and activities that may impact the materials should cease until laboratory analytical results are reviewed or (b) the suspect LCMs should be assumed to be LCMs and handled as such.

## 8 LIMITATIONS

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited sampling and chemical analysis. Further assessment of potential adverse environmental impacts may be accomplished by conducting a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the areas evaluated. However, if additional suspect hazardous building materials are encountered during renovation/demolition

activities, these materials should be sampled by qualified personnel, and analyzed for content prior to further disturbance. ***In addition, please note that quantities of identified hazardous building materials are approximate. It is the contractor's responsibility to assess the actual quantities of hazardous building materials present.***

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard of care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject site. The testing and analyses have been conducted by an independent laboratory that is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our findings, opinions, and recommendations are based on an analysis of the observed site conditions. It should be understood that the conditions of a site can change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

**NOTES:**

Total lead in paint analyzed via Flame Atomic Absorption Spectroscopy/Flame AAS (EPA Test Method EPA SW-846 3050B/7000B).

Total lead in ceramic samples analyzed via Total Threshold Limit Concentration (TTLC/7000B).

mg/kg = Milligrams per kilogram

**Bold** concentrations indicate paint that is greater than or equal to 5,000 mg/kg ( $\geq 0.5\%$  by weight, lead-based paint)

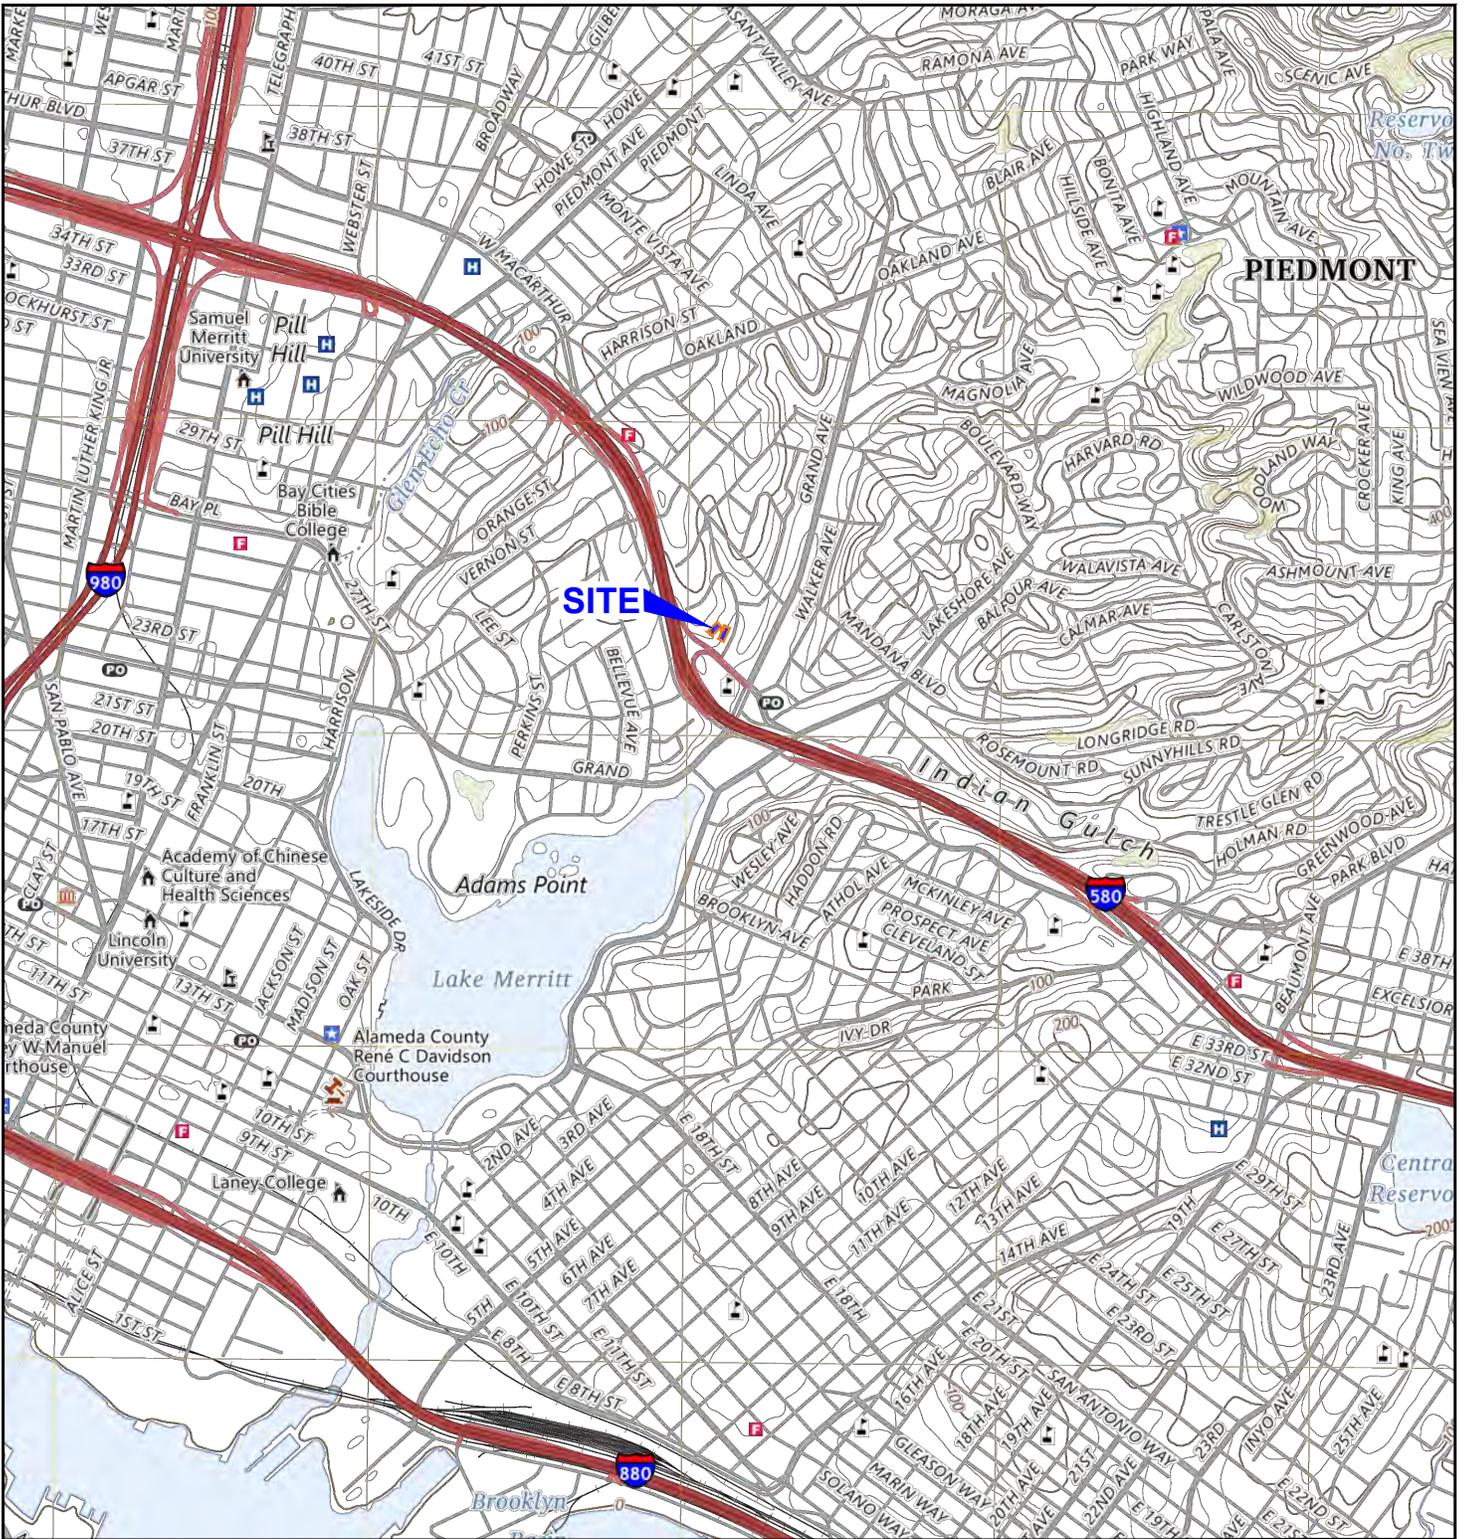

SF = Square feet

\* indicates lead-containing paint that is less than 5,000 mg/kg ( $<0.5\%$  by weight, lead-containing paint)

Estimated quantities are not intended for use in bidding calculations.

October 25, 2023

**William Patrick Larkin**  
**4 Miramonte Road**  
**Orinda CA 94563**

Dear Certified Asbestos Consultant or Technician:

Enclosed is your certification card. **To maintain your certification, you must abide by the rules printed on the back of the certification card.**

Your certification is valid for a period of one year. If you wish to renew your certification, you must apply for renewal at least 60 days before the expiration date shown on your card. [8 CCR 341.15(h)(1)].

Please hold and do not send copies of your required AHERA refresher renewal certificates to our office until you apply for renewal of your certification.

Certificates must be kept current if you are actively working as a CAC or CSST. The grace period is only for those who are not actively working as an asbestos consultant or site surveillance technician.

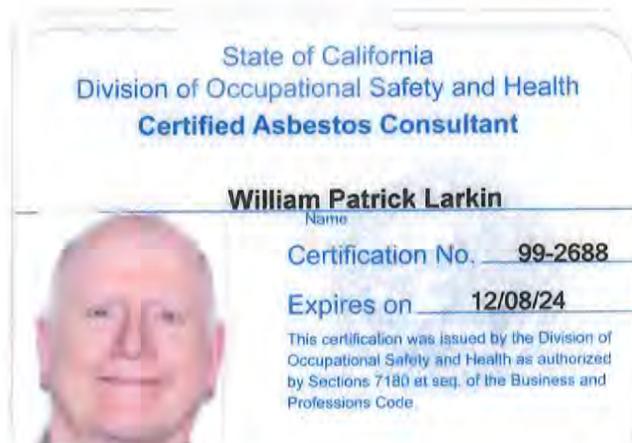

Please contact our office at the above address or email w any changes in your contact/ mailing information within 15 days of the change.

Sincerely,

Kevin Graulich  
 Principal Safety Engineer

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted.

\* Analysis following Lead in Paint by EMSL SOP/Determination of Environmental Lead by FLAA. Reporting limit is 0.008% wt based on the minimum sample weight per our SOP. "<" (less than) result signifies the analyte was not detected at or above the reporting limit. Measurement of uncertainty is available upon request. Definitions of modifications are available upon request.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. Reporting limit is 40 mg/kg based on a 0.5 gram sample weight. "<" (less than) result signifies that the analyte was not detected at or above the reporting limit. Measurement of uncertainty is available upon request. Definitions of modifications are available upon request.

Samples analyzed by EMSL Analytical, Inc San Leandro, CA Method SW 846 7000B replaces EPA 7420 for lead analysis and is an equivalent method. CA ELAP 1628, AIHA LAP, LLC-ELLAP Accredited #101748

# APPENDIX C

## CDPH Form 5881 – Lead Hazard Evaluation Report

## LEAD HAZARD EVALUATION REPORT

**Section 1 – Date of Lead Hazard Evaluation** 6/10/2024

**Section 2 – Type of Lead Hazard Evaluation (Check one box only)**

Lead Inspection   
  Risk assessment   
  Clearance Inspection   
  Other (specify) Chip Sampling

**Section 3 – Structure Where Lead Hazard Evaluation Was Conducted**

Address [number, street, apartment (if applicable)]		City	County	Zip Code
<u>401 Santa Clara Avenue</u>		<u>Oakland</u>	<u>Alameda</u>	<u>94610</u>
Construction date (year) of structure	Type of structure		Children living in structure?	
<u>1960s</u>	<input type="checkbox"/> Multi-unit building <input type="checkbox"/> School or daycare <input type="checkbox"/> Single family dwelling <input checked="" type="checkbox"/> Other <u>Residential Bldg</u>		<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Don't Know	

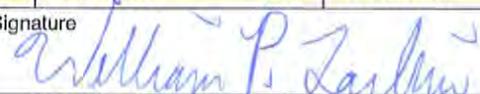

**Section 4 – Owner of Structure (if business/agency, list contact person)**

Name		Telephone number	
<u>Oakland Housing Authority/Paige Peltzer</u>		<u>510/587-2147</u>	
Address [number, street, apartment (if applicable)]		City	State
<u>1619 Harrison Street</u>		<u>Oakland</u>	<u>California</u>
			Zip Code
			<u>94612</u>

**Section 5 – Results of Lead Hazard Evaluation (check all that apply)**

No lead-based paint detected   
  Intact lead-based paint detected   
  Deteriorated lead-based paint detected  
 No lead hazards detected   
  Lead-contaminated dust found   
  Lead-contaminated soil found   
  Other \_\_\_\_\_

**Section 6 – Individual Conducting Lead Hazard Evaluation**

Name		Telephone number	
<u>William P. Larkin</u>		<u>510/343-3000</u>	
Address [number, street, apartment (if applicable)]		City	State
<u>1301 Marina Village Parkway, Suite 110</u>		<u>Alameda</u>	<u>California</u>
			Zip Code
			<u>94501</u>
CDPH certification number	Signature	Date	
<u>1284/1285</u>		<u>6/20/24</u>	

Name and CDPH certification number of any other individuals conducting sampling or testing (if applicable)

N/A

**Section 7 – Attachments**

- A. A foundation diagram or sketch of the structure indicating the specific locations of each lead hazard or presence of lead-based paint;
- B. Each testing method, device, and sampling procedure used;
- C. All data collected, including quality control data, laboratory results, including laboratory name, address, and phone number.

## Interim Radon Test Report

**Date:** May 30, 2024

**Client:** Orion Environmental  
2955 Redondo Avenue  
Long Beach, CA. 90806

**Site:** Grand Lake Garden Apartments  
401 Santa Clara  
Oakland, CA. 94610

**KELLCO Job #** 2405-03

**Inspector:** Bonnie Lee Kellogg NRRP #102253 RT  
Derrick Quach NRRP 10458T RT

**Analytical Lab:** Air Chek - NRSB: NELAP: #11441  
1936 Butler Bridge Rd  
Mill River, NC. 28759

**Device Information:** Air Chek Pro Chek Real Estate Radon Test kit, using activated charcoal to absorb radon gas in the air. These are sometimes referred to as “CAD” (Charcoal Absorption Detector) monitors.

**Protocol Used:** Testing followed the ANSI/AARST Standard MA-MFLB 2023 “Protocol for Conducting Measurements of Radon and Radon Decay Products in Multifamily, School, Commercial and Mixed-Use Buildings.”

**Notes:** The protocol was modified as described below due to the condition of the buildings at the time of the testing

### Background

Grand Lake Garden Apartments was previously damaged by a fire on the 5<sup>th</sup> floor, resulting in water damage down to the first floor in some areas. At the time of the radon testing, renovations were ongoing. In some locations, damaged drywall had been removed and not yet replaced, creating difficulty in establishing true “close house conditions.” In each location where samples were deployed, it was possible to establish “close house condition” for that portion of the unit (for example, a sample may have been deployed in a closed bedroom, but the other rooms of the unit were missing drywall and did not meet closed house conditions). Because of these conditions, the testing was considered an interim radon test.

## Executive Summary

Although radon was not detected at or above the EPA recommended remediation level of 4.0 pCi/L, in Building B radon was detected as high as 3 pCi/L, indicating the presence of radon within the structure. The basement samples (office and break room) were voided, having the doors left open during the testing period. Since these are areas where people are known to spend time and since the potential for radon has been determined, timely re-testing of these areas is recommended.

Radon below 2 pC/L was detected in the Building A community room and Building B rooms 214, 217, 224 & 223.

## Method

Short Term Activated Charcoal (AC) radon test kits, provided and analyzed by Air Chek, were deployed in each ground floor residential and office location, each unit above a garage and 10% of the units of floors above, with exceptions as noted. If a targeted unit did not meet the “closed house conditions,” it was omitted from the sampling. Because the fifth-floor units had interior walls removed (due to water damage), it was omitted from this round of testing, as was the 6<sup>th</sup> floor.

As noted above, each tested area (room) was in “closed house conditions” with the doors and windows closed for the duration of the testing period, except for normal entry and exit.

A total of 30 detectors were deployed including 2 duplicate and 2 blanks. They were placed between 20 and 30 inches above the floor, away from walls and drafts. Signs advising of the testing and the requirements for doors to remain closed were placed on each door during the testing period.

Tests that last from 2-90 days are considered “short term.”

No HVAC systems were in use.

Except as noted with “void” samples, no irregularities were noted when the monitors were retrieved ~71 hours later.

## Sampling Results

The results of the radon testing are as follows. Note that these results include 2 duplicate samples 2 and 2 blanks. Green highlights indicate levels above 2 pC/L, the EPA recommended action level. Blue highlights indicated detectible radon below 2 pC/L.

GRAND LAKE GARDEN APARTMENTS RADON TESTING MAY 2024					
DETECTOR	DUP	UNIT	NOTES	RADON pCi/L	HOURS
11739179		Bldg A 1st floor office	front desk	< 0.3	70
11739180		Bldg A 1st floor office	open space	< 0.3	71

**GRAND LAKE GARDEN APARTMENTS RADON TESTING MAY 2024**

<b>DETECTOR</b>	<b>DUP</b>	<b>UNIT</b>	<b>NOTES</b>	<b>RADON pCi/L</b>	<b>HOURS</b>

11739188	D	Bldg B Room 212	Liv/Kit	3	72

Void samples occur when the retrieval inspector notices an irregularity in the conditions of the unit being tested or the sample itself. The following samples from this inspection were void:

VOID Samples – Grand Lake Garden Apartments Interim Radon Inspection May 2024		
DETECTOR	UNIT	NOTES
7420432	Basement office	VOID - door was left open
7420433	Basement break room	VOID - door was left open

## Radon Health Risk Information

Radon is the second leading cause of lung cancer, after smoking. The concentration of radon in a home, school or office environment is measured in picoCuries per liter of air (pCi/L). The U.S. Environmental Protection Agency (EPA) and the Surgeon General strongly recommend taking further action when the radon test results are 4.0 pCi/L or greater.

Radon levels less than 4.0 pCi/L still pose risk and, in many cases, may be reduced. According to the EPA it is difficult to reduce the radon below 2.0 pCi/L.

The national average indoor radon level is about 1.3 pCi/L. The higher a building's radon level, the greater the health risk to occupants.

**Smokers and former smokers are at especially high risk.**

## Interpreting Test Results

Short term test results above 4 pCi/L indicate occupants may be exposed to radon concentrations that meet or exceed EPA's recommended remediation level. The EPA recommends remediation for radon levels at or above 4 pCi/L.

If your radon level is 4.0 pCi/L, you can check the CDPH radon website for information, including a list of EPA or California approved radon contractors who can fix or can help you develop a plan for fixing the radon problem: <https://www.cdph.ca.gov/Programs/CEH/DRSEM/Pages/EMB/Radon/Radon.aspx>

You may call the **Radon Fix-It Line at 800-644-6999** between noon and 8:00 p.m., M-F, EST/EDT for information and assistance. This toll-free line is operated by EPA and Kansas State University.

The Environmental Protection Agency (EPA) recommends acting even if radon levels are below 4 picocuries per liter (pCi/L). Specifically, the EPA suggests the following for levels detected below 4 pCi/L:

1. **Between 2 and 4 pCi/L:** Consider fixing the units. Although this level is below the 4 pCi/L action level, the EPA suggests considering mitigation because any radon exposure carries some risk, and lowering radon levels can further reduce lung cancer risk.
2. **Below 2 pCi/L:** No immediate action is necessary. However, it is advisable to retest the radon levels periodically to ensure they remain low, as levels can fluctuate.

Additionally, it is recommended to:

- Test your building every 2 years or after any significant renovations or changes to your building's structure, which could alter radon levels
- Test in different seasons, as radon levels can vary with weather conditions and ventilation patterns.

Taking these steps helps ensure that radon levels remain low and minimizes the risk of long-term health issues associated with radon exposure

The testing performed followed that prescribed for multi-family housing, modified for the prevailing conditions. For a more accurate evaluation consider installing “long term” detectors for 91-180 days. Long term detectors do not require closed house conditions and are not affected by weather conditions.

Radon testing should also be conducted when any of the following circumstances occur:

- A new addition is constructed or alterations for building reconfiguration or rehabilitation occur;
- Ground contact area(s) not previously tested are occupied, or a building is newly occupied;
- Heating or cooling systems are significantly altered, resulting in changes to air pressures or pressure relationships;
- Ventilation is significantly altered by extensive weatherization, changes to mechanical systems or comparable procedures
- There are significant openings to soil occur due to:
  - Groundwater or slab surface water control systems that are altered or added (e.g., sumps, perimeter drain tile, shower/tub retrofits, etc.) or
  - Natural settlement causing major cracks to develop;
  - Earthquakes or construction blasting, fracking or formation of sink holes nearby; or
  - A mitigation system is altered, modified or repaired.

Should testing indicate concentrations that meet or exceed the action level, conduct evaluations, corrections and further testing until radon concentrations have been mitigated to below the action level.

### QA/QC

Quality Control/Quality Assurance measures to ensure the integrity of the sample results. The three means of assurance are Blank Samples, Duplicate Samples and Spike Samples.

#### Duplicate Samples

DUPLICATE SAMPLES FOR GLENVIEW GARDEN APTS – MAY 2024					
DETECTOR	DUP	UNIT	NOTES	RADON pCi/L	HOURS
7420435	D	Lobby	Library	< 0.3	72
7420436	D	Lobby	Library	< 0.3	72
11739188	D	Bldg B Room 212	Liv/Kit	3	72
11739189	D	Bldg B Room 212	Liv/Kit	2.9	72
11739199	D	Bldg A 4th Floor	Outside 405 corridor	< 0.3	72
11739200	D	Bldg A 4th Floor	Outside 405 corridor	< 0.3	72

The duplicate samples above show consistent analysis.

### Blank Samples

The following blank samples were submitted to the laboratory. If blank samples indicate radon detected, the reason for exposure must be investigated. The results of blank testing for this project are:

BLANKS FOR GRAND LAKE GARDEN APARTMENTS		
DETECTOR	NOTE	Radon pC/L
7420437	Blank	< 0.3
7420438	Blank	< 0.3

The blank samples for this project do not indicate any irregularities in storage, handling or laboratory analysis.

### Spike Samples

Four test kits were submitted to Bowser Morner testing laboratories, where the samples were subjected to a known amount of radon. The samples were then submitted to Air Chek for analysis as if they were field samples:

Radon Spike Report      4/15/24

# Bonnie Lee Kellogg

Has satisfactorily fulfilled the requirements set forth by the National Radon Proficiency Program and is therefore certified as a:

## Radon Measurement Professional with Standard Services

NRPP ID 102253-RMP

Issued On: 2023-10-26 Expires: 2025-10-31

Valid for specific activities or measurement devices, which can be verified with NRPP. State and local agencies may have additional requirements.

In witness Whereof,  
I have subscribed my name as a  
Representative of NRPP

*Christina Johnson*

## ABSTRACT

The Phase I Cultural Resources Study for the proposed affordable housing project located at 401 Santa Clara Avenue, Oakland, Alameda County, California, was prepared by Dana E. Supernowicz, M.A., RPA, of Historic Resource Associates. The project site is delineated on the United States Geological Survey (USGS) 7.5' *Oakland East, California* topographic map in unsectioned land within Township 1 South, Range 3 West, MDM (Figure 1). The proposed undertaking is located on the north side of Santa Clara Avenue, east of the interchange of East Park Avenue and the CA-580 freeway. The project parcels, identified as Assessor's Parcel Numbers (APNs) 010-0823-015-05 and 010-0823-039-02, are developed with a 103-unit, six-story apartment building constructed in 1966 and occupied in 1967 (Figures 2-3).

The existing apartment building was previously used for senior housing, but has been vacant since 2022 after suffering significant fire damage. The planning and entitlement for the rehab and additional units for the project has not been approved and therefore no California Environmental Quality Act (CEQA) determination has been made. The proposed project is receiving funding through the United States Department of Housing and Urban Development (HUD) program that requires National Environmental Policy Act (NEPA) compliance for the HUD Home financing. The National Historic Preservation Act of 1966 requires federal agencies to consider the impact of their projects on historic properties through the Section 106 review process and its implementing regulations – 36 CFR Part 800.

The area of potential effect-direct effects (APE-DE) for the project includes the entirety of APNs 010-0823-015-05 and 010-0823-039-02, which includes the apartment building located at 401 Santa Clara Avenue, commonly known as “Grand Lake Gardens,” an affiliation related to the district in which the property is located. The area of potential effect-visual effects (APE-VE) includes any surrounding properties on the first block flanking the project site (Figures 2-3).

On July 16, 2024, a record search (NWIC File No. 24-0052) was conducted at the Northwest Information Center (NWIC), utilizing the California Historical Resources Information System (CHRIS) in Rohnert Park. Review of NWIC records indicated that there had been zero (0) cultural resource studies conducted within the project APE-DE and one (1) cultural resource study conducted within the APE-VE: Scott and Whitaker 2023 (S-57382a).

According to the NWIC records, there are zero (0) recorded archaeological resources identified in the APE-DE and APE-VE. The State Office of Historic Preservation (OHP) Built Environment Resources Directory (BERD), which includes listings of the California Register of Historical Resources (CRHR), California State Historical Landmarks (CHL), California State Points of Historical Interest (CPHI), and the National Register of Historic Places (NRHP), listed no buildings or structures within the project APE-DE or APE-VE. The subject property does not appear to have been assessed for its significance based upon the aforementioned repositories nor does the City of Oakland list the subject property in any historic resource inventory. The nearest built environment resource listed in the BERD is the Kendall-Greuner Building (P-01-000961/HRI #4623-1316-0000), built in 1926,

rated 7R, and located at 430-466 Santa Clara Avenue, approximately 1/2 block to the southwest of the project site.

A further review of geophysical data does not suggest that the project site is sensitive for precontact resources, as opposed to the sloughs and bay front near Lake Merritt. On-site soils are categorized as 151 Urban land-Tierra complex with 5%-15% slopes. The geomorphology of the project area is classified as alluvium with loam, clay, and sandy clay loam below 5' feet (NRCS Website 2024).

On July 14, 2024, Dana E. Supernowicz, M.A., RPA of HRA conducted a physical inspection of the project APE-DE. Photographs were taken of the project building and 523 DPR site records were prepared. There was no indication of native soils present within the project site as a result of the construction of the existing apartment building and landscaping. Archival research was conducted at the Oakland History Center, the Oakland City Planning Department, historic newspapers, photographs, maps, and the internet.

In summary, following a physical inspection of the subject property located at 401 Santa Clara Avenue, and after conducting archival research, the Grand Lake Gardens Apartments, designed in the International style of architecture, does not appear to be eligible for the National Register of Historic Places (NRHP) under Criterion A-D.

No precontact or historical archaeological sites, features, or artifacts were identified within the project parcels, which are largely covered by the building's footprint. Construction of the subject property would have involved extensive excavation, likely disturbing or destroying any below-grade archaeological deposits. As previously noted, the probability of uncovering subsurface archaeological properties is extremely low.

Based on the results of the Phase I CRS and NAHC SLF search, as well as the incorporation of recommendations from the Muwekma Ohlone Tribe and the City's Standard Conditions of Approval into a Tribal Monitoring and Discovery Plan to which the project would be subject, the City has determined that the **proposed project would result in no affect to historic properties and no adverse effect on archaeological resources with the mitigations and City standard conditions proposed.**

## INTRODUCTION AND PROJECT DESCRIPTION

The Phase I Cultural Resources Study for the proposed affordable housing project located at 401 Santa Clara Avenue, Oakland, Alameda County, California, was prepared by Dana E. Supernowicz, M.A., RPA, of Historic Resource Associates. The project site is delineated on the United States Geological Survey (USGS) 7.5' *Oakland East, California* topographic map in unsectioned land within Township 1 South, Range 3 West, MDM (Figure 1). The proposed undertaking is located on the north side of Santa Clara Avenue, east of the interchange of East Park Avenue and the CA-580 freeway. The project location is developed with a 103-unit, six-story apartment building constructed in 1966 (Figures 2-3).

The existing apartment building was previously used for senior housing, but has been vacant since 2022 after suffering significant fire damage. The affordable housing project has been determined to be exempt from the California Environmental Quality Act (CEQA), but is receiving funding through the United States Department of Housing and Urban Development (HUD) program that requires National Environmental Policy Act (NEPA) compliance for the HUD Home financing. The National Historic Preservation Act of 1966 requires federal agencies to consider the impact of their projects on historic properties through the Section 106 review process and its implementing regulations – 36 CFR Part 800.

The area of potential effect-direct effects (APE-DE) for the project includes the entirety of APNs 010-0823-015-05 and 010-0823-039-02, which includes the apartment building located at 401 Santa Clara Avenue, commonly known as “Grand Lake Gardens,” an affiliation related to the district in which the property is located. The vertical APE-DE varies from 2'-9' in depth. The area of potential visual effects (APE-VE) includes any surrounding properties on the first block flanking the project site.

This historical and archaeological study was completed by Dana E. Supernowicz, M.A., RPA on August 9, 2024, in accordance with state and federal guidelines (California State Historic Preservation Office). It is intended to provide information that will enable the California State Historic Preservation Office (CASHPO) to review the subject project. The Principal Investigator meets and/or exceeds the qualifications described in the Secretary of the Interior's Professional Guidelines (Federal Register 48:190:44738-44739) (United States Department of the Interior 1983). Background research was conducted at the Northwest Information Center (NWIC) utilizing the California Historical Resources Information System (CHRIS), as well as archival information curated from the library of Historic Resource Associates.

The 0.93-acre sloping project site at 401 Santa Clara Avenue is developed with a 77,076-square-foot, seven-story, multi-family residential building and associated garden areas. The building, which was constructed in 1966 and occupied in early 1967, previously operated under the name of the “Grand Lake Gardens” and has been vacant since 2022, after suffering fire damage. Surrounding existing uses include multi-family residences immediately to the north; single-family and multi-family residences to the east, across Santa Clara Avenue; multi-family residences immediately to the south; Oakland Unified School District (OUSD) classrooms and surface parking areas further to the south; and multi-

family residences to the west. The City of Oakland General Plan designates the project site as Urban Residential and the site is zoned Urban Residential-3 Zone (RU-3).

The proposed project would consist of renovations to the existing apartment complex, which would eventually serve as affordable housing. The project applicant, the Oakland Housing Authority, intends to purchase the property and rehabilitate the building to livable conditions, and anticipating adding five residential units within the interior of the building for a new total of 108 units. Because the building was constructed in 1966, the proposed project would also include seismic retrofitting improvements to ensure the building is in compliance with current building standards. The project would require only limited ground disturbance, which would be associated with trenching to a depth from 2'-9' for new footings to support new exterior walls constructed for the purposes of load-bearing support. The new footings and exterior walls would be adjacent to the existing structure and would require excavation of three feet from the existing exterior and interior walls to a depth of two feet below ground surface to match the existing footing depths.

## **ENVIRONMENTAL SETTING**

According to the 1986 United States Geological Survey (USGS) 7.5' *Oakland East, California* Topographic Quadrangle Map, the subject property and project site are located at an elevation of approximately 57' feet above mean sea level (msl). The topography of the subject property is moderately sloping to the southeast. Soils are classified as 151 Urban land-Tierra complex with 5%-15% slopes. The geological characteristics of the project site are classified as alluvium with sandy clay loam (NRCS Website 2024).

## **PREHISTORIC OVERVIEW**

The coastal region stretching from San Francisco to the East Bay including Oakland and other nearby communities has been the subject of numerous archaeological surveys and excavations since the early 1900s. The earliest of these investigations reflected an amateur archaeological approach, which included collecting museum specimens for display purposes or for private collections. In general, these studies were extremely limited in scope and provided little understanding of prehistoric culture of the Central Coast.

The first stratigraphic excavations made in California were conducted at the Emeryville Site in 1902 by Max Uhle and J.C. Merriam, as part of the anthropology program developed by A. L. Kroeber, with the financial support of Phoebe Hearst. A trench and tunnel on the west side revealed ten strata with ten burials confined to the five middle strata. Three phases of mound development were evidenced by the excavation, including the Early, Middle and Late periods. In 1908, N.C. Nelson, S.A. Barrett, P.E. Goddard, and A.V. Wepfer, working under the direction of J.C. Merriam, stratigraphically excavated a small, but deep, shaft in the east side of the mound and found four burials and unassociated artifacts, representing both the Middle and Late periods (Bennyhoff 1983). By 1939, excavations at interior sites had finally established a succession of three prehistoric periods, termed "horizons."

By 1947, R. K. Beardsley had re-examined all the major excavations in the Bay Area and had found stratigraphic support for the Middle and Late Horizons on San Francisco Bay. Coyote Hills Regional Park, near Fremont on the southeastern shore of San Francisco Bay, contains three prehistoric shell-mound sites. One, the Patterson Mound Site (CA-Ala-328), originally 10 feet high and 100 feet across, was first occupied around 1500 B.C. (Chartkoff and Chartkoff 1984:386). Ultimately, Bennyhoff and others believe that the Emeryville Site remains of “key importance” in the re-evaluation of the region, because it provides stratigraphic evidence for significant cultural change through some 3,000 years of Bay region prehistory (Bennyhoff 1983).

The Diablo Range divides two environmentally and culturally distinct regions: the Central Valley to the east and the eastern reaches of the San Francisco Bay area to the west. In recent years, work conducted in this region was discussed in some detail in *California Prehistory* (2007), edited by Terry Jones and Katherine Klar. Authors Jeffrey Rosenthal, Gregory White, and Mark Sutton (2007:147) discuss research conducted in the Central Valley and anthropologist Randall Milliken addresses research conducted specifically in the San Francisco Bay area, as it relates to the region’s ethnography (Milliken et al. 2007:104). Recent models of language migrations within the study area were prepared by Golla (2007) based upon Moratto’s chapter on Linguistic Prehistory in *California Archaeology* (Moratto 1984:529–574).

Pollen evidence collected from lake sediment samples in northwestern California indicate that the climate became progressively wetter at the end of the Pleistocene. Coastal environments appear to have sustained themselves into the Holocene (Huesser and Barron 2002, cited in West et al. 2007:20). One interior site in California, CA-SIS-218, may reflect such an early occupation, dating to roughly 11,300 cal B.C. (Beaton 1991). Some of the earliest dates along the coastline come from Arlington Springs on Santa Rosa Island, where human bone fragments were radiocarbon-dated to between 11,000 and 10,000 cal B.C. (Erlandson et al. 2007:57).

The earliest occupation of the Central Valley appears to be around Tracy Lake and in the southern end of the Central Valley, within Merced and King counties (Rosenthal, White, and Sutton 2007:151). The sites are represented by basally thinned and fluted projectile points, similar to Clovis points, which have been dated to 11,500 to 9550 B.C. Sites reflective of Paleo Indian occupation or culture within the San Francisco Bay area have yet to be identified. Such sites have likely been covered by alluvium, eroded away by streams or along ocean cliffs, or are submerged as a result of rising sea levels (Newland 2009; Milliken et al. 2007:114).

As the early Holocene progressed, environmental conditions became progressively drier, with periods of summer drought and the beginning of the development of contemporary forest communities (Huesser and Barron 2002, cited in West et al. 2007:20, 21). Central Valley climate changes at the end of the Pleistocene triggered alluvial fan and floodplain development throughout low areas within Central California, marking the transition from Pleistocene to early Holocene (Rosenthal and Meyer 2004:21). The Lower Archaic is still poorly represented, with isolated finds consisting of stemmed points, crescents, and early concave-based points found along the ancient shorelines of Tulare Lake (Hartzell 1992, cited in Rosenthal, White, and Sutton 2007:151; Newland 2009).

The emphasis on large, wide-stemmed points suggests an emphasis on artiodactyl hunting during the Lower Archaic. Geomorphological processes at the end of the Lower Archaic capped much of the archaeological evidence of this time period beneath alluvium, as a result of a shift to wetter and cooler climate. The Early Holocene reportedly denotes the earliest identified occupation of the San Francisco Bay Area. Milling slabs, hand stones, and large, wide-stemmed and leaf-shaped projectile points characterize this time period. The earliest reported date for a San Francisco Bay Area site, derived from C14 dating of charcoal associated with a milling slab, is 7920 cal B.C. (Milliken et al. 2007:114). Based on archaeobotanical remains, it appears that acorn, wild cucumber, and manzanita berries played important roles in the economy of this culture (Wohlgemuth 1997:H-33). The artifact assemblage and botanical remains suggest a culture with a highly mobile, foraging subsistence strategy (Milliken et al. 2007:114; Wohlgemuth 1997:H-33; Newland 2009). Increased global temperatures starting around 6000 B.C. influenced the movement and subsistence patterns of prehistoric populations. Milling slabs and hand stones begin to appear during this time. By the Middle Holocene, temperatures had risen, while precipitation decreased. Summer drought was a common occurrence and a jump in seasonal fires. During the Middle Archaic/Early Period, the vegetation communities seen at the time of contact within the Sacramento-San Joaquin Delta likely became established (Newland 2009; West et al. 2007:20-21, 24).

## **ETHNOGRAPHIC CONTEXT**

Prior to 6000 B.C., it is believed that the first inhabitants of the region probably spoke a language ancestral to the Hokan language family, i.e. Proto-Hokan. Hokan speakers at the time of contact with Europeans fell generally into six language families and five isolated languages. The time depth required for these languages and language families to split off suggests some antiquity to Proto-Hokan. Moratto (1984:543-545) proposes that Proto-Hokan speakers migrated into California from the east, rather than directly down the coast as a handful of other early languages likely had, and may have carried the Western Fluted Point Tradition with them, including the Clovis point examples found at Tracy Lake (Newland 2009). Speakers of what would become the Esselen language, one of the Hokan language isolates, split off from Hokan during this time (Hester 1978:496; Moratto 1984:551). Esselen speakers occupied areas just south of Monterey Bay at the time of contact, but ancestrally may have extended east into the Central Valley and north as far as San Francisco (Moratto 1984:551; Shaul 1984:47).

During this time, approximately 2500 B.C., a population that spoke an early Penutian language linguists refer to as “Utian” and directly ancestral to the Ohlone and Miwok arrived, probably from Great Basin or southern Columbia Plateau into the lower Sacramento Valley. Their arrival is marked by the advent of the Windmill Pattern and reflects an emphasis on riparian-marshland resources, an expansive bone toolkit, extended burials, and substantial grave goods (Moratto 1984:552). The territory of the ancestral Ohlone expanded either pushing ancestral Esselen speakers out of the San Francisco and East Bay areas or absorbing Esselen populations.

The Berkeley Pattern, which arose during this time period, may represent a fusion of Esselen material technology and resource emphasis on acorn with that of the more riparian marshland-based emphasis of the ancestral Ohlone, represented by the Windmill Pattern. Linguistic data may support this merger, as the vocabulary for coastal resources within Ohlone appears to borrow words from Esselen. The first evidence of Berkeley Pattern artifacts appeared in approximately 1910 B.C. in San Ramon

Valley. It seems plausible that the Penutian population from which Ohlone speakers descend was located in or near the Carquinez straits, subsequently branching out into the East Bay (Moratto 1984:554; Newland 2009). Approximately 500 to 1,000 years after the arrival of ancestral Ohlone speakers, a second wave of Penutian-speaking peoples settled in the Delta area. It appears likely that they too came from the northwestern Great Basin or southern Columbia Plateau. This population would spread throughout the San Joaquin Valley and into the Sierra and represent the ancestral Yokuts (Moratto 1984:555-557).

It is during the Middle Archaic/Early Period that Utian-speaking peoples arrived in the San Francisco Bay area. Ancestral Ohlone come in contact with ancestral Esselen, resulting in what seems to be a merger of the two cultures. The resulting material culture assemblage has been defined as the Berkeley Pattern. Esselen subsistence patterns continued to focus on acorns but included newly introduced fishing techniques. Appearing for the first time, cut shell beads, particularly *Haliotis* and *Olivella*, were common in Berkeley Pattern assemblages. Burials tended to be flexed in variable orientations (Milliken et al. 2007:114–115; Moratto 1984:209-210). Grave goods also appeared for the first time but were less common than those found in Windmill Pattern sites. The predominance of a variety of beads found throughout the region during this time period indicates that local populations shared common cultural traits and were part of a much wider trade network (Milliken 2007:114–115; Moratto 1984:210).

This time period also marks the first evidence of indigenous buildings via the discovery of elliptical structures having floors with postholes (Price et al. 2006, cited in Milliken et al. 2007:115). The presence of structural remnants and artifact assemblages signals a more sedentary or semi-sedentary lifeway than was seen during the Lower Archaic/Early Holocene (Milliken et al. 2007:114). As the ancestral Ohlone and Bay Miwok populations expanded, the Berkeley Pattern was introduced into the lower Sacramento and northern San Joaquin valleys.

During the Late Holocene, precipitation increased and cooler conditions set in (West et al. 2007:25). By A.D. 1 ancestral Ohlone likely occupied most of the territory they held during the time of contact with the Spanish. The Bay Miwok and the Ohlone appear to have been focused largely on riparian resources (Moratto 1984:552). Some time around A.D. 500, ancestral Wintuan-speaking people, probably originating in southern Oregon, expanded southward through the lower Sacramento Valley (Fredrickson 1984:485; Moratto 1984:211). Though this population does not directly inhabit the project vicinity, its arrival had a dramatic effect on the local cultural groups. The ancestral Wintu appear to have introduced the bow and arrow; intensive fishing, hunting and gathering strategies that could have supported large, highly-populated villages. This new pattern of artifacts is referred to as the Augustine Pattern (Moratto 1984:211).

This period represented a major cultural shift in the region as a result of contact with Augustine Pattern material culture traditions brought south by ancestral Wintuan populations. The rectangular shell bead types found in Early Period components disappear from Lower Middle Period components in archaeological sites both in the Bay Area and the Central Valley, replaced with split-beveled and saucer *Olivella* (Elsasser 1978:41-43; Milliken et al. 2007:115). As in the Central Valley, a new bone tool kit, including barbless fish spears and elk femur spatulae, and basketry awls appears. Net sinkers also

appear, and the mortar and pestle continue to be the primary food-processing tools. Burial complexes dating to this time period illustrate the ceremonial change that local cultures adopted in addition to changes in subsistence strategies.

The first evidence of well-developed middens can be dated to this time period. By circa A.D. 700, ancestral Wintuan speakers arrived in the lower Sacramento Valley, possibly pushing the Bay Miwok into the Mount Diablo region (Moratto 1984:562). Evidence of conflict can be seen in human remains recovered from several south and east Bay Area sites that date to this time (Milliken et al. 2007:113, 116). The Ohlone had been firmly established in the areas they occupied for millennia at the time of Spanish contact (Moratto 1984:555). Local variations of the Augustine Pattern material culture assemblage continued to develop up to the time of contact with Euroamericans.

As Newland notes, the east side of the Livermore Valley appears to straddle lands that may have been occupied by both Costanoan, also known as Ohlone, and Northern Valley Yokut-speaking peoples. The Diablo Range including the Santa Clara Valley is generally considered the boundary between the two languages (Newland 2009; Levy 1978:485; Wallace 1978:462). The territory of the aboriginal Ohlone extended from San Francisco Bay in the north, east through Oakland into the Livermore Valley, and as far south as Point Sur and the upper Salinas River. Within this area there were recorded eight uniquely different languages of the Costanoan language family (Levy 1978:485). Like Northern Valley Yokut, the Costanoan language family is part of the larger Penutian language stock (Golla 2007:75).

At the time of contact, the Costanoan-speaking people lived in approximately 50 separate and politically autonomous nations, or tribelets. The East Bay area was included within the territory of people who spoke the Chochenyo language, which comprised about 10 tribelets of around 2,000 speakers (Levy 1978:485; Milliken 1997:9–10). Aboriginal groups of the San Francisco and Monterey Bay area came to be known collectively as Costanoan, a word derived from the Spanish word *Costaños* meaning 'coast people.'

The term Costanoan refers to a linguistic family consisting of eight languages: Karkin was spoken in a single tribelet on the southern edge of the Carquinez Strait; Chochenyo or East Bay Costanoan was spoken among the tribelets occupying the east shore of San Francisco Bay between Richmond and Mission San Jose; Tamyen or Santa Clara Costanoan was spoken around the south end of San Francisco Bay and in the lower Santa Clara Valley; Ramaytush or San Francisco Costanoan was spoken in San Mateo and San Francisco counties; Awaswas or Santa Cruz Costanoan was spoken among the people living along the ocean shore between Davenport and Aptos in Santa Cruz County; Mutsun was spoken among the tribelets of the Pajaro River drainage; Rumsen speakers occupied the lower Carmel, Sur, and lower Salinas rivers; and Chalon or Soledad was spoken on the Salinas River (Levy 1978).

Materials crafted by the Costanoans and used in subsistence activities included baskets, mortars, pestles, nets, net sinkers, anchors, and a variety of chipped stone tools. Trade with the surrounding Plains Miwok, Sierra Miwok and Yokuts allowed nonindigenous materials and food (i.e. piñon nuts)

to be brought into the area as well. In exchange, the Costanoan are thought to have exported bows, salt, and salmon to neighboring groups (Levy 1978). Economic reciprocity, in addition to intermarriage, is thought to have linked settlements together, some of which, by Spanish accounts, indicate stable and prosperous villages with as many as 200 people (Milliken 1993). Overall population density along this part of the coast was, nevertheless, very sparse.

Costanoan-speaking peoples had an abundant range of natural resources available to them. They collected and processed acorns from coast live oak, black oak, and valley oak, and, to a lesser degree, also used buckeye nuts, hazelnuts, and laurel nuts. Seeds from dock, tarweed, chia, and foothill pine were parched in basketry trays and eaten or ground into meal. Berries including blackberry, elderberry, strawberries, manzanita and madrone berries, and wild grapes were also eaten. Edible roots that were collected include wild onion, cattail roots, wild carrots, and several other species (Levy 1978:491).

Animal species were hunted, including black-tailed deer, Roosevelt elk, antelope, grizzly bear, and mountain lion, as well as smaller animals such as dog, wildcat, skunk, rabbits, raccoons, squirrels, and small rodents. Larger game was hunted by individual hunters, while smaller game was hunted communally with traps, snares, and nets (Levy 1978:491). Waterfowl, including several species of goose and duck, were important food sources as were dove, quail, robin, and hawk. Fish also held an important role in the Costanoan diet, particularly steelhead, salmon, sturgeon, and lamprey (Levy 1978:492).

Several building types were used by the Costanoan-speaking peoples. A domed thatched structure with rectangular doorway and central firepit was the most common house type. Semi-subterranean sweathouses were built adjacent to stream banks and could hold up to eight people. For dances, circular or oval enclosures were built, delineated by laurel branch or brush fencing. Both the dance enclosures and domed assembly houses, some of which were historically known to hold up to 200 people, were built in the center of villages (Levy 1978:492).

Costanoan-speaking peoples appear to have traded primarily with their eastern neighbors, the Plains Miwok, Northern Yokut, and Sierra Miwok, rather than their northern neighbors across the bay and Sacramento Delta, the Miwok and Patwin. Important hematite and cinnabar quarries were located in the Oakland hills and New Almaden; these minerals were used in face and body paint and were so important that conflict between Costanoan groups over access to the quarries often arose.

The Rumsen were reportedly the first of the Costanoan peoples to be encountered by Spanish exploring expeditions in 1602 and between 1769 and 1776. Between 1770 and 1797, seven missions were established within Costanoan territory (Levy 1978). During the mission period, 1770-1835, significant changes occurred for the Costanoan people. The population was recruited into nearby missions and their traditional subsistence economy was replaced by an agricultural one. Most of the Ohlone groups in the region went to Mission San Jose from 1802 through 1805, with the largest group being baptized in 1805 (Milliken 1997:28).

Missionization, disease, and displacement from their lands significantly impacted the Ohlone-speaking people (Levy 1978:486–487). Analyses of mission baptismal records demonstrate that the last Costanoan tribelets living a traditional existence had disappeared by 1810 (Cook 1943; Levy 1978). The population declined from 10,000 in 1770 to less than 2,000 in 1832, due to the introduction of European diseases and falling birth rates. The mission culture that had absorbed and to some degree supported the Costanoans was short-lived. The secularization or abandonment of the missions by the Mexican government in 1832 caused the Costanoan to relocate to different areas and establish small settlements, fragmenting the survivors and separating them farther away from their cultural heritage. It is believed that the Costanoan languages were probably extinct by 1935 (Levy 1978).

## HISTORIC CONTEXT

During the Spanish occupation of California, the land that included Oakland belonged to Don Luis Maria Peralta (1759-1851). After California gained statehood, Peralta's vast land holdings in the East Bay were largely lost (Bagwell 1982:12). The area owes its early history to the development of industries related to logging and lumber. Following the discovery of gold at Coloma in January 1848, one of the first industries in what was to become Oakland was lumber manufacturing. In the hills surrounding the town, a coastal redwood (*sequoia sempervirens*) forest flourished. In just ten short years, almost all of the virgin timber had been logged off the nearby hills (Bagwell 1982:15). Most of the logs were dragged from the woods via teams of oxen to the wharves and sawmills. It is likely that present-day Park Boulevard once provided relatively easy access into the groves of coastal redwoods that lined the hills above Oakland.

During the early 1850s, Carpentier, Moon, and Adams leased land from Vicente Peralta and began to subdivide the property into lots. They hired Swiss engineer Julius Kellerberger to map out the streets in a standard grid pattern (Bagwell 1982:27). On May 4, 1852, Oakland was incorporated as a city. The original townsite was located on the west side of the marsh that was to later become Lake Merritt. East of San Antonio Slough, the region became known as Brooklyn and ultimately merged with Oakland to form one city (Bagwell 1982:34). By 1860, according to the United States Federal Census, there were 1,543 residents living in Oakland and 1,341 in Brooklyn (Bagwell 1982:41).

Oakland's central location in the East Bay and proximity to the waterfront made it an ideal candidate as a terminus for the Central Pacific Railroad in 1869. The railroad influenced the development of industry in Oakland and provided jobs and passenger service to various points to the east. By the 1870s, besides its rail service, Oakland had its share of industries, which included planing mills, breweries, canneries, and cotton mills. Child labor was still quite common in America's factories during the 1870s and 1880s, and Oakland was beginning to see its fair share of crime and social problems. During this same period, Oakland's population was becoming more ethnically diverse, with Irish, German, Chinese, and African-Americans contributing significantly to the shaping of Oakland's cultural heritage.

Oakland thrived through World War II, propelled by new industry related to wartime production. The post-World War II years led to increased social problems, including unemployment, poverty, and the physical deterioration of the inner city. But, like other cities surrounding the bay, Oakland has witnessed an economic rebirth during the last decade of the twentieth century. Many of Oakland's

historic buildings have been renovated or are in the process of being restored, and migration back to the inner city has begun.

While Oakland fared much better than San Francisco following the 1906 earthquake, considerable damage to its infrastructure and buildings did occur. Following the earthquake, Oakland became a sanctuary for individuals and families who had lost everything in San Francisco. Between 1900 to 1910, Oakland's population grew from 67,000 to over 150,000 (Bagwell 1982:179). The 1910s through the 1930s were a progressive era for Oakland, characterized by growth in transportation, improvements in sanitation, city streets, and continued expansion of the city's boundaries. In 1908, the Oakland Park Commission was formed (Bagwell 1982:183). Shortly afterward, Lakeside Park at Lake Merritt was developed. During the 1910s, Major Mott defended municipal planning and, in 1912, Oakland's City Hall was constructed followed by other civic buildings of stature. As the downtown developed so did the city's waterfront district. By the 1920s shipbuilding became one of the city's dominant industries and the Port of Oakland witness major expansion (Bagwell 1982:191). With the growth of industry came the need to provide adequate housing, so during the 1910s through the 1930s housing projects sprang up throughout the city, including hundreds of new apartment and commercial buildings.

The City of Oakland had two major renaissance periods in commercial construction – the 1920s prior to the Great Depression and the 1950s associated with the post-World War II expansion of the city and its growth as a leader in attracting large corporations to its core downtown area. Unlike the 1920s when most of the high-rise architecture included Neo-Classical, Classical Revival, Renaissance Revival, and Beaux-Arts designs, while the 1950s ushered in a period of contemporary architects who adapted modern designs to their buildings using state of the art materials, such as cast steel, aluminum, and precast concrete.

The subject property is located in the Grand Lake neighborhood of East Oakland, east of the 580 Freeway. Lake Park Avenue forms the key roadway through the neighborhoods, which were developed in the 1910s-1930s with later infill through the 1960s, as the city expanded to the east into the hills above the central city (Gebhard 1985:304-306). The Sanborn Fire Insurance map for Oakland, published in 1911 and revised in 1950, indicates that the project site was located in a residential neighborhood dating back to the 1910s (Figure 4).

In order to address the shortage of affordable housing in Oakland after World War II, both the city and other organizations, including religious organization, began a concerted effort to fill the need for new housing. The subject property was financed by the American Baptist Homes and Hospitals in Northern California, originally known as the American Baptist Homes of the West (ABHOW). The first project reportedly in California was construction of Pilgrim Haven in 1949 at 373 Pine Lane, Los Altos, California. Another facility nearby is referred to as the Terraces of Los Gatos (*The Berkeley Gazette*, June 13, 1967).

The seven-story Modernist reinforced concrete International style apartment complex at 401 Santa Clara Avenue was designed by architect Elso B. DiLuck, AIA, whose office was located at 57 North Fulton Street, Fresno, California. DiLuck received his education at the University of Washington, and served in World War II as a Lieutenant-Col. within the Army Corps of Engineers. Apparently DiLuck had an ongoing relationship with the American Baptist Homes and Hospitals of Northern California, because in 1968, he was responsible for designing an independent living addition to the San Joaquin Gardens Apartments I Fresno (*The Fresno Bee*, May 5, 1968: 134). DiLuck's penchant for designing civic, educational, and other types of commercial buildings, including shopping centers, is born-out in newspaper accounts throughout the 1950s-1960s. One of DiLuck's designs for a retirement center in West Fresno was published in the *Fresno Bee* on October 26, 1956 (Figure 5). Another example of a design by DiLuck is the Piedmont Garden Apartments at 110 41<sup>st</sup> Street in Oakland, constructed in 1968 (Figure 6). The similarity between the Piedmont Garden Apartments and Grand Lake Gardens Apartments is apparent. Both buildings have a geometric vocabulary and rely on reinforced concrete construction with minimal ornamentation.

During the summer of 1966, preparations were underway for the "model apartments" known as the Grand Lake Gardens, which were anticipated to be ready in the fall of that year. As described in the *Oakland Tribune*:

#### Apartment Models Go On Display –

Model apartments in Grand Lake Gardens, the \$2.3 million Oakland retirement center of American Baptist Homes and Hospitals of Northern California, are now open and the building will be ready for occupancy this fall. Officials of the Baptist organization were on hand yesterday for a ceremony marking the opening. They included the Rev. Harold Bottemiller, executive director; Edward E. Waller, chairman of the board of managers for the center and Rolland Peterson, president of the corporation's board of trustees. The model apartments will be open until 5 p.m. today and again tomorrow from 1 to 5 p.m. Robert L. Mathews, administrator for the center at 401 Santa Clara Ave., said more than half of the apartments in the six-story structure are rented. Rentals will range from \$85 to \$135 a month, including utilities. An entry fee is also required to help pay the cost of limited medical care, periodic housekeeping, counseling and an activities and recreation program. A full life medical care program is available as an optional service with monthly rates or a prepayment plan. Evening meals will be served in a sixth floor dining room on the west wing of the structure. Grand Lake Gardens is open to persons of all religious denominations (*Oakland Tribune*, June 23, 1966).

On January 15, 1967, the Grand Lake Gardens apartment complex was dedicated. The following article was published by the *Oakland Tribune* describing the building and its benefactors during the dedication:

#### Baptist Home Dedication Wednesday –

Grand Lake Gardens, the 103-unit retirement center erected at 401 Santa Clara Ave., by American Baptist Homes and Hospitals of Northern California, will be dedicated at 8 p.m. Wednesday. The Rev. Gerald Gingrich of American Baptist headquarters at Valley Forge, Pa., secretary of the Division of Health and Social Ministries for the

American Baptist Home Mission Societies, will be the principal speaker. Other participants include Oakland Mayor John Reading, Roy Pryor, president-elect of the California Association of Homes for the Aging, the Rev. Harold Bottemiller, executive director of American Baptist Homes, Edward Waller, chairman of the board of managers of Grand Lake Gardens, Roland Peterson, president of American Baptist Homes, and the Rev. Dr. Russell Orr, executive minister of the American Baptist Churches of Northern California. A quartet from Berkeley Baptist Divinity School will provide special music for both programs. Robert Mathews is the administrator of the right-story retirement center. Mrs. Gordon Forbes, wife of the assistant pastor of the First Baptist Church, Berkeley, is assistant administrator and director of activities. The project includes studio, one and two bedroom apartments. Most apartments have balconies overlooking one of the five garden areas surrounding the U-shaped building. According to the Rev. Mr. Bottemiller, the center will be 80 per cent occupied at the time of dedication (*Oakland Tribune*, January 15, 1967: 23).

American Baptist Homes of the West (ABHOW) reportedly began in 1949 with the establishment of the Pilgrim Haven Retirement Community, now known as The Terraces at Los Altos in Los Altos, California. The Grand Lake Apartments were reportedly funded through the Northern California Chapter of the American Baptist Homes and Hospital Association, part of ABHOW whose headquarters was located in Valley Forge, Pennsylvania. The Association, as previously described, was active in building non-secular retirement facilities during the late-1940s through the late-1960s. The Northern California Chapter appears to have been dissolved. In 2022, still under ownership with ABHOW, the Grand Lake Apartments suffered a damaging fire, after which the facility closed and remains vacant.

## **KNOWN ARCHAEOLOGICAL AND HISTORICAL SITES**

On July 16, 2024, a record search (NWIC File No. 24-0052) was conducted at the Northwest Information Center (NWIC), utilizing the California Historical Resources Information System (CHRIS) in Rohnert Park. According to the NWIC records, there are zero (0) recorded archaeological resources identified in the APE-DE and APE-VE.

## **PRIOR CULTURAL RESOURCE SURVEYS**

Review of NWIC records indicated that there had been zero (0) cultural resource studies conducted within the project APE-DE and one (1) cultural resource study conducted within the APE-VE: Scott and Whitaker 2023 (S-57382a).

## **NATIONAL AND STATE REGISTER FILES**

The State Office of Historic Preservation (OHP) Built Environment Resources Directory (BERD), which includes listings of the California Register of Historical Resources (CRHR), California State Historical Landmarks (CHL), California State Points of Historical Interest (CPHI), and the National Register of Historic Places (NRHP), listed no buildings or structures within the project APE-DE or APE-VE. The subject property does not appear to have been assessed for its significance based upon the aforementioned repositories nor does the City of Oakland list the subject property in any historic

resource inventory. The nearest built environment resource listed in the BERD is the Kendall-Greuner Building (P-01-000961/HRI #4623-1316-0000), built in 1926, rated 7R, and located at 430-466 Santa Clara Avenue, approximately ½ block to the southwest of the project site.

## **HISTORIC MAP AND AERIAL PHOTOGRAPH REVIEW**

A review of historic topographic quadrangle maps and aerial photographs from 1906-2024 indicates that the project APE-DE was developed with residential houses beginning in the early-1900s. Beginning in the 1960s, urban renewal projects demolished many of the residential homes on the north side of Santa Clara Avenue to make way for large apartment complexes, such as the one located at 401 Santa Clara Avenue.

## **PROPERTY DESCRIPTION**

The subject property consists of a four-story and six-story, reinforced concrete garden apartment building, characterized by “U-shaped” massing; a below-grade parking area under the building; uniform banks of apartments, each having a deck with vertical railing overlooking Santa Clara Avenue the inner courtyard, with concrete vertical columns running from the ground to the sixth-floor separating each apartment; a plain horizontal roof, perhaps designed to block the sun above the sixth-floor dining room; and an upper-level deck having closed or filled railing with vertical incised decorations that reflect the building’s geometric vocabulary. The roof eave above the second floor is wide and finished with smooth concrete. Vertical steel columns support the left and right sides of the slightly elevated roof that reflects the building geometric design elements.

The northern wing rises four stories as opposed to the six-stories of the main wing facing Santa Clara Avenue. Although the wall surfaces on the front façade of the building are flat, the sidewalls have an irregular or rusticated finish. The northern wing of the building features a similar architectural design as the main building along Santa Clara Avenue. The main entrance to the building faces Santa Clara Avenue via a series of concrete stairs from the sidewalk, and is sheltered by a large cloth awning. The building is accessed through replaced anodized aluminum lighted entry doors. The interior lobby appears to have been remodeled.

The overall design of the subject property is consistent with the transcendence of Modern commercial architecture towards Post-Modern architecture. The 1960s marked a transformational era in commercial architecture evidenced by a shift in thinking and values. It was a period in which local and regional architects broke free from traditional architectural styles and explored new ways of design and construction. Architecture during this period was often viewed not just as a functional art form but also as an expression of political and social views. With this transformation came more daring and innovative designs. Music, art, and construction all help shaped the architecture of the time, that emphasized creativity, individuality, and progress. The architecture of the 1960s was a reflection of the broader cultural and social changes of the era, representing a new way of thinking about the built environment. Examples include the “Brutalist” forms of architecture evident at U.C. Berkeley during the 1960s.

## SIGNIFICANCE ASSESSMENT

The subject property located at 401 Santa Clara Avenue was evaluated for the NRHP. The subject property was evaluated for the National Register of Historic Places (NRHP), under Criteria A, B, C, and D:

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
- D. Applies to properties that have yielded, or may be likely to yield, information important in prehistory or history.

For a property to be significant it must also retain integrity. Integrity is defined by the National Park Service as follows:

### Location

**Location is the place where the historic property was constructed or the place where the historic event occurred.** The relationship between the property and its location is often important to understanding why the property was created or why something happened. The actual location of a historic property, complemented by its setting, is particularly important in recapturing the sense of historic events and persons. Except in rare cases, the relationship between a property and its historic associations is destroyed if the property is moved.

### Design

**Design is the combination of elements that create the form, plan, space, structure, and style of a property.** It results from conscious decisions made during the original conception and planning of a property (or its significant alteration) and applies to activities as diverse as community planning, engineering, architecture, and landscape architecture. Design includes such elements as organization of space, proportion, scale, technology, ornamentation, and materials. A property's design reflects historic functions and technologies as well as aesthetics. It includes such considerations as the structural system; massing; arrangement of spaces; pattern of fenestration; textures and colors of surface materials; type, amount, and style of ornamental detailing; and arrangement and type of plantings in a designed landscape. Design can also apply to districts, whether they are important primarily for historic association, architectural value, information potential, or a combination thereof. For districts, significant primarily for historic association or architectural value, design concerns more than just the individual buildings or structures located within the boundaries. It also applies to the way in which buildings, sites, or structures are related: for example, spatial relationships between major features; visual rhythms in a streetscape or landscape plantings; the layout and materials of walkways and roads; and the relationship of other features, such as statues, water fountains, and archeological sites.

## Setting

**Setting is the physical environment of a historic property.** Whereas location refers to the specific place where a property was built or an event occurred, setting refers to the *character* of the place in which the property played its historical role. It involves *how*, not just where, the property is situated and its relationship to surrounding features and open space.

Setting often reflects the basic physical conditions under which a property was built and the functions it was intended to serve. In addition, the way in which a property is positioned in its environment can reflect the designer's concept of nature and aesthetic preferences.

The physical features that constitute the setting of a historic property can be either natural or manmade, including such elements as:

- Topographic features (a gorge or the crest of a hill);
- Vegetation;
- Simple manmade features (paths or fences); and
- Relationships between buildings and other features or open space.

These features and their relationships should be examined not only within the exact boundaries of the property, but also between the property and its *surroundings*. This is particularly important for districts.

## Materials

**Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.** The choice and combination of materials reveal the preferences of those who created the property and indicate the availability of particular types of materials and technologies. Indigenous materials are often the focus of regional building traditions and thereby help define an area's sense of time and place.

A property must retain the key exterior materials dating from the period of its historic significance. If the property has been rehabilitated, the historic materials and significant features must have been preserved. The property must also be an actual historic resource, not a recreation; a recent structure fabricated to look historic is not eligible. Likewise, a property whose historic features and materials have been lost and then reconstructed is usually not eligible (refer to Criteria Consideration E in Part VII: *How to Apply the Criteria Considerations* for the conditions under which a reconstructed property can be eligible.)

## Workmanship

**Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.** It is the evidence of artisans' labor and skill in constructing or altering a building, structure, object, or site. Workmanship can apply to the property as a whole or to its individual components. It can be expressed in vernacular methods of construction and plain finishes or in highly sophisticated configurations and ornamental detailing. It can be based

on common traditions or innovative period techniques. Workmanship is important because it can furnish evidence of the technology of a craft, illustrate the aesthetic principles of a historic or prehistoric period, and reveal individual, local, regional, or national applications of both technological practices and aesthetic principles. Examples of workmanship in historic buildings include tooling, carving, painting, graining, turning, and joinery.

### Feeling

**Feeling is a property's expression of the aesthetic or historic sense of a particular period of time.** It results from the presence of physical features that, taken together, convey the property's historic character. For example, a rural historic district retaining original design, materials, workmanship, and setting will relate the feeling of agricultural life in the 19th century. A grouping of prehistoric petroglyphs, unmarred by graffiti and intrusions and located on its original isolated bluff, can evoke a sense of tribal spiritual life.

### Association

**Association is the direct link between an important historic event or person and a historic property.** A property retains association if it is the place where the event or activity occurred and is sufficiently intact to convey that relationship to an observer. Like feeling, association requires the presence of physical features that convey a property's historic character. For example, a Revolutionary War battlefield whose natural and manmade elements have remained intact since the 18th century will retain its quality of association with the battle. Because feeling and association depend on individual perceptions, their retention *alone* is never sufficient to support eligibility of a property for the National Register.

## FINDING OF SIGNIFICANCE

In determining the significance of the property located at 401 Santa Clara Avenue, historic documents and photographs were examined, and the subject property was compared to other similar buildings erected in Oakland and northern California during the 1960s. Furthermore, a building must retain integrity for it to be considered a significant resource for the NRHP. Since its construction in 1967, the building retains good integrity of location, design, setting, feeling, and association. Due to all the windows being replaced, the building's integrity of workmanship, and feeling are slightly diminished, however, as a whole, the building still reads as it was originally designed.

Under NRHP Criterion A, no evidence has been found to suggest that the subject property played a significant role in the history of Oakland during the late-1960s.

Under NRHP Criterion B, no evidence has been found to suggest that the subject property is associated with a person or persons of significance in the history of Oakland. The apartment complex was among a number of similar housing units funded by the Northern California Chapter of the American Baptist Homes and Hospital Association., whose headquarters were in Valley Forge, Pennsylvania. The building's architect, Elso B. DiLuck, AIA, had his office in Fresno and was involved with numerous projects, many associated with the American Baptist Homes and Hospitals

Association, including the other Association's senior housing project in Oakland known as Piedmont Garden Apartments which was built in 1968.

Under NRHP Criterion C, the subject property retains fair to good integrity, the major alteration being replacement of all the building's original doors and windows. The most interesting feature of the apartment complex is its "garden" design, which is also evidenced in much older apartments built from the 1920s forward in Oakland. Thus, this design element was not new, but certainly practical for tenants to easily access safe and functional outdoor spaces. As a whole, the subject property lacks many of the features that are notable as cutting-edge designs adapted by other Modernist architects working in the 1950s and 1960s in the International style of architecture in the East Bay Area. A review of listed or significant low and high rise commercial buildings, including apartments, in Oakland, appears to indicate that most date from the 1920s-1950s. Many represent important designs by significant local architectural firms as well as innovative architecture designs by an important architect generally recognized to be a master in his or her field, whose work is clearly distinguishable from other architects or craftsman.

Under NRHP Criterion D, there is no evidence that the subject property could yielded, or may be likely to yield, information important in prehistory or history.

Therefore, the subject property does not appear to be individually eligible for the National Register of Historic Places (NRHP) under Criteria A, B, and C, nor does the subject property appear to be a potential contributing element to a historic district.

### **ARCHAEOLOGICAL AND HISTORICAL SENSITIVITY OF THE APE-DE**

Archaeological and historical site sensitivity was deemed to be low, due to the lack of precontact archaeological resources identified within a ¼ mile radius of the proposed project site, lack of nearby natural water sources, extensive grading throughout the parcel, and subsequent construction of a building on the project site.

### **PEDESTRIAN SURVEY**

On July 11, 2024, a pedestrian survey of the APE-DE was completed by Dana E. Supernowicz, M.A., RPA. The surface reconnaissance focused on assessing and photographing the general surface conditions found within the project area. The archaeological potential was evaluated based on several factors, including proximity to recorded sites, creeks, rivers and wetlands, as well as the presence of early historic development. The entirety of the APE-DE is covered with the existing apartment complex, hardscape, and other landscaping. Soils displacement would have been substantial since the apartment includes parking underneath the apartment units and is cut in a moderately sloping hillside. No evidence of precontact or historical archaeological sites, features, or artifacts were observed during the pedestrian survey. Photographs were taken of the existing building and used to form the historic assessment detailed in the DPR 523 site records.

## NATIVE AMERICAN CONSULTATION

In accordance with Section 106 of the NHPA, an invitation to consult was distributed on August 16, 2024, to representatives of the following tribes, which were identified by the NAHC as potentially having knowledge of cultural resources in the project area: Amah Mutsun Tribal Band, Amah Mutsun Tribal Band of Mission San Juan Bautista, Confederated Villages of Lisjan Nation, Costanoan Rumsen Carmel Tribe, Indian Canyon Mutsun Band of Costanoan, Muwekma Ohlone Indian Tribe of the San Francisco Bay Area Region (Muwekma Ohlone Tribe), Northern Valley Yokut/Ohlone Tribe, The Ohlone Indian Tribe, and Wuksachi Indian Tribe/Eshon Valley Band.

The Muwekma Ohlone Tribe confirmed its desire to consult in a letter to the City on September 5, 2024, which included recommendations that were ultimately incorporated into the Tribal Monitoring and Discovery Plan prepared for the proposed project. The City sent the Tribal Monitoring and Discovery Plan to the Muwekma Ohlone Tribe for the tribe's review and approval on October 14, 2024. The Tribal Leadership responded that they approve of the Monitoring and Discovery Plan and recommended that if an ancestral heritage site is discovered educational signage about the history and heritage of the Muwekma Ohlone Tribe be developed and established on site for the community, and, if a precontact archaeological site is discovered, the Tribe would like to contribute either a stand-alone or a contributing ethnohistory chapter as part of the final report.

Additionally, the Costanoan Rumsen Carmel Tribe notified the City of its desire to consult on August 28, 2024; however, efforts by the City to consult with the Costanoan Rumsen Carmel Tribe were not responded to by the tribe. Subsequently a Monitoring and Discovery Plan has been prepared for the project, which was forwarded to the City of Oakland and accepted by Muwekma Ohlone Tribe.

## CONCLUSION AND RECOMMENDATIONS

In summary, following a physical inspection of the proposed project located at 401 Santa Clara Avenue, and after conducting archival research, the Grand Lake Gardens Apartments do not appear to be eligible for the National Register of Historic Places (NRHP) under Criterion A-D. No precontact or historical archaeological sites, features, or artifacts were identified within the project parcels, which are largely covered by the building's footprint. Construction of the subject property would have involved extensive excavation, likely disturbing or destroying any below-grade archaeological deposits.

Based on the results of the Phase I CRS and NAHC SLF search, as well as the incorporation of recommendations from the Muwekma Ohlone Tribe and the City's Standard Conditions of Approval into a Tribal Monitoring and Discovery Plan to which the project would be subject, the City has determined that the **proposed project would result in no affect to historic properties and no adverse effect on archaeological resources with the mitigations and City standard conditions proposed.**

## MITIGATION MEASURES

The following mitigation measures apply to the project to reduce the adverse effect on archeological resources.

### Archeological and Tribal Monitoring Plan

The project applicant shall implement the Tribal Monitoring and Discovery Plan, dated October 2024 that was approved by the Tribes and included the following measures:

- The project applicant shall prepare a construction ALERT sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil-disturbing activities within the project site.
- The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones.
- The ALERT sheet shall also include that the project applicant must keep the Muwekma Ohlone and other consulting tribes, if needed, informed on the construction schedule of the proposed project and allow a Native American monitor to be present during ground-disturbing activities. In the event of the discovery of ancestral heritage cultural features and/or artifacts, the Muwekma Ohlone, and, if needed, other consulting tribes, shall also be notified.
- Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible location at the project site.
- In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant.

- If any find is determined by the Native American monitor to be of cultural importance, appropriate avoidance measures recommended by the monitor and approved by the City shall be followed, unless avoidance is determined infeasible by the City. Should Native American cultural resources be identified during ground disturbance, the project applicant shall install a plaque or other educational display honoring the history and heritage of the tribe in a public location on or within the building.
- In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense. Furthermore, the tribe will coordinate with the archeologist to prepare either a stand-alone or contributing ethnohistory chapter as part of the final report.

### **Human Remains – Discovery During Construction**

In the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of Section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant.

Should any Native American human remains be discovered during the course of project construction, the project applicant shall allow the tribe to coordinate with the qualified archaeologist on the exposure, removal, documentation, analysis, writing of a final report, and reburial of the tribe's ancestral remains, which shall occur as close to the location of discovery as practical.

### **Paleontological Resources – Discovery During Construction**

In the event that any historic or precontact subsurface cultural resources are discovered during ground-disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as

applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented.

## PROFESSIONAL QUALIFICATIONS

Dana E. Supernowicz, M.A., RPA, principal of Historic Resource Associates, received his B.A. degree at the University of California, Irvine in Social Ecology with an emphasis on cultural history and environmental planning, and earned his M.A. degree in History at California State University, Sacramento in 1983, with an emphasis on Native American and Western United States history. Supernowicz worked in southern California as a consulting archaeologist and later with the U.S. Forest Service, National Park Services, Bureau of Land Management, and State of California as an archaeologist and historian, having over 40 years of experience working in the field of cultural resource management. He is a member of the Society for California Archaeology and National Trust for Historic Preservation. Supernowicz is a Registered Professional Archaeologist (RPA), meets the Secretary of Interior Professional Standards in Architectural History, Archaeology, and History, and is listed throughout many California municipalities as an approved Archaeological and Historical Consultant.

**P1. Other Identifier:** Grand Lake Gardens

**\*P2. Location:**  Not for Publication  Unrestricted

**\*a. County:** Alameda

**b. USGS 7.5' Quadrangle:** Oakland West, CA **Date:**

**c. Address:** 401 Santa Clara Avenue **City:** Oakland **Zip:** 94610

**d. UTM:** N/A

**e. Other Locational Data (APN #):** The subject property is located on the north side of Santa Clara Avenue, east of the interchange of East Park Avenue and the CA-580 freeway. APN 010-0823-015-05 and 010-0823-039-02.

**\*P3a. Description:** The 0.93-acre sloping parcel at 401 Santa Clara Avenue is developed with a 77,076-square-foot, seven-story, multi-family residential building and associated garden areas. The building, which was constructed in 1966 and occupied in early 1967, previously operated under the name of the "Grand Lake Gardens" and has been vacant since 2022, after suffering fire damage. The subject property consists of a four-story and six-story, reinforced concrete garden apartment building, characterized by "U-shaped" massing; a below-grade parking area under the building; uniform banks of apartments, each having a deck with vertical railing overlooking Santa Clara Avenue the inner courtyard, with concrete vertical columns running from the ground to the sixth-floor separating each apartment; a plain horizontal roof, perhaps designed to block the sun above the sixth-floor dining room; and an upper-level deck having closed or filled railing with vertical incised decorations that reflect the building's geometric vocabulary. The roof eave above the second floor is wide and finished with smooth concrete. Vertical steel columns support the left and right sides of the slightly elevated roof that reflects the building geometric design elements. The northern wing rises four stories as opposed to six-story main wing facing Santa Clara Avenue. Although the wall surfaces on the front façade of the building are flat, the sidewalls have an irregular or rusticated finish. The northern wing of the building rises four stories instead of six-stories and features a similar architectural design as the main building along Santa Clara Avenue. The main entrance to the building faces Santa Clara Avenue via a series of concrete stairs from the sidewalk, and is sheltered by a large cloth awning. The building is accessed through replaced anodized aluminum lighted entry doors. The interior lobby appears to have been remodeled. The overall design of the subject property is consistent with the transcendence of Modern commercial architecture towards Post-Modern architecture. The 1960s marked a transformational era in commercial architecture evidenced by a shift in thinking and values. It was a period in which local and regional architects broke free from traditional architectural styles and explored new ways of design and construction. Architecture during this period was often viewed not just as a functional art form but also as an expression of political and social views. With this transformation came more daring and innovative designs. Music, art, and construction all help shaped the architecture of the time, which emphasized creativity, individuality, and progress. The architecture of the 1960s was a reflection of the broader cultural and social changes of the era, representing a new way of thinking about the built environment. Examples include the "Brutalist" forms of architecture evident at U.C. Berkeley during the 1960s.

- Applicable Criteria:** A, B, C, and D

During the Spanish occupation of California, the land that included Oakland belonged to Don Luis Maria Peralta (1759-1851). After California gained statehood, Peralta's vast land holdings in the East Bay were largely lost (Bagwell 1982:12). The area owes its early history to the development of industries related to logging and lumber. Following the discovery of gold at Coloma in January 1848, one of the first industries in what was to become Oakland was lumber manufacturing. In the hills surrounding the town, a coastal redwood (*sequoia sempervirens*) forest flourished. In just ten short years, almost all of the virgin timber had been logged off the nearby hills (Bagwell 1982:15). Most of the logs were dragged from the woods via teams of oxen to the wharves and sawmills. It is likely that present-day Park Boulevard once provided relatively easy access into the groves of coastal redwoods that lined the hills above Oakland. During the early 1850s, Carpentier, Moon, and Adams leased land from Vicente Peralta and began to subdivide the property into lots. They hired Swiss engineer Julius Kellerberger to map out the streets in a standard grid pattern (Bagwell 1982:27). On May 4, 1852, Oakland was incorporated as a city. The original townsite was located on the west side of the marsh that was to later become Lake Merritt. East of San Antonio Slough, the region became known as Brooklyn and ultimately merged with Oakland to form one city (Bagwell 1982:34). By 1860, according to the U.S. Federal Census, there were 1,543 residents living in Oakland and 1,341 in Brooklyn (Bagwell 1982:41). Refer to BSO, Page 3 of 16.

## BUILDING, STRUCTURE, AND OBJECT RECORD

### \*B10. Significance: (Continued):

Oakland's central location in the East Bay and proximity to the waterfront made it an ideal candidate as a terminus for the Central Pacific Railroad in 1869. The railroad influenced the development of industry in Oakland and provided jobs and passenger service to various points to the east. By the 1870s, besides its rail service, Oakland had its share of industries, which included planing mills, breweries, canneries, and cotton mills. Child labor was still quite common in America's factories during the 1870s and 1880s, and Oakland was beginning to see its fair share of crime and social problems. During this same period, Oakland's population was becoming more ethnically diverse, with Irish, German, Chinese, and African-Americans contributing significantly to the shaping of Oakland's cultural heritage.

Oakland thrived through World War II, propelled by new industry related to wartime production. The post-World War II years led to increased social problems, including unemployment, poverty, and the physical deterioration of the inner city. But, like other cities surrounding the bay, Oakland has witnessed an economic rebirth during the last decade of the twentieth century. Many of Oakland's historic buildings have been renovated or are in the process of being restored, and migration back to the inner city has begun. The subject property lies near the Glenview neighborhoods of East Oakland, east of the 580 Freeway. Park Boulevard forms the key roadway through the neighborhoods which were developed in the 1920s, as the city expanded to the east into the hills above the central city (Gebhard 1985:304-306).

While Oakland fared much better than San Francisco following the 1906 earthquake, considerable damage to its infrastructure and buildings did occur. Following the earthquake, Oakland became a sanctuary for individuals and families who had lost everything in San Francisco. Between 1900 to 1910, Oakland's population grew from 67,000 to over 150,000 (Bagwell 1982:179). The 1910s through the 1930s were a progressive era for Oakland, characterized by growth in transportation, improvements in sanitation, city streets, and continued expansion of the city's boundaries. In 1908, the Oakland Park Commission was formed (Bagwell 1982:183). Shortly afterward, Lakeside Park at Lake Merritt was developed. During the 1910s, Major Mott defended municipal planning and, in 1912, Oakland's City Hall was constructed followed by other civic buildings of stature. As the downtown developed so did the city's waterfront district. By the 1920s shipbuilding became one of the city's dominant industries and the Port of Oakland witness major expansion (Bagwell 1982:191). With the growth of industry came the need to provide adequate housing, so during the 1910s through the 1930s housing projects sprang up throughout the city, including hundreds of new apartment and commercial buildings.

The city of Oakland had two major renaissance periods in commercial construction – the 1920s prior to the Great Depression and the 1950s and early 1960s associated with the post-World War II expansion of the city and its growth as a leader in attracting large corporations to its core downtown area. Unlike the 1920s when most of the high-rise architecture included Neo-Classical, Classical Revival, Renaissance Revival, and Beaux-Arts designs, the 1950s ushered in a period of contemporary architects who adapted modern designs to their buildings using state of the art materials, such as cast steel, aluminum, and precast concrete.

The subject property reflects the architectural theme of Modernism as it applies to commercial low-rise architecture in Oakland after World War II. In the years following World War II, California experienced a period of unparalleled prosperity and optimism spurred by unprecedented urban growth and economic expansion. California's population increased by fifty-three percent between 1940 and 1950. This increase in population created a new problem, one of accommodating this influx of new residents. In 1948, Governor Earl Warren noted that the increase in California's population resulted in unprecedented civic problems, such as an appalling housing shortage, packed schools, and inadequate and dangerous highways.

**BUILDING, STRUCTURE, AND OBJECT RECORD**

**\*B10. Significance: (Continued):**

In order to address the shortage of affordable housing in Oakland, both the city and other organizations, including religious organization, began a concerted effort at fill the need for new housing. The subject property was financed by the American Baptist Homes and Hospitals in Northern California, originally known as the American Baptist Homes of the West (ABHOW). The first project reportedly in California was construction of Pilgrim Haven in 1949 at 373 Pine Lane, Los Altos, California. Another facility nearby is referred to as the Terraces of Los Gatos (*The Berkeley Gazette*, June 13, 1967). The seven-story Modernist reinforced concrete International style apartment complex at 401 Santa Clara Avenue was designed by architect Elso B. DiLuck, AIA, whose office was located at 57 North Fulton Street, Fresno, California. DiLuck received his education at the University of Washington, and served in World War II as a Lieutenant-Col. within the Army Corps of Engineers. Apparently DiLuck had an ongoing relationship with the American Baptist Homes and Hospitals of Northern California, because in 1968, he was responsible for designing an independent living addition to the San Joaquin Gardens Apartments I Fresno (*The Fresno Bee*, May 5, 1968: 134). DiLuck's penchant for designing civic, educational, and other types of commercial buildings, including shopping centers, is born-out in newspaper accounts throughout the 1950s-1960s. One of DiLuck's designs for a retirement center in West Fresno was published in the *Fresno Bee* on October 26, 1956 (Figure 1). Another example of a design by DiLuck is the Piedmont Garden Apartments at 110 41<sup>st</sup> Street in Oakland, constructed in 1968 (Figure 2). The similarity between the Piedmont Garden Apartments and Grand Lake Gardens Apartments is apparent. Both buildings have a geometric vocabulary and rely on reinforced concrete construction with minimal ornamentation.

Figure 1: Design for Cross Church Home for the Aged (*The Fresno Bee*, October 26, 1956).

## BUILDING, STRUCTURE, AND OBJECT RECORD

**\*B10. Significance: (Continued):**

**Figure 2: View looking east at 110 41<sup>st</sup> Street, Oakland, designed by DiLuck and known as the Piedmont Garden Apartments, constructed in 1968.**

During the summer of 1966, preparations were underway for the “model apartments” known as Grand Lake Gardens, which were anticipated to be ready in the fall of that year. As described in the *Oakland Tribune*:

*Apartment Models Go On Display –*

Model apartments in Grand Lake Gardens, the \$2.3 million Oakland retirement center of American Baptist Homes and Hospitals of Northern California, are now open and the building will be ready for occupancy this fall. Officials of the Baptist organization were on hand yesterday for a ceremony marking the opening. They included the Rev. Harold Bottemiller, executive director; Edward E. Waller, chairman of the board of managers for the center and Rolland Peterson, president of the corporation’s board of trustees. The model apartments will be open until 5 p.m. today and again tomorrow from 1 to 5 p.m. Robert L. Mathews, administrator for the center at 401 Santa Clara Ave., said more than half of the apartments in the six-story structure are rented. Rentals will range from \$85 to \$135 a month, including utilities. An entry fee is also required to help pay the cost of limited medical care, periodic housekeeping, counseling and an activities and recreation program. A full life medical care program is available as an optional service with monthly rates or a prepayment plan. Evening meals will be served in a sixth-floor dining room on the west wing of the structure. Grand Lake Gardens is open to persons of all religious denominations (*Oakland Tribune*, June 23, 1966).

## BUILDING, STRUCTURE, AND OBJECT RECORD

**\*B10. Significance: (Continued):**

On January 15, 1967, the Grand Lake Gardens apartment complex was dedicated (Figure 3). The following article was published by the *Oakland Tribune* describing the building and its benefactors during the dedication:

Baptist Home Dedication Wednesday –

Grand Lake Gardens, the 103-unit retirement center erected at 401 Santa Clara Ave., by American Baptist Homes and Hospitals of Northern California, will be dedicated at 8 p.m. Wednesday. The Rev. Gerald Gingrich of American Baptist headquarters at Valley Forge, Pa., secretary of the Division of Health and Social Ministries for the American Baptist Home Mission Societies, will be the principal speaker. Other participants include Oakland Mayor John Reading, Roy Pryor, president-elect of the California Association of Homes for the Aging, the Rev. Harold Bottemiller, executive director of American Baptist Homes, Edward Waller, chairman of the board of managers of Grand Lake Gardens, Roland Peterson, president of American Baptist Homes, and the Rev. Dr. Russell Orr, executive minister of the American Baptist Churches of Northern California. A quartet from Berkeley Baptist Divinity School will provide special music for both programs. Robert Mathews is the administrator of the right-story retirement center. Mrs. Gordon Forbes, wife of the assistant pastor of the First Baptist Church, Berkeley, is assistant administrator and director of activities. The project includes studio, one and two bedroom apartments. Most apartments have balconies overlooking one of the five garden areas surrounding the U-shaped building. According to the Rev. Mr. Bottemiller, the center will be 80 per cent occupied at the time of dedication (*Oakland Tribune*, January 15, 1967: 23).

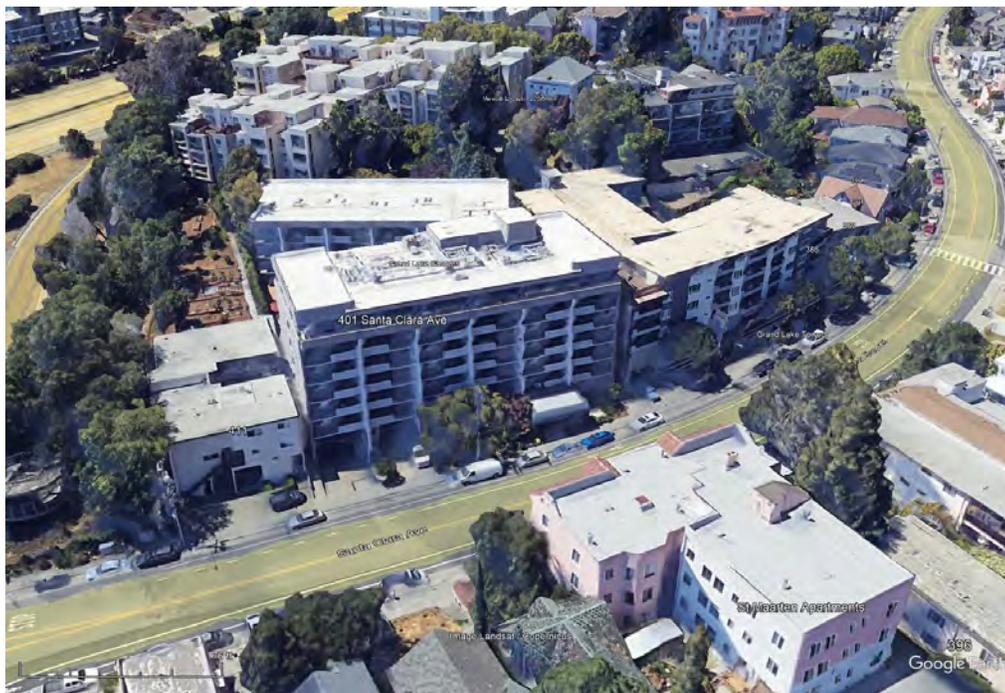

**Figure 3: Photograph of 401 Santa Clara Avenue taken shortly after its construction (*Oakland Tribune*, January 15, 1967: 23).**

## BUILDING, STRUCTURE, AND OBJECT RECORD

### \*B10. Significance: (Continued):

The overall design of the subject property, albeit rather austere lacking ornamentation, is clearly identifiable with other similar "Modernist" reinforced concrete low-rise apartment buildings constructed in the mid to late-1960s. The most unusual design element of 401 Santa Clara Avenue is its irregular "U-shaped" design with an internal open-air courtyard. However, as early as the 1920s in Oakland other apartments were also designed with "U-shaped" massing and open-air courtyards, so the design concept was not new, but rather more practical given the verticality of the building and the design for tenants to easily access safe and functional outdoor spaces.

American Baptist Homes of the West (ABHOW) reportedly began in 1949 with the establishment of the Pilgrim Haven Retirement Community, now known as The Terraces at Los Altos in Los Altos, California. The Grand Lake Apartments were reportedly funded through the Northern California Chapter of the American Baptist Homes and Hospital Association, part of ABHOW whose headquarters was located in Valley Forge, Pennsylvania. The Association, as previously described, was active in building non-secular retirement facilities during the late-1940s through the late-1960s. The Northern California Chapter appears to have been dissolved. In 2022, still under ownership with ABHOW, the Grand Lake Apartments suffered a damaging fire, after which the facility closed and remains vacant.

### SIGNIFICANCE ASSESSMENT

The subject property was evaluated for the National Register of Historic Places (NRHP), under Criteria A, B, and C:

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
- D. Applies to properties that have yielded, or may be likely to yield, information important in prehistory or history.

For a property to be significant it must also retain integrity. Integrity is defined by the National Park Service as follows:

#### Location

**Location is the place where the historic property was constructed or the place where the historic event occurred.** The relationship between the property and its location is often important to understanding why the property was created or why something happened. The actual location of a historic property, complemented by its setting, is particularly important in recapturing the sense of historic events and persons. Except in rare cases, the relationship between a property and its historic associations is destroyed if the property is moved.

#### Design

**Design is the combination of elements that create the form, plan, space, structure, and style of a property.** It results from conscious decisions made during the original conception and planning of a property (or its significant alteration) and applies to activities as diverse as community planning, engineering, architecture, and landscape architecture. Design includes such elements as organization of space, proportion, scale, technology, ornamentation, and materials. A property's design reflects historic functions and technologies as well as aesthetics. It includes such considerations as the structural system; massing; arrangement of spaces; pattern of fenestration; textures and colors of surface materials; type, amount, and style of ornamental detailing; and arrangement and type of plantings in a designed landscape. Design can also apply to districts, whether they are important primarily for historic association, architectural value, information potential, or a combination thereof. For districts, significant primarily for historic association or architectural value, design concerns more than just the individual buildings or structures located within the boundaries. It also applies to the way in which buildings, sites, or structures are related: for example, spatial relationships between major features; visual rhythms in a streetscape or landscape plantings; the layout and materials of walkways and roads; and the relationship of other features, such as statues, water fountains, and archeological sites.

## BUILDING, STRUCTURE, AND OBJECT RECORD

### \*B10. Significance: (Continued):

#### Setting

**Setting is the physical environment of a historic property.** Whereas location refers to the specific place where a property was built or an event occurred, setting refers to the *character* of the place in which the property played its historical role. It involves *how*, not just where, the property is situated and its relationship to surrounding features and open space.

Setting often reflects the basic physical conditions under which a property was built and the functions it was intended to serve. In addition, the way in which a property is positioned in its environment can reflect the designer's concept of nature and aesthetic preferences.

The physical features that constitute the setting of a historic property can be either natural or manmade, including such elements as:

- Topographic features (a gorge or the crest of a hill);
- Vegetation;
- Simple manmade features (paths or fences); and
- Relationships between buildings and other features or open space.

These features and their relationships should be examined not only within the exact boundaries of the property, but also between the property and its *surroundings*. This is particularly important for districts.

#### Materials

**Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.** The choice and combination of materials reveal the preferences of those who created the property and indicate the availability of particular types of materials and technologies. Indigenous materials are often the focus of regional building traditions and thereby help define an area's sense of time and place.

A property must retain the key exterior materials dating from the period of its historic significance. If the property has been rehabilitated, the historic materials and significant features must have been preserved. The property must also be an actual historic resource, not a recreation; a recent structure fabricated to look historic is not eligible. Likewise, a property whose historic features and materials have been lost and then reconstructed is usually not eligible (refer to Criteria Consideration E in Part VII: *How to Apply the Criteria Considerations* for the conditions under which a reconstructed property can be eligible.)

#### Workmanship

**Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.** It is the evidence of artisans' labor and skill in constructing or altering a building, structure, object, or site. Workmanship can apply to the property as a whole or to its individual components. It can be expressed in vernacular methods of construction and plain finishes or in highly sophisticated configurations and ornamental detailing. It can be based on common traditions or innovative period techniques. Workmanship is important because it can furnish evidence of the technology of a craft, illustrate the aesthetic principles of a historic or prehistoric period, and reveal individual, local, regional, or national applications of both technological practices and aesthetic principles. Examples of workmanship in historic buildings include tooling, carving, painting, graining, turning, and joinery.

#### Feeling

**Feeling is a property's expression of the aesthetic or historic sense of a particular period of time.** It results from the presence of physical features that, taken together, convey the property's historic character. For example, a rural historic district retaining original design, materials, workmanship, and setting will relate the feeling of agricultural life in the 19th century. A grouping of prehistoric petroglyphs, unmarred by graffiti and intrusions and located on its original isolated bluff, can evoke a sense of tribal spiritual life.

## BUILDING, STRUCTURE, AND OBJECT RECORD

### \*B10. Significance: (Continued):

#### Association

**Association is the direct link between an important historic event or person and a historic property.** A property retains association if it is the place where the event or activity occurred and is sufficiently intact to convey that relationship to an observer. Like feeling, association requires the presence of physical features that convey a property's historic character. For example, a Revolutionary War battlefield whose natural and manmade elements have remained intact since the 18th century will retain its quality of association with the battle. Because feeling and association depend on individual perceptions, their retention *alone* is never sufficient to support eligibility of a property for the National Register.

#### FINDING OF SIGNIFICANCE

In determining the significance of the property located at 401 Santa Clara Avenue, historic documents and photographs were examined, and the subject property was compared to other similar buildings erected in Oakland and northern California during the 1960s. Furthermore, a building must retain integrity for it to be considered a significant resource for the NRHP. Since its construction in 1967, the building retains good integrity of location, design, setting, feeling, and association. Due to all the windows being replaced, the building's integrity of workmanship, and feeling are slightly diminished, however, as a whole, the building still reads as it was originally designed.

Under NRHP Criterion A, no evidence has been found to suggest that the subject property played a significant role in the history of Oakland during the late-1960s.

Under NRHP Criterion B, no evidence has been found to suggest that the subject property is associated with a person or persons of significance in the history of Oakland. The apartment complex was among a number of similar housing units funded by the Northern California Chapter of the American Baptist Homes and Hospital Association., whose headquarters were in Valley Forge, Pennsylvania. The building's architect, Elso B. DiLuck, AIA, had his office in Fresno and was involved with numerous projects, many associated with the American Baptist Homes and Hospitals Association, including the other Association's senior housing project in Oakland known as Piedmont Garden Apartments which was built in 1968.

Under NRHP Criterion C, the subject property retains fair to good integrity, the major alteration being replacement of all the building's original doors and windows. The most interesting feature of the apartment complex is its "garden" design, which is also evidenced in much older apartments built from the 1920s forward in Oakland. Thus, this design element was not new, but certainly practical for tenants to easily access safe and functional outdoor spaces. As a whole, the subject property lacks many of the features that are notable as cutting-edge designs adapted by other Modernist architects working in the 1950s and 1960s in the International style of architecture in the East Bay Area. A review of listed or significant low and high rise commercial buildings, including apartments, in Oakland, appears to indicate that most date from the 1920s-1950s. Many represent important designs by significant local architectural firms as well as innovative architecture designs by an important architect generally recognized to be a master in his or her field, whose work is clearly distinguishable from other architects or craftsman.

Under NRHP Criterion D, there is no evidence that the subject property could yielded, or may be likely to yield, information important in prehistory or history.

In summary, the subject property does not appear to be individually eligible for the National Register of Historic Places (NRHP) under Criteria A, B, and C, nor does the subject property appear to be a potential contributing element to a historic district.

Introduction . . . . .	1
Project Description . . . . .	1
Archaeological Sensitivity and Monitoring Protocols . . . . .	2
Paleontological Resources - Discovery During Construction . . . . .	4
Archaeological Resources - Discovery During Construction . . . . .	4
Data Recovery of Archaeological Resources . . . . .	4
Human Remains - Discovery During Construction . . . . .	5

## **INTRODUCTION**

This Tribal Monitoring and Discovery Plan (Plan) was prepared to satisfy compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA) for the 401 Santa Clara Avenue project. The purpose of the Plan is to allow for the identification, evaluation, treatment, and protection of significant archaeological resources, including archaeological resources with traditional religious and cultural importance to the Muwekma Ohlone Indian Tribe of the San Francisco Bay Area Region (Muwekma Ohlone) that may be unearthed during ground-disturbing activities associated with the proposed project.

The proposed project will receive Project-Based Vouchers (PBV) and Moving to Work (MTW) funds provided by the U.S. Department of Housing and Urban Development (HUD). Therefore, the proposed project is subject to the HUD environmental review procedures (24 Code of Federal Regulations [CFR] Part 58), which require compliance with NEPA and Section 106 of the NHPA, as well as the regulations found at 36 CFR Part 800. Under 24 CFR 58.4, the City has assumed HUD's environmental review responsibilities for the proposed project, including tribal consultation related to historic properties. Historic properties include archaeological sites, burial grounds, sacred landscapes or features, ceremonial areas, traditional cultural places and landscapes, plant and animal communities, and buildings and structures with significant tribal association.

In August 2024, Registered Professional Archaeologist (RPA) Dana E. Supernowicz, M.A. of Historic Resource Associates completed a Phase I Cultural Resources Study of the project site to provide the State Historic Preservation Officer (SHPO) information on the historical context of the site and any potential for on-site cultural resources (Historic Resource Associates. Phase I Cultural Resources Study of 401 Santa Clara Avenue, Oakland, California, August 2024). The Phase I Cultural Resources Study included a record search (File No. 24-0052) at the Northwest Information Center (NWIC) of the California Historical Resources Information System (CHRIS); a review of historical maps, aerial photographs, and other information; and a pedestrian field survey of the project site on July 11, 2024, which included a reconnaissance of surface conditions to assess the potential sensitivity for buried historic-period archaeological resources.

## **PROJECT DESCRIPTION**

The proposed project is located on a 0.93-acre site located at 401 Santa Clara Avenue in the City of Oakland, Alameda County, California. The project site is comprised of two parcels, which are identified by Assessor's Parcel Numbers (APNs) 010-0823-015-05 and 010-0823-039-02. The project site is currently developed with a seven-story, 77,076-square-foot (sf) multi-family residential building. The building, which was constructed in 1966, previously operated under the name of the Grand Lake Gardens and has been vacant since 2022 after suffering fire damage. Surrounding existing uses include multi-family residences immediately to the north, west, and south, as well as to the east across Santa Clara Avenue; single-family

residences to the east, across Santa Clara Avenue; and Lakeview Elementary School further to the south.

The Oakland Housing Authority (OHA) intends to purchase the project site and rehabilitate the existing building to livable conditions. The proposed project would also add five residential units for a new total of 108 units and include seismic retrofitting improvements to bring the existing building into compliance with current building standards. Thus, the proposed project would require limited ground disturbance associated with trenching for new footings to support new load-bearing exterior walls. The new footings and exterior walls would be adjacent to the existing structure and would require excavation in nine areas to the depths of the existing footings, which are approximately two to nine feet below the existing slab-on-grade. The areas of disturbance would range from 200 sf to 500 sf. Other potential renovation and repair activities to restore the property from the previously incurred fire damage and resulting concrete distress would not require modifications to the building foundations or ground excavation.

## **ARCHAEOLOGICAL SENSITIVITY AND MONITORING PROTOCOLS**

Although Muwekma Ohlone site sensitivity maps do not show any previously recorded ancestral heritage sites within the project site boundaries, previous on-site construction activities associated with the existing structure could have uncovered tribal cultural resources that were not documented when the building was initially constructed. Section 106 of the NHPA establishes tribes' rights to consult on the mitigation to prevent potential adverse impacts to recorded and unrecorded tribal cultural resources that could otherwise occur during the construction of development projects seeking federal funding assistance. Therefore, the Muwekma Ohlone tribe has been included in the consultation process with the City of Oakland (City) for the proposed project and has informed the measures contained within this Plan.

The Phase I Cultural Resources Study prepared for the proposed project concluded that the existing building is not eligible for the National Register of Historic Places (NRHP) under Criterion A through D, and did not identify precontact or historic archaeological sites, features, or artifacts within the project site, which is largely covered by the existing building's footprint. Construction of the existing building would have involved extensive excavation, likely disturbing or destroying any subsurface archaeological deposits and rendering the potential occurrence of unknown subsurface archaeological resources as extremely low. However, the potential for unrecorded subsurface archaeological resources to occur on-site cannot be completely eliminated.

Thus, the purpose of this Plan is to outline the monitoring protocols and procedures to follow in the event that unknown archaeological resources, including resources with traditional religious and cultural importance, are unearthed during ground-disturbing activities associated with the proposed project. Included herein are the monitoring and discovery protocols and procedures for addressing specific contingencies, such as the discovery of

human remains, project personnel qualifications, data collection protocols, site safety considerations, and post-field actions.

The following provides a description of the specific procedures to identify, evaluate, and treat archaeological discoveries and details the methodology and protocols employed prior to and during project construction. The procedures include the City of Oakland Standard Conditions of Approval, which have been slightly modified to incorporate recommendations from the Muwekma Ohlone.

The project applicant shall prepare a construction ALERT sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil-disturbing activities within the project site.

The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones.

The ALERT sheet shall also include that the project applicant must keep the Muwekma Ohlone and other consulting tribes, if needed, informed on the construction schedule of the proposed project and allow a Native American monitor to be present during ground-disturbing activities. In the event of the discovery of ancestral heritage cultural features and/or artifacts, the Muwekma Ohlone, and, if needed, other consulting tribes, shall also be notified.

Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible location at the project site

## **PALEONTOLOGICAL RESOURCES – DISCOVERY DURING CONSTRUCTION**

Pursuant to California Environmental Quality Act Guidelines (CEQA) Guidelines Section 15064.5(f), in the event that any historic or precontact subsurface cultural resources are discovered during ground-disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented.

In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant.

## **ARCHAEOLOGICAL RESOURCES – DISCOVERY DURING CONSTRUCTION**

If any find is determined by the Native American monitor to be of cultural importance, appropriate avoidance measures recommended by the monitor and approved by the City shall be followed, unless avoidance is determined infeasible by the City. Should Native American cultural resources be identified during ground disturbance, the project applicant shall consider installation of a plaque or an educational display honoring the history and heritage of the tribe for the future residents living at the proposed project.

## **DATA RECOVERY OF ARCHAEOLOGICAL RESOURCES**

In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if

nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense.

### **HUMAN REMAINS – DISCOVERY DURING CONSTRUCTION**

Pursuant to CEQA Guidelines Section 15064.5(e)(1), in the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of Section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant.

Should any Native American human remains be discovered during the course of project construction, the project applicant shall allow the tribe to coordinate with the qualified archaeologist on the exposure, removal, documentation, analysis, writing of a final report, and reburial of the tribe's ancestral remains, which shall occur as close to the location of discovery as practical.

## INTRODUCTION

The 401 Santa Clara Ave Residential project is located in the City of Oakland, California. The project includes the rehabilitation of an existing apartment building. Surrounding land uses include multifamily residential.

**Figure 1** shows the proposed project site plan. **Figure 2** shows an aerial view of the project site and noise measurement locations.

## ACOUSTIC FUNDAMENTALS AND TERMINOLOGY

### BACKGROUND INFORMATION ON NOISE

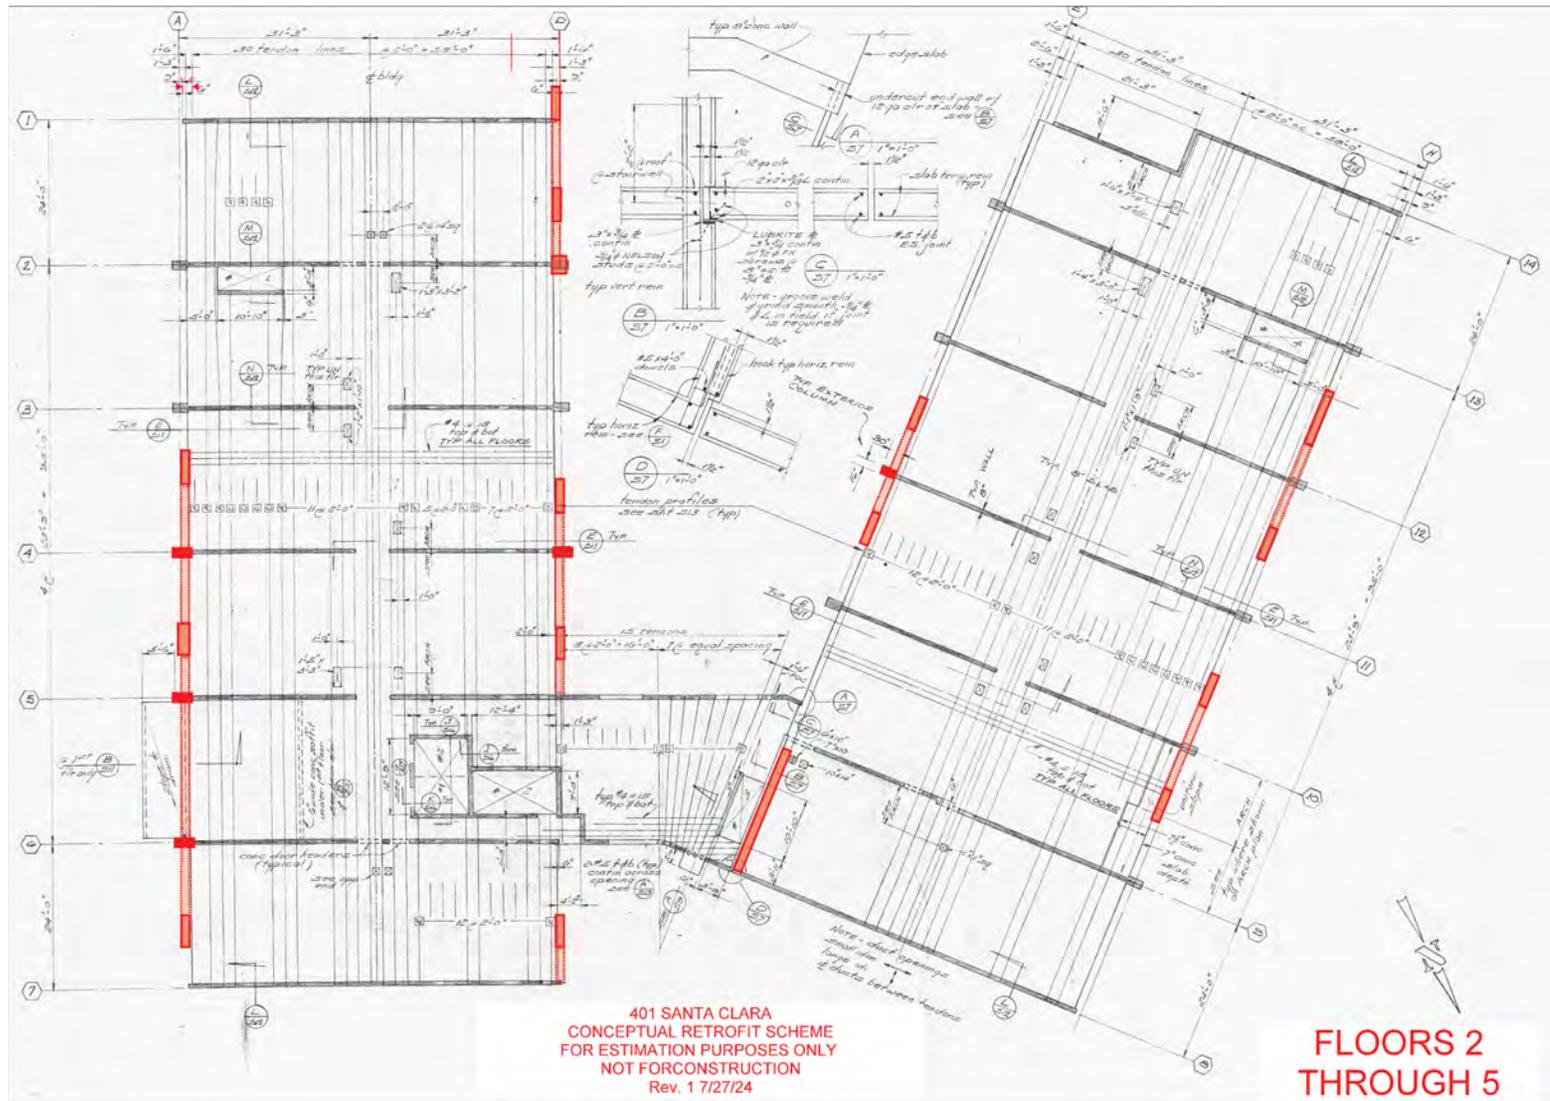

#### *Fundamentals of Acoustics*

Acoustics is the science of sound. Sound may be thought of as mechanical energy of a vibrating object transmitted by pressure waves through a medium to human (or animal) ears. If the pressure variations occur frequently enough (at least 20 times per second), then they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound and is expressed as cycles per second or Hertz (Hz).

Noise is a subjective reaction to different types of sounds. Noise is typically defined as (airborne) sound that is loud, unpleasant, unexpected or undesired, and may therefore be classified as a more specific group of sounds. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals), as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels (dB) correspond closely to human perception of relative loudness.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by A-weighted sound levels. There is a strong correlation between A-weighted sound levels (expressed as dBA) and the way the human ear perceives sound. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. C-weighted (dBC) noise levels are also commonly used for monitoring noise from music as the C-weighting is more sensitive to low-frequency noise (a.k.a. bass).

Rev. Date: 06/07/2024

The decibel scale is logarithmic, not linear. In other words, two sound levels 10-dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic decibel is A-weighted, an increase of 10-dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound, and twice as loud as a 60 dBA sound.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given environment. A common statistical tool is the average, or equivalent, sound level ( $L_{eq}$ ), which corresponds to a steady-state A weighted sound level containing the same total energy as a time varying signal over a given time period (usually one hour). The  $L_{eq}$  is the foundation of the composite noise descriptor,  $L_{dn}$ , and shows very good correlation with community response to noise.

The day/night average level (DNL or  $L_{dn}$ ) is based upon the average noise level over a 24-hour day, with a +10-decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because  $L_{dn}$  represents a 24-hour average, it tends to disguise short-term variations in the noise environment.

**Table 1** lists several examples of the noise levels associated with common situations. **Appendix A** provides a summary of acoustical terms used in this report.

**TABLE 1: TYPICAL NOISE LEVELS**

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	--110--	Rock Band
Jet Fly-over at 300 m (1,000 ft.)	--100--	
Gas Lawn Mower at 1 m (3 ft.)	--90--	
Diesel Truck at 15 m (50 ft.), at 80 km/hr. (50 mph)	--80--	Food Blender at 1 m (3 ft.) Garbage Disposal at 1 m (3 ft.)
Noisy Urban Area, Daytime Gas Lawn Mower, 30 m (100 ft.)	--70--	Vacuum Cleaner at 3 m (10 ft.)
Commercial Area Heavy Traffic at 90 m (300 ft.)	--60--	Normal Speech at 1 m (3 ft.)
Quiet Urban Daytime	--50--	Large Business Office Dishwasher in Next Room
Quiet Urban Nighttime	--40--	Theater, Large Conference Room (Background)
Quiet Suburban Nighttime	--30--	Library
Quiet Rural Nighttime	--20--	Bedroom at Night, Concert Hall (Background)
	--10--	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	--0--	Lowest Threshold of Human Hearing

### ***Effects of Noise on People***

The effects of noise on people can be placed in three categories:

- Subjective effects of annoyance, nuisance, and dissatisfaction
- Interference with activities such as speech, sleep, and learning
- Physiological effects such as hearing loss or sudden startling

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the last category. There is no completely satisfactory way to measure the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted: the so-called ambient noise level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it.

With regard to increases in A-weighted noise level, the following relationships occur:

- Except in carefully controlled laboratory experiments, a change of 1-dBA cannot be perceived;
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference;
- A change in level of at least 5-dBA is required before any noticeable change in human response would be expected; and
- A 10-dBA change is subjectively heard as approximately a doubling in loudness and can cause an adverse response.

Stationary point sources of noise – including stationary mobile sources such as idling vehicles – attenuate (lessen) at a rate of approximately 6-dB per doubling of distance from the source, depending on environmental conditions (i.e. atmospheric conditions and either vegetative or manufactured noise barriers, etc.). Widely distributed noises, such as a large industrial facility spread over many acres, or a street with moving vehicles, would typically attenuate at a lower rate.

**EXISTING AMBIENT NOISE LEVELS**

The existing noise environment in the project area is primarily defined by traffic on I-580. Secondary noise sources include Santa Clara Avenue. To quantify the existing ambient noise environment in the project vicinity, Saxelby Acoustics conducted a continuous (24-hr.) noise level measurement at one location on the project site. Noise measurement locations are shown on **Figure 2**. A summary of the noise level measurement survey results is provided in **Table 2**. **Appendix B** contains the complete results of the noise monitoring.

The sound level meter was programmed to record the maximum, median, and average noise levels at each site during the survey. The maximum value, denoted  $L_{max}$ , represents the highest noise level measured. The average value, denoted  $L_{eq}$ , represents the energy average of all of the noise received by the sound level meter microphone during the monitoring period. The median value, denoted  $L_{50}$ , represents the sound level exceeded 50 percent of the time during the monitoring period.

A Larson Davis Laboratories (LDL) model 820 integrating sound level meter was used for the ambient noise level measurement survey. The meter was calibrated before and after use with a CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 sound level meters (ANSI S1.4).

**TABLE 2: SUMMARY OF EXISTING BACKGROUND NOISE MEASUREMENT DATA**

## REGULATORY CONTEXT

### HUD CRITERIA

The U.S. Department of Housing and Urban Development (HUD) establishes an acceptable exterior noise environment of 65 dBA  $L_{dn}$  (also expressed as “DNL” or Day/Night Level) at exterior areas of residential uses. Noise levels in the 65-75 dBA DNL range are considered Normally Unacceptable. However, 65-75 dBA DNL may be allowed, but require special approvals and additional sound attenuation measures. Such measures include a 5 dBA improvement to the building façade noise level reduction (NLR) for exterior noise levels in the 65-70 dBA range, and an improvement of 10 dBA for exterior noise levels in the 70-75 dBA range. The improvement is required in addition to “attenuation provided by buildings as commonly constructed in the area and requiring open windows for ventilation.”

Noise levels exceeding 75 dBA DNL are considered unacceptable and may only be allowed under special circumstances. In addition, HUD established an interior noise level goal of 45 dBA DNL, while assuming a typical exterior-to-interior NLR of 20 dBA.

## EVALUATION OF TRANSPORTATION NOISE SOURCES ON THE PROJECT SITE

### ON-SITE TRANSPORTATION NOISE PREDICTION METHODOLOGY

Saxelby Acoustics measured an exterior transportation noise level of 73 dBA  $L_{dn}$  at noise measurement site LT-1. This level was used to calibrate the SoundPLAN noise prediction model. Inputs to the model included sound power levels for the adjacent roadways, existing and proposed buildings, terrain type, and locations of sensitive receptors. Future transportation noise levels were calculated by assuming a 1% per year increase in traffic volumes on I-580 and Santa Clara Avenue. The results of this analysis are shown on **Figure 3**.

As shown in **Figure 3**, transportation noise levels up to 73 dBA  $L_{dn}$  are predicted at the façades of the project building facing I-580. This is greater than the HUD 65 dBA  $L_{dn}$  noise level standard and additional noise level reduction measures are required. For the normally unacceptable range of 70-75 dBA  $L_{dn}$ , an additional 10 dBA interior noise level reduction is required. The total noise level reduction required is 30 dBA.

# 401 Santa Clara Avenue Residential

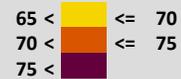

City of Oakland, California

Figure 3

Transportation Noise

Scale 1:80

## ANALYSIS OF INTERIOR NOISE CONTROL MEASURES

In order to calculate interior noise levels for the actual project construction, it is necessary to determine the noise reduction provided by the residential building façades. This may be calculated by using a measured A-weighted noise frequency spectrum for traffic. The composite transmission loss and resulting noise level in the receiving room is first determined. After correcting for room absorption, the overall noise level in the room is calculated.

Based upon the exterior transportation noise levels at the project building façades of 73 dBA  $L_{dn}$ , an exterior-to-interior noise level reduction of 30 dBA would be required to meet HUD standards. **Figure 4** shows the required interior noise control measures. **Appendix C** shows the complete exterior-to-interior noise calculations.

# 401 Santa Clara Avenue Residential

City of Oakland, California

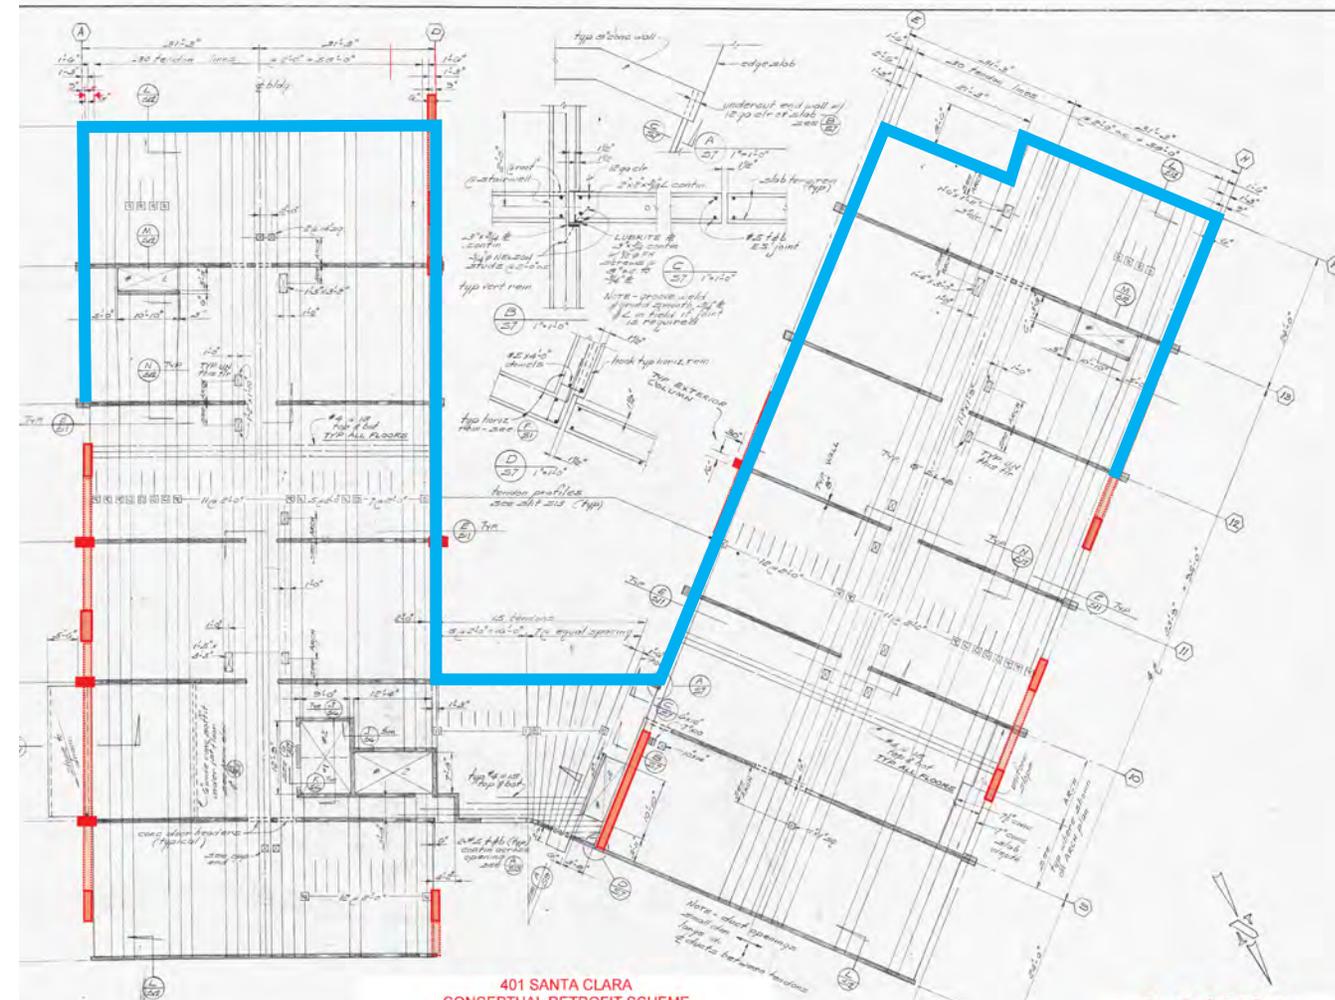

Figure 4

Interior Noise Control Measures

## Legend

 Indicated Lot Facades Needing Acoustic Upgrades

Note: Standard construction is sufficient for project units that do not need acoustical upgrades. Standard construction assumes a minimum STC rating of 29 for exterior window assemblies.

401 SANTA CLARA  
CONCEPTUAL RETROFIT SCHEME

### Interior Noise Control Measures (Required for the Indicated Lots Facades Directly Adjacent to Freeway/Roadways)

- Glazing shall have a sound transmission class (STC) rating of 36 minimum;
- Exterior finish shall be stucco with sheathing or system with equivalent weight;
- Interior gypsum at exterior walls shall be 5/8";
- Ceiling gypsum shall be 5/8";
- Mechanical ventilation shall be installed in all residential uses to allow residents to keep doors and windows closed, as desired for acoustical isolation;
- No PTAC's shall be used.

## CONCLUSIONS

The proposed project is predicted to meet HUD exterior and interior noise level standards assuming the following requirements are incorporated into design for the new residential building portions of the project:

- The affected building façades of the project shall include the following noise control measures, as outlined on **Figure 4**:
  - Glazing shall have a minimum sound transmission class (STC) rating of 36;
  - Building façades shall include use of stucco with sheathing or cement fiber board with sheathing;
  - Interior gypsum wallboards at exterior walls shall be 5/8”;
  - Ceiling gypsum shall be 5/8”;
  - Flooring shall be vinyl plank or carpeting;
  - Saxelby Acoustics recommends that mechanical ventilation penetrations for exhaust fans not face toward I-580. Where feasible, these vents should be routed towards the opposite side of the building to minimize sound intrusion to sensitive areas of the buildings.  
Where vents must face toward I-580, it is recommended that the duct work be increased in length and make as many “S” turns as feasible prior to exiting the dwelling. This separates the openings between the noise source and the living space with a long circuitous route. Each time the sound turns a corner, it is reduced slightly. Flexible duct work is preferred ducting for this noise mitigation. Where the vent exits the building, a spring-loaded flap with a gasket should be installed to reduce sound entering the duct work when the vent is not in use.
  - Mechanical ventilation shall be provided to allow occupants to keep doors and windows closed for acoustic isolation;
  - No PTACs shall be used;
  - In lieu of these measures, an interior noise control report may be prepared by a qualified acoustic engineer demonstrating that the proposed building construction would achieve the HUD interior noise reduction requirement of 30 dBA.

## Appendix A: Acoustical Terminology

<b>Acoustics</b>	The science of sound.
<b>Ambient Noise</b>	The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
<b>ASTC</b>	Apparent Sound Transmission Class. Similar to STC but includes sound from flanking paths and correct for room reverberation. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
<b>Attenuation</b>	The reduction of an acoustic signal.
<b>A-Weighting</b>	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
<b>Decibel or dB</b>	Fundamental unit of sound, A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.
<b>CNEL</b>	Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by +5 dBA and nighttime hours weighted by +10 dBA.
<b>DNL</b>	See definition of Ldn.
<b>IIC</b>	Impact Insulation Class. An integer-number rating of how well a building floor attenuates impact sounds, such as footsteps. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
<b>Frequency</b>	The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz (Hz).
<b>Ldn</b>	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
<b>Leq</b>	Equivalent or energy-averaged sound level.
<b>Lmax</b>	The highest root-mean-square (RMS) sound level measured over a given period of time.
<b>L(n)</b>	The sound level exceeded a described percentile over a measurement period. For instance, an hourly L50 is the sound level exceeded 50% of the time during the one-hour period.
<b>Loudness</b>	A subjective term for the sensation of the magnitude of sound.
<b>NIC</b>	Noise Isolation Class. A rating of the noise reduction between two spaces. Similar to STC but includes sound from flanking paths and no correction for room reverberation.
<b>NNIC</b>	Normalized Noise Isolation Class. Similar to NIC but includes a correction for room reverberation.
<b>Noise</b>	Unwanted sound.
<b>NRC</b>	Noise Reduction Coefficient. NRC is a single-number rating of the sound-absorption of a material equal to the arithmetic mean of the sound-absorption coefficients in the 250, 500, 1000, and 2,000 Hz octave frequency bands rounded to the nearest multiple of 0.05. It is a representation of the amount of sound energy absorbed upon striking a particular surface. An NRC of 0 indicates perfect reflection; an NRC of 1 indicates perfect absorption.
<b>RT60</b>	The time it takes reverberant sound to decay by 60 dB once the source has been removed.
<b>Sabin</b>	The unit of sound absorption. One square foot of material absorbing 100% of incident sound has an absorption of 1 Sabin.
<b>SEL</b>	Sound Exposure Level. SEL is a rating, in decibels, of a discrete event, such as an aircraft flyover or train pass by, that compresses the total sound energy into a one-second event.
<b>SPC</b>	Speech Privacy Class. SPC is a method of rating speech privacy in buildings. It is designed to measure the degree of speech privacy provided by a closed room, indicating the degree to which conversations occurring within are kept private from listeners outside the room.
<b>STC</b>	Sound Transmission Class. STC is an integer rating of how well a building partition attenuates airborne sound. It is widely used to rate interior partitions, ceilings/floors, doors, windows and exterior wall configurations. The STC rating is typically used to rate the sound transmission of a specific building element when tested in laboratory conditions where flanking paths around the assembly don't exist. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
<b>Threshold of Hearing</b>	The lowest sound that can be perceived by the human auditory system, generally considered to be 0 dB for persons with perfect hearing.
<b>Threshold of Pain</b>	Approximately 120 dB above the threshold of hearing.
<b>Impulsive</b>	Sound of short duration, usually less than one second, with an abrupt onset and rapid decay.
<b>Simple Tone</b>	Any sound which can be judged as audible as a single pitch or set of single pitches.

**Traffic Counts** or Traffic Volumes are for the State Highway System only (in various formats).

Highways are signed as **Interstate**, **California State Route**, or **United States Route**. See examples below:

Traffic count information for city and county streets may be found at the city Traffic Engineering or Public Works Department, or the Community Development Office in the area where the street is located.

[Explanation of Traffic Counts \(Back & Ahead Leg Diagrams\) \(PDF\)](#)

## Traffic Counts are summarized annually into four categories:

Traffic Volumes: Annual Average Daily Traffic (AADT) For ALL vehicles on California State Highways All files are .XLSX				
<a href="#">2021 AADT</a>	<a href="#">2022 AADT</a>	N/A	N/A	N/A
<a href="#">2016 AADT</a>	<a href="#">2017 AADT</a>	<a href="#">2018 AADT</a>	<a href="#">2019 AADT</a>	<a href="#">2020 AADT</a>
N/A	N/A	<a href="#">2013 AADT</a>	<a href="#">2014 AADT</a>	<a href="#">2015 AADT</a>

by Webpage: [2017](#)

Truck Traffic: Annual Average Daily Truck Traffic For truck traffic on California State Highways All files are .XLSX				
<a href="#">2021 AADT Truck</a>	<a href="#">2022 AADT Truck</a>	N/A	N/A	N/A
<a href="#">2016 AADT Truck</a>	<a href="#">2017 AADT Truck</a>	<a href="#">2018 AADT Truck</a>	<a href="#">2019 AADT Truck</a>	<a href="#">2020 AADT Truck</a>
N/A	N/A	<a href="#">2013 AADT Truck</a>	<a href="#">2014 AADT Truck</a>	<a href="#">2015 AADT Truck</a>

Ramp Volumes For ramp volumes on California State Freeways, by Caltrans District 2020-2017 files are .XLSX and 2016 files are .PDF

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 8/8/2024 at 2:19 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

## Preface

The draft of the *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (Guidance Manual) is a description of the algorithms, recommended exposure variates, cancer and noncancer health values, and the air modeling protocols needed to perform a health risk assessment (HRA) under the Air Toxics Hot Spots Information and Assessment Act of 1987 (Health and Safety Code Section 44300 et seq., see Appendix B). The Children's Environmental Health Protection Act of 1999 (Health and Safety Code Section 39606, also contained in Appendix B), which requires explicit consideration of infants and children in assessing risks from air toxics, necessitated revisions of the methods for both noncancer and cancer risk assessment, and of the exposure variates. This draft version of the Guidance Manual updates the previous version (OEHHA, 2003), and reflects advances in the field of risk assessment along with explicit consideration of infants and children.

The information presented in the draft manual is compiled from three technical support documents (TSDs) released by the Office of Environmental Health Hazard Assessment (OEHHA) for the Hot Spots Program. The three TSDs (which are also revised versions, replacing the original four Hot Spots TSDs adopted between 1999 and 2003) underwent public comment and peer review and were adopted for use in the Air Toxics Hot Spots program by the Director of OEHHA. The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (June, 2008) addressed the methodology for deriving acute, chronic and eight hour Reference Exposure Levels. The Technical Support Document for Cancer Potency Factors (May 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity of early-in-life exposure to carcinogens. The Technical Support Document for Exposure Assessment and Stochastic Analysis (June 2012) presents the exposure model for the Hot Spots program and reviews the available literature on exposure and relevant fate and transport variates. All three TSDs are available on OEHHA's web site at: [http://www.oehha.ca.gov/air/hot\\_spots/index.html](http://www.oehha.ca.gov/air/hot_spots/index.html). Excerpts of these three TSDs are presented in this document. There is relatively little new information in the Guidance Manual since the adoption of the TSDs.

The draft Guidance Manual was released for public review. Public comments were received and changes were made in response to some comments. Responses were developed to all public comments. Both the Guidance Manual and OEHHA's response to comments were then reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP), who previously reviewed the three TSDs upon which this guidance is based. Following review by the SRP, OEHHA finalized this Guidance Manual. This Guidance Manual supersedes the risk assessment methods presented in the *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* (OEHHA, 2003), which in turn replaced earlier guidance provided by the California Air Pollution Control Officer's Association (CAPCOA, 1993). This manual updates health effects values, exposure pathway variates (e.g., breathing rates), and

continues to use a tiered approach for performing HRAs based on current science and policy assessment. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) recommends a tenfold early-in-life potency factor adjustment for the third trimester and ages zero to less than two, and a threefold adjustment factor for ages two to less than sixteen. In addition, we recommend evaluating residency periods of nine, thirty and seventy years. This means that exposure variates are needed for the third trimester, ages zero to less than two, ages two to less than nine, ages two to less than 16, ages 16 to less than 30, and ages 16 to 70.

The tiered approach presented in this draft manual provides a risk assessor with flexibility and allows consideration of site-specific differences. Furthermore, risk assessors can tailor the level of effort and refinement of an HRA by using the point-estimate exposure variates or the stochastic treatment of distributions of exposure variates. The four-tiered approach to risk assessment primarily applies to residential cancer risk assessment. Compared to the OEHHA 2003 document, the exposure pathways in the Guidance Manual remain the same. The exposure and risk algorithms are similar, but they have been revised to accept new data or variables that are used in the tiered risk assessment approach.

The draft manual also contains example calculations and an outline for a modeling protocol and an HRA report. A software program, the Hot Spots Analysis and Reporting Program (HARP), has been developed by the Air Resources Board in consultation with OEHHA and Air Pollution Control/Air Quality Management District representatives. The HARP software, which is being updated with the new exposure variates and health values, is the recommended model for calculating and presenting HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) under the Hot Spots Program.

The intent of the Guidance Manual and the HARP software is to incorporate children's health concerns, update risk assessment practices, and to provide consistent risk assessment procedures. The use of consistent risk assessment methods and report presentation has many benefits, such as expediting the preparation and review of HRAs, minimizing revision and resubmission of HRAs, allowing a format for facility comparisons, and cost-effective implementation of HRAs and the Hot Spots Program. Risk assessments prepared with this Guidance Manual may be used for permitting new or modified stationary sources, or public notification, and risk reduction requirements of the Hot Spots Program. The use of uniform procedures allows comparison of risks from different facilities and enables identification of facilities that are problematic from a public health perspective. OEHHA reviews the HRAs to insure they are adequate for decision making, but does not play a role in permitting decisions that may result from the HRAs. OEHHA will provide advice to the Districts when requested on any of the risk assessment methods or health values they have used.

# 1 - Introduction

## 1.1 Development of Guidelines

The Air Toxics Hot Spots Information and Assessment Act is designed to provide information to state and local agencies and to the general public on the extent of airborne emissions from stationary sources and the potential public health impacts of those emissions. The Hot Spots Act requires that the Office of Environmental Health Hazard Assessment (OEHHA) develop risk assessment guidelines for the Hot Spots program (Health and Safety Code (HSC) Section 44360(b)(2)) (see Appendix B for the text of the HSC). In addition, the Hot Spots Act specifically requires OEHHA to develop a “likelihood of risks” approach to health risk assessment. In response, OEHHA developed a tiered approach to risk assessment where a point estimate approach is first employed. If a more detailed analysis is needed, OEHHA has developed a stochastic, or probabilistic, approach using exposure factor distributions that can be applied in a stochastic estimate of the exposure. A detailed presentation of the tiered approach, risk assessment algorithms, selected exposure variates (e.g., breathing rate), and distributions with a literature review is presented in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012). A summary of this information can be found in Chapter 5 of this document.

The Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHA, 2008) addresses dose response relationships for noncancer health effects and the methodology for deriving acute, chronic and 8-hour Reference Exposure Levels (RELs). Currently there are 53 acute RELs, 82 chronic RELs, and 10 eight-hour RELs. Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act. The Technical Support Document for Cancer Potency Factors (OEHHA, 2009) addresses the methodology for deriving cancer potency factors and adjusting cancer potency to account for the increased sensitivity to early-in-life exposure to carcinogens. This document contains inhalation cancer potency factors and oral cancer potency factors for 142 toxicants and toxicant compound classes developed by OEHHA or developed by other authoritative bodies and endorsed by OEHHA. The OEHHA website ([www.oehha.ca.gov](http://www.oehha.ca.gov)) should be consulted for the most current adopted chronic, acute and 8-hour RELs and cancer potency factors. In addition, for a small subset of these substances that are subject to airborne deposition and hence human oral and dermal exposure, oral chronic RELs and oral cancer potency factors have been developed by OEHHA. A summary of cancer and noncancer health effects values can be found in Appendix L and Chapters 6 and 7 of the Guidance Manual. All three Technical Support Documents have undergone public and peer review and have been approved by the state’s Scientific Review Panel on Toxic Air Contaminants and adopted by OEHHA. The Guidance Manual is undergoing the same public and peer review process.

The Guidance Manual contains a description of the algorithms, recommended exposure variates, and cancer and noncancer health values, and modeling protocols needed to perform a Hot Spots risk assessment under the Hot Spots Act (see Appendix B). The information for the Guidance Manual is taken from the three TSDs. The Guidance Manual supersedes the risk assessment methods presented in the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2003).

The Guidance Manual is intended to address health risks from airborne contaminants released by stationary sources. Some of the methodology used is common to other regulatory risk assessment applications, particularly for California programs. However, if the reader needs to prepare a Health Risk Assessment (HRA) under another program, the HRA may need additional analyses. Therefore, appropriate California and federal agencies should be contacted. For example, if a facility must comply with HRA requirements under the Resource Conservation and Recovery Act (RCRA) or the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), the California Department of Toxic Substances Control (DTSC) must be contacted to determine if an HRA written to comply with AB 2588 will also satisfy RCRA/CERCLA requirements.

## 1.2 Use of the Guidance Manual

The intent in developing this Guidance Manual is to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of existing, new, or modified stationary sources. The Air Resources Board (ARB) website ([www.arb.ca.gov](http://www.arb.ca.gov)) provides more information on the Hot Spots Program and risk management guidelines, including recommendations for permitting existing, new, or modified stationary sources. The use of consistent risk assessment procedures and report presentation allows comparison of one facility to another, expedites the review of HRAs by reviewing agencies, and minimizes revision and resubmission of HRAs.

OEHHA recognizes that no one risk assessment procedure or set of exposure variates could perfectly address the many types of stationary facilities in diverse locations in California. Therefore a tiered risk assessment approach was developed to provide flexibility and allow consideration of site-specific differences. The tiered approach to risk assessment is discussed in detail in Chapter 8 of this Guidance.

These guidelines should be used in conjunction with the emission data collected and reported pursuant to requirements of the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report for the Air Toxics "Hot Spots" Program* (EICG Report), which is incorporated by reference therein (see ARB's web site: <http://www.arb.ca.gov/ab2588/2588guid.htm> for the most current version, which was approved on August 27, 2007). This regulation outlines requirements for the collection of emission data, based on an inventory plan, which must be approved by the Air Pollution Control or Air Quality Management District (District). The emissions reported under this program are routine or predictable and include continuous

and intermittent releases and predictable process upsets or leaks. Emissions for unpredictable releases (e.g., accidental catastrophic releases) are not reported under this program.

For landfill sites, these guidelines should be applied to the results of the landfill testing required under Health and Safety Code Section 41805.5 as well as to any emissions reported under the emission inventory requirements of the Air Toxics Hot Spots Act (e.g., from flares or other on-site equipment). Districts should be consulted to determine the specific landfill testing data to be used.

### **1.3 Who is Required to Conduct a Risk Assessment**

The Hot Spots Act requires that each local Air Pollution Control District or Air Quality Management District (hereinafter referred to as District) determine which facilities will prepare an HRA. As defined under the Hot Spots Act, an HRA includes a comprehensive analysis of the dispersion of hazardous substances in the environment, their potential for human exposure, and a quantitative assessment of both individual and population-wide health risks associated with those levels of exposure.

Districts are to determine which facilities will prepare an HRA based on a prioritization process outlined in the law. The process by which Districts identify priority facilities for risk assessment involves consideration of potency, toxicity, quantity of emissions, and proximity to sensitive receptors such as hospitals, daycare centers, schools, work-sites, and residences. The District may also consider other factors that may contribute to an increased potential for significant risk to human receptors. As part of this process Districts categorize facilities as high, intermediate, or low priority. The District prioritization process is described in the *CAPCOA Air Toxics Hot Spots Program Facility Prioritization Guidelines, July 1990* (CAPCOA, 1990), although some Districts may have adopted their own method for prioritizing facilities for the purposes of AB2588, permitting, etc. Consult the District for updates to the Prioritization Guidelines. See the Hot Spots Program on ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) for more information on facility prioritization procedures.

Facilities designated by a District as "high priority" are required to submit an HRA to the District within 150 days of designation. Districts may grant a 30-day extension. However, a District may require any facility to prepare and submit an HRA according to the District priorities established for purposes of the Hot Spots Act.

## 1.4 The Hot Spots Analysis and Reporting Program (HARP) Software

The ARB and the Districts have identified a critical need for software to assist with the programmatic aspects of the Hot Spots Program. HARP is computer software used by the ARB, OEHHA, Districts, and facility operators to promote statewide consistency, efficiency, and cost-effective implementation of HRAs and the Hot Spots Program. The HARP software package includes: 1) an Emissions Inventory Database Module, 2) an Air Dispersion Modeling Module, and 3) a Risk Analysis Module. The user-friendly Windows-based package provides for:

1. Electronic implementation of the risk assessment methods presented in the OEHHA guidelines (Guidance Manual);
2. Electronic data transfer from facilities and Districts;
3. The production of reports;
4. Facility prioritization;
5. Air dispersion modeling (AERMOD) of multiple emission releases or facilities for cumulative impact evaluations;
6. A summary report of acute, 8-hour, and chronic health hazard quotients or indices, and cancer risk at the point of maximum impact (PMI), maximally exposed individual resident (MEIR), maximally exposed individual worker (MEIW) and other receptors to be evaluated as needed;
7. Mapping displays of facility property boundaries, risk isopleths, and elevation contours;
8. The ability to display combined risk contours from multiple emission sources;
9. Output of data for use in other “off-the-shelf” Geographic Information Systems (GIS) programs for additional types of analysis; and
10. Census data for determining population-related health impacts showing the number of people exposed at various cancer risk levels and cancer burden.

## 1.5 Risk Assessment Review Process

The Hot Spots Act risk assessments are reviewed by the local District and by OEHHA. The Districts focus their review on the emissions data and the air dispersion modeling. OEHHA provides comments on the HRA’s general concordance with the Guidelines Manual and the completeness of the reported health risks. The District, taking into account the comments of OEHHA, approves the HRA or returns it to the facility for revision and resubmission. If the HRA is not revised and resubmitted by the facility within 60 days, the District may modify the HRA and approve it as modified. Based on the approved HRA, the District determines if there is a significant health risk associated with emissions from the facility. If the District determines that facility emissions pose a significant health risk, the facility operator provides notice to all exposed individuals regarding the results of the HRA and may be required to take steps to reduce emissions by implementing a risk reduction audit and plan. Notification is to be made according to

procedures specified by the District. Each District determines its own levels of significance for cancer and noncancer health effects for notification and risk reduction. See the Hot Spots Program on ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov) for more information on significance levels selected by each District.

## 1.6 Uncertainty in Risk Assessment

OEHHA has striven to use the best science available in developing these risk assessment guidelines. However, there is a great deal of uncertainty associated with the process of risk assessment. The uncertainty arises from lack of data in many areas necessitating the use of assumptions. The assumptions used in these guidelines are designed to err on the side of health protection in order to avoid underestimation of risk to the public. Sources of uncertainty, which may overestimate or underestimate risk, include: 1) extrapolation of toxicity data in animals to humans, 2) uncertainty in the estimation of emissions, 3) uncertainty in the air dispersion models, and 4) uncertainty in the exposure estimates. In addition to uncertainty, there is a natural range or variability in measured parameters defining the exposure scenario. Scientific studies with representative sampling and large enough sample sizes can characterize this variability. In the specific context of a Hot Spots risk assessment, the source of variability with the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants. OEHHA captures at least some of the variability in exposure by developing data driven distributions of intake rates, where feasible, in the TSD for Exposure Assessment (OEHHA, 2012).

Interactive effects of exposure to more than one carcinogen or toxicant are addressed in the risk assessment with default assumptions of additivity. Cancer risks from all carcinogens addressed in the HRA are added. Similarly, non-cancer hazard quotients for substances impacting the same target organ/system are added to determine the hazard index (HI). Although such effects of multiple chemicals are assumed to be additive by default, several examples of synergism (interactive effects greater than additive) are known. For substances that act synergistically, the HRA could underestimate the risks. Some substances may have antagonistic effects (lessen the toxic effects produced by another substance). For substances that act antagonistically, the HRA could overestimate the risks.

Other sources of uncertainty, which may underestimate or overestimate risk, can be found in exposure estimates where little or no data are available (e.g., soil half-life and dermal penetration of some substances from a soil matrix).

The differences among species and within human populations usually cannot be easily quantified and incorporated into risk assessments. Factors including metabolism, target site sensitivity, diet, immunological responses, and genetics may influence the response to toxicants. The human population is much more diverse both genetically and culturally (e.g., lifestyle, diet) than inbred experimental animals. The intraspecies variability among humans is expected to be much greater than in laboratory animals.

In most cases, cancer potency values have been estimated only for the single most affected tumor site. This represents a source of uncertainty in the cancer risk assessment. Adjustment for tumors at multiple sites induced by some carcinogens may result in a higher potency. Some recent assessments of carcinogens include such adjustments. Other uncertainties arise 1) in the assumptions underlying the dose-response model used, and 2) in extrapolating from large experimental doses, where other toxic effects may compromise the assessment of carcinogenic potential, to usually much smaller environmental doses.

When occupational epidemiological data are used to generate a carcinogenic potency or a health protective level for a non-carcinogen, less uncertainty is involved in the extrapolation from workplace exposures to environmental exposures. When using human data, no interspecies extrapolation is necessary eliminating a significant source of uncertainty. However, children are a subpopulation with hematological, nervous, endocrine, and immune systems that are still developing and may be more sensitive to the effects of toxicants. The worker population and risk estimates based on occupational epidemiological data are more uncertain for children than adults. Current risk assessment guidelines include procedures designed to address the possibly greater sensitivity of infants and children, but there are only a few compounds for which these effects have actually been measured experimentally. In most cases, the adjustment relies on default assumptions which may either underestimate or overestimate the true risks faced by infants and children exposed to toxic substances or carcinogens.

Risk estimates generated by an HRA should not be interpreted as the expected rates of disease in the exposed population but rather as estimates of potential for disease, based on current knowledge and a number of assumptions.

In the Hot Spots program, cancer risk is often expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance over a 30-year residential period. However, there is uncertainty associated with the cancer risk estimate. An individual's risk of contracting cancer from exposure to facility emissions may be less or more than the risk calculated in the risk assessment. An individual's risk not only depends on the individual's exposure to a specific chemical but also on his or her genetic background, health, diet, lifestyle choices and other environmental and workplace exposures. OEHHA uses health-protective exposure assumptions to avoid underestimating risk. For example, the risk estimate for airborne exposure to chemical emissions uses the health-protective assumption that the individual has a high breathing rate and exposure began early in life when cancer risk is highest.

A Reference Exposure Level (REL) is the concentration level at or below which no adverse non-cancer health effects are anticipated for the specified exposure duration. RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. RELs are designed to protect the most sensitive individuals in the population by the inclusion of factors that account for uncertainties as well as individual differences in human susceptibility to chemical exposures. The factors used in the calculation of RELs are meant to err on the side of public health

protection in order to avoid underestimation of non-cancer hazards. Exceeding the REL does not automatically indicate an adverse health impact. However, increasing concentrations above the REL value increases the likelihood that the health effect will occur.

Risk assessments under the Hot Spots program are often used to compare one source with another and to prioritize concerns. Consistent approaches to risk assessment are necessary to fulfill this function.

### 1.7 Tiered Approach to Risk Assessment

OEHHA developed a tiered approach to accommodate consideration of site-specific data that may be more appropriate for a given facility than the default variate. The first tier is the simplest point estimate approach to estimating exposure to facility emissions. Tier 1 is the first step in conducting a comprehensive risk assessment using algorithms and point estimates of input values described in the *Technical Support Document for Exposure Assessment and Stochastic Analysis*. (OEHHA, 2012) Each facility conducts a Tier 1 risk assessment to promote consistency across the state in facility risk assessments and facilitate comparisons across facilities. To be health-protective, high-end estimates for the key intake exposure variates are used for the dominant exposure pathways.

Tier 2 allows use of site-specific point estimates of exposure variates as long as these estimates can be justified. For example, if there are data indicating that consumption of fish from an impacted body of water is lower than the OEHHA-recommended fish consumption rate, then the facility can use that data to generate a point estimate for sport-fish consumption from that body of water. The risk assessor must supply the data and methods used for the site-specific estimates, and the site-specific estimates must be reproducible and approved by both the District and OEHHA.

Tier 3 risk assessment involves stochastic analysis of exposure using data-based distributions for the key exposure variates compiled in the OEHHA (2012) *Technical Support Document*. Since a stochastic approach to risk assessment provides more information about the range of risk estimates based on the range of exposures, Tier 3 can serve as a useful supplement to the Tier 1 and 2 approaches. Variance propagation methods (e.g., Monte Carlo analysis) are used to derive a range of cancer risk estimates reflecting the known variability in the inputs. Finally, a Tier 4 approach would use distributions of exposure variates that may be more appropriate for a site, such as the distribution of fish consumption rates for a specific body of water impacted by a facility. As in a Tier 2 approach, the risk assessment must supply the data and methods used for the site-specific distributions for exposure variates, and the site-specific estimates must be justified to and reproducible by the Districts and OEHHA.

## 2 - Overview of Health Risk Assessment

### 2.1 The Model for Risk Assessment

The standard approach currently used for health risk assessment (HRA) was originally proposed by the National Academy of Sciences in the 1983 book: *Risk Assessment in the Federal Government: Managing the Process* (NAS, 1983) and was updated in the Academy's 1994 book: *Science and Judgment in Risk Assessment* (NAS, 1994). In 2009 the National Academy published *Science and Decisions: Advancing Risk Assessment* (NAS, 2009), in which a number of recommendations are made on improving the risk assessment process and expanding it to include community concerns and cumulative risks. The four steps involved in the risk assessment process are 1) hazard identification, 2) exposure assessment, 3) dose-response assessment, and 4) risk characterization. These four steps are briefly discussed below.

### 2.2 Hazard Identification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. For the Air Toxics Hot Spots Program (Hot Spots), the emitted substances that are addressed in a risk assessment are found in the list of substances designated in the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report* (EICG Report), which is incorporated by reference therein (ARB, 2007). This list of substances is contained in Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

### 2.3 Exposure Assessment

The purpose of the exposure assessment is to estimate the extent of public exposure to emitted substances. For the Hot spots program, in practice this means estimating exposures for those emitted substances for which potential cancer risk or noncancer health hazards for acute, repeated 8-hour, and chronic exposures will be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. These activities are described in Chapters 4 and 5. Chapter 5 also discusses the tiered approach to risk assessment.

The ARB's Emission Inventory Criteria and Guidelines (EICG) Report provides assistance in determining those substances that must be evaluated in an HRA and the reporting requirements of facilities, while the Hot Spots Analysis and Reporting Program (HARP) software can be used to model ground level concentrations at specific off-site

locations resulting from facility emissions. The United States Environmental Protection Agency (U.S. EPA) has adopted the AERMOD air dispersion model into its list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments. The AERMOD air modeling software will be incorporated into the HARP software, which allows the user to input all dispersion parameters directly into the program to generate air dispersion data. Alternatively, the air dispersion data may be generated separately from HARP using other air dispersion models, and then imported into HARP to generate risk estimates. Data imported into HARP must already be in the format required by HARP. HARP has the flexibility to generate a summary of the risk data necessary for an HRA by either of the above approaches.

Most of the toxicants assessed under the Hot Spots program are volatile organic compounds that remain as gases when emitted into the air. These chemicals are not subject to appreciable deposition to soil, surface waters, or plants. Therefore, human exposure via ingestion or dermal exposure, at least at concentrations typically encountered in the ambient air, is not considered for volatile organic compounds in the Hot Spots risk assessments. While some models indicate potential for dermal exposure to certain volatile organic compounds, at this time, the Hot spots program does not consider this pathway. Significant exposure to volatile organic toxicants emitted into the air occurs through the inhalation pathway, and this pathway is the primary consideration in the Hot Spots risk assessments. A small subset of Hot Spots substances consists of semi-volatile organic and metal toxicants emitted partially or totally as particles subject to deposition. Ingestion and dermal pathways as well as the inhalation pathway must be evaluated for these chemicals. A few of these semi-volatile organic and metal toxicants must also include the breast milk ingestion pathway. Additional ingestion pathways may also need to be evaluated depending on the pathways of exposure for the specific receptor of interest. Table 5.1 in Chapter 5, Table 6.4 in Chapter 6, and Table 7.1 in Chapter 7 list the substances that must be evaluated for multipathway impacts. HARP is designed to assess potential health impacts posed by substances that must be analyzed by a multipathway approach.

## 2.4 Dose-Response Assessment

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with an estimated exposure. Cancer potency factors are expressed as the 95<sup>th</sup> percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. Typically, potency factors are expressed as units of inverse dose (e.g., (mg/kg BW/day)<sup>-1</sup>) or inverse concentration (e.g., (µg/m<sup>3</sup>)<sup>-1</sup>). It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis.

The Office of Environmental Health Hazard Assessment (OEHHA) has compiled cancer potency factors, which should be used in risk assessments for the Hot Spots program, in Table 7.1. Cancer potency factors listed in Table 7.1 were derived either by the U.S. EPA or by OEHHA, underwent public and peer-review, and were adopted for use in the program. Chapter 8 describes procedures for use of potency values in estimating excess cancer risk. For a detailed description of cancer potency factors, refer to the *Technical Support Document for Cancer Potency Factors* (OEHHA, 2009).

For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, 8-hour, and chronic noncancer Reference Exposure Levels (RELs). The acute, 8-hour and chronic RELs are defined as the concentration at which no adverse noncancer health effects are anticipated even in sensitive members of the general population, with infrequent one hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively. The most sensitive health effect is chosen to develop the REL if the chemical affects multiple organ systems. Unlike cancer health effects, noncancer health effects are generally assumed to have thresholds for adverse effects. In other words, injury from a pollutant will not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold) and/or dose. The acute, 8-hour, and chronic RELs are air concentrations intended to be below the threshold for health effects for the general population.

The actual threshold for health effects in the general population is generally not known with any precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies to help ensure that the chronic, 8-hour and acute REL values are below the threshold for human health for nearly all individuals. This guidance manual provides the acute, 8-hour, and chronic Reference Exposure Levels in Tables 6.1 through 6.3. Some substances that pose a chronic or repeated 8-hour inhalation hazard may also present a chronic hazard via non-inhalation routes of exposure (e.g., ingestion of contaminated water, foods, or soils, and dermal absorption). The oral RELs for these substances are presented in Table 6.4. The methodology and derivations for acute, 8-hour, and chronic, RELs are described in the *Technical Support Document for the Derivation of Noncancer Reference Exposure Levels* (OEHHA, 2008).

## 2.5 Risk Characterization

This is the final step of risk assessment. In this step, modeled concentrations and exposure information, which are determined through exposure assessment, are combined with potency factors and RELs that are developed through dose-response assessment. The use of cancer potency factors to assess total cancer risk and the use of the hazard index approach for evaluating the potential for noncarcinogenic health effects are described in Chapter 8. Example calculations for determining (inhalation) cancer risk and noncancer acute, 8-hour, and chronic hazard quotients and hazard indices are presented in Appendix I. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

Under the Hot Spots Act, health risk assessments are to quantify both individual and population-wide health impacts (Health and Safety Code, Section 44306) (Appendix B). The health risk assessments are facility specific and the calculated risk should be combined for all pollutants emitted by a single facility. For example, cancer risk from multiple carcinogens is considered additive. For exposures to multiple non-carcinogen pollutants, a hazard index approach is applied for air contaminants affecting the same organ system. All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA, including those on the list that do not have a potency value or REL.

For assessing risk, OEHHA has developed two methods for determining dose via inhalation, dermal absorption, and ingestion pathways. These two methods, the point estimate approach and the stochastic exposure assessment approach, are described below and in Chapters 5 and 8. Detailed presentations of these methods can be found in: *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012).

### **2.5.1 Point Estimate Approach**

OEHHA provides information in this document on average and high-end values for key exposure pathways (e.g., breathing rate for the inhalation exposure pathway). The average and high-end of point estimates in this document are defined in terms of the probability distribution of values for that variate. The mean represents the average values for point estimates and the 95<sup>th</sup> percentiles represent the high-end point estimates from the distributions identified in OEHHA (2012). Thus, within the limitations of the data, average and high-end point estimates are supported by the distribution.

Tier 1 of the tiered approach to risk assessment, which is briefly discussed in Section 2.5.3 and presented in more detail in Chapter 8, utilizes a combination of the average and high-end point estimates to more realistically estimate exposure in multipathway risk assessments. This method uses high-end exposure estimates for the pathways that are the main drivers of exposure and the average point estimate for the other non-driving exposure pathways. This approach will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all exposure pathways. See Chapter 8 for detailed discussions of how this multipathway methodology is applied to cancer and noncancer calculations. The HARP software can perform this analysis (referred to as the derived approach in the HARP software).

In addition to using an estimate of average and high-end consumption rates, cancer risk evaluations at individual receptors are presented for 9, 30, and 70-year exposure durations. The 9 and 30-year durations correspond to the average and high-end of residency time recommended by U.S. EPA (1997). The California data presented in Appendix L of the Exposure TSD (OEHHA, 2012) are generally supportive of the nationwide data. The 9 and 70-year exposure durations present potential impacts over the range of residency periods, while the 30-year exposure duration is recommended

for use as the basis for estimating cancer risk at the MEIR in all HRAs. Population-wide impacts should use the 70-year exposure duration.

The parameters used for all exposure durations assume exposure begins in the last trimester of pregnancy and progresses through the exposure duration of interest (e.g., 9, 30, or 70 years). These assumptions are thus protective of children. Children have higher intake rates on a per kilogram body weight basis (e.g., they breathe, drink and eat more per kg body weight than adults) and thus receive a higher dose from contaminated media. See Chapter 5 for the point estimates that can be used to estimate impacts for children. Chapters 5 and 8 discuss how to calculate cancer risk based on various exposure durations and point estimates. Appendix I contains an example calculation and Chapter 9 clarifies how to present the findings in an HRA.

### **2.5.2 Stochastic Exposure Assessment**

OEHHA was directed under the Air Toxics “Hot Spots” program (SB 1731, Calderon, stat. 1992; Health and Safety Code Section 44360(b)(2)) to develop a “likelihood of risk” approach to risk assessment. To satisfy this requirement, OEHHA developed a stochastic approach to risk assessment that utilizes distributions for exposure variates such as breathing rate and water consumption rate rather than a single point estimate. The variability in exposure can be propagated through the risk assessment model using the distributions as input and a Monte Carlo or similar method. The result of such an analysis is a range of risks that at least partially characterizes variability in exposure.

Distributions of key exposure variates that are presented in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) were taken from the literature, if adequate, or developed from raw data of original studies. Intake variates such as vegetable consumption are relatively data rich; for these variates reasonable probability distributions can be constructed. However, the data necessary to characterize the variability in risk assessment variates are not always available. For example, for the fate and transport variates (e.g., fish bioaccumulation factors), there are only a few measurements for a given chemical available which precludes the adequate characterization of a probability distribution. We only developed distributions for those key exposure variates that were adequately characterized by data. Development of distributions is described in detail in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012).

### 2.5.3 Tiered Approach to Risk Assessment

OEHHA recommends using a tiered approach to risk assessment. Tier 1 is a standard point estimate approach using the recommended point estimates presented in this document. If site-specific information is available to modify some point estimates developed in the *Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012) and is more appropriate to use than the recommended point estimates in this document, then Tier 2 allows use of that site-specific information. Site-specific information should be presented to the District before being used. The District may contact OEHHA for additional advice. Note that all non-default variates need to be adequately justified to OEHHA and the Districts to be used. In Tier 3, a stochastic approach to exposure assessment is used with the data distributions developed in the TSD (OEHHA, 2012) and presented in this document. Tier 4 is also a stochastic approach but allows for utilization of site-specific distributions, if they are justifiable (to OEHHA and the Districts) and more appropriate for the site under evaluation than those recommended in this document. Persons preparing an HRA that has a Tier 2 through Tier 4 evaluation must also include the results of a Tier 1 evaluation. Tier 1 evaluations are required for all HRAs prepared for the Hot Spots Program to promote consistency across the state for all facility risk assessments and allow comparisons across facilities. Chapter 8 provides a summary of the tiered approach and the TSD (OEHHA, 2012) discusses it in detail. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

## 3 - Hazard Identification - Air Toxics Hot Spots Emissions

### 3.1 The Air Toxics Hot Spots List of Substances and Emissions Inventory

For air toxics sources, hazard identification involves identifying pollutants of concern and whether these pollutants are potential human carcinogens or associated with other types of adverse health effects. For the Air Toxics Hot Spots (Hot Spots) Program, the emitted substances that are addressed in a health risk assessment (HRA) are found in the list of hazardous substances designated in the Air Resources Board's (ARB's) *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report (EICG Report)*, which is incorporated by reference therein (ARB, 2007). This list of substances is contained in both Appendix A of this document and the EICG Report. The list of substances also identifies those substances that are considered human carcinogens or potential human carcinogens.

The substances included on the Hot Spots Program list of substances are defined in the statute as those substances found on lists developed by the following sources:

- International Agency for Research on Cancer (IARC);
- U.S. Environmental Protection Agency (U.S. EPA);
- U.S. National Toxicology Program (NTP);
- ARB Toxic Air Contaminant Identification Program List;
- Hazard Evaluation System and Information Service (HESIS) (State of California);
- Proposition 65 (Safe Drinking Water and Toxic Enforcement Act of 1986) list of carcinogens and reproductive toxicants (State of California);
- Any additional substance recognized by the State Board as presenting a chronic or acute threat to public health when present in the ambient air.

All substances emitted by the facility that are on the Hot Spots Act list of substances must be identified in the HRA.

The ARB EICG Report (ARB, 2007) specifies that each facility subject to the Hot Spots Act must submit an Emission Inventory Report to the local air pollution control or air quality management district. This Emission Inventory Report must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. These inventory reports include the emission data necessary to estimate off-site levels of facility-released Hot Spots substances. These inventory reports will be discussed in further detail in Chapter 4. See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results. As presented in Appendix A, the EICG Report divides the list into three groups for reporting purposes. Potency or severity of toxic effects and potential for facility emission were considered in placing compounds into the three groups.

For the first group (listed in these guidelines in Appendix A-I), all emissions of these substances must be quantified in the HRA. For substances in the second group (listed in these guidelines in Appendix A-II), emissions are not quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site (i.e., these substances are simply listed in a table in the HRA). Lastly, substances in the third group (Appendix A-III) also only need to be reported in a table in the HRA if they are manufactured by the reporting facility.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the California Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment. Some RCRA/CERCLA facilities may emit substances which are not currently listed under the Hot Spots Program but which may require evaluation in a RCRA/CERCLA risk assessment.

## 4 - Air Dispersion Modeling

The information contained in this section is primarily an abbreviated version of the material found in Chapter 2 of the Air Toxics Hot Spots Risk Assessment Guidelines; Exposure Assessment and Stochastic Analysis Technical Support Document (OEHHA, 2012). Several references have been included in this section to indicate those areas that are covered in more detail in Chapter 2 of the Technical Support Document. However, some air dispersion concepts and procedures have been added to assist the reader in the health risk assessment (HRA) process. In particular, a brief summary of the Hot Spots Analysis and Reporting Program (HARP) software applicability to air dispersion analysis has been included. The HARP software has been developed by the Air Resources Board (ARB), in consultation with OEHHA and Air Pollution Control or Air Quality Management District (District) representatives. The HARP software is the recommended model for calculating and presenting HRA results for the Air Toxics Hot Spots Program (Hot Spots). Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov). See Chapter 9 for an outline that specifies the content and recommended format for presenting the air dispersion modeling and HRA results.

The U.S. EPA has adopted the AERMOD air dispersion model into their list of regulatory approved models, in place of the previously used ISCST3 model. AERMOD is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain (U.S. EPA, 2009). The Air Resources Board recommends AERMOD for Hot Spots risk assessments.

### 4.1 Air Dispersion Modeling in Exposure Assessment: Overview

Estimates of air concentrations of emitted toxicants in the surrounding community from a facility's air emissions are needed in order to determine cancer and noncancer risks. One approach to determining the concentration of air pollutants emitted from the facility is to do air monitoring in the surrounding community. However, there are a number of disadvantages to this approach. Ambient air monitoring is costly because good estimates of an annual average concentration typically require monitoring at least one day in six over a year. Because it is costly, monitoring is usually limited to a select number of pollutants, and a limited number of sites. There can be significant risks from some chemicals at or even below the monitoring detection limit, which can add considerable uncertainty to risk estimates if many of the measurements are below or near the detection limit. Monitoring measures not only facility emissions but also general ambient background as well. It can be difficult and expensive to distinguish between the two using monitoring, particularly if general ambient background levels are high relative to the contribution of facility emissions. These limitations often make it impractical to use monitoring in a program such as the Air Toxics Hot Spots program with hundreds of facilities.

Air dispersion models have several advantages over monitoring. Modeling can provide greater spatial detail and the costs are relatively cheap by comparison. For example, dispersion models can estimate the pollutant concentration in air at many receptor locations (hundreds to thousands) and for a multitude of averaging periods. Air dispersion models have been validated using air monitoring.

There are, however, uncertainties associated with the typical usage of air dispersion modeling. The use of meteorological data from the nearest airport may not ideally be the best representation of localized conditions. Gaussian plume air dispersion models ignore calm hours. This can bias model predictions towards underestimation. Some dispersion models offer limited chemical reactions within the algorithms; however, we generally assume the pollutant is inert for the near-field atmospheric travel time. This may bias estimated concentrations towards over-prediction for those pollutants that are highly reactive in the atmosphere. Air dispersion model results are only as good as the emissions estimates and emissions estimates can be uncertain. However, on the whole, the advantages of air dispersion modeling for a program like the Air Toxics Hot Spots far outweigh the disadvantages.

Professional judgment is required throughout the dispersion modeling process. The local air quality district has final authority on modeling protocols. The following guidance is intended to assist in the understanding of dispersion modeling for risk assessments.

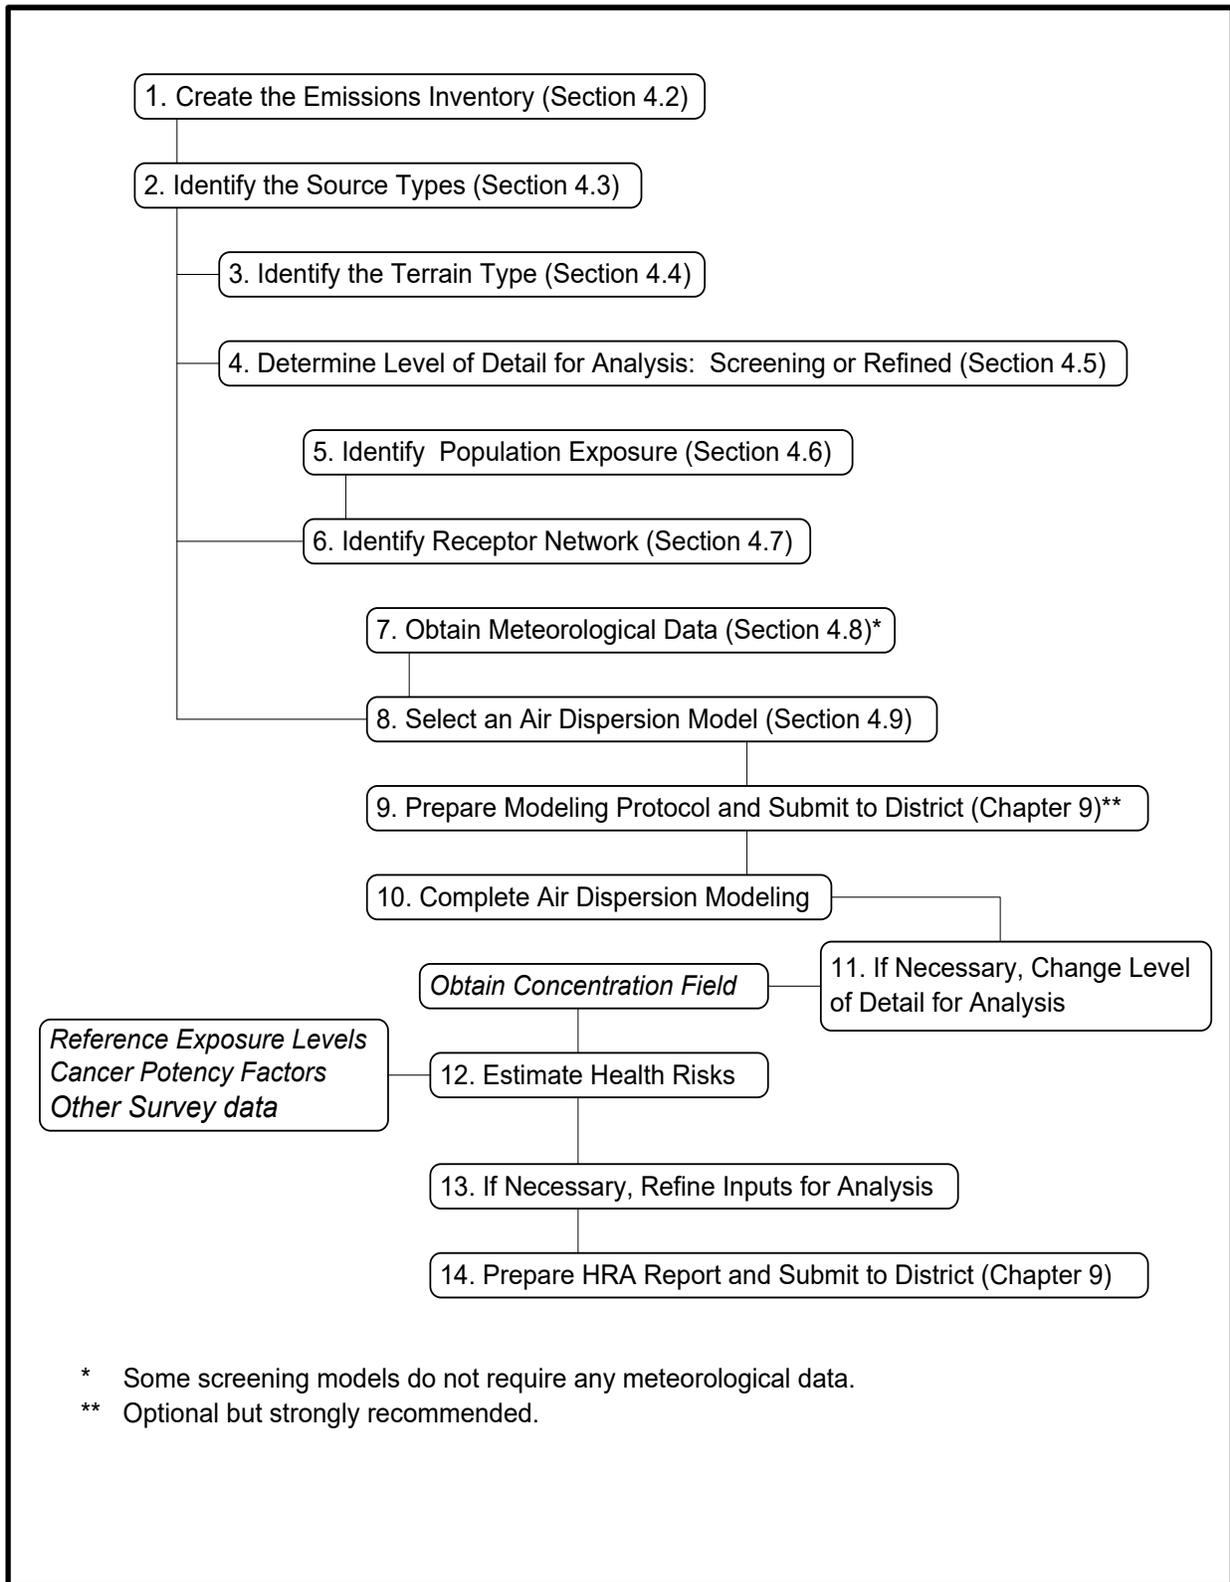

Air dispersion modeling includes the following steps (see Figure 1):

1. Create an emission inventory of the toxic releases (Section 4.2)
2. Identify the source types (Section 4.3)
3. Identify the terrain type and land use (Section 4.4)
4. Determine the detail needed for the analysis: screening or refined (Section 4.5)
5. Identify the population exposure (Section 4.6)
6. Identify the receptor network (Section 4.7)
7. Obtain meteorological data (for refined air dispersion modeling only) (Section 4.8)
8. Select an air dispersion model (Section 4.9)
9. Prepare a modeling protocol and submit to the local Air District (hereafter referred to as "the District") (Section 4.14)
10. Complete the air dispersion analysis
11. If necessary, redefine the receptor network and return to Step 10

12. Complete the risk assessment
13. If necessary, refine the inputs and/or the model selection and return to Step 8
14. Present the HRA results (Chapter 9 provides an outline that specifies the content and recommended format of HRA results).

The output of the air dispersion modeling analysis includes a receptor field of ground level concentrations of the pollutant in ambient air. These concentrations can be used to estimate an inhaled or ingested dose for the estimation of multipathway cancer risk, or used to determine a hazard index for acute (inhalation), and chronic noncancer multipathway risks. It should be noted that in the Air Toxics “Hot Spots” program, facilities simulate the dispersion of the chemical emitted as an inert compound, and do not model any atmospheric transformations or dispersion of products from such reactions. The U.S. EPA Guideline on Air Quality Models (U.S. EPA, 2005) should be consulted when evaluating reactive pollutants for other regulatory purposes.

**Figure 1 Overview of the Air Dispersion Modeling Process.**

## 4.2 Emission Inventories

The Emission Inventory Reports (Inventory Reports) developed under the Hot Spots Program provide data to be used in the HRA and in the air dispersion modeling process. The Inventory Reports contain information regarding emission sources, emitted substances, emission rates, emission factors, process rates, and release parameters (area and volume sources may require additional release data beyond that generally available in Emissions Inventory reports). This information is developed according to the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report (EICG Report)*, which is incorporated by reference therein (ARB, 2007).

Updated emission data for process changes, emission factor changes, material/fuel changes, or shutdown must be approved by the District prior to the submittal of the health risk assessment (HRA). Ideally, the District review of updated emissions could be completed within the modeling protocol. In addition, it must be stated clearly in the risk assessment if the emission estimates are based on updated or revised emissions (e.g., emission reductions). This section summarizes the requirements that apply to the emission data which are used for Air Toxics "Hot Spots" Act risk assessments.

### 4.2.1 Air Toxics Hot Spots Emissions

As noted in Chapter 3, Hazard Identification, the HRA should identify all substances emitted by the facility, which are on the Hot Spots Act list of substances (see Appendix A of the Guidance Manual or the EICG Report). The EICG Report specifies that Inventory Reports must identify and account for all listed substances used, manufactured, formulated, or released by the facility. All routine, predictable releases must be reported. Under the regulations, the list is divided into three groups for reporting purposes. The first group (listed in Appendix A-I of the Inventory Guidelines Report) has all pollutants whose emissions must be quantified. The second group (listed in Appendix A-II of the Inventory Guidelines Report) includes substances where emissions do not need to be quantified; however, facilities must report whether the substance is used, produced, or otherwise present on-site. The third group (listed in Appendix A-III of the Emissions Inventory Guidelines Report) includes substances whose emissions need not be reported unless the substance is manufactured by the facility. Chemicals or substances in the second and third groups should be listed in a table in the risk assessment.

Facilities that must comply with the Resource Conservation and Recovery Act and Comprehensive Environmental Response, Compensation and Liability Act (RCRA/CERCLA) requirements for risk assessment need to consult the Department of Toxic Substances Control (DTSC) Remedial Project Manager to determine which substances must be evaluated in their risk assessment in addition to the list of "Hot Spots" chemicals. Some RCRA/CERCLA facilities may emit chemicals that are not currently listed under the "Hot Spots" Program. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.1.1 Emission Estimates Used in the Risk Assessment

The HRA must include emission estimates for all substances that are required to be quantified in the facility's emission inventory report. Specifically, HRAs should include both annual average emissions and maximum 1-hour emissions for each pollutant. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).

Emissions for each substance must be reported for individual emitting processes associated with unique devices within a facility. Total facility emissions for an individual air contaminant will be the sum of emissions, reported by process, for that facility. Information on daily and annual hours of operation, and relative monthly activity, must be reported for each emitting process. Devices and emitting processes must be clearly identified and described and must be consistent with those reported in the emissions inventory report.

The HRA should include tables that present the emission information (i.e., emission rates for each substance released from each process) in a clear and concise manner. The District may allow the facility operator to base the HRA on more current emission estimates than those presented in the previously submitted emission inventory report (i.e., actual enforceable emission reductions realized by the time the HRA is submitted to the District). If the District allows the use of more current emission estimates, the District must review and approve the new emissions estimates prior to use in the HRA. The HRA report must clearly state what emissions are being used and when any reductions became effective. Specifically, a table presenting emission estimates included in the previously submitted emission inventory report as well as those used for the HRA should be presented. The District should be consulted concerning the specific format for presenting the emission information. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. A revised emission inventory report must be submitted to the District prior to submitting the HRA and forwarded by the District to the ARB, if revised emission data are used.

##### 4.2.1.1.1 *Molecular Weight Adjustments for the Emissions of Metal Compounds*

For most of the Hot Spots toxic metals, the OEHHA cancer potency factors, acute and chronic RELs apply to the weight of the toxic metal atom contained in the overall compound. Some of the Hot Spots compounds contain various elements along with the toxic metal atom (e.g., "Nickel hydroxide", CAS number 12054-48-7, has a formula of  $\text{H}_2\text{NiO}_2$ ). Therefore, an adjustment to the reported pounds of the overall compound is needed before applying the OEHHA cancer potency factor for "Nickel and compounds" to such a compound. This ensures that the cancer potency factor, acute or chronic REL is applied only to the fraction of the overall weight of the emissions that are associated with health effects of the metal. In other cases, the Hot Spots metals are already reported as the metal atom equivalent (e.g., CAS 7440-02-0, "Nickel"), and these cases do not use any further molecular weight adjustment. (Refer to Note [7] in Appendix A,

List of Substances in the EICG Report for further information on how the emissions of various Hot Spots metal compounds are reported.)

The appropriate molecular weight adjustment factors (MWF) to be used along with the OEHHA cancer potency factors, acute and chronic RELs for Hot Spots metals can be found in the MWF column<sup>1</sup> of the table containing OEHHA/ARB Approved Health Values for use in Hot Spots Facility Risk Assessments that is in Appendix L of this document.

As an example, the compound “Nickel hydroxide” has a molecular formula of  $H_2NiO_2$ . The atomic weight of each of the elements in this compound, and the fraction they represent of the total weight, are therefore as follows:

<u>Element</u>	<u>Number of atoms</u>	<u>Atomic Weight</u>	<u>Fraction of Total Weight = MWF</u>
1 x Nickel (Ni)	1 x	58.70	$58.70 / 92.714 = \mathbf{0.6332}$ (MWF for Nickel)
2 x Oxygen (O)	2 x	15.999	
2 x Hydrogen (H)	2 x	1.008	
Total Molecular Weight of $H_2NiO_2$ :		92.714	

So, for example, assume that 100 pounds of “Nickel hydroxide” emissions are reported under CAS number 12054-48-7. To get the Nickel atom equivalent of these emissions, multiply by the listed MWF (0.6332) for Nickel hydroxide:

- 100 pounds x 0.6332 = 63.32 pounds of Nickel atom equivalent.

This step should be completed prior to applying the OEHHA cancer potency factor for “Nickel and compounds” in a calculation for a prioritization score or risk assessment calculation. (Note - The HARP software automatically applies the appropriate MWF for each Hot Spots chemical (by CAS number), so the emissions should not be manually adjusted when using HARP. Therefore, if using HARP, you would use 100 pounds for Nickel hydroxide and HARP will make the MWF adjustment for you. If not using HARP, you would use 63.32 pounds.)

---

<sup>1</sup> The value listed in the MWF column for Asbestos is not a molecular weight adjustment. This is a conversion factor for adjusting mass and fibers or structures. See Appendix C for more information on Asbestos reporting and risk assessment information or see the EICG report for reporting guidance.

#### 4.2.1.2 Release Parameters

Emission release parameters (e.g., stack height and inside diameter, stack gas exit velocity, release temperature and emission source location in UTM coordinates) are needed as inputs to the air dispersion model. The Inventory Guidelines specify the release parameters that must be reported for each stack, vent, ducted building, exhaust site, or other site of exhaust release. Additional information may be required to characterize releases from non-stack (volume and area) sources; see U.S. EPA dispersion modeling guidelines or specific user's manuals. This information should also be included in the air dispersion section of the risk assessment. This information must be presented in tables included in the risk assessment. Note that some dimensional units needed for the dispersion model may require conversion from the units reported in the Inventory Report (e.g., Kelvin (K) vs. degrees Fahrenheit (°F)). Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.1.3 Operation Schedule

The HRA should include a discussion of the facility operation schedule and daily emission patterns. For AB2588 purposes, emissions should be reported based on routine and predictable operations. Weekly or seasonal emission patterns may vary and should be discussed. This is especially important in a refined HRA. Diurnal emission patterns should be simulated in the air dispersion model because of diurnal nature of meteorological observations. Diurnal evaluations are important to include since diurnal weather patterns and emission releases may cause significant differences in the concentration at a receptor of interest.

A table should be included listing the emission schedule on an hourly and yearly basis. In addition, the emission schedule and exposure schedule should corroborate any exposure adjustment factors used for approximating an inhaled dose. For more information about exposure adjustment factors, see Section 4.8.1. Alternatively, exposure adjustments can be made through refining the air dispersion analysis. See Section 4.11.1.2(h) for special case modeling or Appendix M. An alternative to including modeling that addresses diurnal influences would be to include a sensitivity study showing, and/or text explaining, the reason(s) why there are no significant differences due to diurnal influences on the emissions from the facility or at the receptor(s) of interest. For more guidance, you can contact the district or reviewing authority. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.2.1.4 Emission Controls

The HRA should include a description of control equipment, the emitting processes it serves, and its efficiency in reducing emissions of substances on the Air Toxics "Hot Spots" list. The EICG Report requires that this information be included in the Inventory Reports, along with the emission data for each emitting process. If the control equipment did not operate full-time throughout the year, then the reported overall control efficiency must be adjusted to account for any predictable downtime of the

control equipment. Any entrainment of toxic substances to the atmosphere from control equipment should be accounted for; this includes fugitive releases during maintenance and cleaning of control devices (e.g., baghouses and cyclones). Contact the District for guidance with control equipment adjustments. Recommended default deposition rates that are used when calculating potential noninhalation health impacts are listed in Section 5.3.2. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### **4.2.2 Landfill Emissions**

Emission estimates for landfill sites should be based on testing required under Health and Safety Code, Section (HSC) 41805.5 (AB 3374, Calderon) and any supplemental AB 2588 source tests or emission estimates used to characterize air toxics emissions from landfill surfaces or through off-site migration. The District should be consulted to determine the specific Calderon data to be used in the HRA. The “Hot Spots” Program HRA for landfills should also include emissions of listed substances for all applicable power generation and maintenance equipment at the landfill site. Processes that need to be addressed include stationary internal combustion engines, flares, evaporation ponds, composting operations, boilers, and gasoline dispensing systems.

### **4.3 Source Characterization**

Pollutants are released into the atmosphere in many different ways. The release conditions need to be properly identified and characterized to appropriately use the air dispersion models.

#### **4.3.1 Source Type**

Source types can be identified as point, line, area, or volume sources for input to the air dispersion model. Several air dispersion models have the capability to simulate more than one source type.

##### **4.3.1.1 Point Sources**

Point sources are probably the most common type of source and most air dispersion models have the capability to simulate them. Typical examples of point sources include exhaust stacks. Isolated vents from buildings are special examples of point sources.

##### **4.3.1.2 Line Sources**

The version 12345 or newer of the AERMOD can accommodate line sources. Line sources can be also treated as a special case of either an area or a volume source. Examples of line sources include: conveyor belts and rail lines, freeways, and busy roadways. Not all mobile sources may be subject to the Hot Spots program; however, non-motor vehicles that operate within a facility (e.g., ships, trains, and cranes, etc.) are subject to the Hot Spots program. For more information, see the ARB’s Emission Inventory and Criteria Guidelines document or ARB’s interpretation and guidance

memorandum to CAPCOA regarding mobile sources which are subject to the “Hot Spots” program. This memo can be found at <http://www.arb.ca.gov/ab2588/motorv.pdf>.

Mobile sources and rail lines are required to be evaluated under SB 352. SB 352 requires a risk assessment performed under the Hot Spots risk assessment guidance for proposed school sites within 500 feet of a busy roadway. Dedicated air dispersion models are available for motor vehicle emissions from roadways which are a special type of line source. These models (i.e., CALINE3, CAL3QHCR, and CALINE4) are designed to simulate the mechanical turbulence and thermal plume rise due to the motor vehicle activity on the roadway. However, these dedicated models use the Pasquill-Gifford dispersion stability classes for dispersion; the AERMOD dispersion model uses a more advanced continuous stability estimation method based on observations. The limitation with AERMOD is that the user needs to estimate initial mixing (Szo and Syo) for mechanical turbulence and thermal plume rise. Consult with the District prior to conducting roadway modeling to determine model use.

For practical information on how to simulate roadway emission dispersion using these models, see the California Air Pollution Control Officer’s Association (CAPCOA) website at <http://www.capcoa.org> or the Sacramento Metropolitan AQMD (SMAQMD) website at <http://www.airquality.org/ceqa/RoadwayProtocol.shtml>. The SMAQMD has a document titled, “Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways”(January, 2010). The ARB recommends this document for SB-352 risk assessments.

#### 4.3.1.3 Area Sources

Emissions that are to be modeled as area sources are typical of fugitive sources characterized by non-buoyant emissions containing negligible vertical extent (e.g., no plume rise or emissions distributed over a large horizontal area).

Fugitive particulate (PM<sub>2.5</sub>, PM<sub>10</sub>, TSP) emission sources include areas of disturbed ground (e.g., open pits, parking lots) which may be present during operational phases of a facility’s life. Also included are areas of exposed material (e.g., storage piles and slag dumps) and segments of material transport where potential fugitive emissions may occur (uncovered haul trucks or rail cars, emissions from unpaved roads). Fugitive emissions may also occur during stages of material handling where particulate material is exposed to the atmosphere (uncovered conveyors, hoppers, and crushers).

Other fugitive emissions emanating from many points of release may be modeled as area sources. Examples include fugitive emissions from valves, flanges, venting, and other connections that occur at ground level or at an elevated level or deck if on a building or structure. Modern dispersion models include an option for an initial vertical extent (Szo) where needed.

Modeling portable equipment as an area source is a case-by-case situation that should be discussed with the District or reviewing authority. Situations may exist where this type of operation is best represented as another type of release.

#### 4.3.1.4 Volume Sources

Non-point sources with emissions containing an initial vertical extent should be modeled as volume sources. The initial vertical extent may be due to plume rise or a vertical distribution of numerous smaller sources over a given area. Examples of volume sources include buildings with natural fugitive or passive ventilation, and line sources such as conveyor belts and rail lines.

#### 4.3.2 **Quantity of Sources**

The number of sources at a facility may influence the selection of the air dispersion model. Some dispersion models are capable of simulating only one source at a time, and are therefore referred to as single-source models (e.g., AERSCREEN).

In some cases, for screening purposes, single-source models may be used in situations involving more than one source using one of the following approaches:

- Combining all sources into one single “representative” source

In order to be able to combine all sources into one single source, the individual sources must have similar release parameters. For example, when modeling more than one stack as a single “representative” stack, the stack gas exit velocities and temperatures must be similar. In order to obtain a conservative estimate, the values leading to the higher concentration estimates should typically be used (e.g., the lowest stack gas exit velocity and temperature, the height of the shortest stack, and a receptor distance and spacing that will provide maximum concentrations, etc.).

- Running the model for each individual source and superimposing results

Superimposition of results of single sources of emissions is the actual approach followed by all the Gaussian models capable of simulating more than one source. Simulating sources in this manner may lead to conservative estimates if worst-case meteorological data are used or if the approach is used with a model that automatically selects worst-case meteorological conditions, especially wind direction. The approach will typically be more conservative the farther apart the sources are because each run would use a different worst-case wind direction.

Additional guidance regarding source merging is provided by the U.S. EPA (1995a). It should be noted that depending upon the population distribution, the total burden can actually increase when pollutants are more widely dispersed. If the total burden from the facility or zone of impact (see Section 4.6.1) could increase for the simplifying modeling assumptions described above, the District should be consulted.

#### 4.4 **Terrain Type**

Two types of terrain characterizations are required to select the appropriate model. One classification is made according to land type and another one according to terrain topography.

#### 4.4.1 *Terrain Type – Land Use*

Some air dispersion models (e.g., CALINE) use different dispersion coefficients (sigmas) depending on the land use over which the pollutants are being transported. The land use type is also used by some models to select appropriate wind profile exponents. Traditionally, the land type has been categorized into two broad divisions for the purposes of dispersion modeling: urban and rural. Accepted procedures for determining the appropriate category are those suggested by Irwin (1978): one based on land use classification and the other based on population.

The land use procedure is generally considered more definitive. Population density should be used with caution and should not be applied to highly industrialized areas where the population density may be low. For example, in low population density areas a rural classification would be indicated, but if the area is sufficiently industrialized the classification should already be “urban” and urban dispersion parameters should be used.

If the facility is located in an area where land use or terrain changes abruptly, for example, on the coast, the District should be consulted concerning the classification. If need be, the model should be run in both urban and rural modes and the District may require a classification that biases estimated concentrations towards over prediction. As an alternative, the District may require that receptors be grouped according to the terrain between source and receptor.

AERMOD is the U.S. EPA’s preferred dispersion model for a wide range of applications in rural or urban conditions. The users should refer to section 5.0 of the AERMOD Implementation Guide to determine urban or rural conditions.

The Land Use and the Population Density Procedures discussed above are described as follows.

##### 4.4.1.1 Land Use Procedure

- (1) Classify the land use within the total area  $A$ , circumscribed by a 3 km radius circle centered at the source using the meteorological land use typing scheme proposed by Auer (1978) and shown in Table 4.1.
- (2) If land use types I1, I2, C1, R2 and R3 account for 50 percent or more of the total area  $A$  described in (1), use urban dispersion coefficients. Otherwise, use appropriate rural dispersion coefficients.

##### 4.4.1.2 Population Density Procedure

- (1) Compute the average population density ( $p$ ) per square kilometer with  $A$  as defined in the Land Use procedure described above. (Population estimates are also required to determine the exposed population; for more information see Section 4.6.3.)

(2) If  $p$  is greater than 750 people/km<sup>2</sup> use urban dispersion coefficients, otherwise, use appropriate rural dispersion coefficients.

**Table 4.1 Identification and classification of land use types (Auer, 1978)**

Used to define rural and urban dispersion coefficients in certain models.

Type	Use and Structures	Vegetation
I1	<i>Heavy Industrial</i> Major chemical, steel and fabrication industries; generally 3-5 story buildings, flat roofs	Grass and tree growth extremely rare; <5% vegetation
I2	<i>Light-moderate industrial</i> Rail yards, truck depots, warehouses, industrial parks, minor fabrications; generally 1-3 story buildings, flat roofs	Very limited grass, trees almost totally absent; <5% vegetation
C1	<i>Commercial</i> Office and apartment buildings, hotels; >10 story heights, flat roofs	Limited grass and trees; <15% vegetation
R1	<i>Common residential</i> Single family dwelling with normal easements; generally one story, pitched roof structures; frequent driveways	Abundant grass lawns and light-moderately wooded; >70% vegetation
R2	<i>Compact residential</i> Single, some multiple, family dwelling with close spacing; generally <2 story, pitched roof structures; garages (via alley), no driveways	Limited lawn sizes and shade trees; <30% vegetation
R3	<i>Compact residential</i> Old multi-family dwellings with close (<2 m) lateral separation; generally 2 story, flat roof structures; garages (via alley) and ash pits, no driveways	Limited lawn sizes, old established shade trees; <35% vegetation
R4	<i>Estate residential</i> Expansive family dwelling on multi-acre tracts	Abundant grass lawns and lightly wooded; >80% vegetation
A1	<i>Metropolitan natural</i> Major municipal, state, or federal parks, golf courses, cemeteries, campuses; occasional single story structures	Nearly total grass and lightly wooded; >95% vegetation
A2	Agricultural rural	Local crops (e.g., corn, soybean); >95% vegetation
A3	<i>Undeveloped</i> Uncultivated; wasteland	Mostly wild grasses and weeds, lightly wooded; >90% vegetation
A4	Undeveloped rural	Heavily wooded; >95% vegetation
A5	<i>Water surfaces</i> Rivers, lakes	

#### 4.4.2 *Terrain Type - Topography*

Surface conditions and topographic features generate turbulence, modify vertical and horizontal winds, and change the temperature and humidity distributions in the boundary layer of the atmosphere. These in turn affect pollutant dispersion and models differ in their need to take these factors into account.

The classification according to terrain topography should ultimately be based on the topography at the receptor location with careful consideration of the topographical features between the receptor and the source. Differentiation of simple versus complex terrain is unnecessary with AERMOD. In complex terrain, AERMOD employs the well-known dividing-streamline concept in a simplified simulation of the effects of plume-terrain interactions. For other plume models, topography can be classified as follows:

##### 4.4.2.1 Simple Terrain (also referred to as “Rolling Terrain”)

Simple terrain is all terrain located below stack height including gradually rising terrain (i.e., rolling terrain). Note that *Flat Terrain* also falls in the category of simple terrain.

##### 4.4.2.2 Intermediate Terrain

Intermediate terrain is terrain located above stack height and below plume height. The recommended procedure to estimate concentrations for receptors in intermediate terrain is to perform an hour-by-hour comparison of concentrations predicted by simple and complex terrain models. The higher of the two concentrations should be reported and used in the risk assessment.

##### 4.4.2.3 Complex Terrain

Complex terrain is terrain located above plume height. Complex terrain models are necessarily more complicated than simple terrain models. There may be situations in which a facility is “overall” located in complex terrain but in which the nearby surroundings of the facility can be considered simple terrain. In such cases, receptors close to the facility in this area of simple terrain will “dominate” the risk analysis and there may be no need to use a complex terrain model. It is unnecessary to determine which terrain dominates the risk analysis for users of AERMOD.

#### 4.5 **Level of Detail: Screening vs. Refined Analysis**

Air dispersion models can be classified according to the level of detail which is used in the assessment of the concentration estimates as “screening” or “refined”. Refined air dispersion models use more robust algorithms capable of using representative meteorological data to predict more representative and usually less conservative estimates. Refined air dispersion models are, however, more resource intensive than their screening counterparts. It is advisable to first use a screening model to obtain conservative concentration estimates and calculate health risks. If the health risks are estimated to be above the threshold of concern, then use of a refined model to calculate

more representative concentration and health risk estimates would be warranted. There are situations when screening models represent the only viable alternative (e.g., when representative meteorological data are not available). The district or reviewing authority should be consulted to determine the appropriate method for determining the level of detail in the modeling analysis. The HARP software will incorporate the capability of using either representative meteorological data from AERMOD or the default meteorological conditions from the AERSCREEN model.

It is acceptable to use a refined air dispersion model in a “screening” mode for this program’s health risk assessments. In this case, a refined air dispersion model is used:

- with worst-case meteorology instead of representative meteorology;
- with a conservative averaging period conversion factor to calculate longer term concentration estimates (see Section 4.10 for more discussion on screening air dispersion models and adjustments factors).

Note that use of worst case meteorology in a refined model is not the normal practice in New Source Review or Ambient Air Quality Standard evaluation modeling.

## 4.6 Population Exposure

The level of detail required for the analysis (e.g., screening or refined), and the procedures to be used in determining geographic resolution and exposed population require case-by-case analysis and professional judgment. The District should be consulted before beginning the population exposure estimates, and as results are generated, further consultation may be necessary. Some suggested approaches and methods for handling the breakdown of population and performance of a screening or detailed risk analysis are provided in this section.

In addition to estimating individual cancer risk at specific points such as the MEI (maximally exposed individual), OEHHA recommends determining the number of people who reside within the  $1 \times 10^{-6}$ ,  $1 \times 10^{-5}$ ,  $1 \times 10^{-4}$ , and higher cancer risk isopleths. For noncancer population evaluations, the number of people who reside within the 0.5, one, five, or higher hazard index isopleths should be reported. The HARP software can provide population exposure estimates as cancer burden or as the number of persons exposed to a selected (user identified) health risk/impact level. Information on obtaining the HARP software can be found under the Hot Spots Program on the ARB’s web site at [www.arb.ca.gov](http://www.arb.ca.gov). Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

### 4.6.1 Zone(s) of Impact

As part of the estimation of the population exposure for the cancer risk analysis, it is necessary to determine the geographic area affected by the facility’s emissions. An initial approach to define a “zone of impact” surrounding the source is to generate an isopleth where the total excess lifetime cancer risk from inhalation exposure to all emitted carcinogens is greater than  $10^{-6}$  (one in 1,000,000).

For noncarcinogens, a second, third, and fourth isopleth (to represent the chronic, 8-hour, and acute impacts) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 1.0. For clarity these isopleths may need to be presented on separate maps in the HRA.

Contact the District or reviewing authority to discuss inclusion of isopleth maps if all potential health risks fall within the facility boundary and no receptors have, or will ever, be present within the boundary (also see Section 4.7.1 for a discussion of on-site receptors).

The initial “zone of impact” can be determined as follows:

- Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors which is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors the user needs to provide some information normally consisting of starting distance, increment and number of intervals.
- Calculate total cancer risk and hazard index (HI) for each receptor location by using the methods provided in the risk characterization sections in Chapter 8 of the Air Toxics Hot Spots Risk Assessment Guidance Manual.
- Find the distance where the total inhalation cancer risk is equal to  $10^{-6}$ ; this may require redefining the receptor array in order to have two receptor locations that bound a total cancer risk of  $10^{-6}$ . Next, find the distance where the chronic, 8-hour, and acute health hazard indices are declared significant by the District (e.g., acute, 8-hour, or chronic HI = 1.0).

Some Districts may prefer to use a cancer risk of  $10^{-7}$  or an HI of 0.5 as the zone of impact. Therefore, the District should be consulted before modeling efforts are initiated. If the zone of impact is greater than 25 km from the facility at any point, then the District should be consulted. The District may specify limits on the area of the zone of impact. Ideally, these preferences would be presented in the modeling protocol (see Section 4.14).

Note that when depicting the risk assessment results, risk isopleths must present the total cancer and noncancer risk from both inhalation and noninhalation pathways. The zone of impact should be clearly shown on a map with geographic markers of adequate resolution (see Section 4.6.3.1). The text below discusses methodology for defining the zone of impact and has format recommendations. Chapter 9 provides an outline that specifies the content and recommended format of all HRA results.

The zone of impact can be defined once the exposure assessment (air dispersion modeling) process has determined the pollutant concentrations at each designated off-site receptor and a risk analysis (see Chapter 8) has been performed. For clarity, the cancer and noncancer zone(s) of impact should be presented on separate maps. A

map illustrating the carcinogenic zone of impact is required. The District may at its discretion ask for the map illustrating the potential carcinogenic zone of impact to identify the zone of impact for the minimum exposure pathways (inhalation, soil, dermal, and mother's milk) and the zone of impact for all applicable pathways of exposure (minimum pathways plus site/route dependent pathways). Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.

The noncancer maps should also clearly identify the noncancer zones of impact. These include the acute (inhalation) zone of impact, 8-hour (inhalation) zone of impact and the chronic (including both inhalation, multipathway) zone of impact. The District may at its discretion require separate chronic inhalation and chronic multipathway zones of impact maps. For clarity, presentation of the two chronic zones of impact may also require two or more maps. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways (and target organs) that were included in the assessment. Further information regarding the methods for determination of hazard indices and cancer risk are discussed in Chapter 8 and Appendix I.

#### **4.6.2 Screening Population Estimates for Risk Assessments**

A screening risk assessment should include an estimate of the maximum exposed population. For screening risk assessments, a detailed description of the exposed population is not required. The impact area to be considered should be selected to be health protective (i.e., will not underestimate the number of exposed individuals). A health-protective assumption is to assume that all individuals within a large radius of the facility are exposed to the maximum concentration. If a facility must also comply with the RCRA/CERCLA risk assessment requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. The District should be consulted to determine the population estimate that should be used for screening purposes. Guidance for one screening method is presented here.

1. Use a screening dispersion model (e.g., AERSCREEN) to obtain concentration estimates for each emitted pollutant at varying receptor distances from the source. Several screening models feature the generation of an automatic array of receptors that is particularly useful for determining the zone of impact. In order for the model to generate the array of receptors, the user needs to provide some information normally consisting of starting distance, increment, and number of intervals.
2. Calculate the potential cancer risk and hazard index for each receptor location by using the methods provided in the risk characterization sections of this document (Chapter 8).
3. Find the distance where the potential cancer risk is equal to District specified levels (e.g.,  $10^{-6}$ ); this may require redefining the receptor array in order to have

two receptor locations that bound a total cancer risk of  $10^{-6}$ . This exercise should be repeated for the noncancer health impacts.

4. Calculate cancer burden by estimating the number of people in the grid and stipulate that all are exposed at the highest level.

#### **4.6.3 Refined Population Estimates for Risk Assessments**

The refined HRA requires a detailed analysis of the population exposed to emissions from the facility. Where possible, a detailed population exposure analysis provides estimates of the number of individuals in residences and offsite workplaces, as well as at sensitive receptor sites such as schools, daycare centers and hospitals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, daycare centers, hospitals). These population analyses can include exposure estimates for workers and residents through the use of land use maps or other tools. The overall exposed residential and worker populations should be apportioned into smaller geographic subareas. The information needed for each subarea is:

1. The number of exposed persons, and
2. The receptor location at which the calculated ambient air concentration is assumed to be representative of the exposure to the entire population in the subarea.

A multi-tiered approach is suggested for the population analysis. Census tracts, which the facility could significantly impact, should be identified (see Section 4.6.3.1). A census tract should be divided into smaller subareas if it is close to the facility where ambient concentrations vary widely. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure or they may prefer the census information to be evaluated using smaller blocks. Further downwind where ambient concentrations are less variable, the census tract level may be acceptable to the District. The District may determine that the aggregation of census tracts (e.g., when the census tracts making up a city are combined) is appropriate for receptors that are considerable distances from the facility.

If a facility must also comply with the RCRA/CERCLA HRA requirements, health effects to on-site workers may also need to be addressed. The DTSC's Remedial Project Manager should be consulted on this issue. In some cases it may be appropriate to evaluate risks to on-site receptors. The district should be consulted about special cases for which evaluation of on-site receptors is appropriate, such as facilities frequented by the public or where people may reside (e.g., military facilities).

##### **4.6.3.1 Census Tracts**

For a refined risk assessment, the boundaries of census tracts can be used to define the geographic area to be included in the population exposure analysis. Digital maps showing the census tract boundaries in California can be obtained from "The Thomas

Guide”® on the World Wide Web. Statistics for each census tract can be obtained from the U.S. Census Bureau. The website address for the U.S. Census Bureau is <http://www.census.gov>. Numerous additional publicly accessible or commercially available sources of census data can be found on the World Wide Web. A specific example of a census tract is given in Appendix K. The HARP software includes U.S. census data and is a recommended tool for performing population exposure estimates.

The two basic steps in defining the area under analysis are:

(1) Identify the “zone of impact” (as defined previously in Section 4.6.1) on a map detailed enough to provide for resolution of the population to the subcensus tract level. (The U.S. Geological Survey (USGS) 7.5-minute series maps and the maps within the HARP software provide sufficient detail.) This is necessary to clearly identify the zone of impact, location of the facility, and sensitive receptors within the zone of impact. If significant development has occurred since the USGS survey, this should be indicated. A specific example of a 7.5-minute series map is given in Appendix K.

(2) Identify all census tracts within the zone of impact using a U.S. Bureau of Census or equivalent map (e.g., Thomas Brothers, HARP Software). If only a portion of the census tract lies within the zone of impact, then only the population that falls within the isopleth should be used in the population estimate or burden calculation. To determine this level of detail, local planning and zoning information may need to be collected. When this more detailed information is not available, then a less refined approach is to include the census data if the centroid of the census block falls within the isopleths of interest. The census tract boundaries should be transferred to a map, such as a USGS map (referred to hereafter as the “base map”).

An alternative approach for estimating population exposure in heavily populated urban areas is to apportion census tracts to a Cartesian grid cell coordinate system. This method allows a Cartesian coordinate receptor concentration field to be merged with the population grid cells. This process can be computerized and minimizes manual mapping of centroids and census tracts. The HARP software includes this function and will provide population estimates that are consistent with the methodology discussed here.

The District may determine that aggregation of census tracts (e.g., which census tracts making up a city can be combined) is appropriate for receptors that are located at considerable distances from the facility. If the District permits such an approach, it is suggested that the census tract used to represent the aggregate be selected in a manner to ensure that the approach is health protective. For example, the census tract included in the aggregate that is nearest (downwind) to the facility should be used to represent the aggregate.

#### *4.6.3.1.1 Subcensus Tract*

Within each census tract are smaller population units. These units [urban block groups (BG) and rural enumeration districts (ED)] contain about 1,100 persons. BGs are

further broken down into statistical units called blocks. Blocks are generally bounded by four streets and contain an average of 70 to 100 persons. However, this range in population is an average and population units may vary significantly. In some cases, the EDs are very large and identical to a census tract.

The area requiring detailed (subcensus tract) resolution of the exposed residential and worker population will need to be determined on a case-by-case basis through consultation with the District. The District may determine that census tracts provide sufficient resolution near the facility to adequately characterize population exposure.

Employment population data can be obtained at the census tract level from the U.S. Census Bureau or from local planning agencies. This degree of resolution will generally not be sufficient for most risk assessments. For the area requiring detailed analysis, zoning maps, general plans, and other planning documents should be consulted to identify subareas with worker populations.

The boundaries of each residential and employment population area should be transferred to the base map.

#### **4.6.4 Sensitive Receptor Locations**

Individuals who may be more sensitive to toxic exposures than the general population are distributed throughout the total population. Sensitive populations may include young children and chronically ill individuals. The District may require that locations with high densities of sensitive individuals be identified (e.g., schools, nursing homes, residential care facilities, daycare centers, and hospitals). The HRA should state what the District requirements are regarding identification of sensitive receptor locations.

Although protection of sensitive individuals is incorporated into OEHHA's risk assessment methodology in both cancer risk and noncancer risk assessment, the assessment of risk at the specific location of such sensitive individuals (e.g., schools, hospitals, or nursing homes) may be useful to assure the public that such individuals are being considered in the analysis. For some chemicals (e.g., mercury and manganese) children have been specifically identified as the sensitive subpopulation for noncancer health impacts, so it can be particularly appropriate to assess school sites.

### **4.7 Receptor Siting**

#### **4.7.1 Receptor Points**

The modeling analysis should contain a network of receptor points with sufficient detail (in number and density) to permit the estimation of the maximum concentrations. Locations that must be identified include:

- The maximum estimated off-site impact or point of maximum impact (PMI),
- The maximum exposed individual at an existing residential receptor (MEIR),
- The maximum exposed individual at an existing occupational worker receptor (MEIW).

Note that some situations may also require that on-site receptor (worker or residential) locations be evaluated. The risk assessor can contact the District or reviewing authority for guidance if on-site exposure situations are present at the emitting facility. However, these on-site locations should be included in the HRA. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, day care facilities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health protective should be used for risk management decisions. The cancer risk estimates for the onsite residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported.

All of these locations (i.e., PMI, MEIR, and MEIW) must be identified for potential multipathway carcinogenic and noncarcinogenic effects. It is possible that the estimated PMI, MEIR, and MEIW risk for cancer, chronic noncancer, 8-hour, and acute noncarcinogenic risks occur at different locations or that some of these evaluations may not be necessary (e.g., the receptor does not exist). For example, some facilities will not have off-site workers in the vicinity of the facility and will not need to evaluate worker exposure, or the exposure situation may only require the evaluation of short-term carcinogenic or acute noncancer impacts (see Section 8.2.10 for a discussion of short-term projects). The approval to revise the exposure assessment for a receptor, or to omit the MEIW receptor, should be verified in writing with the District or reviewing authority and included in the HRA.

Other sensitive receptor locations may also be of interest and required to be included in the HRA. The District or reviewing authority should be consulted to determine which sensitive receptor locations must be included.

The results from a screening model (if available) can be used to identify the area(s) where the maximum concentrations are likely to occur. Receptor points should also be located at the population centroids (see Section 4.7.2) and sensitive receptor locations (see Section 4.6.4). The exact configuration of the receptor array used in an analysis will depend on the topography, population distribution patterns, and other site-specific factors. All receptor locations should be identified in the HRA using UTM (Universal Transverse Mercator) coordinates and receptor number. The receptor numbers in the summary tables should match receptor numbers in the computer output (e.g., HARP output files). In addition to actual UTM coordinates, the block/street locations (i.e., north side of 3,000 block of Smith Street) should be provided in the HRA for the PMI, MEIR, and MEIW for carcinogenic and noncarcinogenic health effects. Chapter 9 provides an outline that specifies the content and recommended format of HRA results.

#### 4.7.1.1 Receptor Height

To evaluate localized impacts, receptor height should be taken into account at the point of maximum impact on a case-by-case basis. For example, receptor heights may have to be included to account for receptors significantly above ground level. Flagpole receptors at the height of the breathing zone of a person may need to be considered when the source receptor distance is less than a few hundred meters. Consideration must also be given to the noninhalation pathway analysis which requires modeling of chemical deposition onto soil or water at ground level. For the inhalation pathway, a health protective approach is to select a receptor height from 0 meters to 1.8 meters that will result in the highest predicted downwind concentration. Final approval of this part of the modeling protocol should be with the District or reviewing authority.

#### 4.7.2 ***Centroid Locations***

For each subarea analyzed, a centroid location (the location at which a calculated ambient concentration is assumed to represent the entire subarea) should be determined. When population is uniformly distributed within a population unit, a geographic centroid based on the shape of the population unit can be used. If only a portion of the census tract lies within the isopleth or area of interest, then only the population that falls within the isopleth should be used in the calculation for population exposure. To determine this level of detail, local planning and zoning information may need to be collected. Where populations are not uniformly distributed, a population-weighted centroid may be used. Another alternative uses the concentration at the point of maximum impact within that census tract as the concentration to which the entire population of that census tract is exposed. While this less refined approach is commonly accepted, Districts should be contacted to approve this method prior to its use in a risk assessment.

The centroids represent locations that should be included as receptor points in the dispersion modeling analysis. Annual average concentrations should be calculated at each centroid using the modeling procedures presented in this chapter.

For census tracts and BG/EDs, judgments can be made using census tracts maps and street maps to determine the centroid location. At the block level, a geographic centroid is sufficient.

#### 4.7.3 ***Spatial Averaging***

Since the inception of the “Hot Spots” and California’s Air Toxics Programs, HRA results for an individual receptor have typically been based on air dispersion modeling results at a single point or location. With a few exceptions, this method has been traditionally used for all types of receptors (e.g., PMI, MEIR, MEIW, pathway receptors, etc.). The assumptions used in risk assessment are designed to prevent underestimation of health impacts to the public resulting in a health protective approach. However, basing risk estimates on a single highest point (PMI, MEIR, or MEIW) does not take into account that a person does not remain at one location on their property, or in one location at the

workplace over an extended period of time. Therefore, the average air concentration over a small area is likely to be more representative than using the air concentration at a single point, particularly in those situations where concentrations fall off rapidly around that single point. The concept of averaging air concentrations over a small area is known as spatial averaging.

In order to understand how spatial averaging can impact air dispersion modeling results with various types of facilities, the ARB, in conjunction with the OEHHA, performed sensitivity analyses to evaluate the impacts of spatially averaging air dispersion modeling results (see Appendix C of the Air Toxics Hot Spots Program Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (EASA)). Based on these sensitivity analyses, it is reasonable and appropriate to include spatial averaging techniques in air toxic risk assessments as supplemental information to Tier 1 information (i.e., modeling results that are based on the air concentration from a single point or location). While all risk assessments must include results based on Tier 1 methodology, the spatially averaged concentrations around the point of interest (e.g., PMI, MEIR, MEIW, multipathway exposure evaluations, etc.) could also be included as an option in risk assessments and acceptable for risk management decisions subject to approval by the District or reviewing agency. Spatial averaging is an option for the purpose of additional refinement to the risk assessment.

A few reasons that support the inclusion of spatially averaged modeled concentrations in risk assessment include the following:

- Averaging results over a small domain will give a more representative picture of individual exposure and risk than an estimate based on one single location within their property.
- Spatial averaging will allow air dispersion modeling and risk assessment results to be characterized as the estimated concentration and risk in a discrete area of interest, rather than an exact value for a single location.
- From a risk communication standpoint, the ARB and OEHHA feel it is more appropriate to present the modeling output and the calculated health impacts as the potential impacts within a small or discrete area, rather than an exact value at a specific point on a grid or map.
- Spatial averaging is the recommended procedure in ARB's Lead Risk Management Guidelines (2001) and has been used in several complex source HRAs [e.g., Roseville Railyard (2004), Ports of LA/LB (2006), Port of Oakland (2008)].
- Spatially averaging the deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios is a planned upgrade for the HARP Software. This will provide an option that will refine multipathway exposure assessments. Average deposition on these types of areas (e.g., a water body) is not necessarily well represented by the single highest point of deposition, or deposition at the geographic center of the water body. Likewise, since produce is grown over the entire surface of the garden and cows graze the

entire pasture, deposition is better estimated by evaluating the entire area rather than using a single point.

#### 4.7.3.1 Spatial Averaging Methodology

The spatial averaging sensitivity study in Appendix C of the EASA is based on simulating emissions from point, volume, area, and line sources. Most source types (e.g., point) are simulated as a small, medium or large source. Line sources are only simulated as small and large. In addition, meteorological data collected at five different locations in California were used. Nested spatial average grids of various domains were used to study the differences on the spatial average concentration. In the case of the 20 meter by 20 meter spatial average nested grid, the spatial average concentration showed little change over the PMI for medium and large sources. In the case for small sources, the spatial average concentration is approximately 45% to 80% of the PMI concentration. Individual source type and meteorological conditions will cause variations in these results.

The results of the spatial averaging sensitivity study in Appendix C of the EASA shows that sources with low plume rise that result in a PMI, MEIW, or MEIR located at or near the property fence line are most sensitive to spatial averaging. Source types with high plume rise (e.g., tall stacks) show a PMI far downwind where the concentration gradient is more gradual and therefore spatial averaging has a lesser effect. While spatial averaging can be used regardless of source size or the location of the PMI, the following conditions generally apply when a source is a good candidate for spatial averaging:

- The MEIR, MEIW, or PMI is located at the fence line or close to the emission source.
- The concentration gradient is high near the PMI. This is more associated with low level plumes such as fugitive, volume, area, or short stacks.
- A long term average is being calculated to represent a multi-year risk analysis based on one to five years of meteorological data. Note that spatial averaging should **not** be used for short term (acute) calculations.

In general, the method for calculating the spatial average in air toxic risk assessments includes the following steps:

1. Locate the point(s) of interest and receptor(s) (i.e., PMI, MEIW, MEIR, and any additional receptor locations of interest or concern) with a grid resolution spacing of no greater than five meters. To achieve this, two or more modeling runs with successively finer nested grid resolutions may be needed to find the final location where the nested grid that will be used for spatial averaging will be placed.

2. Center the spatial average nested grid on the each receptor's location of interest determined in step 1. Limit the nested grid to no larger than 20 meters by 20 meters or 400 square meters. Note that if a portion of the centered and nested grid falls within the facility boundary and the receptor location of interest is outside of the boundary, then adjustments to the nested grid to obtain the spatially-averaged concentration for the offsite receptor are reasonable. This may be done by either repositioning the nested grid to cover 400 square meters of off-boundary area surrounding the receptor or center the nested grid and delete any on-site grid points so that only the offsite grid points surrounding the receptor are used in the spatially averaged concentration. The grid resolution spacing should be no greater than five meters. With a five meter grid resolution, the 20 meter by 20 meter domain will result in 25 receptors. The size, shape, and placement of the domain and the resolution of points are subject to approval by the District, ARB, or other reviewing authority. See the Sections 4.7.3.1.2 and 4.7.3.1.3 below for additional discussion on domain sizing and grid spacing at worksites, pastures, gardens, and water bodies.
3. Some configurations of source activity and meteorological conditions result in a predominant downwind plume center line that is significantly askew from one of the four ordinate directions. In this case, a tilted nested grid is necessary to coincide with the dominant plume centerline. Polar receptors are easier to implement than a tilted rectangular grid. The domain of the polar receptor field should be limited to a 15 meter radius. See Appendix C of the EASA for detailed instructions on tilted polar receptors.
4. Calculate the arithmetic mean of the long term period average concentration (e.g., annual average) of the nested grid of receptors to represent the spatial average. This average is used in the risk calculations.
5. Document and include all methods, assumptions, data, maps, and files used in the spatial averaging analysis and clearly present this information in the risk assessment following the requirements of the District or reviewing authority. Note that in the update to the HARP software, functionality will be included that will assist with spatial averaging and the methodology discussed.

The following sections discuss the use of spatial averaging for various receptor types and exposure pathways.

#### *4.7.3.1.1 Residential Receptors*

Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To remain health protective when evaluating a residential receptor, spatial averaging should not take place using large nested domains. The domain used for spatial averaging should be no larger than 20 meters by 20 meters with a maximum grid spacing resolution of equal to or less than five meters. This domain represents an area

that is approximately the size of a small urban lot. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

#### 4.7.3.1.2 *Worker Receptors*

Offsite worker locations (e.g. MEIW) may also be a candidate for spatial averaging. However, workers can be at the same location during almost their entire daily work shift (e.g., desk/office workers). When this is the situation, then the traditional method of using a single location and corresponding modeled concentration is appropriate. If spatial averaging is used, care should be taken to determine the proper domain size and grid resolution. Follow the steps in Section 4.7.3 outlining the spatial averaging methodology. To be consistent with the residential receptor assumptions and remain health protective, a modeling domain size no larger than 20 meters by 20 meters is recommended with a grid spacing resolution of equal to or less than five meters. However, if workers routinely and continuously move throughout the worksite over a space greater than 20 meters by 20 meters, then a larger domain may be considered.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties and the percentage of time spent in those areas. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain to find the concentration that will be used to calculate health impacts should be sufficient in number and detail to obtain a representative concentration across the area of interest. The size of the domain and resolution of points shall be subject to approval by the District, ARB, or other reviewing authority.

#### 4.7.3.1.3 *Pastures, Gardens, or Water Bodies*

The simplified approach of using the concentration (deposition rate) at the centroid, a specific point of interest, or the PMI location for an area being evaluated for noninhalation exposures (e.g., a body of water used for fishing, a pasture used for grazing, area of a garden, etc.) is acceptable for use in HRA. However, evaluating deposition concentrations over pasture land, a garden, or a water body for multipathway exposure scenarios using spatial averaging could give more representative estimates of the overall deposition rate. Use of spatial averaging in this application is subject to approval by the District, ARB, or other reviewing authority.

If spatial averaging will be done, follow the steps in Section 4.7.3.1 outlining the spatial averaging methodology. When using spatial averaging over the deposition area, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the area of interest (e.g., pasture or water body) should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way

to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture, garden, or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The size of the domain and grid resolution is subject to approval by the reviewing authority.

In lieu of following the details in the paragraph above, the approach used for the other receptors (e.g., MEIR, MEIW) that uses a domain size not greater than 20 meters by 20 meters, located on the PMI within the area of interest, with a maximum grid spacing resolution of five meters, can be used. This default refined approach would apply to deposition areas greater than 20 meters by 20 meters. For smaller deposition areas, the simplified approach of using the PMI for the area, the concentration at the centroid or a specific point of interest, or averaging over the actual smaller domain can be used. This again is subject to approval by the reviewing authority.

The HRA or modeling protocol shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the water body, pasture, or garden; all data; maps; representative coordinates, and etc.), and the details clarifying how and where the averaging was done (e.g., location and magnitude of concentration gradients, the grid spacing used).

#### **4.8 Meteorological Data**

Refined air dispersion models require hourly meteorological data. The first step in obtaining meteorological data should be to check with the District and the ARB for data availability. Other sources of data include the National Weather Service (NWS), National Climatic Data Center (NCDC), Asheville, North Carolina, ARB meteorological database (METDB), military stations and private networks. Meteorological data for a subset of NWS stations are available from the U.S. EPA Support Center for Regulatory Air Models (SCRAM). The SCRAM can be accessed at [www.epa.gov/scram001/main.htm](http://www.epa.gov/scram001/main.htm). All meteorological data sources should be approved by the District. Data not obtained directly from the District or the ARB should be checked for quality, representativeness, and completeness. It should be approved by the District before use. U.S. EPA provides guidance (U.S. EPA, 1995e) for these data. Meteorological data may need further processing. Data users can consult with the District or the ARB on how to process the raw meteorological data. The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating District approval of meteorological data should be attached in an appendix. If no representative meteorological data are available, screening procedures should be used as indicated in Section 4.10.

The analyst should acquire enough meteorological data to ensure that the worst-case meteorological conditions are represented in the model results. The US-EPA Guideline on Air Quality Models (U.S. EPA 2005) prefers that the latest five years of consecutive meteorological data be used to represent long term averages (i.e., cancer and chronic impacts). Previous OEHHA guidance allowed the use of the worst-case year to save

computer time. The processing speed of modern computers has increased to the point where processing five years of data over one year is no longer burdensome. However, the District may determine that one year of representative meteorological data is sufficient to adequately characterize the facility's impact. This may especially be the case when five years of quality consecutive data are not available.

To determine long term average concentrations the data can be averaged. For calculation of the one-hour maximum concentrations needed to evaluate acute effects, the worst-case year should be used in conjunction with the maximum hourly emission rate. For example, the long term average concentration and one-hour maximum concentration at a single receptor for five years of meteorological data are calculated below:

Year	Annual Average ( $\mu\text{g}/\text{m}^3$ )	Maximum One-Hour ( $\mu\text{g}/\text{m}^3$ )
1	7	100
2	5	80
3	9	90
4	8	110
5	6	90
5-year average	7	

In the above example, the long-term average concentration over five years is  $7 \mu\text{g}/\text{m}^3$ . Therefore,  $7 \mu\text{g}/\text{m}^3$  should be used to evaluate carcinogenic and chronic effects (i.e., annual average concentration). The one-hour maximum concentration is the highest one-hour concentration in the five-year period. Therefore,  $110 \mu\text{g}/\text{m}^3$  is the peak one-hour concentration that should be used to evaluate acute effects.

The higher hourly concentration usually occurs when meteorological dispersion conditions become worse, such as, calm or light wind, inversion, etc. Inversion usually happens in late afternoon through early morning. As the sun goes down, the atmospheric temperature near surface starts to fall, usually faster than the temperature in the upper atmosphere causing a temperature inversion layer to form and extend downward. This inversion layer usually sustains throughout the night, and remains until early morning. Because of the inversion (cold air sitting on warm air at the top of the inversion layer), pollutant vertical mixing is very low in the morning.

When predicted concentrations are high and the mixing height is very low for the corresponding averaging period, the modeling results deserve additional consideration. For receptors in the near field, it is within the model formulation to accept a very low mixing height for short durations. However, it would be unlikely that the very low mixing height would persist long enough for the pollutants to travel into the far field. In the

event that the analyst identifies any of these time periods, they should be discussed with the District on a case-by-case basis.

#### **4.8.1 Meteorological Data Formats**

Most short-term dispersion models require input of hourly meteorological data in a format which depends on the model. U.S. EPA provides software for processing meteorological data for use in U.S. EPA recommended dispersion models. U.S. EPA recommended meteorological processors include the Meteorological Processor for Regulatory Models (MPRM), PCRAMMET, and AERMET. Use of these processors will ensure that the meteorological data used in an U.S. EPA recommended dispersion model will be processed in a manner consistent with the requirements of the model.

Meteorological data for a subset of NWS stations are available on the World Wide Web at the U.S. EPA SCRAM address, <http://www.epa.gov/scram001>.

#### **4.8.2 Treatment of Calms**

Calms are hours when the wind speed is below the starting threshold of the anemometer. Gaussian plume models require a wind speed and direction to estimate plume dispersion in the downwind direction.

U.S. EPA's policy is to disregard calms until such time as an appropriate analytical approach is available. The recommended U.S. EPA models contain a routine that eliminates the effect of the calms by nullifying concentrations during calm hours and recalculating short-term and annual average concentrations. Certain models lacking this built-in feature can have their output processed by U.S. EPA's CALMPRO program (U.S. EPA, 1984a) to achieve the same effect. Because the adjustments to the concentrations for calms are made by either the models or the postprocessor, actual measured on-site wind speeds should always be input to the preprocessor. These actual wind speeds should then be adjusted as appropriate under the current U.S. EPA guidance by the preprocessor.

Following the U.S. EPA methodology, measured on-site wind speeds of less than 1.0 m/s, but above the instrument threshold, should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Calms are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold. Some air districts provide pre-processed meteorological data for use in their district that treats calms differently. Local air districts should be consulted for available meteorological data. In addition, to reduce the number of calms and missing winds in the surface data, EPA has developed a pre-processor – AERMINUTE – to process 1-minute ASOS wind data for generating hourly average wind speed and directions for input to AERMET in Stage 2. The details can be found in the EPA's AERMINUTE User's Instructions at:

[http://www.epa.gov/ttn/scram/models/aermod/aerminute\\_userguide\\_v11059\\_draft.pdf](http://www.epa.gov/ttn/scram/models/aermod/aerminute_userguide_v11059_draft.pdf)

If the fraction of calm hours is excessive, then an alternative approach may need to be considered to characterize dispersion. The Calpuff model modeling system can simulate calm winds as well as complex wind flow and therefore is a viable alternative. The local air district should be consulted for alternative approaches.

#### **4.8.3 Treatment of Missing Data**

Missing data refer to those hours for which no meteorological data are available from the primary on-site source for the variable in question. When missing values arise, they should be handled in one of the following ways listed below, in the following order of preference:

- (1) If there are other on-site data, such as measurements at another height, they may be used when the primary data are missing. If the height differences are significant, corrections based on established vertical profiles should be made. Site-specific vertical profiles based on historical on-site data may also be appropriate to use if their determination is approved by the reviewing authority. If there is question as to the representativeness of the other on-site data, they should not be used.
- (2) If there are only one or two missing hours, then linear interpolation of missing data may be acceptable, however, caution should be used when the missing hour(s) occur(s) during day/night transition periods.
- (3) If representative off-site data exist, they may be used. In many cases this approach may be acceptable for cloud cover, ceiling height, mixing height, and temperature. This approach will rarely be acceptable for wind speed and direction. The representativeness of off-site data should be discussed and agreed upon in advance with the reviewing authority.
- (4) An imputation methodology may be acceptable, provided it is well-documented, sufficiently justified, and properly applied.
- (5) Failing any of the above, the data field should be coded as missing using missing data codes appropriate to the applicable meteorological pre-processor.

Appropriate model options for treating missing data, if available in the model, should be employed. Substitutions for missing data should only be made in order to complete the data set for modeling applications, and should not be used to attain the “regulatory completeness” requirement of 90%. That is, the meteorological data base must be 90% complete on a monthly basis (before substitution) in order to be acceptable for use in air dispersion modeling. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

If the recommended methods for addressing missing meteorological data cannot be achieved as described, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

#### **4.8.4 Representativeness of Meteorological Data**

The atmospheric dispersion characteristics at an emission source need to be evaluated to determine if the collected meteorological data can be used to adequately represent atmospheric dispersion for the project.

Such determinations are required when the available meteorological data are acquired at a location other than that of the proposed source. In some instances, even though meteorological data are acquired at the location of the pollutant source, they still may not correctly characterize the important atmospheric dispersion conditions.

Considerations of representativeness are always made in atmospheric dispersion modeling whether the data base is "on-site" or "off-site." These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. If in doubt, the District should be consulted.

##### **4.8.4.1 Spatial Dependence**

The location where the meteorological data are acquired should be compared to the source location for similarity of terrain features. For example, in complex terrain, the following considerations should be addressed in consultation with the District:

- Aspect ratio of terrain, i.e., ratio of:
  - Height of valley walls to width of valley;
  - Height of ridge to length of ridge; and
  - Height of isolated hill to width of hill at its base
- Slope of terrain
- Ratio of terrain height to stack/plume height
- Distance of source from terrain (i.e., how close to valley wall, ridge, isolated hill)
- Correlation of terrain feature to prevailing meteorological conditions

Likewise, if the source is located on a plateau or plain, the source of meteorological data used should be from a similar plateau or plain.

Judgments of representativeness should be made only when sites are climatologically similar. Sites in nearby, but different air sheds, often exhibit different weather patterns. For instance, meteorological data acquired along a shoreline are not normally representative of inland sites and vice versa.

Meteorological data collected need to be examined to determine if drainage, transition, and synoptic flow patterns are characteristics of the source, especially those critical to the regulatory application. Consideration of orientation, temperature, and ground cover should be included in the review.

An important aspect of space dependence is height above the ground. Where practical, meteorological data should be acquired at the release height, as well as above or below, depending on the buoyancy of the source's emissions. AERMOD at a minimum requires wind observations at a height above ground between seven times the local surface roughness height and 100 meters.

#### 4.8.4.2 Temporal Dependence

To be representative, meteorological data must be of sufficient duration to define the range of sequential atmospheric conditions anticipated at a site. As a minimum, one full year of on-site meteorological data is necessary to prescribe this time series. Multiple years of data are used to describe variations in annual and short-term impacts. Consecutive years from the most recent, readily available 5-year period are preferred to represent these yearly variations.

#### 4.8.4.3 Further Considerations

It may be necessary to recognize the non-homogeneity of meteorological variables in the air mass in which pollutants disperse. This non-homogeneity may be essential in correctly describing the dispersion phenomena. Therefore, measurements of meteorological variables at multiple locations and heights may be required to correctly represent these meteorological fields. Such measurements are generally required in complex terrain or near large land-water body interfaces.

It is important to recognize that, although certain meteorological variables may be considered unrepresentative of another site (for instance, wind direction or wind speed), other variables may be representative (such as temperature, dew point, cloud cover). Exclusion of one variable does not necessarily exclude all. For instance, one can argue that weather observations made at different locations are likely to be similar if the observers at each location are within sight of one another - a stronger argument can be made for some types of observations (e.g., cloud cover) than others. Although by no means a sufficient condition, the fact that two observers can "see" one another supports a conclusion that they would observe similar weather conditions.

Other factors affecting representativeness include change in surface roughness, topography and atmospheric stability. Currently there are no established analytical or statistical techniques to determine representativeness of meteorological data. The establishment and maintenance of an on-site data collection program generally fulfills the requirement for "representative" data. If in doubt, the District should be consulted.

#### **4.8.5 *Alternative Meteorological Data Sources***

It is necessary, in the consideration of most air pollution problems, to obtain data on site-specific atmospheric dispersion. Frequently, an on-site measurement program must be initiated. As discussed in Section 4.8.3, representative off-site data may be used to substitute for missing periods of on-site data. There are also situations where current or past meteorological records from a National Weather Service station may suffice. These considerations call for the judgment of a meteorologist or an equivalent professional with expertise in atmospheric dispersion modeling. More information on Weather Stations including: National Weather Service (NWS), military observations, supplementary airways reporting stations, upper air and private networks, is provided in "On-Site Meteorological Program Guidance for Regulatory Modeling Applications" (U.S. EPA, 1995e).

##### **4.8.5.1 Recommendations**

On-site meteorological data should be processed to provide input data in a format consistent with the particular models being used. The input format for U.S. EPA short-term regulatory models is defined in U.S. EPA's MPRM. The input format for AERMOD is defined in the AERMET meteorological pre-processor. Processors are available on the SCRAM web site. The actual wind speeds should be coded on the original input data set. Wind speeds less than 1.0 m/s but above the instrument threshold should be set equal to 1.0 m/s by the preprocessor when used as input to Gaussian models. Wind speeds below the instrument threshold of the cup or vane, whichever is greater, should be considered calm, and are identified in the preprocessed data file by a wind speed of 1.0 m/s and a wind direction equal to the previous hour. For input to AERMOD, no adjustment should be made to the site specific wind data. AERMOD can produce model estimates for conditions when the wind speed may be less than 1 m/s but still greater than the instrument threshold.

If data are missing from the primary source, they should be handled as follows, in order of preference: (1) substitution of other representative on-site data; (2) linear interpolation of one or two missing hours; (3) substitution of representative off-site data; (4) use of a well-documented and justified imputation methodology; or (5) coding as a missing data field, according to the discussions in Section 4.8.3. The use of any data substitution technique should be thoroughly documented to provide the District or reviewing authority with all the information necessary to determine its approvability.

If the data processing recommendations in this section cannot be achieved, then alternative approaches should be discussed and developed in conjunction with the District or reviewing authority.

#### **4.8.6 *Quality Assurance and Control***

The purpose of quality assurance and maintenance is the generation of a representative amount (90% of hourly values for a year on a monthly basis) of valid data. For more information on data validation consult reference U.S. EPA (1995e). Maintenance may

be considered the physical activity necessary to keep the measurement system operating as it should. Quality assurance is the management effort to achieve the goal of valid data through plans of action and documentation of compliance with the plans.

Quality assurance (QA) will be most effective when following a QA Plan which has been signed-off by appropriate project or organizational authority. The QA Plan should contain the following information (paraphrased and particularized to meteorology from Lockhart):

1. Project description - how meteorology data are to be used
2. Project organization - how data validity is supported
3. QA objective - how QA will document validity claims
4. Calibration method and frequency - for data
5. Data flow - from samples to archived valid values
6. Validation and reporting methods - for data
7. Audits - performance and system
8. Preventive maintenance
9. Procedures to implement QA objectives - details
10. Management support - corrective action and reports

It is important for the person providing the quality assurance (QA) function to be independent of the organization responsible for the collection of the data and the maintenance of the measurement systems. Ideally, the QA auditor works for a separate company.

#### **4.9 Model Selection**

There are several air dispersion models that can be used to estimate pollutant concentrations and new ones are likely to be developed. U.S. EPA added AERMOD, which incorporates the PRIME downwash algorithm, to the list of preferred models in 2005 as a replacement to ISCST3. CalPuff was added in 2003. The latest version of the U.S. EPA recommended models can be found at the SCRAM Bulletin board located at <http://www.epa.gov/scram001>. However, any model, whether a U.S. EPA guideline model or otherwise, must be approved for use by the local air district. Recommended models and guidelines for using alternative models are presented in this section. All air dispersion models used to estimate pollutant concentrations for risk assessment analyses must be in the public domain. Classification according to terrain, source type and level of analysis is necessary before selecting a model (see Section 4.4). The selection of averaging times in the modeling analysis is based on the health effects of concern. Annual average concentrations are required for an analysis of carcinogenic or other chronic effects. One-hour maximum concentrations are required for analysis of acute effects.

##### **4.9.1 Recommended Models**

Recommended air dispersion models to estimate concentrations for risk assessment analyses are generally referenced in US EPA's Guideline on Air Quality Models

available at <http://www.epa.gov/scram001>. Currently AERMOD is recommended for most refined risk assessments in flat or complex terrain and in rural or urban environments<sup>1</sup>. In addition, CalPuff is available where spatial wind fields are highly variable or transport distances are large (e.g., 50 km). AERSCREEN is a screening model based on AERMOD. AERSCREEN can be used when representative meteorological data are unavailable. CTSCREEN is available for screening risk assessments in complex terrain. The most current version of the models should be used for risk assessment analysis. Some facilities may also require models capable of special circumstances such as dispersion near coastal areas. For more information on modeling special cases see Sections 4.12 and 4.13.

Most air dispersion models contain provisions that allow the user to select among alternative algorithms to calculate pollutant concentrations. Only some of these algorithms are approved for regulatory application such as the preparation of health risk assessments. The sections in this guideline that provide a description of each recommended model contain information on the specific switches and/or algorithms that must be selected for regulatory application.

To further facilitate the model selection, the District should be consulted for additional recommendations on the appropriate model(s) or a protocol submitted for District review and approval (see Section 4.14.1).

#### **4.9.2 Alternative Models**

Alternative models are acceptable if applicability is demonstrated or if they produce results identical or superior to those obtained using one of the preferred models referenced in Section 4.9.1. For more information on the applicability of alternative models refer to the following documents:

- U.S. EPA (2005). "Guideline on Air Quality Models" Section 3.2.2
- U.S. EPA (1992). "Protocol for Determining the Best Performing Model"

#### **4.10 Screening Air Dispersion Models**

A screening model may be used to provide a maximum concentration that is biased toward overestimation of public exposure. Use of screening models in place of refined modeling procedures is optional unless the District specifically requires the use of a refined model. Screening models are normally used when no representative meteorological data are available and may be used as a preliminary estimate to determine if a more detailed assessment is warranted.

---

<sup>1</sup> AERMOD was promulgated by U.S. EPA as a replacement to ISCST3 on November 9, 2006.

Some screening models provide only 1-hour average concentration estimates. Other averaging periods can be estimated based on the maximum 1-hour average concentration in consultation and approval of the responsible air district. Because of variations in local meteorology, the exact factor selected may vary from one district to another. Table 4.2 provides guidance on the range and typical values applied. The conversion factors are designed to bias predicted longer term averaging periods towards overestimation.

**Table 4.2 Recommended Factors to Convert Maximum 1-hour Avg. Concentrations to Other Averaging Periods (U.S. EPA, 2011, 1995a; ARB, 1994).**

Averaging Time	Range	Typical SCREEN3 Recommended	AERSCREEN Recommended
3 hours	0.8 - 1.0	0.9	1.0
8 hours	0.5 - 0.9	0.7	0.9
24 hours	0.2 - 0.6	0.4	0.6
30 days	0.2 - 0.3	0.3	
Annual	0.06 - 0.1	0.08	0.1

AERSCREEN automatically provides the converted concentration for longer than 1-hour averaging periods. For area sources, the AERSCREEN 3, 8, and 24-hour average concentration are equal to the 1-hour concentration. No annual average concentration is calculated. SCREEN3 values are shown for comparison purposes.

#### **4.10.1 AERSCREEN**

The AERSCREEN (U.S. EPA, 2011) model is now available and should be used in lieu of SCREEN3 with approval of the local District. AERSCREEN is a screening level air quality model based on AERMOD. AERSCREEN does not require the gathering of hourly meteorological data. Rather, AERSCREEN requires the use of the MAKEMET program which generates a site specific matrix of meteorological conditions for input to the AERMOD model. MAKEMET generates a matrix of meteorological conditions based on local surface characteristics, ambient temperatures, minimum wind speed, and anemometer height.

AERSCREEN is currently limited to modeling a single point, capped stack, horizontal stack, rectangular area, circular area, flare, or volume source. More than one source may be modeled by consolidating the emissions into one emission source.

### 4.10.2 Valley Screening

The Valley model is designed to simulate a specific worst-case condition in complex terrain, namely that of a plume impaction on terrain under stable atmospheric conditions. The algorithms of the VALLEY model are included in other models such as SCREEN3 and their use is recommended in place of the VALLEY model. The usefulness of the VALLEY model and its algorithms is limited to pollutants for which only long-term average concentrations are required. For more information on the Valley model consult the user's guide (Burt, 1977).

#### 4.10.2.1 Regulatory Options

Regulatory application of the Valley model requires the setting of the following values during a model run:

- Class F Stability (rural) and Class E Stability (urban)
- Wind Speed = 2.5 m/s
- 6 hours of occurrence of a single wind direction (not exceeding a 22.5 deg sector)
- 2.6 stable plume rise factor

### 4.10.3 CTSCREEN

The CTSCREEN model (Perry et al., 1990) is the screening mode of the Complex Terrain Dispersion Model (CTDMPLUS). CTSCREEN can be used to model single point sources only. It may be used in a screening mode for multiple sources on a case by case basis in consultation with the District. CTSCREEN is designed to provide conservative, yet theoretically sounder, worst-case 1-hour concentration estimates for receptors located on terrain above stack height. Internally-coded time-scaling factors are applied to obtain other averages (see Table 4.3). These factors were developed by comparing the results of simulations between CTSCREEN and CTDMPLUS for a variety of scenarios and provide conservative estimates (Perry et al., 1990).

CTSCREEN produces identical results as CTDMPLUS if the same meteorology is used in both models. CTSCREEN accounts for the three-dimensional nature of the plume and terrain interaction and requires detailed terrain data representative of the modeling domain. A summary of the input parameters required to run CTSCREEN is given in Table 4.4. The input parameters are provided in three separate text files. The terrain topography file (TERRAIN) and the receptor information file (RECEPTOR) may be generated with a preprocessor that is included in the CTSCREEN package. In order to generate the terrain topography file the analyst must have digitized contour information.

**Table 4.3 Time-scaling factors internally coded in CTSCREEN**

Averaging Period	Scaling Factor
3 hours	0.7
24 hour	0.15
Annual	0.03

**Table 4.4 Input Parameters Required to Run CTSCREEN**

Parameter	File
Miscellaneous program switches	CTDM.IN
Site Latitude and Longitude (degrees)	CTDM.IN
Site TIME ZONE	CTDM.IN
Meteorology Tower Coordinates (user units)	CTDM.IN
Source Coordinates: x and y (user units)	CTDM.IN
Source Base Elevation (user units)	CTDM.IN
Stack Height (m)	CTDM.IN
Stack Diameter (m)	CTDM.IN
Stack Gas Temperature (K)	CTDM.IN
Stack Gas Exit Velocity (m/s)	CTDM.IN
Emission Rate (g/s)	CTDM.IN
Surface Roughness for each Hill (m)	CTDM.IN
Meteorology: Wind Direction (optional)	CTDM.IN
Terrain Topography	TERRAIN
Receptor Information (coordinates and associated hill number)	RECEPTOR

## 4.11 Refined Air Dispersion Models

Refined air dispersion models are designed to provide more representative concentration estimates than screening models. In general, the algorithms of refined models are more robust and have the capability to account for site-specific meteorological conditions. For more information regarding general aspects of model selection see Section 4.9.

### 4.11.1 AERMOD

For a wide variety of applications in all types of terrain, the recommended model is AERMOD. AERMOD is a steady-state plume dispersion model for assessment of pollutant concentrations from a variety of sources. AERMOD simulates transport and dispersion from multiple point, area, or volume sources based on an up-to-date characterization of the atmospheric boundary layer. Sources may be located in rural or urban areas and receptors may be located in simple or complex terrain. AERMOD accounts for building wake effects (i.e., plume downwash) based on the PRIME building downwash algorithms. The model employs hourly sequential preprocessed meteorological data to estimate concentrations for averaging times from one hour to one year (also multiple years). AERMOD is designed to operate in concert with two pre-processor codes: AERMET processes meteorological data for input to AERMOD, and AERMAP processes terrain elevation data and generates receptor information for input to AERMOD. Guidance on input requirements may be found in the AERMOD Users Guide.

#### 4.11.1.1 Regulatory Options

U.S. EPA regulatory application of AERMOD requires the selection of specific switches (i.e., algorithms) during a model run. All the regulatory options can be set by selecting the DFAULT keyword. The U.S. EPA regulatory options, automatically selected when the DFAULT keyword is used, are:

- Stack-tip downwash
- Incorporates the effects of elevated terrain
- Includes calms and missing data processing routines
- Does not allow for exponential decay for applications other than a 4-hour half life for SO<sub>2</sub>

Additional information on these options is available in the AERMOD User's Guide.

#### 4.11.1.2 Special Cases

- a. Building Downwash:  
AERMOD automatically determines if the plume is affected by the wake region of buildings when their dimensions are given. The specification of building dimensions does not necessarily mean that there will be downwash. See

Section 4.13.1 for guidance on how to determine when downwash is likely to occur.

b. Area Sources:

The area source algorithm in AERMOD estimates source emission strength by integrating an area upwind of the receptor location. Receptors may be placed within the area itself, downwind of the area or adjacent to the area. However, since the vertical distribution parameter ( $\sigma_z$ ) goes to zero as the downwind distance goes to zero, the plume function solution is infinite for a downwind receptor distance of zero. In order to avoid such singularity in the plume function solution, the AERMOD model arbitrarily sets the plume function to zero when the receptor distance is less than one meter. As a result, the area source algorithm will not provide reliable solutions for receptors located within or adjacent to very small areas, with dimensions on the order of a few meters across. In these cases, the receptor should be placed at least one meter outside of the area.

c. Volume Sources:

The volume source algorithms in AERMOD require an estimate of the initial distribution of the emission source. The initial distribution of emissions for a volume source is in the horizontal and vertical directions. When modeling volume source emissions, one needs to provide initial horizontal ( $\sigma_{y0}$ ) and vertical ( $\sigma_{z0}$ ) dimensions as accurate as possible so that pollutant buoyancy and dispersion are also calculated accurately. US EPA's AERMOD User Guide provides suggested procedures to estimate these initial dimensions based on source type (Table 3-1) (U.S. EPA, 2004a).

d. Line Sources:

Examples of line sources include conveyor belts or roads. Depending on the source, these can be modeled three ways; as a line source, as a series of volume sources, or as an elongated area source. Where the emission source is neutrally buoyant, such as a conveyor belt, AERMOD can be used according to the user guide. In the event that the line source is a roadway, then additional considerations are required.

At the present time, CALINE (CALINE3, CAL3QHCR, and CALINE4) is the only model dedicated to modeling the enhanced mechanical and thermal turbulence created by motor vehicles traveling on a roadway. Of these, CAL3QHCR is the only model that accepts hourly meteorological data and can estimate annual average concentrations. However, CALINE uses the Pasquill-Gifford stability categories which are used in the ISCST model. AERMOD is now the preferred plume model over ISCST3 with continuous plume dispersion calculations based on observations but AERMOD does not include the enhanced roadway turbulence. Therefore, in the case where roadway emissions dominate the risk assessment, it may be most important to simulate the enhanced thermal and mechanical turbulence from motor vehicles with the CAL3QHCR model.

In the case where roadway emissions are a subset of all emissions for the risk assessment, including roadway emissions along with facility emissions, it may be best to use AERMOD for all emissions, roadway and facility, in order to maintain continuity with one dispersion model for the risk assessment. If AERMOD is used, it is important to consider that a major freeway may act similar to a large building which can cause some mixing and therefore initial vertical dispersion. This dispersion could be estimated with sensitivity studies based on wind speed, wind angle, roadway orientation, roadway width, and etc. This could be a complex estimation and needs very adept modeling skills. Roadway modeling should be evaluated on a case-by-case basis in consultation with the District or the reviewing authority.

Line sources inputs include a composite fleetwide emission factor, roadway geometry, hourly vehicle activity (i.e., diurnal vehicle per hour pattern), hourly meteorological data, and receptor placement. For practical information on how to simulate roadway emissions using these models, see CAPCOA's website at <http://www.capcoa.org> or the Sacramento Metropolitan AQMD (SMAQMD) website at <http://www.airquality.org/ceqa/RoadwayProtocol.shtml>. The SMAQMD has a document titled, "Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways"(January, 2010).

- e. Complex Terrain:  
AERMOD uses the Dividing Streamline ( $H_c$ ) concept for complex terrain. Above  $H_c$ , the plume is assumed to be "terrain following" in the convective boundary layer. Below  $H_c$ , the plume is assumed to be "terrain impacting" in the stable boundary layer. AERMOD computes the concentration at any receptor as a weighted function between the two plume states (U.S. EPA, 2004b).
- f. Deposition:  
AERMOD contains algorithms to model settling and deposition and requires additional information to do so including particle size distribution. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a).
- g. Diurnal Considerations:  
Systematic diurnal changes in atmospheric conditions are expected along the coast (or any large body of water) or in substantially hilly terrain. The wind speed and direction are highly dependent on time of day as the sun rises and begins to heat the Earth. The sun heats the surface of the land faster than the water surface. Therefore the air above the land warms up sooner than over water. This creates a buoyant effect of warm air rising over land and the cool air from over water moves in to fill the void. Near large bodies of water (e.g., the ocean) this is known as a sea breeze. In complex terrain this is known as upslope flow as the hot air follows the terrain upwards. When the sun sets and the surface of the land begins to cool, the air above also cools and creates a draining effect. Near the water this is the land breeze; in complex terrain this is known as downslope or drainage flow. In addition, for the sea breeze, the atmospheric

conditions change rapidly from neutral or stable conditions over water to unstable conditions over land.

Near the large bodies of water the sea breeze is typical in the afternoon and the land breeze is typical for the early morning before sunrise. In complex terrain upslope flow is typical in the afternoon, while drainage flow is typical at night. Diurnal profiles need to be evaluated in conjunction with the facility emissions since sources can have varied emission profiles (e.g., some sources are continuously emitting while others are intermittent). These intermittent emission profiles may be influenced by diurnal patterns; therefore, they need to be evaluated to properly estimate potential exposures. For these reasons, it is especially important to simulate facility emissions with a hourly diurnal pattern reflective of source activity so that the risk assessment is representative of daily conditions.

- h. 8-hour Modeling for the Offsite Worker's Exposure and Residential Exposure:  
If the ground level air concentrations from a facility operating 5 days a week, 8 hours per day have been estimated by a 24 hour per day annual average, an adjustment factor can be applied to estimate the air concentration that an offsite worker with the same schedule would be exposed to. The 24-hour annual average concentration is multiplied times 4.2.

If the meteorology during the time that the facility is emitting is used, hourly model simulations need to be post-processed to cull out the data needed for the offsite worker exposure. See Appendix M for information on how to calculate the refined offsite worker concentrations using the hourly raw results from the AERMOD air dispersion model. For more discussion on worker exposure, see Section 4.8.1.

Eight-hour exposure modeling can be used to evaluate the potential for health impacts (including effects of repeated exposures) in children and teachers exposed during school hours. Although not required in the HRA, 8-hour exposure modeling could also be performed at the discretion of the District to a residential scenario (i.e., the MEIR) where a facility operates only a portion of the day and exposure to residences are not adequately reflected by averaging concentrations over a 24 hour day.

#### 4.11.1.3 HARP Dispersion Analysis

It is highly recommended that air dispersion analysis be performed using the HARP software. HARP can perform refined dispersion analysis by utilizing the U.S. EPA standard program AERMOD. In the future, the updated version of HARP will link the AERMOD outputs with risk assessment modules.

#### **4.11.2 CTDMPLUS**

CTDMPLUS is a Gaussian air quality model for use in all stability conditions in complex terrain. In comparison with other models, CTDMPLUS requires considerably more

detailed meteorological data and terrain information that must be supplied using specifically designed preprocessors. CTDMPLUS was designed to handle up to 40 point sources.

#### **4.12 Modeling to Obtain Concentrations used for Various Health Impacts**

The following section outlines how emissions and air dispersion modeling results are used or adjusted for a receptor that is exposed to either a non-continuous or continuously emitting source.

##### **4.12.1 Emission Rates for Cancer, Chronic, and Acute Health Impacts**

As discussed in Section 4.2.1.1, the HRA should include both annual average emissions and maximum 1-hour emissions for each pollutant emitted by the facility. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment). When applying the emission rates in the air dispersion analysis, it is important not to artificially inflate or deplete the reported emission inventory.

For annual average emissions, the emissions are spread evenly over the entire year for continuous emitting sources. However, for sources where the emission patterns vary (i.e., non-continuous emitting sources), the emission rate should also account for the facility's emission schedule. If appropriate, the variable emissions rate option (e.g., hour-of-day) should be used in the air dispersion analysis. For more information consult the AERMOD User's Guide (U.S. EPA, 2004a). Also, when calculating emission rates for acute health impacts, it is important the emission rates never exceed the reported maximum 1-hour emissions.

##### **4.12.2 Modeling and Adjustments for Inhalation Cancer Risk at a Worksite**

Modeled long-term averages are typically used for cancer risk assessments for residents and workers. In an inhalation cancer risk assessment for an offsite worker, the long-term average should represent what the worker breathes during their work shift. However, the long-term averages calculated from AERMOD typically represent exposures for receptors that were present 24 hours a day and seven days per week (i.e., the schedule of a residential receptor). To estimate the offsite worker's concentration, there are two approaches. The more refined, complex, and time consuming approach is to post-process the hourly raw dispersion model output and examine the hourly concentrations that fall within the offsite worker's shift. See Appendix M for information on how to simulate the long-term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

In lieu of post-processing the hourly dispersion model output, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation exposure using an adjustment factor. The actual adjustment factor that is used to adjust the concentration may differ from the example below based on the specifics of the source and worker receptor

(e.g., work-shift overlap). Once the worker's inhalation concentration is determined, the inhalation dose is calculated using additional exposure frequency and duration adjustments. See Chapter 5 for more information on the inhalation dose equation.

#### 4.12.2.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker inhalation risk, we want to determine the long-term concentration the worker is breathing during their work shift. Therefore, the long-term concentration needs to be adjusted so it is based only on the hours when the worker is present. For example, assuming the emitting source and worker's schedules are the same, the adjustment factor is  $4.2 = (24 \text{ hours per day}/8 \text{ hours per shift}) \times (7 \text{ days in a week}/5 \text{ days in a work week})$ . In this example, the long term residential exposure is adjusted upward to represent the exposure to a worker. Additional concentration adjustments may be appropriate depending on the work shift overlap. These adjustments are discussed below.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

- a. Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).
- b. Determine the coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule.
- c. Calculate the worker adjustment factor (WAF) using Equation 4.1. When assessing inhalation cancer health impacts, a discount factor (*DF*) may also be applied if the offsite worker's schedule partially overlaps with the source's emission schedule. The discount factor is based on the number of coincident hours per day and days per week between the source's emission schedule and the offsite worker's schedule (see Equation 4.2). The *DF* is always less than or equal to one.

Please note that worker adjustment factor does not apply if the source's emission schedule and the offsite worker's schedule do not overlap. Since the worker is not present during the time that the source is emitting, the worker is not exposed to the source's emission (i.e., the *DF* in Equation 4.2 becomes 0).

$$WAF = \frac{H_{residential}}{H_{source}} \times \frac{D_{residential}}{D_{source}} \times DF \quad \text{Eq. 4.1}$$

Where:

$WAF$  = the worker adjustment factor

$H_{residential}$  = the number of hours per day the long-term residential concentration is based on (always 24 hours)

$H_{source}$  = the number of hours the source operates per day

$D_{residential}$  = the number of days per week the long-term residential concentration is based on (always 7 days)

$D_{source}$  = the number of days the source operates per week

$DF$  = a discount factor for when the offsite worker's schedule partially overlaps the source's emission schedule. Use 1 if the offsite worker's schedule occurs within the source's emission schedule. If the offsite worker's schedule partially overlaps with the source's emission schedule, then calculate the discount factor using Equation 4.2 below.

$$DF = \frac{H_{coincident}}{H_{worker}} \times \frac{D_{coincident}}{D_{worker}} \quad \text{Eq. 4.2}$$

Where:

$DF$  = the discount factor for assessing cancer impacts

$H_{coincident}$  = the number of hours per day the offsite worker's schedule and the source's emission schedule overlap

$D_{coincident}$  = the number of days per week the offsite worker's schedule and the source's emission schedule overlap

$H_{worker}$  = the number of hours the offsite worker works per day

$D_{worker}$  = the number of days the offsite worker works per week

- d. The final step is to estimate the offsite worker's inhalation concentration by multiplying the worker adjustment factor with the long-term residential concentration. The worker's concentration is then plugged into the dose equation and risk calculation.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post-process refined worker concentrations using the hourly raw results from an air dispersion analysis.

#### 4.12.2.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift. Equation 4.1 becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. Note however, if an assessor does not wish to apply the assumption the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

#### 4.12.3 **Modeling and Adjustments for Noncancer 8-Hour RELs**

For 8-hour noncancer health impacts, we evaluate if the receptor (e.g., worker or resident) is exposed to an 8 hour average concentration, occurring daily, that exceeds the 8-hour REL. The 8 hour RELs were derived primarily for the offsite worker scenario. Although not required in an HRA, residential receptors can be evaluated with an 8-hour

REL at the discretion of the District or Reviewing authority. For ease, we use a worker receptor in this discussion and in the discussion below for a non-continuously emitting source. The daily average concentration is intended to represent the long-term average concentration the worker is breathing during the work shift. In general, there are two approaches for estimating the concentration used for the 8-hour hazard index. The more refined, complex, and time consuming approach is to post-process the hourly dispersion model output and use only the hourly concentrations that are coincident with the offsite worker hours to obtain the long-term concentration. See Appendix M for information on how to simulate the daily average concentration through air dispersion modeling.

Before proceeding through a refined analysis described in Appendix M, the assessor may wish to approximate the long-term concentration, as described below, and calculate the 8-hour hazard index. In lieu of post-processing the hourly dispersion model output described in Appendix M, the more typical approach is to obtain the long-term average concentration as you would for modeling a residential receptor and approximate the worker's inhalation concentration using an adjustment factor. The method for applying the adjustment factor is described in the section below.

The results from the 8-hour hazard index calculations should not be combined with the chronic or acute hazard indices. Each of the potential noncancer health impacts should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

#### 4.12.3.1 Non-Continuous Sources

When modeling a non-continuously emitting source (e.g., operating for eight hours per day and five days per week), the modeled long-term average concentrations are based on 24 hours a day and seven days per week for the period of the meteorological data set. Even though the emitting source is modeled using a non-continuous emissions schedule, the long-term concentration is still based on 24 hours a day and seven days per week. Thus, this concentration includes the zero hours when the source was not operating. For the offsite worker 8-hour hazard index, we want to determine the long-term average daily concentration the worker may be breathing during their work shift. This is similar to the cancer approximation adjustment method with one difference; there is no adjustment for partial overlap between the worker's schedule and the source's emission schedule. The reason for this difference in methodology is because the 8-hour REL health factors are designed for repeated 8-hour exposures and cannot readily be adjusted to other durations of exposure. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

When calculating the long-term average daily concentration for the 8-hour REL comparison, the long-term residential concentration needs to be adjusted so it is based only on the operating hours of the emitting source with the assumption the offsite

worker's shift falls within the emitting source's schedule. For example, assuming the emitting source operates 8 hours per day, 5 days per week and the offsite worker's schedule falls anywhere within this period of emissions, then the adjustment factor is  $4.2 = (24 \text{ hours per day} / 8 \text{ hours of emissions per day}) \times (7 \text{ days in a week} / 5 \text{ days of emissions per week})$ . In this example, the long term residential exposure is adjusted upward to represent the 8-hour exposure to a worker. No adjustments are applied for partial work shift overlap with the emitting source. If the source emits at night, then see Appendix N for additional recommendations.

Using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern with this method, the district or assessor should contact OEHHA for further guidance regarding the substance of concern. If necessary, further evaluation can be performed using the refined daily average modeling methodology discussed in Appendix M.

The calculation of the adjustment factor from a non-continuous emitting source is summarized in the following steps.

- b. Obtain the long-term concentrations from air dispersion modeling as is typical for residential receptors (all hours of a year for the entire period of the meteorological data set).
- c. Calculate the worker adjustment factor (WAF) using Equation 4.3. The source's emission schedule is assumed to overlap offsite worker's schedule. Note that the worker adjustment factor and the 8-hour inhalation REL do not apply if the source's emission schedule and the offsite worker's schedule do not overlap at some point.

$$WAF = \frac{H_{residential}}{H_{source}} \times \frac{D_{residential}}{D_{source}} \quad \text{Eq. 4.3}$$

Where:

$WAF$  = the worker adjustment factor

$H_{residential}$  = the number of hours per day the long-term residential concentration is based on (always 24 hours)

$H_{source}$  = the number of hours the source operates per day

$D_{residential}$  = the number of days per week the long-term residential concentration is based on (always 7 days).

$D_{source}$  = the number of days the source operates per week.

- d. The final step is to estimate the offsite worker's daily average inhalation concentration by multiplying the WAF with the long-term residential concentration. The worker's concentration is then used to calculate the 8-hour hazard index. This method using the approximation factor is a screening method. If the 8-hour hazard index is above a threshold of concern, the district or assessor should contact OEHHA for further guidance regarding the substance of concern.

In the future, the HARP software will have the ability to use 8-hour RELs, calculate worker impacts using an approximation factor, and to post-process worker concentrations using the hourly raw results from an air dispersion analysis.

#### 4.12.3.2 Continuous Sources

If the source is continuously emitting, then the worker is assumed to breathe the long-term annual average concentration during their work shift and no concentration adjustments are made when estimating 8-hour health impacts. Note however, if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

Note that 8-hour RELs are not typically used for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate a chronic Hazard Index using the annual average concentrations and chronic RELs. However, there may be situations where the District may wish to assess an 8-hour Hazard Index, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

#### **4.12.4 Modeling and Adjustment Factors for Noncancer Chronic RELs**

Potential chronic noncancer health impacts use the long-term annual average concentration regardless of the emitting facility's schedule. No adjustment factors should be used to adjust this concentration. Chronic RELs are used to assess not only residential health impacts, but in many cases worker health impacts as well. There are currently only a limited number of substances with an 8-hour inhalation REL, and a facility may emit only, or mostly, substances that currently have just a chronic REL. Until there are 8-hour RELs for all the Hot Spots substances emitted from a specified facility, we recommend determining the chronic HI for the MEIW to adequately protect the offsite worker.

The results from the chronic hazard index calculations are not combined with the 8-hour or acute hazard indices. All potential noncancer results should be reported independently. See Chapter 8 for more discussion on calculating health impacts.

#### **4.12.5 Modeling and Adjustments for Oral Cancer Potencies and Oral RELs**

When estimating the cancer risk or noncancer health impacts from noninhalation pathways, no adjustment is made to the long-term annual average concentration regardless of the emitting facility's schedule. Since the media (e.g., soil) at the receptor location where deposition takes place for noninhalation pathways is continuously present, the concentrations used for all noninhalation pathways are not adjusted (up or down) by an adjustment factor. However, some adjustments are made to the concentration once the pollutants reach the media, for example, pollutants undergo decay in soils. In addition, when the dose for each pathway is calculated, exposure adjustments may also be made. See Chapter 5 of this document and the Technical

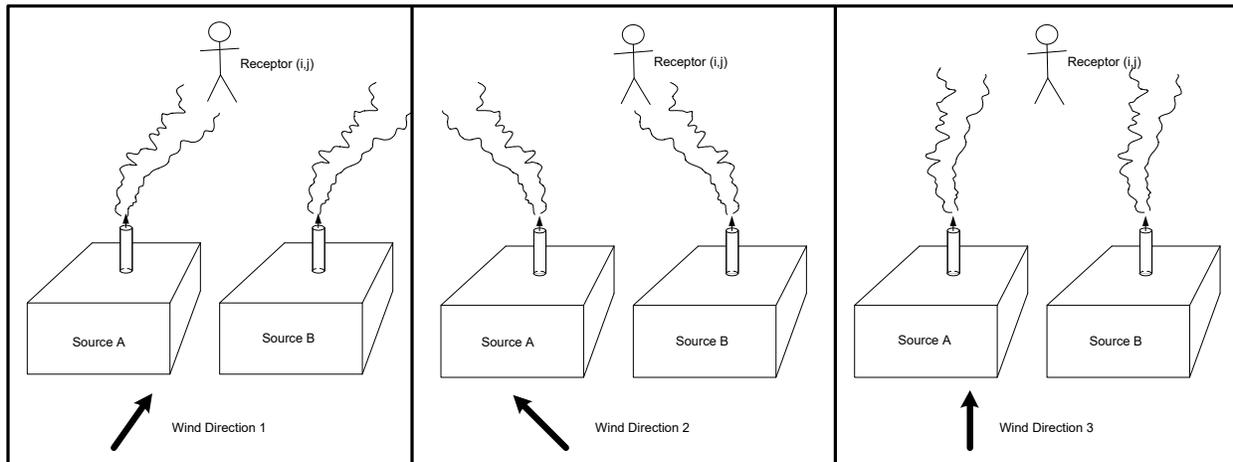

Support Document for Exposure Assessment and Stochastic Analysis (OEHHA, 2012) to get more information on these types of adjustments. Oral cancer potencies and oral RELs are used to assess both residential or worker health impacts.

#### **4.12.6 Modeling One-Hour Concentrations using Simple and Refined Acute Calculations**

Modeled one-hour concentrations are needed for the acute health hazard index calculations. HARP has two methods to calculate this concentration: Simple and Refined. As an aid to understanding the differences between Simple and Refined, Figure 2 shows three possible conditions showing how wind direction may vary and impact a downwind receptor (i,j) differently from just two sources (A and B).

For the Simple calculation, HARP stores only the maximum one-hour concentration at each receptor (i,j) from each source (A and B) as the dispersion model marches down each hour of the simulation (e.g., one to five years of hourly data). At the end of the simulation period, HARP reports back only the maximum impacts at each receptor from each source regardless of which hour of the simulation period this occurred. For example, the Simple Maximum Acute Impacts would be the summation of Source A impacts from Wind Direction 1 and Source B impacts from Wind Direction 2 as shown in Figure 2.

For the Refined simulation, HARP stores each hourly concentration at each receptor (i,j) from each source. At the end of the simulation period, HARP evaluates the coincident impact at each receptor from all sources for each hour of the simulation period. In this case the maximum impacts will be identified by a particular hour of the period with associated wind speed, direction, and atmospheric conditions. For example, the Refined Maximum Acute impact from Sources A and B on receptor (i,j) could be from any wind direction (1,2, or 3) as shown in Figure 2. Since HARP stores all simulations for all sources – at all receptors – for all hours to calculate the refined impacts, there is great potential to fill large amounts of disk storage space. The Refined simulation provides a more representative picture of the maximum acute hazard index from a facility. The Simple calculation will provide an upper bound to the acute hazard index.

**Figure 2 Acute Scenarios**

### 4.13 Modeling Special Cases; Specialized Models

Special situations arise in modeling some sources that require considerable professional judgment; a few are outlined below. It is recommended that the reader consider retaining professional consultation services if the procedures are unfamiliar. The following sections, taken mostly from the document “On-Site Meteorological Program Guidance for Regulatory Modeling Applications” (U.S. EPA, 1995e), provide general information on data formats and representativeness. Some Districts may have slightly different recommendations from those given here.

#### 4.13.1 Building Downwash

The entrainment of a plume in the wake of a building can result in the “downwash” of the plume to the ground. This effect can increase the maximum ground-level concentration downwind of the source. Therefore, stack sources must be evaluated to determine whether building downwash is a factor in the calculation of maximum ground-level concentrations.

The PRIME algorithm, included with AERMOD, has several advances in modeling building downwash effects including enhanced dispersion in the wake, reduced plume rise due to streamline deflection and increased turbulence, and continuous treatment of the near and far wakes (Schulman, 2000).

Complicated situations involving more than one building may necessitate the use of the Building Profile Input Program (BPIP) which can be used to generate the building dimension section of the input file of the ISC models (U.S. EPA, 1993). The BPIP program calculates each building’s direction-specific projected width. The Building Profile Input Program for PRIME (BPIP-PRM) is the same as BPIP but includes an algorithm for calculating downwash values for input into the PRIME algorithm which is contained in such models as AERMOD. The input structure of BPIP-PRM is the same as that of BPIP.

### **4.13.2 Deposition**

There are two types of deposition: wet deposition and dry deposition. Wet deposition is the incorporation of gases and particles into rain-, fog- or cloud water followed by a precipitation event and also rain scavenging of particles during a precipitation event. Wet deposition of gases is therefore more important for water soluble chemicals; particles (and hence particle-phase chemicals) are efficiently removed by precipitation events (Bidleman, 1988). Dry deposition refers to the removal of gases and particles from the atmosphere.

In the Air Toxics “Hot Spots” program, deposition is quantified for particle-bound pollutants and not gases. Wet deposition of water-soluble gas phase chemicals is thus not considered. When calculating pollutant mass deposited to surfaces without including depletion of pollutant mass from the plume, airborne concentrations remaining in the plume and deposition to surfaces can be overestimated, thereby resulting in overestimates of both the inhalation and multi-pathway risk estimates. However, neglecting deposition in the air dispersion model, while accounting for it in the multipathway health risk assessment, is a conservative, health protective approach (CAPCOA, 1987; Croes, 1988). Misapplication of plume depletion can also lead to possible underestimates of multi-pathway risk and for that reason no depletion is the default assumption. If plume depletion is incorporated, then some consideration for possible resuspension is warranted. An alternative modeling methodology accounting for plume depletion can be discussed with the Air District and used in an approved modeling protocol.

Although not generally used, several air dispersion models can provide downwind concentration estimates that take into account the upwind deposition of pollutants to surfaces and the consequential reduction of mass remaining in the plume. Air dispersion models having deposition and plume depletion algorithms require particle distribution data that are not always readily available. These variables include particle size, mass fraction, and density for input to AERMOD. In addition, the meteorological fields need to include additional parameters including relative humidity, precipitation, cloud cover, and surface pressure. Consequently, depletion of pollutant mass from the plume often is not taken into account.

In conclusion, multipathway risk assessment analyses normally incorporate deposition to surfaces in a screening mode, specifically by assigning a default deposition velocity of 2 cm/s for controlled sources and 5 cm/s for uncontrolled sources in lieu of actual measured size distributions (ARB, 1989). For particles (and particle-phase chemicals), the deposition velocity depends on particle size and is minimal for particles of diameter approximately 0.1-1 micrometer; smaller and larger particles are removed more rapidly.

### **4.13.3 Short Duration Emissions**

Short-duration emissions (i.e., much less than an hour) require special consideration. In general, “puff models” provide a better characterization of the dispersion of pollutants having short-duration emissions. Continuous Gaussian plume models have traditionally

been used for averaging periods as short as about 10 minutes and are not recommended for modeling sources having shorter continuous emission duration.

#### **4.13.4 Fumigation**

Fumigation occurs when a plume that was originally emitted into a stable layer in the atmosphere is mixed rapidly to ground-level when unstable air below the plume reaches plume level. Fumigation can cause very high ground-level concentrations. Typical situations in which fumigation occurs are:

- Breaking up of a nocturnal radiation inversion by solar warming of the ground surface (rising warm unstable air); note that the break-up of a nocturnal radiation inversion is a short-lived event and should be modeled accordingly.
- Shoreline fumigation caused by advection of pollutants from a stable marine environment to an unstable inland environment
- Advection of pollutants from a stable rural environment to a turbulent urban environment

SCREEN3 incorporates concentrations due to inversion break-up and shoreline fumigation and is limited to maximum hourly evaluations. The Offshore and Coastal Dispersion Model incorporates overwater plume transport and dispersion as well as changes that occur as the plume crosses the shoreline – hourly meteorological data are needed from both offshore and onshore locations.

#### **4.13.5 Raincap on Stack**

The presence of a raincap or any obstacle at the top of the stack hinders the momentum of the exiting gas. The extent of the effect is a function of the distance from the stack exit to the obstruction and of the dimensions and shape of the obstruction.

On the conservative side, the stack could be modeled as having a non-zero, but negligible exiting velocity, effectively eliminating any momentum rise. Such an approach would result in final plume heights closer to the ground and therefore higher concentrations nearby. There are situations where such a procedure might lower the actual population-dose and a comparison with and without reduced exit velocity should be examined.

Plume buoyancy is not strongly reduced by the occurrence of a raincap. Therefore, if the plume rise is dominated by buoyancy, it is not necessary to adjust the stack conditions. (The air dispersion models determine plume rise by either buoyancy or momentum, whichever is greater.)

The stack conditions should be modified when the plume rise is dominated by momentum and in the presence of a raincap or a horizontal stack. Sensitivity studies with the SCREEN3 model, on a case-by-case basis, can be used to determine whether

plume rise is dominated by buoyancy or momentum. The District should be consulted before applying these procedures.

- Set exit velocity to 0.001 m/sec
- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter

Stack tip downwash is a function of stack diameter, exit velocity, and wind speed. The maximum stack tip downwash is limited to three times the stack diameter in the AERMOD air dispersion model. In the event of a horizontal stack, stack tip downwash should be turned off and no stack height adjustments should be made. Note: This approach may not be valid for large (several meter) diameter stacks.

An alternative, more refined, approach could be considered for stack gas temperatures which are slightly above ambient (e.g., ten to twenty degrees Fahrenheit above ambient). In this approach, the buoyancy and the volume of the plume remain constant and the momentum is minimized.

- Turn stack tip downwash off
- Reduce stack height by 3 times the stack diameter ( $3D_o$ )
- Set the stack diameter ( $D_b$ ) to a large value (e.g., 10 meters)
- Set the stack velocity to  $V_b = V_o (D_o/D_b)^2$

Where  $V_o$  and  $D_o$  are the original stack velocity and diameter and  $V_b$  and  $D_b$  are the alternative stack velocity and diameter for constant buoyancy. This approach is advantageous when  $D_b \gg D_o$  and  $V_b \ll V_o$  and should only be used with District approval.

In the presence of building downwash and in the event that PRIME downwash is being utilized in AERMOD, an alternative approach is recommended. PRIME algorithms use the stack diameter to define initial plume radius and to solve conservation laws. The user should input the actual stack diameter and exit temperature but set the exit velocity to a nominally low value (e.g., 0.001 m/s). Also since PRIME does not explicitly consider stack-tip downwash, no adjustments to stack height should be made.

Currently U.S. EPA is BETA testing options for capped and horizontal releases in AERMOD. It is expected that these options will replace the above guidance when BETA testing is complete.

#### **4.13.6 Landfill Sites**

Landfills should be modeled as area sources. The possibility of non-uniform emission rates throughout the landfill area should be investigated. A potential cause of non-uniform emission rates would be the existence of cracks or fissures in the landfill cap (where emissions may be much larger). If non-uniform emissions exist, the landfill should be modeled with several smaller areas assigning an appropriate emission factor to each one of them, especially if there are nearby receptors (distances on the same order as the dimensions of the landfill).

## 4.14 Specialized Models

Some models have been developed for application to very specific conditions. Examples include models capable of simulating sources where both land and water surfaces affect the dispersion of pollutants and models designed to simulate emissions from specific industries.

### 4.14.1 *Buoyant Line and Point Source Dispersion Model (BLP)*

BLP is a Gaussian plume dispersion model designed for the unique modeling problems associated with aluminum reduction plants, and other industrial sources where plume rise and downwash effects from stationary line sources are important.

#### 4.14.1.1 Regulatory Application

Regulatory application of BLP model requires the selection of the following options:

- rural (IRU=I) mixing height option;
- default (no selection) for all of the following: plume rise wind shear (LSHEAR), transitional point source plume rise (LTRANS), vertical potential temperature gradient (DTHTA), vertical wind speed power law profile exponents (PEXP), maximum variation in number of stability classes per hour (IDELS), pollutant decay (DECFA), the constant in Briggs' stable plume rise equation (CONST2), constant in Briggs' neutral plume rise equation (CONST3), convergence criterion for the line source calculations (CRIT), and maximum iterations allowed for line source calculations (MAXIT); and
- terrain option (TERAN) set equal to 0.0, 0.0, 0.0, 0.0, 0.0, 0.0.

For more information on the BLP model consult the user's guide (Schulman and Scire, 1980).

### 4.14.2 *Offshore and Coastal Dispersion Model (OCD)*

OCD (DiCristofaro and Hanna, 1989) is a straight-line Gaussian model developed to determine the impact of offshore emissions from point, area or line sources on the air quality of coastal regions. OCD incorporates "over-water" plume transport and dispersion as well as changes that occur as the plume crosses the shoreline. Hourly meteorological data are needed from both offshore and onshore locations. Additional data needed for OCD are water surface temperature, over-water air temperature, mixing height, and relative humidity.

Some of the key features include platform building downwash, partial plume penetration into elevated inversions, direct use of turbulence intensities for plume dispersion, interaction with the overland internal boundary layer, and continuous shoreline fumigation.

#### 4.14.2.1 Regulatory Application

OCD has been recommended for use by the Minerals Management Service for emissions located on the Outer Continental Shelf (50 FR 12248; 28 March 1985). OCD is applicable for over-water sources where onshore receptors are below the lowest source height. Where onshore receptors are above the lowest source height, offshore plume transport and dispersion may be modeled on a case-by-case basis in consultation with the District.

#### **4.14.3 *Shoreline Dispersion Model (SDM)***

SDM (PEI, 1988) is a hybrid multipoint Gaussian dispersion model that calculates source impact for those hours during the year when fumigation events are expected using a special fumigation algorithm and the MPTER regulatory model for the remaining hours.

SDM may be used on a case-by-case basis for the following applications:

- tall stationary point sources located at a shoreline of any large body of water;
- rural or urban areas;
- flat terrain;
- transport distances less than 50 km;
- 1-hour to 1-year averaging times.

#### **4.15 Interaction with the District**

The risk assessor must contact the District to determine if there are any specific requirements. Examples of such requirements may include, but are not limited to: specific receptor location guidance, specific usage of meteorological data, and specific report format (input and output). See Chapter 9 for more information on the format and content of modeling protocols and HRAs.

##### **4.15.1 *Submittal of Modeling Protocol***

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling process. Following is an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

## **Outline for a Modeling Protocol**

### ***I. Introduction***

***Include the facility name, address, and a brief overview describing the facility's operations.***

- Provide a description of the terrain and topography surrounding the facility and potential receptors.
- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).
- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

### ***II. Emissions***

***For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)<sup>2</sup>. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).***

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.
- Identify if this will be a multipathway assessment based on emitted substances.

### ***III. Models / Modeling Assumptions***

***Specify the model and modeling assumptions***

- Identify the model(s) to be used, including the version number.
- Identify the model options that will be used in the analysis.

---

<sup>2</sup> Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.
- Indicate complex terrain options that may be used, if applicable.
- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).
- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).
- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

#### **IV. Meteorological Data**

***Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).***

- State how the data are representative for the facility site.
- Describe QA/QC procedures.
- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

#### **V. Deposition**

- Specify the method to calculate deposition (if applicable).

#### **VI. Receptors**

***Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.***

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), and the maximum exposed individual residential (MEIR) and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).

- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.
- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).
- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.
- Identify and support the use of any exposure adjustments (e.g., time a location, diurnal).
- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

## **VII. Maps**

### ***Identify how the information will be graphically presented.***

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g.,  $10^{-7}$ ,  $10^{-6}$  see Section 4.6.1).
- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

## **4.16 Health Risk Assessment Report**

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment. This section is also presented in Chapter 9, Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report, in Section 9.2. The District may have specific requirements regarding format and content (see Section 4.15). Sample calculations should be provided at each step to indicate how reported emissions data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

### **4.16.1 Information on the Facility and its Surroundings**

Report the following information regarding the facility and its surroundings:

- Facility Name

- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

#### **4.16.2 Source and Emission Inventory Information<sup>3</sup>**

##### **4.16.2.1 Release Parameters**

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
  - Stack height (m), stack diameter (building dimensions for downwash), exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

##### **4.16.2.2 Source Description and Operating Schedule**

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)
- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released

---

<sup>3</sup> Health and Safety Code section 44346 authorizes facility operators to designate certain "Hot Spots" information as trade secret. Section 44361(a) requires districts to make health risk assessments available for public review upon request. Section 44346 specifies procedures to be followed upon receipt of a request for the release of trade secret information. See also the Inventory Guidelines Report regarding the designation of trade secret information in the Inventory Reports.

- Fraction of source emissions emitted at each release point by release point ID number

#### 4.16.2.3 Emission Control Equipment and Efficiency

Report emission control equipment and efficiency by source and by substance

#### 4.16.2.4 Emissions Data Grouped By Source

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### 4.16.2.5 Emissions Data Grouped by Substance

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics "Hot Spots" Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

#### 4.16.2.6 Emission Estimation Methods

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

#### 4.16.2.7 List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer health impacts.

### **4.16.3 *Exposed Population and Receptor Location***

Report the following information regarding exposed population and receptor locations. See Chapter 9 and specific sections within this chapter for more detailed information.

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)
- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. Three separate maps (to represent both chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), the maximum exposed individual worker (MEIW), and any other locations of interest for both cancer and noncancer risks should be located on the maps.
- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs, and street addresses of specified receptors).
- Heights or elevations of the receptor points.
- For each receptor type (e.g., PMI, MEIR, MEIW, and any other location(s) of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps,

representative coordinates, grid resolution, concentration gradients, etc.). The use or spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

#### **4.16.4 Meteorological Data**

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

#### **4.16.5 Model Selection and Modeling Rationale**

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- version number
- selected options and parameters in table form
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

#### **4.16.6 Air Dispersion Modeling Results**

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors
- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs
- Model printouts (numbered), annual concentrations, maximum hourly concentrations
- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)
- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer

model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

## 5 - Exposure Assessment

### Estimation of Concentration and Dose

#### 5.1 Introduction

This chapter provides a summary of how toxicant ground level air concentrations estimated from air dispersion modeling or monitoring results are used to determine dose at receptors of interest. This chapter includes all the algorithms and data (e.g., point estimates, distributions, and transfer factors) that are needed to determine the substance-specific concentration in exposure media and the dose at a receptor of interest. The determination of exposure concentration and dose precedes the calculations of potential health impacts. See Chapter 8 and Appendix I for information on calculating potential health impacts.

At a minimum, three receptors are evaluated in Hot Spots health risk assessments (HRA) (see Section 4.7); these are:

- the Point of Maximum Impact (PMI),
- the Maximally Exposed Individual Resident (MEIR), and
- the Maximally Exposed Individual Worker (MEIW).

The PMI is defined as the receptor point(s) with the highest acute, 8-hour, chronic, or cancer health impact outside the facility boundary. The facility boundary is defined as the property line. Often the fence is on the property line. The MEIR is typically defined as the existing off-site residence(s) (i.e., house, apartment or other dwelling) with the highest acute, chronic, or cancer health impact. Calculating an 8-hour hazard index is not required for the MEIR, but can be performed at the discretion of the District. The MEIW is typically defined as the existing offsite workplace with the highest acute, 8-hour, chronic, or cancer health impact.

In addition, it may be necessary to determine risks at sensitive receptors (e.g., schools, day care centers, elder care centers, and hospitals). The District or reviewing authority should be consulted in order to determine the appropriate sensitive receptors for evaluation. Some situations may require that on-site receptor (worker or residential) locations be evaluated. Some examples where the health impacts of on-site receptors may be appropriate could be military base housing, prisons, universities, or locations where the public may have regular access for the appropriate exposure period (e.g., a lunch time café or museum for acute exposures). The risk assessor should contact the Air Pollution Control or Air Quality Management District (the District) for guidance about any on-site exposure situations at the emitting facility. These on-site locations should be included in the health risk assessment (HRA). If the facility emits multiple substances from two or more stacks, the acute, 8-hour, chronic, and cancer health impacts at the PMI may be located at different physical locations. The MEIR or MEIW cancer, acute, 8-hour, and chronic receptors may also be at different locations.

The process for determining dose at the receptor location, and ultimately potential health impacts, will likely include air dispersion modeling, and, with less frequency, air monitoring data. Air dispersion modeling combines the facility emissions and release parameters and uses default or site-specific meteorological conditions to estimate downwind, ground-level concentrations at various (user-defined) receptor locations. Air dispersion modeling is described in Chapter 4 and is presented in detail in the *Air Toxics Hot Spots Program Risk Assessment Guidelines; Technical Support Document for Exposure Assessment and Stochastic Analysis* (OEHHA, 2012a).

In summary, the process of using air dispersion modeling results as the basis of an HRA follows these four steps:

- Air dispersion modeling is used to estimate annual average and maximum one-hour ground level concentrations (GLC). The air dispersion modeling results are expressed as an air concentration or in terms of (Chi over Q) for each receptor point. (Chi over Q) is the modeled downwind air concentration (Chi) based on an emission rate of one gram per second (Q). (Chi over Q) is expressed in units of micrograms per cubic meter per gram per second, or  $(\mu\text{g}/\text{m}^3)/(\text{g}/\text{s})$ . (Chi over Q) is sometimes written as  $(\chi/Q)$  and is sometimes referred to as the dilution factor.
- When multiple substances are evaluated, the  $\chi/Q$  is normally utilized since it is based on an emission rate of one gram per second. The  $\chi/Q$  at the receptor point of interest is multiplied by the substance-specific emission rate (in g/s) to yield the substance-specific ground-level concentration (GLC) in units of  $\mu\text{g}/\text{m}^3$ . The following equations illustrate this point.

$$\text{GLC} = \left( \chi/Q \right) \times (Q_{\text{substance}})$$

$$\chi/Q = (\text{Chi over Q}) \text{ in } \left( \frac{\mu\text{g}/\text{m}^3}{\text{g}/\text{s}} \right), \text{ from model results with unit emission rate}$$

$$Q_{\text{substance}} = \text{substance specific emission rate} \left( \frac{\text{g}}{\text{s}} \right)$$

- The applicable exposure pathways (e.g., inhalation, soil contact, fish consumption) are identified for the emitted substances, and the receptor locations are identified. This determines which exposure algorithms in this chapter are ultimately used to estimate dose. After the exposure pathways are identified, the fate and transport algorithms described in this chapter are used to estimate concentrations in the applicable exposure media (e.g., soil or water) and the exposure algorithms are used to determine the substance-specific dose.
- The dose is used with cancer and noncancer health values to calculate the potential health impacts for the receptor (Chapter 8). An example calculation

using the high-end point-estimates for the inhalation (breathing) exposure pathway can be found in Appendix I. Appendix I and Chapters 5 (this Section) and 8 also contain information on how the annual average and maximum one-hour ground level concentrations are used for chronic, 8-hour, and acute health risk calculations.

The algorithms in this chapter are also used to calculate media concentrations and dose in the rare instance, for the Hot Spots program, when monitoring equipment was used rather than air dispersion modeling to obtain a receptor's substance-specific GLC. One situation that is specific to monitored data is the treatment of results below the sampling method level of detection (LOD). In short, it is standard risk assessment practice when monitoring results are reported both above and below the LOD to use one-half of the LOD for those sample concentrations reported below the LOD. If all testing or monitoring results fall below the LOD, then assessors should contact the District for appropriate procedures. For more information about reporting emissions under the Hot Spots Program, see the ARB's *Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5)*, and the *Emission Inventory Criteria and Guidelines Report (EICG Report)*, which is incorporated by reference therein (ARB, 2007).

The recommended model for calculating and presenting HRA results for the Hot Spots Program is the HARP software, available from the Air Resources Board (ARB). More information on HARP and directions for downloading the software can be found on the ARB's web site at <http://www.arb.ca.gov/toxics/harp/downloads.htm>.

## 5.2 Criteria for Exposure Pathway Evaluation

In order to determine total dose to the receptor the applicable pathways of exposure need to be identified. The inhalation pathway must be evaluated for all Hot Spots substances emitted by the facility. A small subset of Hot Spots substances is subject to deposition onto soil, plants, and water bodies. These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals. Such substances are referred to as multipathway substances. Two steps are necessary to determine if a substance should be evaluated for multipathway impacts:

1. Determine whether the substance or its group (e.g., dioxins, PAHs) is listed in Table 5.1.
2. Determine if the substance has an oral reference exposure level (REL) listed in Table 6.4, or if it has an oral cancer slope factor listed in Table 7.1. Two other references for checking the presence of oral health factors are OEHHA's website (OEHHA, 2012b) and the *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values* on the Air Resources Board website (ARB, 2012). Oral or noninhalation exposure pathways include the ingestion of soil, angler-caught fish, drinking water from surface water sources, mother's milk,

homegrown produce, beef, pork, chicken, eggs and cow's milk. The dermal pathway is also evaluated via contact with contaminated soil.

For all multipathway substances, the minimum exposure pathways that must be evaluated at every residential site (in addition to inhalation) are soil ingestion and dermal exposure. If dioxins, furans, PCBs, PAHs or lead are emitted, then the breast-milk consumption pathway also becomes mandatory. The other exposure pathways (e.g., the ingestion of homegrown produce or angler-caught fish) are evaluated on a site-by-site basis. If the resident can be exposed through an impacted exposure pathway, then it must be included in the HRA. However, if there are no vegetable gardens or fruit trees within the zone of impact for a facility, for example, then the produce pathways need not be evaluated. Note that on-site residential receptors are potentially subject to inhalation and noninhalation exposure pathways. Table 8.2 identifies the residential and worker receptor exposure pathways that are mandatory and those that are dependent on the site-specific decisions. While residents can be exposed through several exposure pathways, worker receptors are only evaluated for inhalation, soil ingestion, and dermal exposure using point estimates.

Table 5.1 shows the multipathway substances that, based on available scientific data, can be considered for each noninhalation exposure pathway. The exposure pathways that are evaluated for a substance depend on two factors: 1) whether the substance is considered a multipathway substance for the Hot Spots Program (Table 5.1), and 2) what the site-specific conditions are. A multipathway substance may be excluded from a particular exposure pathway because its physical-chemical properties can preclude significant exposure via the pathway. For example, some water-soluble substances do not appreciably bioaccumulate in fish; therefore, the fish pathway is not appropriate. In addition, if a particular exposure pathway is not impacted by the facility or is not present at the receptor site, then the pathway is not evaluated. For example, if a fishable water body is not impacted by the facility, or the water source is impacted but no receptor uses it for fishing, then the angler-caught fish pathway is not evaluated.

**Table 5.1 Specific Pathways to be Analyzed for Each Multipathway Substance**

Substance	Soil Ingestion	Dermal	Meat, Milk & Egg Ingestion	Fish Ingestion	Exposed Vegetable Ingestion	Leafy Vegetable Ingestion	Protected Vegetable Ingestion	Root Vegetable Ingestion	Water Ingestion	Breast Milk Ingestion
<b><i>Inorganic chemicals</i></b>										
Arsenic & compounds	X	X	X	X	X	X	X	X	X

PAHs	X	X	X	X	X	X			X	X

<sup>a</sup> Cow's milk only; no multipathway analysis for meat and egg ingestion

<sup>b</sup> To be evaluated by pathway in future amendments to the Hot Spots Program

### 5.3 Estimation of Concentrations in Air, Soil, and Water

Once emissions exit the source, the substances emitted will be dispersed in the air. The substances in the exhaust gas with high vapor pressures will remain largely in the vapor phase, and substances with lower vapor pressures will tend to adsorb to fly ash or other particulate matter. The emission plume may contain both vapor phase substances and particulates. A semivolatile organic toxicant can partition into both vapor and particulate phases. Particulates will deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. Use the 0.02 m/s deposition rate for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns (e.g., internal combustion engines). The following algorithms are used to estimate concentrations in environmental media including air, soil, water, vegetation, and animal products.

### 5.3.1 Air

The ground level concentration (GLC, or  $C_{\text{air}}$  as shown in EQ 5.3.1) of a substance in air is a function of the facility emission rate and the dilution factor ( $\chi/Q$ ) at the points under evaluation.

#### **A. Equation 5.3.1:**

$$C_{\text{air}} = Q_{\text{substance}} \times \chi/Q$$

1.  $C_{\text{air}}$  = Ground level concentration ( $\mu\text{g}/\text{m}^3$ )
2.  $Q_{\text{substance}}$  = Substance emission rate (g/sec)
3.  $\chi/Q$  = Dilution factor provided by dispersion modeling ( $\mu\text{g}/\text{m}^3/\text{g}/\text{sec}$ )

#### **a. Recommended values for EQ 5.3.1:**

1.  $Q_{\text{substance}}$  = Facility-specific, substance emission rate
2.  $\chi/Q$  = For point of interest, site specific, from dispersion modeling

#### **b. Assumptions for EQ 5.3.1:**

1. No plume depletion
2. Emission rate is constant, i.e., assumes steady state

### 5.3.2 Soil

The average concentration of the substance in soil ( $C_s$ ) is a function of the deposition, accumulation period, chemical specific soil half-life, mixing depth, and soil bulk density. For simplicity and health protection, the Tier 1 default assumes 70-year soil deposition for the accumulation period at end of 70-year facility lifetime. The risk assessor may also choose a supplemental Tier 2 approach, subject to District approval or reviewing authority approval, in which the assessor applies a soil accumulation period based on the facility's start date of operation (e.g., historical date when emissions began), or the current exposure conditions, and the expected duration of operation.

#### **A. Equation 5.3.2 A:**

$$C_s = \text{Dep} \times X / (K_s \times \text{SD} \times \text{BD} \times T_t)$$

1.  $C_s$  = Average soil concentration over the evaluation period ( $\mu\text{g}/\text{kg}$ )
2. Dep = Deposition on the affected soil area per day ( $\mu\text{g}/\text{m}^2\text{-d}$ )
3. X = Integral function for soil accumulation (d), see **EQ 5.3.2 C** below
4.  $K_s$  = Soil elimination constant ( $\text{d}^{-1}$ )
5. SD = Soil mixing depth (m)
6. BD = Soil bulk density ( $\text{kg}/\text{m}^3$ )
7.  $T_t$  = Soil exposure duration or soil accumulation period (d)

**a: Recommended default values for EQ 5.3.2 A:**

1. Dep = Calculated in EQ 5.3.2 B
2. X = Calculated in EQ 5.3.2 C
3.  $K_s$  = Calculated in EQ 5.3.2 D
4. SD = 0.01 (m) for playground setting (soil ingestion and dermal pathways) and 0.15 (m) for agricultural setting (produce and meat pathways)
5. BD = 1,333 ( $\text{kg}/\text{m}^3$ )
6.  $T_t$  = 25,550 (d) = 70 years

**b: Assumptions for EQ 5.3.2 A:**

1. Substances are uniformly mixed in soil.
2. Substances are not leached or washed away, except where evidence exists to the contrary.
3. It is assumed that toxicants accumulate in the soil for 70 years from deposition over the 70 year lifespan of the facility. Use 70-year soil accumulation ( $T_t$ ) for Tier 1 estimation of 9-, 30- and 70-year residential exposure, and 25-year off-site worker exposure.
4. For a receptor ingesting mother's milk, the mother is exposed from birth to 25 years of age; the infant is then born and receives mother's milk for one year. Default assumes 70-year soil accumulation for mother's milk pathway. See Table 5.1 for information on which substances or groups of substances must be evaluated by the mother's milk pathway.

**B. Equation 5.3.2 B:**

$$\text{Dep} = C_{\text{air}} \times \text{Dep-rate} \times 86,400$$

1.  $C_{\text{air}}$  = Ground level concentration ( $\mu\text{g}/\text{m}^3$ )
2. Dep-rate = Vertical rate of deposition (m/sec)
3. 86,400 = Seconds per day conversion factor (sec/d)

**a: Recommended default values for EQ 5.3.2 B:**

1.  $C_{\text{air}}$  = Calculated above in EQ 5.3.1 A
2. Dep-rate = Use 0.02 meters/second for controlled sources, or 0.05 meters/second for uncontrolled sources.

**b: Assumptions for EQ 5.3.2 B:**

1. Deposition rate remains constant. A deposition rate must be used when determining potential noninhalation health impacts. In the absence of facility specific information on the size of the emitted particles, the default values for deposition rate should be used. Currently, the default value of 0.02 meters per second is used for emission sources that have verifiable particulate matter control devices or for emission sources that may be uncontrolled but only emit particulate matter that is less than 2.5 microns

(e.g., internal combustion engines). The 0.05 meters per second default value is used for risk assessment if the emissions are uncontrolled. If other deposition rate factors are used, sufficient support documentation must be included with the HRA.

**C. Equation 5.3.2 C:**

$$X = \left[ \frac{e^{-K_s \cdot T_f} - e^{-K_s \cdot T_o}}{K_s} \right] + T_t$$

1.  $e = 2.718$
2.  $K_s$  = Soil elimination constant
3.  $T_f$  = End of soil accumulation evaluation period (d)
4.  $T_o$  = Beginning of soil accumulation evaluation period (d)
5.  $T_t$  = Total days of soil exposure (soil accumulation period)  $T_f - T_o$  (d)

**a: Recommended default values for EQ 5.3.2 C:**

- 1:  $K_s$  = Calculated in EQ 5.3.2 D
- 2:  $T_f = 25,550$  (d) = 70 years. Total soil exposure time at end of facility operation
- 3:  $T_o = 0$  (d) The initial time (start period) of soil exposure to all receptors that are impacted by the soil pathway.

Note: Under a Tier 2 scenario, the risk assessor may also adjust  $T_f$  and  $T_t$ , subject to District approval, to replicate current soil accumulation and expected accumulation at the end of facility operation.

**D. Equation 5.3.2 D:**

$$K_s = 0.693 / t_{1/2}$$

1. 0.693 = Natural log of 2
2.  $t_{1/2}$  = Chemical specific soil half-life (d)

**a: Recommended default values for EQ 5.3.2 D:**

1.  $t_{1/2}$  = Chemical-specific. See Table 5.2

**5.3.3 Water**

The water pathway is evaluated if a standing water body (e.g., pond or lake) is impacted by facility emissions and is used as a source for drinking water by food-producing animals or humans, or is a source of angler-caught fish. The average concentration of the substance in water ( $C_w$ ) is a function of direct deposition and material carried in by surface run-off. However, only the contribution from direct deposition will be considered at this time.

**A. Equation 5.3.3 A:**

$$C_w = C_{depw}$$

1.  $C_w$  = Average concentration in water ( $\mu\text{g}/\text{kg}$ )
2.  $C_{depw}$  = Contribution due to direct deposition ( $\mu\text{g}/\text{kg}$ )

**B. Equation 5.3.3 B:**

$$C_{\text{depw}} = \text{Dep} \times \text{SA} \times 365 / (\text{WV} \times \text{VC})$$

1. Dep = Deposition on water body per day ( $\mu\text{g}/\text{m}^2/\text{d}$ )
2. SA = Water surface area ( $\text{m}^2$ )
3. 365 = Days per year (d/yr)
4. WV = Water volume (kg)
5. VC = Number of volume changes per year

**a: Recommended default values for EQ 5.3.3 B:**

1. Dep = Calculated above in EQ 5.3.2 B
2. SA = Site specific water surface area ( $\text{m}^2$ )
3. WV = Site specific water volume in (kg) (1L = 1 kg)
4. VC = Site specific number of volume changes per year  
(SA, WV, and VC values can be obtained from the appropriate Department of Water Resources (DWR) Regional office)

**b: Assumptions for EQ 5.3.3 B:**

1. With the exception of dilution via number of volume changes per year, all material deposited into the water remains suspended or dissolved in the water column and is available for bioaccumulation in fish.

**5.3.4 Estimation of Concentrations in Vegetation, Animal Products, and Mother's Milk**

Estimates of the concentration of the substance in vegetation, animal products and mother's milk require the use of the results of the air, water, and soil environmental fate evaluation. Plants, animals and nursing mothers will be exposed to the substances at the concentrations previously calculated in Section 5.31 to 5.33 above.

**5.3.4.1 Vegetation**

The average concentration of a substance in and on vegetation ( $C_v$ ) is a function of direct deposition of the substance onto the vegetation and of root translocation or uptake from soil contaminated by the substance. We currently recommend root translocation only for the inorganic compounds.

**A. Equation 5.3.4.1 A:**

$$C_v = C_{\text{depv}} + C_{\text{trans}}$$

1.  $C_v$  = Average concentration in and on specific types of vegetation ( $\mu\text{g}/\text{kg}$ )
2.  $C_{\text{depv}}$  = Concentration due to direct deposition ( $\mu\text{g}/\text{kg}$ )
3.  $C_{\text{trans}}$  = Concentration in vegetation due to root translocation or uptake ( $\mu\text{g}/\text{kg}$ ) – see EQ 5.3.4.1 C below

**B. Equation 5.3.4.1 B:**

$$C_{\text{depv}} = [\text{Dep} \times \text{IF} / (k \times Y)] \times (1 - e^{-kT})$$

1. Dep = Deposition on affected vegetation per day ( $\mu\text{g}/\text{m}^2/\text{d}$ )
2. IF = Interception fraction
3. k = Weathering constant ( $\text{d}^{-1}$ )
4. Y = Yield ( $\text{kg}/\text{m}^2$ )
5. e = Base of natural logarithm (2.718)
6. T = Growth period (d)

**a: Recommended default values for EQ 5.3.4.1 B:**

1. Dep = Calculated above in EQ 5.3.2 B
2. IF = Crop specific:
  - a: Root crops = 0.0
  - b: Leafy crops = 0.2
  - c: Protected crops = 0.0
  - d: Exposed crops = 0.1
  - e: Pasture = 0.7
3. k = 0.1 ( $\text{d}^{-1}$ )
4. Y = 2 ( $\text{kg}/\text{m}^2$ ) for root, leafy, protected, exposed and pasture [CA Department of Food and Agriculture dot maps]
5. T = 45 (d) for leafy crops  
T = 90 (d) for exposed crops

**b: Crop-type definitions for EQ 5.3.4.1 B:**

1. **Leafy** crop category consists of broad-leafed vegetables in which the leaf is the edible part. Examples include spinach, lettuce, cabbage, and kale.
2. **Root** crop category includes vegetables in which the edible portion is underground. Examples are potato, radish, and carrot.
3. **Exposed** produce category consists of crops with a small surface area subject to air deposition. Examples include strawberries, tomato, cucumber, zucchini, green bean and bell pepper.
4. **Protected** produce category consists of crops in which the edible part is not exposed to air deposition (e.g., the exposed skin of the crop is removed and not eaten). Examples are corn, pea, pumpkin and oranges.

Tables H-9 through H-15 in Appendix H provide more examples of various leafy, root, exposed and protected crop types.

**c: Assumptions for EQ 5.3.4.1 B:**

1. No deposition on root or protected crops
2. No uptake and translocation of deposited chemicals onto crops

**C. Equation 5.3.4.1 C: (for inorganic compounds)**

$$C_{\text{trans}} = C_s \times UF_2$$

1.  $C_s$  = Average soil concentration ( $\mu\text{g}/\text{kg}$ )
2.  $UF_2$  = Uptake factor based on soil concentration

**a: Recommended default values for EQ 5.3.4.1 C:**

1.  $C_s$  = Calculated above in EQ 5.3.2 A
2.  $UF_2$  = See Table 5.2

**D. Equation 5.3.4.1 D: (for organic compounds)**

$$UF_2 = [(0.03 \times K_{ow}^{0.77}) + 0.82] / [(K_{oc})(F_{oc})]$$

1. 0.03 = Empirical constant
2.  $K_{ow}$  = Octanol:water partition factor
3. 0.77 = Empirical constant
4. 0.82 = Empirical constant
5.  $K_{oc}$  = Organic carbon partition coefficient
6.  $F_{oc}$  = Fraction organic carbon in soil

**a: Recommended default values for EQ 5.3.4.1 D:**

1.  $K_{ow}$  = Chemical specific, see Table 5.2
2.  $K_{oc}$  = Chemical specific, see Table 5.2
3.  $F_{oc}$  = 0.1

**b: Assumptions for EQ 5.3.4.1 D:**

1. OEHHA currently has no recommended root uptake factors for organic compounds listed in Table 5.2. Evidence suggests this route is insignificant compared to airborne deposition. Nevertheless, if it becomes necessary in specific cases to assess root uptake for an organic compound, Equation 5.3.4.1 D would be the algorithm OEHHA recommends using to assess root uptake.

**5.3.4.2 Animal Products**

The average concentration of the substance in animal products ( $C_{fa}$ ) depends on which routes of exposure exist for the animals. Animal exposure routes include inhalation, soil ingestion, ingestion of contaminated feed and pasture, and ingestion of contaminated water.

**A. Equation 5.3.4.2:**

$$C_{fa} = (\text{Inhalation} + \text{Water ingestion} + \text{Feed ingestion} + \text{Pasture/Grazing ingestion} + \text{Soil ingestion}) * T_{co}$$

1.  $C_{fa}$  = Average concentration in farm animals and their products ( $\mu\text{g}/\text{kg}$ )
2. Inhalation, water ingestion, etc. = Dose through inhalation, water ingestion, etc. ( $\mu\text{g}/\text{d}$ )
3.  $T_{co}$  = Chemical-specific transfer coefficient of contaminant from diet to animal product ( $\text{d}/\text{kg}$ )

**a: Recommended default values for EQ 5.3.4.2:**

1.  $T_{co}$  = See Tables 5.3a and 5.3b

**b: Assumptions for EQ 5.3.4.2:**

1. The  $T_{co}$  for a given chemical is the same for all exposure routes

**5.3.4.2.1 Inhalation****A. Equation 5.3.4.2.1:**

$$\text{Inhalation} = BR_a \times C_{air}$$

1. Inhalation = Dose through inhalation ( $\mu\text{g}/\text{d}$ )
2.  $BR_a$  = Breathing rate for animal ( $\text{m}^3/\text{d}$ )
3.  $C_{air}$  = Ground-level concentration ( $\mu\text{g}/\text{m}^3$ )

**a: Recommended default values for EQ 5.3.4.2.1:**

1.  $BR_a$  = See Table 5.4
2.  $C_{air}$  = Calculated above in EQ 5.3.1 A

**b: Assumptions for EQ 5.3.4.2.1:**

1. All material inhaled is 100% absorbed

**5.3.4.2.2 Water Ingestion**

The water ingestion pathway is applied if there are surface water sources of drinking water, such as springs, ponds or lakes, which are exposed to airborne deposition of facility emissions. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated drinking water ingested by the animals, if such sources exist.

**A. Equation 5.3.4.2.2:**

$$\text{Water ingestion} = WI_a \times FSW \times C_w$$

1. Water ingestion = Dose through water ingestion ( $\mu\text{g}/\text{d}$ )
2.  $WI_a$  = Water ingestion for animal ( $\text{kg}/\text{d}$ )
3. FSW = Fraction of water ingested from a contaminated body of water (site-specific)
4.  $C_w$  = Average concentration in water ( $\mu\text{g}/\text{kg}$ )  
For water 1 kg = 1 L

**a: Recommended default values for EQ 5.3.4.2.2:**

1.  $WI_a$  = See Table 5.4
2. FSW = Site specific fraction, need to survey water ingestion practices in affected area
3.  $C_w$  = Calculated above in EQ 5.3.3 A

**5.3.4.2.3 Feed Ingestion**

The fraction of feed intake by cattle, pigs and poultry that is contaminated by facility emissions can vary considerably depending on the manner in which the animals are raised. Due to the site-specific nature for this exposure pathway, OEHHA recommends that the risk assessor conduct a survey at the site to estimate the fraction of contaminated feed eaten by the animals. For a Tier 1 assessment, default values are provided by OEHHA (see Table 5.4 and Table 5.4 footnotes) for estimation of exposure to the animals.

Agricultural mixing depth should be used for calculating soil concentration for feed and pasture contamination.

**5.3.4.2.3.1 Feed Ingestion****A. Equation 5.3.4.2.3.1:**

$$\text{Feed ingestion} = (1.0 - FG) \times FI \times L \times C_v$$

1. Feed ingestion = Dose through the ingestion of feed ( $\mu\text{g}/\text{d}$ ) that is harvested after it is impacted by source emissions
2. FG = Fraction of diet provided by grazing (site-specific)
3. FI = Feed ingestion rate ( $\text{kg}/\text{d}$ )
4. L = Fraction of locally grown (source impacted) feed that is not pasture (site-specific)
5.  $C_v$  = Concentration in feed ( $\mu\text{g}/\text{kg}$ )

**a: Recommended default values EQ 5.3.4.2.3.1:**

1. FG = Default values in Table 5.4 footnote b, although a site-specific survey for the fraction of diet provided by grazing is recommended
2. FI = See Table 5.4
3. L = Default values in Table 5.4 footnote b, although a site-specific survey for fraction of locally grown (source impacted) feed that is not pasture is recommended
4.  $C_v$  = As calculated above in EQ 5.3.4.1 A

**b: Assumptions for EQ 5.3.4.2.3.1:**

1. Feed (FI) transported from an off-site location (i.e., not grown locally) is not contaminated by facility emissions.

## 5.3.4.2.3.2 Pasture/Grazing ingestion

**A. Equation 5.3.4.2.3.2:**

$$\text{Pasture/Grazing ingestion} = FG \times C_v \times FI$$

1. Pasture/Grazing ingestion = Dose through pasture/grazing ( $\mu\text{g}/\text{d}$ )
2. FG = Fraction of diet provided by grazing (site-specific)
3.  $C_v$  = Concentration in pasture/grazing material ( $\mu\text{g}/\text{kg}$ )
4. FI = Feed ingestion rate ( $\text{kg}/\text{d}$ )

**a: Recommended default values EQ 5.3.4.2.3.2:**

1. FG = Default values in Table 5.4 for fraction of diet provided by grazing, although a site-specific survey is recommended
2.  $C_v$  = As calculated above in EQ 5.3.4.1 A
3. FI = See Table 5.4

## 5.3.4.2.4 Soil ingestion

The feeds provided to dairy and beef cattle may contain small quantities of soil. A larger fraction of soil by weight of food is taken up during grazing. Rooting behavior by pigs with access to soil will result in soil ingestion. Likewise, poultry with free access to soil or pasture will also ingest soil. Defaults for soil ingestion are shown in Table 5.4.

**A. Equation 5.3.4.2.4 A:**

$$\text{Soil ingestion} = SI_a \times C_s$$

1. Soil ingestion = Dose through soil ingestion ( $\mu\text{g}/\text{d}$ )
2.  $SI_a$  = Soil ingestion rate for animal ( $\text{kg}/\text{d}$ )
3.  $C_s$  = Average soil concentration ( $\mu\text{g}/\text{kg}$ )

**a: Recommended default values for EQ 5.3.4.2.4 A:**

1.  $SI_a$  = Calculated below
2.  $C_s$  = Calculated above in EQ 5.3.2 A

**B. Equation 5.3.4.2.4 B:**

$$SI_a = [(1 - FG) \times FS_f \times FI] + [FG \times FS_p \times FI]$$

1. FG = Fraction of diet provided by grazing
2.  $FS_f$  = Soil ingested as a fraction of feed ingested
3. FI = Feed ingestion rate (kg/d)
4.  $FS_p$  = Soil ingested as a fraction of pasture ingested

**a: Recommended default values for EQ 5.3.4.2.4 B:**

1. FG = Site specific fraction of diet provided by grazing
2.  $FS_f$  = See Table 5.4
3. FI = See Table 5.4
4.  $FS_p$  = See Table 5.4

**b: Assumptions for EQ 5.3.4.2.4 B:**

1. The transfer coefficient is the same for all exposure routes.
2. Soil ingested in feed ( $FS_f$ ) transported from an off-site location (i.e., not grown locally) is assumed not to be contaminated by facility emissions.

**5.3.4.3 Bioaccumulation in Angler-Caught Fish**

The average concentration in fish ( $C_f$ ) is based on the concentration in water and a chemical-specific bioaccumulation factor.

**A. Equation 5.3.4.3:**

$$C_t = C_w \times BAF$$

1.  $C_t$  = Concentration in wet weight tissue (muscle) of fish ( $\mu\text{g}/\text{kg}$ )
2.  $C_w$  = Concentration in water ( $\mu\text{g}/\text{kg}$ )
3. BAF = Fish bioaccumulation factor (unitless)

**a: Recommended default values for Equation 5.3.4.3:**

1.  $C_w$  = As calculated above in Equation 5.3.3 A
2. BAF = Chemical-specific; see Table 5.2

**b: Assumptions for Equation 5.3.4.3:**

1. For conversion of a chemical concentration in a volume of water shown as  $\mu\text{g/L}$ , 1 L water = 1 kg water; thus, for concentration of chemical in water,  $\mu\text{g/L} = \mu\text{g/kg}$ .
2. For organic chemicals, BAFs lipid-normalized to adult rainbow trout with 4% lipid content in muscle tissue
3. For organic chemicals, BAFs based on the freely dissolved fraction in water under conditions of average particulate organic carbon and dissolved organic carbon in U.S. lakes and other water bodies
4. For inorganic compounds, BAFs based on wet weight muscle tissue concentration and on the total water concentration of the inorganic compound in water.
5. Contaminant concentrations are uniform in water based on dispersion

**5.3.4.4 Bioaccumulation in Mother's Milk**

The average concentration of a chemical in mother's milk ( $C_m$ ) is a function of the mother's exposure through all exposure routes (i.e., inhalation, ingestion via food, drinking water, and soil, and dermal absorption via skin contact with soil contaminated with the chemical), the contaminant half-life in the mother's body, and transfer of absorbed chemical to mother's milk. The contaminant half-life in the body and transfer to mother's milk is incorporated in biotransfer coefficients ( $T_{co}$ ) in Equation 5.3.4.4. See the TSD (OEHHA, 2012a), Appendix J for details on development of biotransfer factors. The substances assessed by the mother's milk pathway are shown in Table 5.1.

**A. Equation 5.3.4.4:**  $C_m = [(D_{\text{inder}} \times T_{co_{m\_inder}}) + (D_{\text{ing}} \times T_{co_{m\_ing}})] \times BW$

1.  $C_m$  = Concentration in mother's milk (mg/kg-milk)
2.  $D_{\text{inder}}$  = The sum of  $DOSE_{\text{air}}$  +  $DOSE_{\text{dermal}}$  through inhalation and dermal absorption (mg/kg-BW-day)
3.  $D_{\text{ing}}$  = The sum of  $DOSE_{\text{food}}$  +  $DOSE_{\text{soil}}$  +  $DOSE_{\text{water}}$  through ingestion (mg/kg-BW-day)
4.  $T_{co_{m\_inder}}$  = Biotransfer coefficient from inhalation and dermal absorption to mother's milk (d/kg-milk)
5.  $T_{co_{m\_ing}}$  = Biotransfer coefficient from ingestion to mother's milk (d/kg-milk)
6.  $BW$  = Body weight of mother (Kg)

**a: Recommended cancer risk default values for EQ 5.3.4.4:**

1.  $D_{ing}$  = As calculated through ingestion of soil in EQ 5.4.3.1.1 + home-grown produce in EQ 5.4.3.2.1 + home-raised animal products in EQ 5.4.3.2.2 + drinking water in EQ 5.4.3.3.1 + angler-caught fish in EQ 5.4.3.4.1
2.  $D_{inder}$  = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.1
3.  $Tco_{m\_inder}$  = See Table 5.5
4.  $Tco_{m\_ing}$  = See Table 5.5

**b: Recommended noncancer risk default values for EQ 5.3.4.4:**

1.  $D_{ing}$  = As calculated through ingestion of soil in EQ 5.4.3.1.2 + home-grown produce and home-raised animal products in EQ 5.4.3.2.3 + drinking water in EQ 5.4.3.3.2 + angler-caught fish in EQ 5.4.3.4.2
2.  $D_{inder}$  = As calculated through inhalation in EQ 5.4.1.1 + dermal exposure in EQ 5.4.2.2
3.  $Tco_{m\_inder}$  = See Table 5.5
4.  $Tco_{m\_ing}$  = See Table 5.5

**c: Assumptions for EQ 5.3.4.4:**

1. Default age of mother at birth is 25 years of age, then nurses the infant for 1 year; Use 16<30 year old high-end (95<sup>th</sup> percentile) daily breathing rate and intake rates for  $D_{ing}$  and  $D_{inder}$  for estimating dose to mother.
2. For inhalation dose to mother's milk, it is recommended that the EF variate in EQ 5.4.1.1 is left out for calculation of inhalation dose in the mother's milk pathway.
3. Biotransfer coefficient,  $Tco_{m\_inder}$ , the same for both inhalation and dermal pathways based on lack of first-pass metabolism through the liver for both of these pathways.
4. Biotransfer coefficient,  $Tco_{m\_ing}$ , the same for all ingestion pathways based on first-pass metabolism through the liver.
5. For chemicals in Table 5.5 lacking either an oral or inhalation Tco, use the oral Tco for the absent inhalation Tco (i.e., for PCDDs and PCDFs and dioxin-like PCBs), or the inhalation Tco for the absent oral Tco (i.e., for lead) in Equation 5.3.4.4.
6. The concentration in the mother's milk is determined using the derived approach to risk assessment. This method allows use of the high-end dose point estimate for driving exposure pathways and the average dose point estimates for other exposure pathways. See Sections 8.2.6 (cancer) and 8.3.3 (noncancer) for the description of the methodology on how to implement the derived methodology.

**Table 5.2a Substance-Specific Default Values for Organic Multipathway Substances**

Multipathway Substance	Log K <sub>oc</sub>	Log K <sub>ow</sub>	Fish BAF	Root Uptake Factors				GRAF <sup>2</sup>	Soil HalfLife (days)

(1) Averaged log Kow and Koc values determined by most reliable methods (Staples et al., 1997)

(2) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.

(3) Measured by Hansch et al. (1985)

(4) Estimated according to methodology of Lyman et al. (1990)

(5) To be evaluated for specific default values in future amendments to the Hot Spots Program.

(1) GRAF (Gastrointestinal Relative Absorption Factor). The guidelines allow for adjusting for bioavailability where the evidence warrants. For example, there are good data which indicate that dioxin is not as available to an organism when bound to soil or fly ash matrices relative to when it is in solution or in food. Therefore, a bioavailability factor is incorporated into the model to account for this difference. When information becomes available for other chemicals of concern, this type of bioavailability will be incorporated into the model.

(2) Methyl mercury (MeHg) is not represented in the category "mercury & inorganic compounds". The BAF for methyl mercury is orders of magnitude higher than for inorganic mercury. Assessment of MeHg for the fish pathway is not directly applicable to the Hot Spots program, as no facilities are known to emit MeHg directly into the air (OEHHA, 2012; OEHHA, 2006), but it may be formed by action of microbes in sediment. Assessing the methylation of mercury deposited into a water body is difficult, and is also very water body-specific. At this time OEHHA cannot address this issue in the Hot Spots program, but will consider addressing this problem in future amendments of the Guidance.

<sup>b</sup> The meat Tco was estimated using the metabolic weight adjustment ratio of 4.8 from cattle to pig

<sup>c</sup> NA – no data available or was not applicable

**Table 5.4 Point Estimates for Animal Pathway**

Parameter	Beef Cattle	Lactating Dairy Cattle	Pigs	Meat Poultry	Egg-laying Poultry
BW (body weight in kg)	533	575	55	1.7	1.6
BR <sub>a</sub> (inhalation rate in m <sup>3</sup> /d)	107	115	7	0.4	0.4
WL <sub>a</sub> (water consumption in kg/d)	45	110	6.6	0.16	0.23
FI (Food Intake in kg/d) DMI <sup>a</sup> and/or pasture grazing <sup>b</sup>	9	22	2.4	0.13	0.12
FS <sub>f</sub> (soil fraction of feed)	0.01	0.01	NA	NA	NA
FS <sub>p</sub> (soil fraction of pasture)	0.05	0.05	0.04	0.02	0.02

<sup>a</sup> Dry matter intake

<sup>b</sup> For beef and dairy cattle, pasture grazing is assumed to be leafy vegetation (grasses, including greenchop) and accounts for half of the cattle's diet (FG=0.5 in Section 5.3.4.2.3). The default assumes on-site pasture grazing contaminated by facility emissions. Fraction of feed or dry matter intake (e.g., hay, grain) grown on-site is assumed to be contaminated by facility emissions and fraction of feed that is grown off-site is not assumed to be contaminated. A default may be used that assumes all feed is grown off-site (L=0 in Section 5.3.4.2.3), but a survey is recommended to verify the fractions of feed grown on-site and off-site.

For pigs with access to soil, but usually confined to a pen, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). For feed, estimated intake consists of equal portions of all plant types including exposed, leafy, protected and root in which 10% (L=0.1 in Section 5.3.4.2.3) of the diet is homegrown and contaminated by facility emissions. The fraction of feed that was transported from an off-site location is assumed not to be contaminated by facility emissions.

For poultry including egg-laying and broiler chickens that have access to soil, default assumes no pasture grazing (FG=0 in Section 5.3.4.2.3). Estimated feed intake is composed of equal proportions of all plant types with 5% (L=0.05 in Section 5.3.4.2.3) homegrown and contaminated by facility emissions. The fraction of feed grown off-site and transported to the receptor was not contaminated by facility emissions.

NA - Not applicable. Assume FS<sub>f</sub> is equal to zero.

**Table 5.5 Mother's Milk Transfer Coefficients (Tco<sub>m</sub>)<sup>a</sup>**

<b>Chemical/chem. group</b>	<b>Tco<sub>m</sub> (day/kg-milk)</b>
PCDDs - oral <sup>b</sup>	3.7
PCDFs - oral <sup>b</sup>	1.8
Dioxin-like PCBs - oral <sup>b</sup>	1.7
PAHs – inhalation <sup>c</sup>	1.55
PAHs – oral	0.401
Lead - inhalation <sup>d</sup>	0.064

<sup>a</sup> These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed.

<sup>b</sup> Use the oral Tco<sub>m</sub> for the inhalation and dermal pathways. The PCDD, PCDF and dioxin-like PCB Tcos were derived using a Random-effects model from individual Tco<sub>m</sub> estimates for 7 PCDDs, 9 PCDFs and 12 dioxin-like PCBs (See OEHHA, 2012, Appendix J).

<sup>c</sup> Use the inhalation Tco<sub>m</sub> for the dermal pathway

<sup>d</sup> Use the inhalation Tco<sub>m</sub> for the ingestion and dermal pathways

## 5.4 Estimation of Dose

Once the concentrations of substances are estimated in air, soil, water, plants, and animal products, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the daily dose in milligrams per kilogram body weight per day (mg/kg/d). The following algorithms calculate this dose for exposure through inhalation, dermal absorption, and ingestion pathways. All chemicals must be assessed for exposure through inhalation. If there are emissions of one or more of the subset of semi- or non-volatile multipathway substances, the soil ingestion pathway and the dermal soil exposure pathway are also assessed. The mother's milk pathway may also be a mandatory pathway depending on the multipathway substance released (See Table 5.1). The other exposure pathways may also need to be assessed if a survey of the exposure site shows they are present (e.g., ingestion of water, home-grown crops, home-raised animal products, and angler-caught fish).

This section contains average and high-end point estimates and data distributions for adults and children for many exposure pathways. The point-estimates and data distributions for children fall within the 3<sup>rd</sup> trimester, 0<2, 2<9, and 2<16 year age groupings. The point-estimates and data distributions for adults fall within the 16<30 and 16-70 year age groupings. When evaluating 9-, 30-, and 70-year exposure durations for cancer risk assessment, assessors will use distributions starting at the third trimester.

Workers are assessed for cancer risk as adults using 8-hour breathing rate point estimates (See Table 5.8). Point estimates for workers are listed under "offsite worker." OEHHA has not developed stochastic distributions for worker exposure. Therefore, there is no Tier 3 stochastic approach for offsite worker cancer risk assessment.

### 5.4.1 *Estimation of Exposure through Inhalation*

The dose through the inhalation route is estimated for cancer risk assessment and noncancer hazard assessment. Both residential and offsite worker exposures are considered. Since residential exposure includes near-continuous long-term exposure at a residence and workers are exposed only during working hours (i.e., 8 hours/day), different breathing rate distributions are used.

#### 5.4.1.1 Residential Inhalation Dose for Cancer Risk Assessment

Exposure through inhalation is a function of the breathing rate, the exposure frequency, and the concentration of a substance in the air. For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is calculated for each of these age groups, 3<sup>rd</sup> trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. OEHHA used the mother's breathing rates to estimate dose for the 3<sup>rd</sup> trimester fetus assuming the dose to the fetus during the 3<sup>rd</sup> trimester is the same as the mother's dose. These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). A Tier 1 evaluation uses the high-end point estimate (i.e., the 95<sup>th</sup> percentiles) breathing rates for the inhalation

pathway in order to avoid underestimating cancer risk to the public, including children. A possible exception for using high-end breathing rates are when there is exposure to multipathway substances and two of the non-inhalation pathways drive the risk, rather than the inhalation pathway (see Chapter 8).

**A. Equation 5.4.1.1:**  $\text{Dose-air} = C_{\text{air}} \times \{\text{BR/BW}\} \times A \times \text{EF} \times 10^{-6}$

1. Dose-air = Dose through inhalation (mg/kg/d)
2.  $C_{\text{air}}$  = Concentration in air ( $\mu\text{g}/\text{m}^3$ )
3.  $\{\text{BR/BW}\}$  = Daily Breathing rate normalized to body weight (L/kg body weight - day)
4. A = Inhalation absorption factor (unitless)
5. EF = Exposure frequency (unitless), days/365 days
6.  $10^{-6}$  = Micrograms to milligrams conversion, liters to cubic meters conversion

**a: Recommended default values for EQ 5.4.1.1:**

1.  $\{\text{BR/BW}\}$  = Daily breathing rates by age groupings, see As supplemental information, the assessor may wish to evaluate the inhalation dose by using the mean point estimates in Table 5.6 to provide a range of breathing rates for cancer risk assessment to the risk manager.
2. Table (point estimates) and Table 5.7 (parametric model distributions for Tier III stochastic risk assessment). For Tier 1 residential estimates, use 95<sup>th</sup> percentile breathing rates in Table 5.6.
3. A = 1
4. EF = 0.96 (350 days/365 days in a year for a resident)

**b: Assumption for EQ 5.4.1.1:**

1. The fraction of chemical absorbed (A) is the same fraction absorbed in the study on which the cancer potency or Reference Exposure Level is based.

As supplemental information, the assessor may wish to evaluate the inhalation dose by using the mean point estimates in Table 5.6 to provide a range of breathing rates for cancer risk assessment to the risk manager.

#### 5.4.1.2 Offsite Worker (MEIW) Inhalation Dose for Cancer Risk Assessment

For worker exposure, the default assumes working age begins at 16 years, and that exposures to facility emissions occur during the work shift, typically up to 8 hours per day during work days. Breathing rates that occur over an 8-hour period vary depending on the intensity of the activity (See Table 5.8), and are used to estimate the inhalation dose. The 8-hour breathing rates may also be useful for cancer risk assessment of children and teachers exposed at schools during school hours.

Another risk management consideration for the offsite worker scenario for cancer assessment of a Hot Spots facility is whether there are women of child-bearing age at the MEIW location and whether the MEIW has a daycare center. Since the third trimester is only a short segment of the 25 year exposure duration used for the MEIW, the resulting risk estimate would not differ significantly. An exception to this assumption is high exposure to carcinogens over a short period, as might occur during short-term projects (see Section 8.2.10). In this case, risk assessment during the third trimester may be warranted. However, if there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario due to increased exposure (per kg body weight) and increased sensitivity to carcinogen exposure (see Section 8.2.1). In this case, the Districts may wish to include a calculation of inhalation dose for the children in the onsite daycare, assuming they could be there from 0 to age 6 years.

Exposed workers may be engaged in activities ranging from desk work, which would reflect breathing rates of sedentary/passive or light activities, to farm worker activities, which would reflect breathing rates of moderate intensity (See Table 5.9). OEHHA recommends default (Tier 1) point estimate 8-hour breathing rates in L/kg-8-hrs based on the mean and 95<sup>th</sup> percentile of moderate intensity activities, 170 and 230 L/kg-8-hrs, respectively, for adults 16-70 years old.

Many facilities operate non-continuously, as in only 8-10 hours per day, but the air dispersion modeling is performed as if the emissions were uniformly emitted over 24 hours a day, 7 days per week. The air dispersion computer model used, including AERMOD and other models, typically calculate an annual average air concentration based on actual operating conditions but also include the hours of nonoperation in the average concentration.

Therefore, there are two components that determine the worker exposure to facility emissions:

- 1) What is the estimated concentration the worker is exposed to (i.e., breathes), during the work shift, and
- 2) What is the amount of time the offsite worker's schedule overlaps with the facility's emission schedule?

There are two approaches to estimating the modeled concentration the worker is breathing during the work shift. The first approach uses a worker adjustment factor (i.e.,

the WAF) to approximate what the worker is breathing based on the modeling run used for residential receptors. The second approach uses a special modeling run with the hourly raw results from an air dispersion analysis and is described in Appendix M.

The first and more basic approach is to obtain the long term average concentration as you would for modeling a residential receptor, then adjusting this exposure concentration using the calculated WAF (EQ 5.4.1.2 B) to estimate the concentration the offsite worker is exposed to during the work shift (shown as  $(C_{\text{air}} \times \text{WAF})$  in EQ 5.4.1.2 A). This method is characteristic of a default approach used in a Tier 1 assessment. Once the exposure concentration is determined, the worker's inhalation dose (Dose-air) can be calculated as shown in EQ 5.4.1.2 A.

The second approach for determining the air concentration the worker is exposed to uses a refined modeling run where the hourly raw dispersion model output are post processed to examine the hourly concentrations that fall within the offsite worker's shift. This method provides a more representative estimate of the air concentration, but is more complex, and time consuming than the first method. See Appendix M for information on how to simulate the long term concentration for the offsite worker that can be used to estimate inhalation cancer risk.

The HARP software has the ability to calculate worker impacts using an approximation factor and, in the future, it will have the ability to post process refined worker concentrations using the hourly raw results from an air dispersion analysis.

If the off-site worker's shift does not completely overlap the emission schedule of the facility, then a Discount Factor (DF) may be applied to the WAF. Calculation of the DF is shown in EQ 5.4.1.2 C. The default assumption is that the offsite worker's shift falls completely within the emission schedule of the facility, in which case  $DF=1$ . Use of a DF less than 1 requires a survey at the MIEW to verify that some portion of the off-site worker shift is not subject to the facility emissions.

**A. Equation 5.4.1.2 A:**  $\text{Dose-air} = (C_{\text{air}} \times \text{WAF}) \times \{\text{BR}/\text{BW}\} \times A \times \text{EF} \times 10^{-6}$

1. Dose-air = Dose through inhalation (mg/kg/d)
2.  $C_{\text{air}}$  = Annual average concentration in air ( $\mu\text{g}/\text{m}^3$ )
3. WAF = Worker air concentration adjustment factor (unitless)
4.  $\{\text{BR}/\text{BW}\}$  = Eight-hour breathing rate normalized to body weight (L/kg body weight - day)
5. A = Inhalation absorption factor (unitless)
6. EF = Exposure frequency (unitless), days/365 days)
7.  $10^{-6}$  = Micrograms to milligrams conversion, Liters to cubic meters conversion

**a: Recommended default values for EQ 5.4.1.2 A:**

1. WAF = See EQ. 5.4.1.2 B for formula to calculate WAF, or App. M for refined post-processing modeling to calculate WAF.
2.  $\{\text{BR}/\text{BW}\}$  = For workers, use age 16-70 year, 95<sup>th</sup> percentile, moderate intensity 8-hour point estimate breathing rates (see Table 5.8). No worker breathing rate distributions exist for stochastic risk assessment.
3. A = 1
4. EF = 0.68 (250 days / 365 days). Equivalent to working 5 days/week, 50 weeks/year.

**b: Assumption for EQ 5.4.1.2 A:**

1. The fraction of chemical absorbed (A) through the lungs is the same fraction absorbed in the study on which the cancer potency factor is based.
2. The source emits during the daylight hours. Calculate WAF (EQ 5.4.1.2 B) if a special post-processing modeling run described in App. M was not completed. For nighttime emissions and exposure scenarios, see Appendix N.

**B. Equation 5.4.1.2 B:**

$$\text{WAF} = (H_{\text{res}} / H_{\text{source}}) \times (D_{\text{res}} / D_{\text{source}}) \times \text{DF}$$

1. WAF = Worker adjustment factor (unitless)
2.  $H_{\text{res}}$  = Number of hours per day the annual average residential air concentration is based on (always 24 hours)
3.  $H_{\text{source}}$  = Number of hours the source operates per day
4.  $D_{\text{res}}$  = Number of days per week the annual average residential air concentration is based on (always 7 days)
5.  $D_{\text{source}}$  = Number of days the emitting source operates per week
6. DF = Discount factor, for when the offsite worker's schedule partially overlaps the source's emission schedule

**b: Recommended default values for EQ 5.4.1.2 B:**

1. DF = 1 for offsite worker's schedule occurring within the source's emission schedule. A site-specific survey may be used to adjust the DF using EQ 5.4.1.2 C.

**C. Equation 5.4.1.2 C:**

$$\text{DF} = (H_{\text{coincident}} / H_{\text{worker}}) \times (D_{\text{coincident}} / D_{\text{worker}})$$

1.  $H_{\text{coincident}}$  = Number of hours per day the offsite worker's schedule and the source's emission schedule coincide
2.  $H_{\text{worker}}$  = Number of hours the offsite worker works per day
3.  $D_{\text{coincident}}$  = Number of days per week the offsite worker's schedule and the source's emission schedule coincide
4.  $D_{\text{worker}}$  = Number of days the offsite worker works per week

Tier 2 adjustments for EQ 5.4.1.2 A-C may be used for:

1. Eight-hour breathing rate. Point estimates in Table 5.8 for lower breathing rates of sedentary/passive and light intensity work activities may be substituted in site-specific Tier 2 scenarios. Table 5.9 can be used to estimate breathing rate intensities for various job activities. Use of different breathing rates requires a survey of the exposed workplace and approval by Air District, ARB and OEHHA.
2. Discount Factor (DF) in EQ 5.4.1.2 C. If a site-specific survey of the offsite worker schedule only partially overlaps with the source's emission schedule, then a DF less than 1 may be calculated. Use of a DF less than 1 requires a survey of the exposed workplace and approval by the Air District or ARB.

The 8-hour breathing rates are based on minute ventilation rates derived by U.S. EPA (2009). U.S. EPA employed a metabolic equivalent (METs) approach for estimating breathing rates. This method determines daily time-weighted averages of energy expenditure (expressed as multipliers of the basal metabolic rate) across different levels of physical activity. The 8-hour breathing rates shown in Table 5.8 are divided into three categories:

Sedentary & Passive Activities (METs  $\leq$  1.5)

Light Intensity Activities (1.5 < METs  $\leq$  3.0)

Moderate Intensity Activities (3.0 < METs  $\leq$  6.0)

For example, a METS = 1 is roughly equivalent to energy expenditure during sleep and is close to the basal metabolic rate. A METS activity that is two to three times greater (METS = 2 to 3) is characteristic of light intensity activities, such as administrative office work or sales work as shown in Table 5.9.

Under a Tier 1 scenario, the risk assessor may simply use the 95<sup>th</sup> percentile breathing rate for moderate intensity activities of 230 L/kg-8 hrs in Eq. 5.4.1.2 A to calculate the daily dose via the inhalation route to the worker. In an example of a Tier 2 scenario, the risk assessor surveys the workplace and determines that the worker(s) at the MEIW receptor are primarily sitting at a desk performing administrative-type work on a computer. Referring to Table 5.9, this activity corresponds most closely to “administrative office work” with a mean activity level of 1.7 and a SD = 0.3. This level of activity is considered “light intensity activity” (i.e., 1.5 < METs  $\leq$  3.0). With the prior approval of the Air District or ARB, the risk assessor may then use the 95<sup>th</sup> percentile breathing rate of 100 L/kg-8 hr for light intensity activities in Equation 5.4.1.2 A.

**Table 5.8. Eight-Hour Breathing Rate (L/kg per 8 Hrs) Point Estimates for Males and Females Combined<sup>a,b</sup>**

	0<2 years	2<9 years	2<16 years	16<30 years	16-70 years
	<b>Sedentary &amp; Passive Activities (METs <math>\leq</math> 1.5)</b>

Walk/bike/jog (not in transit) age 30	5.7	5.7	1.2	2.1	9.3
Walk/bike/jog (not in transit) age 40	4.7	4.7	1.8	2.3	7.1

Table 5.10 lists some WAFs for a few typical scenarios. For example, if the source is continuously emitting, then the offsite worker is assumed to breathe the long-term annual average concentration during their work shift. The WAF then becomes one and no concentration adjustments are necessary in this situation when estimating the inhalation cancer risk. If the source is non-continuously emitting for 8 hours/day, 5 days/week and the offsite worker's shift completely overlaps the emitting facility's operating schedule, then the WAF would be 4.2:

$$(24 \text{ hrs/day} / 8 \text{ hrs/day}) \times (7 \text{ days/week} / 5 \text{ days/week}) = 4.2$$

If the offsite worker's 8 hour/day shift only overlaps the emitting facility's operation schedule for 4 hrs/day, then the WAF is 2.1 because the DF = 0.5 will reduce the WAF by half:  $DF = (4 \text{ hrs/day} / 8 \text{ hrs/day}) \times (5 \text{ days/week} / 5 \text{ days/week}) = 0.5$

**Table 5.10: Example Worker Adjustment Factors (WAF) to Convert a Long-Term Daily Average Emission Concentration to an Off-Site Worker Receptor Exposure**

Off-Site Workers' Shift Overlap with Facility's Emission Schedule <sup>a</sup>	Facility Operating Schedule	Adjustment Factor
8 hrs/day, 5 days/week	Continuous (24 hrs/7 days/week)	1.0
8 hrs/day, 5 days/week <sup>b</sup>	Non-continuous (8 hrs/5 days/week)	4.2
4 hrs/day, 5 days/week	Non-continuous (8 hrs/5 days/week)	2.1

<sup>a</sup> Worker works 8 hours per day, 5 days per week

<sup>b</sup> Workers' work hours completely overlap the facilities operating hours

#### 5.4.1.3 Inhalation Dose for Children at Schools and Daycare Facilities for Cancer Risk Assessment

The 8-hour breathing rates and inhalation dose equations (EQ 5.4.1.2 A-C) may also be used to estimate risk to children when exposures occur while at school or at day care facilities. Breathing rate point estimates to use in Table 5.8 depend on the ages of the children at the exposed schools and day cares. As a Tier 1 default, moderate intensity breathing rates are recommended. Equations 5.4.1.2 A-C is used in the same way to estimate dose in children as it is for workers.

#### 5.4.1.4 Non-Cancer Inhalation Exposure for Workers and Residents

For typical daily work shifts of 8-9 hours, acute, 8-hour and chronic Reference Exposure Levels (RELs) described in Chapter 8 are used in health risk assessments to characterize the noncancer risks using the Hazard Index approach described in Chapter 8 and in OEHHA (2008). Uncertainty factors are already incorporated into the RELs used to assess noncancer risk, as explained in Chapter 8, so all that is needed to evaluate the noncancer hazard is the air concentration that the worker is exposed to. The modeled maximum 1-hour air concentration is determined for acute hazard assessment and the annual average air concentration is determined for chronic hazard assessment. The modeled average air concentration during a work shift is determined for 8-hour hazard assessment using the adjusted annual average air concentration described below.

The 8-hour RELs are primarily designed to address offsite worker inhalation exposure at the MEIW because they better characterize the daily intermittent exposures of workers than the chronic RELs do. They are used in estimating the 8 hour Hazard Index for offsite workers. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA.

Note, however, there are only a handful of 8-hour RELs currently adopted for use in the Hot Spots program. Therefore, we also recommend performing chronic noncancer exposure assessment for the offsite worker (MEIW) based on the annual average air concentration at the MEIW. Evaluation of the chronic Hazard Index should help protect workers who routinely work longer than 8 hour shifts. Exposure to multipathway substances also requires noncancer hazard assessment for the dermal and oral soil exposure pathways for offsite workers. Because there are few 8-hour RELs currently available, hazard assessment for the noninhalation pathways for multipathway substances is only applied when estimating the chronic Hazard Index.

In addition, the Districts may wish to determine if there is an onsite daycare at the MEIW and include a calculation of the chronic and 8-hour inhalation dose for children, although onsite hazard assessment is not a requirement for a Hot Spots risk assessment.

As explained in Section 5.4.1.2 for cancer risk, the modeled annual average air concentration is adjusted to the air concentration that the worker is actually exposed to if the facility operates non-continuously. The typical method for this adjustment is by calculating the Worker Adjustment Factor (WAF) shown in EQ 5.4.1.4 B and multiplying this value by the annual average air concentration ( $C_{air}$ , in  $\mu\text{g}/\text{m}^3$ ) in EQ 5.4.1.4 A.

Unlike cancer risk assessment, no discount factor (DF) is applied in noncancer assessment for partial overlap between the worker's schedule and the source's emission schedule. Adjustments for worker vacations, work shifts for shortened weeks (e.g., 1 - 4 days), and worker time away on weekends are also not appropriate.

An alternative refined post-processing method, described in Appendix M, may be used to estimate the air concentration the worker is exposed to during their work schedule. OEHHA may be consulted about the particular chemical involved if it is important to make a more refined analysis.

The equation to adjust the annual average air concentration to a worker 8-hour exposure concentration (i.e., the adjusted annual average ground level concentration) is expressed as:

**A. Equation 5.4.1.4 A:**

$$\text{Adjusted } C_{air} (\mu\text{g}/\text{m}^3) = C_{air} \times \text{WAF}$$

Where WAF is determined as:

**B. Equation 5.4.1.4 B:**

$$\text{WAF} = (H_{res} / H_{source}) \times (D_{res} / D_{source})$$

**a: Assumptions for EQ 5.4.1.4 B:**

1. No adjustment of the WAF allowed for partial overlap of the worker's schedule and the source's emission schedule.

Alternatives for calculating off-site worker Adjusted  $C_{air}$  in EQ 5.4.1.4 A-B:

1. Rather than calculate the WAF for a non-continuous emitting facility, a post-processing of the hourly raw dispersion model output and examination of the hourly concentrations that fall within the offsite worker's shift can be conducted to estimate the air concentration the worker is exposed to. This method is a more refined, complex, and time consuming approach, but should result in a more representative exposure concentration. See Appendix M for information on how to simulate the exposure concentration for the off-site worker.
2. For continuously-emitting facilities (i.e., 24 hrs/day, 7 days/week), if an assessor does not wish to assume the worker breathes the long-term annual average concentration during the work shift, then a refined concentration can also be post-processed as described in Appendix M. All alternative assumptions should be approved by the reviewing authority and supported in the presentation of results.

For residential exposure to non-continuously operating facilities, the modeled maximum 1-hour and chronic air concentrations at the MEIR are determined for noncancer hazard assessment. Hazard assessment for repeated 8-hour exposure at the MEIR is not required. Chronic exposure assessment based on the annual average air concentration should adequately protect individuals, in part because residents are considered to be present at the MEIR at or near 24 hrs per day. Many facilities operate for periods longer than 8 hours per day and the hazards are better characterized based on chronic exposure. Nevertheless, differences between 8-hour and chronic exposures (i.e., higher daily 8-hour exposures vs. lower longer daily exposure 24 hrs/day) may result in different toxicological responses including potentially greater toxicological responses with either 8-hour or chronic exposure. There may also be cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) where the 8-hour REL will be more protective than the chronic REL. Thus, the air districts may also elect to have an 8-hour hazard assessment performed at the MEIR, using daily 8 hour exposures and the 8 hr RELs.

Eight-hour exposure assessment is not recommended for continuously emitting sources for residential receptors. In this situation it is only necessary to estimate chronic exposure based on the annual average concentration. However, there may be situations where the air district may wish to assess an 8-hour residential exposure to continuously operating facilities, for example, where there are significant differences in modeled concentration of emissions during the day due to diurnal wind patterns.

For estimating the air concentration from non-continuously operating facilities, EQ 5.4.1.4.A is also used to adjust the annual average concentration to what the residents are exposed to. This is the air concentration that the 8-hour REL will be compared to as discussed in Chapter 8. The alternative refined post-processing method described in Appendix M may also be used to estimate residential exposure.

In summary, the requirements for noncancer hazard assessment using the Hazard Index approach at the MEIW and MEIR are as follows.

For offsite worker exposure:

- Acute hazard assessment based on the maximum 1-hour air concentrations and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure (estimated using adjusted annual average air concentration in EQ 5.4.1.4 A and B or by post-processing method in App. M) for those substances with 8-hour RELs
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

For residential exposure:

- Acute hazard assessment based on the maximum 1-hour air concentration and 1-hour RELs
- Eight-hour hazard assessment based on daily average 8-hour exposure not required, but can be performed at the discretion of the air districts for exposure to non-continuously operating facilities based on the adjusted annual average air concentration (EQ 5.4.1.4 A and B or method in App. M). Eight-hour assessments not recommended for exposure to continuously operating facilities
- Chronic hazard assessment based on annual average exposure and chronic RELs, and oral chronic RELs for noninhalation routes of multipathway substances

#### 5.4.1.5 Exposure Frequency and Age Groupings for Noncancer Hazard Assessment

For cancer risk, the basic assumption is that risk is associated with cumulative dose of carcinogen. Thus, the dose used to estimate cancer risk can be adjusted for exposure frequency, as well as time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose used to calculate hazard index for exposure frequency or time away from the MEIR or MEIW is not appropriate.

The average daily dose for chronic noncancer assessment is based on exposure beginning at birth to 70 years of age, necessitating calculation of a time-weighted average for age 0-2, 2-16 and 16-70 years. Since we are not applying Age Sensitivity Factors for assessing non-cancer hazard, the 3<sup>rd</sup> trimester is not explicitly called out for determining dose, as it is for cancer risk assessment. Rather adult exposure is considered, which would include pregnant women in any trimester. Both inhalation and oral RELs incorporate safety factors to protect sensitive human populations.

#### **5.4.2 Estimation of Exposure through Dermal Absorption**

Exposure through dermal absorption (dose-dermal) is a function of the soil or dust loading of the exposed skin surface, the amount of skin surface area exposed, and the concentration and availability of the substance. In the previous edition of OEHHA's

exposure guidelines document (OEHHA, 2000), we recommended using specified average and high-end point estimate values for four of the variates (body weight, exposed surface area of skin, soil load on skin and frequency of exposure) in the stochastic analysis for dermal dose. This equation required multiplying values together, which could lead to overly conservative exposure estimates when high-end values were used. By combining information from the four variates into one composite distribution, over-conservatism may be avoided.

To this end, OEHHA created a new variate, “annual dermal load”, or ADL, which is a composite of the body surface area (BSA) per kg body weight, exposure frequency, and soil adherence variates. Point estimates from the composite “annual dermal load” can be used for point estimate assessments while parameters and information on the type of distribution (e.g., lognormal) can be used for Tier III stochastic risk assessments. For details on the development of the ADL, refer to the Technical Support Document for Exposure and Stochastic Analysis (OEHHA, 2012).

#### 5.4.2.1 Dermal Dose for Cancer Risk Assessment

The dose through residential dermal exposure to contaminated soil varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to offsite workers; a separate ADL for offsite workers is presented in Table 5.11. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable.

#### **A. Equation 5.4.2.1:**

$$\text{Dose}_{\text{dermal}} = \text{ADL} \times C_s \times \text{ABS} \times 10^{-9} / 365$$

1.  $\text{Dose}_{\text{dermal}}$  = Exposure dose through dermal absorption (mg/kg-d)
2. ADL = Annual dermal load (mg soil/kg BW-yr)
3.  $C_s$  = Average soil concentration ( $\mu\text{g}/\text{kg}$ )
4. ABS = Fraction absorbed across skin (unitless)
5.  $10^{-9}$  = Conversion factor for chemical & soil ( $\mu\text{g}$  to mg, mg to kg)
6.  $1/365$  = Conversion factor for ADL from yrs to days

#### **a: Recommended default values for EQ 5.4.2.1:**

1. ADL = See Table 5.11 (point estimates) & Table 5.12 a-d (distributions)
2.  $C_s$  = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

#### **b: Assumption for EQ 5.4.2.1:**

1. The ADL for the third trimester of the fetus is based on the ADL of the mother; when normalized to body weight, we assume that exposure to the

mother and the fetus will be the same. The mother's exposure is based on that of adults 16-30 years of age in Table 5.11 and 5.12d.

2. Exposure frequency (EF) for vacation time spent away from exposure does not appear as a variate in EQ 5.4.2.1, as it is incorporated in the ADL and includes a 2-week vacation per year away from dermal soil exposure for both residents and offsite workers.

Climate will strongly influence people's choice of clothing. Due to California's varied climatic regions and existing data on clothing choices at different temperatures, three levels of climatic conditions, warm, mixed, and cold, are used to describe California's climate regions:

1. A warm climate is characteristic of Southern California areas such as Los Angeles, which can have warm to hot temperatures throughout the year.
2. A "mixed" climate is one that has warm-to-hot temperatures during much of the year (daily highs over 80 degrees are common), roughly from April to October, and cold temperatures (lows near or below freezing) during the remainder of the year. The mountains and central valley are examples of a mixed climate.
3. A cold climate is representative of San Francisco, Eureka, and other northern coastal communities, which have cool temperatures (daily highs of less than 65 degrees) for the majority of the year and can receive a considerable amount of fog and rainfall.

OEHHA recommends consulting the local air district for assistance on selecting the most appropriate climate.

**Table 5.11 Recommended Annual Dermal Load Point Estimates (in mg/kg-yr) for Dermal Exposure**

	3 <sup>rd</sup> Trimester <sup>a</sup>	Children 0<2 yrs	Children 2<9 yrs	Children 2<16 yrs	Adults <sup>b</sup>	Offsite Worker <sup>c</sup>
<b>Warm climate</b>						
Mean	1.2 x 10 <sup>3</sup>	3.6 x 10 <sup>3</sup>	7.5 x 10 <sup>3</sup>	6.4 x 10 <sup>3</sup>	1.2 x 10 <sup>3</sup>	2.6 x 10 <sup>3</sup>

4,4'methylene dianiline	10
Pentachlorophenol	<sup>a</sup>
Polychlorinated biphenyls	14
Polychlorinated dibenzo-p-dioxins and dibenzofurans	3
Polycyclic aromatic hydrocarbons	13

<sup>a</sup> To be determined in future amendments to the Hot Spots Program

Skin permeability is related to the solubility or strength of binding of the chemical in the delivery matrix (soil or other particles) versus the receptor matrix, the skin's stratum corneum. Fractional dermal absorption point estimate values were derived by OEHHA from available literature sources for the semi-volatile and nonvolatile chemicals in the “Hot Spots” program. The rationale for the chemical-specific dermal absorption fraction values, and the use of default values in cases where sufficient data are lacking, can be found in Appendix F of the Technical Support Document for Exposure and Stochastic Analysis (OEHHA, 2012).

#### 5.4.2.2 Chronic Noncancer Dermal Dose

Dermal exposure, and thus annual dermal load (ADL), varies by age group. Therefore, a time-weighted average ADL for age 0-70 years (0-2, 2-16, and 16-70 years) is estimated for chronic residential exposure using ADL values in Table 5.12. This exposure pathway is also assessed for offsite workers using the offsite worker ADL values in Table 5.12d. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the dermal dose is determined for each age group in EQ 5.4.2.2:

**A. Equation 5.4.2.2:**  $\text{Dose}_{\text{dermal}} = \text{ADL} \times \text{Cs} \times \text{ABS} \times 10^{-9} \times \text{ED}/\text{AT} \times (1/350)$

1.  $\text{Dose}_{\text{dermal}}$  = Exposure dose through dermal absorption (mg/kg/d)
2. ADL = Annual dermal load (mg/kg-yr), age-specific
3. Cs = Average soil concentration ( $\mu\text{g}/\text{kg}$ )
4. ABS = Fraction absorbed across skin (unitless)
5.  $10^{-9}$  = Conversion factor for chemical & soil ( $\mu\text{g}$  to mg, mg to kg)
6. 1/350 = Conversion factor for ADL from yrs to days (Note: this conversion is needed to remove EF, expressed as 350 days/365 days, from the ADLs in Table 5.12a-d)
7. ED = Exposure duration for specified age groups: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70 for residential exposure,
8. AT = Averaging time for residential exposure – 70 yrs

**a: Recommended default values for EQ 5.4.2.2:**

1. ADL = See Table 5.11 for point estimates by age group, climate region and receptor type (resident or worker)
2. Cs = Calculated above in EQ 5.3.2 A
3. ABS = See Table 5.13

**b: Recommended off-site worker default modifications to EQ 5.4.2.2:**

1. Chronic dermal dose to the off-site worker assumes only adult exposure and is incorporated into the off-site worker ADL in Table 5.12d.
2. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.2.2 for dermal dose to the worker.

**c: Recommended nursing mother default modifications to EQ 5.4.2.2:**

1. For dermal dose to mother's milk, use the ADL for age 16-30 years in Table 5.12d.
2. The ED and AT variates in EQ 5.4.2.2 are left out for dermal dose in the mother's milk pathway.

**d: Assumptions for EQ 5.4.2.2:**

1. For cancer risk assessment, Exposure Frequency (EF) for vacation time away from exposure is incorporated into the ADLs shown in Tables 5.11 and 5.12 using the basic assumption that cancer risk is associated with cumulative dose of carcinogen. The dose used to estimate cancer risk can be adjusted for EF, and for time spent within the MEIR or MEIW location. Chronic RELs are not necessarily related to cumulative dose. Thus, adjusting the estimated dose for EF at the MEIR or MEIW is not appropriate, and the unadjusted daily rate is used in EQ 5.4.2.2.
2. For worker exposure, the annual average concentration should not be adjusted to account for worker and facility emission schedules, as done for

inhalation cancer risk assessment. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential chronic exposure, the dermal dose contribution for each age group is summed together to obtain the time-weighted average daily dermal dose for chronic hazard assessment:

$$\begin{aligned} & (\text{ADL age } 0 < 2 \times C_s \times \text{ABS} \times 10^{-9} \times 2 / 70 \times (1/350)) + \\ & (\text{ADL age } 2 < 16 \times C_s \times \text{ABS} \times 10^{-9} \times 14 / 70 \times (1/350)) + \\ & (\text{ADL age } 16 - 70 \times C_s \times \text{ABS} \times 10^{-9} \times 54 / 70 \times (1/350)) = \text{Chronic Dose}_{\text{dermal}} \end{aligned}$$

### 5.4.3 *Estimation of Exposure through Ingestion*

Exposure through ingestion is a function of the concentration of the substance in the ingested soil, water, and food, the gastrointestinal absorption of the substance, and the amount ingested.

#### 5.4.3.1 Exposure through Ingestion of Soil

There are no distributions for soil ingestion currently recommended. Tier III stochastic risk assessments should include a high-end point estimate of soil ingestion, soil loading, exposure frequency and soil area.

##### 5.4.3.1.1 *Soil Ingestion Dose for Cancer Risk*

The exposure dose through residential soil ingestion varies by age and is calculated for each age group ((e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8). This pathway is also assessed for exposure to off-site workers. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The dose from inadvertent soil ingestion can be estimated by the point estimate approach using the following general equation:

**A. Equation 5.4.3.1.1:**

$$\text{DOSE}_{\text{soil}} = C_{\text{soil}} \times \text{GRAF} \times \text{SIR} \times 10^{-9} \times \text{EF}$$

1.  $\text{DOSE}_{\text{soil}}$  = Dose from soil ingestion (mg/kg BW-day)
2.  $10^{-9}$  = Conversion factor ( $\mu\text{g}$  to mg, mg to kg)
3.  $C_{\text{soil}}$  = Concentration of contaminant in soil ( $\mu\text{g}/\text{kg}$ )
4. GRAF = Gastrointestinal relative absorption fraction, chemical-specific (unitless)
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. EF = Exposure frequency (unitless), (days/365 days)

**a: Recommended default values for EQ 5.4.3.1.1:**

1.  $C_{\text{soil}}$  = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14
4. EF = 350 d/year resident, 250 d/year worker

In this approach, it is assumed that the soil ingested contains a representative concentration of the contaminant(s) and the concentration is constant over the exposure period.

The term **GRAF**, or gastrointestinal relative absorption factor, is defined as the fraction of contaminant absorbed by the GI tract relative to the fraction of contaminant absorbed from the matrix (feed, water, other) used in the study(ies) that is the basis of either the cancer potency factor (CPF) or the Reference Exposure Level (REL). If no data are available to distinguish absorption in the toxicity study from absorption from the environmental matrix in question (i.e., soil), then  $\text{GRAF} = 1$ . The GRAF allows for adjustment for absorption from a soil matrix if it is known to be different from absorption across the GI tract in the study used to calculate the CPF or REL. In most instances, the GRAF will be 1.

**Table 5.14 Recommended Soil Ingestion Rate (SIR) Estimates for Adults and Children (mg/kg-day)\***

Age Groups (years)	Mean (mg/kg-day)	95 <sup>th</sup> % (mg/kg-day)
3rd Trimester <sup>a</sup>	0.7	3
0<2	20	40
2<9	5	20
2<16	3	10
16<30	0.7	3
16 to 70	0.6	3
PICA adult	NR	-

<sup>a</sup> Assumed to be the mother's soil ingestion rate (adult age 16 <30)

\* Soil includes outdoor settled dust

NR = No recommendation

#### 5.4.3.1.2 Chronic Noncancer Dose for Soil Ingestion

The soil ingestion rate varies by age. A time-weighted average approach is used to combine soil intake rates of the age groupings (i.e., 0<2 yrs, 2<16 yrs, and 16-70 yrs) to determine the residential soil ingestion dose for chronic noncancer hazard assessment. This pathway is also assessed for exposure to offsite workers using the adult intake values for age 16-70 years in Table 5.14. Children at a MEIW daycare, if present, may also be assessed for exposure if the District deems it advisable. The contribution to the soil ingestion dose by each age group is determined in EQ 5.4.3.1.2:

**A. Equation 5.4.3.1.2:**  $\text{DOSE}_{\text{soil}} = C_{\text{soil}} \times \text{GRAF} \times \text{SIR} \times 10^{-9} \times \text{ED}/\text{AT}$

1.  $\text{DOSE}_{\text{soil}}$  = Dose from soil ingestion (mg/kg BW-day)
2.  $10^{-9}$  = Conversion factor ( $\mu\text{g}$  to mg, mg to kg)
3.  $C_{\text{soil}}$  = Concentration of contaminant in soil ( $\mu\text{g}/\text{kg}$ )
4. GRAF = Gastrointestinal relative absorption fraction, unitless; chemical-specific
5. SIR = Soil ingestion rate (mg/kg BW-day)
6. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
7. AT = Averaging time for lifetime exposure – 70 yrs

**a: Recommended default values for EQ 5.4.3.1.2:**

1.  $C_{\text{soil}}$  = Calculated above in EQ 5.3.2 A
2. GRAF = See Table 5.2
3. SIR = See Table 5.14; use 16-70 age group SIR for workers

**b: Recommended off-site worker default modifications to EQ 5.4.3.1.2:**

1. A time-weighted average estimate of dose is not necessary and the ED and AT variates are left out of EQ 5.4.3.1.2 for oral soil dose to the worker.

**c: Recommended nursing mother default modifications to EQ 5.4.3.1.2:**

1. For mother's ingested soil dose to milk, use the SIR for age 16-30 years in Table 5.14.
2. The ED and AT variates in EQ 5.4.3.1.2 are left out for soil ingestion dose in the mother's milk pathway.

**d: Assumptions for EQ 5.4.3.1.2:**

1. For worker exposure, the annual average concentration should not be adjusted to account for overlap of worker and facility emission schedules. The pollutant will be deposited and accumulate in the soil in the absence or presence of the worker; therefore, the total deposition and soil concentration will be dependent on the annual average air concentration.

For residential exposure, the soil ingestion dose contribution for each age group is summed together to obtain the time-weighted average daily soil intake dose for chronic hazard assessment:

$$\begin{aligned} & (\text{SIR for age } 0 < 2 \text{ yrs} \times C_{\text{soil}} \times \text{GRAF} \times 10^{-9} \times 2 / 70) + \\ & (\text{SIR for age } 2 < 16 \text{ yrs} \times C_{\text{soil}} \times \text{GRAF} \times 10^{-9} \times 14 / 70) + \\ & (\text{SIR for age } 16 - 70 \text{ yrs} \times C_{\text{soil}} \times \text{GRAF} \times 10^{-9} \times 54 / 70) = \text{Chronic Dose}_{\text{soil}} \end{aligned}$$

**5.4.3.2 Exposure through Ingestion of Food**

The exposure through food ingestion can be through ingestion of home-grown plant products (categorized as leafy, protected, exposed and root produce), home-raised animals (categorized as meat, cow's milk and eggs), angler-caught fish and mother's milk. When a specific food pathway is a dominant pathway (e.g., homegrown produce), and multiple pathways such as home raised meat, milk, and eggs categories all need to be assessed, the 95<sup>th</sup> percentile default consumption rate for the driving exposure pathway is used, while the mean consumption values for the remaining exposure pathways (i.e., food categories) are used. See Section 8.2.6 for a complete discussion of the methodology on how to implement the derived methodology.

**5.4.3.2.1 *Dose for Cancer Risk from Home-Grown Produce***

Exposure through ingesting home-grown produce (DOSE<sub>p</sub>) is a function of the type of crop (i.e., exposed, leafy, protected, root), gastrointestinal relative absorption factor, bioavailability and the fraction of plant ingested that is homegrown. The calculation is done for each type of crop, then summed to get total dose for this pathway. The

exposure dose through ingestion of home-grown produce varies by age and is calculated for each age group (e.g., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 and 16-70 yrs). These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

**A. Equation 5.4.3.2.1:**

$$\text{DOSEp} = C_v \times \text{IP} \times \text{GRAF} \times L \times \text{EF} \times 10^{-6}$$

1. DOSEp = Exposure dose through ingestion of home-grown produce (mg/kg/d)
2.  $C_v$  = Concentration in specific type of crop, i.e., exposed, leafy, protected, root ( $\mu\text{g}/\text{kg}$ )
3. IP = Consumption of specific type of crop (g/kg BW\*day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of plant type consumed that is home-grown or locally grown (unitless)
6. EF = Exposure frequency (unitless, days/365 days)
7.  $10^{-6}$  = Conversion factors ( $\mu\text{g}/\text{kg}$  to mg/g)

**a: Recommended default values for Equation 5.4.3.2.1:**

1.  $C_v$  = Calculated above in EQ 5.3.4.1 A
2. IP = See Table 5.15 (point estimates) and 5.16a-e (distributions)
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5. EF = 0.96 (350 d/365 d in a yr)

Once the dose for each type of crop that applies is calculated (See Section 5.3.4.1 for definition of crops types), the doses are summed to get the total dose for the home-grown produce pathway:

$$\text{Total DOSEp} = \text{DOSEp (leafy)} + \text{DOSEp (root)} + \text{DOSEp (exposed)} + \text{DOSEp (protected)}$$

The total home-grown produce dose will need to be calculated for each age group that applies.

**5.4.3.2.2 Dose for cancer risk from home-raised meat, eggs, and cow's milk**

Exposure through ingesting home-raised or farm animal products ( $\text{DOSE}_{\text{fa}}$ ) is a function of the type of food (meat, eggs and cow's milk), gastrointestinal relative absorption factor, bioavailability and the fraction of food ingested that is home-raised. The only meat sources considered here are beef, pork and poultry. Unlike the home-grown produce pathway, the dose is calculated and presented separately for each type of home-raised food. The age-specific groupings to determine dose (3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs or 16-70 yrs) is needed in order to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8).

**A. Equation 5.4.3.2.2:**

$$\text{DOSE}_{\text{fa}} = C_{\text{fa}} \times I_{\text{fa}} \times \text{GRAF} \times L \times \text{EF} \times 10^{-6}$$

1.  $\text{DOSE}_{\text{fa}}$  = Exposure dose through ingestion of home-raised animal product (mg/kg/d)
2.  $C_{\text{fa}}$  = Concentration in animal product, e.g., beef, pork, poultry, dairy, eggs ( $\mu\text{g}/\text{kg}$ )
3.  $I_{\text{fa}}$  = Consumption of animal product (g/kg BW-day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of animal product consumed that is home-raised or locally produced (unitless)
6. EF = Exposure frequency (unitless, days/365 days)
7.  $10^{-6}$  = Conversion factors ( $\mu\text{g}/\text{kg}$  to mg/g)

**a: Recommended default values for EQ 5.4.3.2.2:**

1.  $C_{\text{fa}}$  = Calculated above in EQ 5.3.4.2 A
2.  $I_{\text{fa}}$  = See Table 5.15 (point estimates) and Table 5.16a-e (distributions)
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values
5. EF = 0.96 (350 days / 365 days in a year)

**5.4.3.2.3 Chronic Noncancer Dose for Ingestion of Food**

For oral noncancer hazard assessment, a time-weighted average approach is used to combine food ingestion rates for the age groups (i.e., 0<2, 2<16 and 16-70 yrs) to estimate the chronic dose for residential exposure. The equation used to estimate dose through home-grown produce and home-raised meat/eggs/cow's milk is similar and is shown below in one equation. Similar to the cancer risk dose calculation, home-grown produce is presented as a total dose for all types of crops (See Section 5.4.3.2.1) and home-raised animal product dose is presented separately for each type of animal product that applies (See Section 5.4.3.2.2).

The contribution to the food intake dose is determined for each age group in EQ 5.4.3.2.3:

**A. Equation 5.4.3.2.3:**  $\text{DOSE}_{\text{food}} = C_{\text{food}} \times I_{\text{food}} \times \text{GRAF} \times L \times 10^{-6} \times \text{ED}/\text{AT}$

1.  $\text{DOSE}_{\text{food}}$  = Exposure dose through ingestion of home-grown produce or home-raised animal product (mg/kg/d)
2.  $C_{\text{food}}$  = Concentration ( $\mu\text{g}/\text{kg}$ ) in produce (e.g., exposed, leafy, protected, root) or animal product (e.g., beef, pork, poultry, dairy, eggs)
3.  $I_{\text{food}}$  = Consumption of produce or animal product (g/kg BW-day)
4. GRAF = Gastrointestinal relative absorption factor (unitless)
5. L = Fraction of produce or animal product consumed that is home-grown (unitless)
6.  $10^{-6}$  = Conversion factors ( $\mu\text{g}/\text{kg}$  to mg/g)
7. ED = Exposure duration for a specified age group (2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70)
8. AT = Averaging time for lifetime exposure: 70 yrs

**a: Recommended default values for EQ 5.4.3.2.3:**

1.  $C_{\text{food}}$  = Calculated above in EQ 5.3.4.1 A (for home-grown produce) or EQ 5.3.4.2 A (for home-raised animal products)
2.  $I_{\text{food}}$  = Age-specific, see Table 5.15 for point estimates
3. GRAF = See Table 5.2
4. L = Site-specific survey is recommended. Otherwise, see Table 5.17 for Tier I default values

**b: Recommended nursing mother default modifications to EQ 5.4.3.2.3:**

1. For the mother's dose to milk through ingested food, use the food intake rates for age 16-30 years in Table 5.15 and 5.16d.
2. The ED and AT variates in EQ 5.4.3.2.3 are left out for ingested food dose in the mother's milk pathway.

Following calculation of the intake dose contributions for each age group, the intake rates for home-grown produce and the intake rates for home-raised animal products are summed separately to obtain the residential time-weighted average intake dose for chronic residential exposure to home-grown produce and to home-raised animal products:

$$(I_{\text{food}} \text{ for age } 0<2 \text{ yrs} \times C_{\text{food}} \times \text{GRAF} \times L \times 10^{-6} \times 2 / 70) +$$

$$(I_{\text{food}} \text{ for age } 2<16 \text{ yrs} \times C_{\text{food}} \times \text{GRAF} \times L \times 10^{-6} \times 14 / 70) +$$

$$(I_{\text{food}} \text{ for age } 16-70 \text{ yrs} \times C_{\text{food}} \times \text{GRAF} \times L \times 10^{-6} \times 54 / 70) = \text{Chronic Dose}_{\text{food}}$$

**Table 5.15 Recommended Average and High End Point Estimate Values for Home Produced Food Consumption (g/kg-day)<sup>a</sup>**

<sup>a</sup> April 22, 2022: Transcription errors in Table 5.15 were corrected in accordance with corrections made to the source table, Table 7.1 of the 2012 Exposure Assessment and Stochastic Analysis Technical Support Document (EASA TSD). In the original Table 7.1 of the EASA TSD, data from Table 7.12 were incorrectly copied onto the “Ages 2<16” column. The corrected Table 7.1 replaces the data for this age group with data from Table 7.11 and replaces the column header “Ages 2>16” with “Ages 2<16”. Additionally, the corrected Table 7.1 also switches the order of meat types in the Food Category column to reflect the order shown in the source data tables (Tables 7.8 – 7.13 of EASA TSD). The corrections made to Table 7.1 of the EASA TSD on April 22, 2022 were also made to Table 5.15 of this document.).

<sup>b</sup> Food consumption values for 3<sup>rd</sup> trimester calculated by assuming that the fetus receives the same amount of contaminated food on a per kg BW basis as the mother (adult age 16 to less than 30).

**Table 5.17 Default Values for L in EQs 5.4.3.2.1., 5.4.3.2.2 and 5.4.3.2.3: Fraction of Food Intake that is Home-Produced**

Food Type	Households that Garden <sup>a</sup>	Households that Farm <sup>a</sup>
Avg. Total Veg & Fruits	0.137	0.235
	Households that Garden/Hunt <sup>b</sup>	Households that Farm <sup>b</sup>
Beef	0.485	0.478
Pork	0.242	0.239
Poultry	0.156	0.151
Eggs	0.146	0.214
Total Dairy (Cow's milk)	0.207	0.254

<sup>a</sup> As a default for home-produced leafy, exposed, protected and root produce, OEHHA recommends 0.137 as the fraction of produce that is home-grown. The households that grow their own vegetables and fruits are the population of concern. In rural situations where the receptor is engaged in farming, OEHHA recommends 0.235 as the default value for fraction of leafy, exposed, protected and root produce that is home-grown.

<sup>b</sup> OEHHA recommends the fraction home-raised under "Households that raise animals/hunt" (for beef, pork, poultry (chicken), eggs and dairy (cow's milk), with the exception of rural household receptors engaged in farming. OEHHA recommends that the fractions listed under "Households that farm" be used for the rural household receptors.

#### 5.4.3.3 Exposure through Ingestion of Water

Intake of drinking water varies by age on a ml per kg body weight per day basis resulting in differences in exposure dose by age. The age-specific groupings to determine dose are needed in order to properly use the age sensitivity factors for

cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

#### 5.4.3.3.1 Dose for Cancer Risk through Ingestion of Water

DOSE<sub>water</sub> is calculated for each age group (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure in drinking water.

**A. Equation 5.4.3.3.1:** 
$$\text{DOSE}_{\text{water}} = C_w \times \text{WIR} \times \text{ABS}_{\text{swa}} \times \text{Fdw} \times \text{EF} \times 10^{-6}$$

1. DOSE<sub>water</sub> = Exposure dose through ingestion of water (mg/kg BW/d)
2. C<sub>w</sub> = Water concentration (µg/L)
3. WIR = Water ingestion rate (ml/kg BW-day)
4. ABS<sub>swa</sub> = Gastrointestinal relative absorption factor (unitless)
5. Fdw = Fraction of drinking water from contaminated source
6. EF = Exposure frequency (unitless, days/365 days)
7. 10<sup>-6</sup> = Conversion factors (mg/µg)(L/ml)

#### **a: Recommended default values for EQ 5.4.3.3.1:**

1. C<sub>w</sub> = Calculated above 5.3.3 A
2. WIR = See 5.18 (point estimates) and Table 5.19 (distributions)
3. ABS<sub>swa</sub> = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate
5. EF = 0.96 (350 days/365 days in a year)

#### 5.4.3.3.2 Chronic Noncancer Dose through Ingestion of Water

Because water intake varies by age group, a time-weighted average intake approach is used to determine the daily water ingestion dose for chronic residential exposure. The contribution to the water ingestion dose is determined for each age group (i.e., 0<2, 2<16 and 16-70 yrs) in EQ 5.4.3.3.2.

**A. Equation 5.4.3.3.2:**

$$\text{DOSE}_{\text{water}} = C_w \times \text{WIR} \times \text{ABS}_{\text{wa}} \times \text{Fdw} \times 10^{-6} \times \text{ED}/\text{AT}$$

1.  $\text{DOSE}_{\text{water}}$  = Exposure dose through ingestion of water (mg/kg BW/d)
2.  $C_w$  = Water concentration ( $\mu\text{g}/\text{L}$ )
3. WIR = Water ingestion rate (ml/kg BW-day)
4.  $\text{ABS}_{\text{wa}}$  = Gastrointestinal absorption factor
5. Fdw = Fraction of drinking water from contaminated source (site-specific)
6.  $10^{-6}$  = Conversion factors (mg/ $\mu\text{g}$ )(L/ml)
7. ED = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16, 54 yrs for 16-70
8. AT = Averaging time for residential exposure: 70 yrs

**a: Recommended default values for EQ 5.4.3.3.2:**

1.  $C_w$  = Calculated above in 5.3.3 A
2. WIR = See 5.18 (point estimates)
3.  $\text{ABS}_{\text{wa}}$  = Default set to 1
4. Fdw = Default set to 1, although a site-specific survey is recommended for this variate

**b: Recommended nursing mother default modifications to EQ 5.4.3.3.2:**

1. For the dose to mother's milk through water ingestion, use the WIR for age 16-30 years in Table 5.18.
2. The ED and AT variates in EQ 5.4.3.3.2 are left out for ingested water dose in the mother's milk pathway.

The water intake dose contribution for each age group is summed together to obtain the time-weighted average daily residential water ingestion dose:

$$(\text{WIR for age } 0<2 \text{ yrs} \times C_w \times \text{ABS}_{\text{wa}} \times \text{Fdw} \times 10^{-6} \times 2 / 70) +$$

$$(\text{WIR for age } 2<16 \text{ yrs} \times C_w \times \text{ABS}_{\text{wa}} \times \text{Fdw} \times 10^{-6} \times 14 / 70) +$$

$$(\text{WIR for age } 16-70 \text{ yrs} \times C_w \times \text{ABS}_{\text{wa}} \times \text{Fdw} \times 10^{-6} \times 54 / 70) = \text{Chronic Dose}_{\text{water}}$$

**Table 5.18 Recommended Point Estimate  
Tap Water Intake Rates (ml/kg-day)**

Point Estimates				
Using Mean Values	For the Age Period	9-year scenario	30-year scenario	70-year scenario

#### 5.4.3.4 Exposure through Ingestion of Angler-caught Fish

Exposure through ingestion of angler-caught fish ( $DOSE_{fish}$ ) is a function of the fraction of fish ingested that is caught in the exposed water body, which differs for each age grouping, and the gastrointestinal absorption factor. Ingestion of angler-caught fish on a mg/kg body weight per day basis varies by age resulting in differences in exposure dose by age. The age-specific groupings to determine dose is needed primarily to properly use the age sensitivity factors for cancer risk assessment (see Chapter 8) and to calculate a time-weighted average dose for chronic noncancer assessment.

##### 5.4.3.4.1 *Cancer Risk Dose via Ingestion of Angler-Caught Fish*

$DOSE_{fish}$  is calculated for each age group separately (i.e., 3rd trimester, 0<2 yrs, 2<9 yrs, 2<16 yrs, 16<30 yrs and 16-70 yrs), then incorporated into EQ 8.2.5 in Chapter 8 to determine cancer risk through exposure to angler-caught fish.

**A. Equation 5.4.3.4.1:**  $DOSE_{fish} = C_t \times I_{fish} \times Gf \times L \times EF \times 10^{-6}$

1.  $DOSE_{fish}$  = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2.  $C_t$  = Concentration in fish muscle tissue ( $\mu\text{g}/\text{kg}$ )
3.  $I_{fish}$  = Angler-caught fish ingestion rate (g/kg BW per day)
4.  $Gf$  = Gastrointestinal absorption factor (unitless)
5.  $L$  = Fraction of fish caught at exposed site (unitless)
6.  $EF$  = Exposure frequency (days/365 days)
7.  $10^{-6}$  = Conversion factor (mg/ $\mu\text{g}$ , kg/g)

##### **a: Recommended default values for Equation 5.4.3.4.1:**

1.  $C_t$  = Calculated above in Equation 5.3.4.7
2.  $I_{fish}$  = See Table 5.20 (point estimates) and Table 5.21 (distributions)
3.  $Gf$  = Default set to 1
4.  $L$  = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate
5.  $EF$  = 0.96 (350 days/365 days in a yr)

##### 5.4.3.4.2 *Chronic Noncancer Dose via Ingestion of Angler-Caught Fish*

Angler-caught fish consumption varies by age group. A time-weighted average intake for residential consumption over 70 years is used to determine dose for average and high-end exposure. The contribution to the angler-caught fish consumption dose is determined for each age group in EQ 5.4.3.4.2:

**A. Equation 5.4.3.4.2:**  $\text{DOSE}_{\text{fish}} = C_t \times I_{\text{fish}} \times Gf \times L \times 10^{-6} \times \text{ED}/\text{AT}$ 

1.  $\text{DOSE}_{\text{fish}}$  = Dose via ingestion of angler-caught fish (mg/kg BW-day)
2.  $C_t$  = Concentration in fish muscle tissue ( $\mu\text{g}/\text{kg}$ )
3.  $I_{\text{fish}}$  = Angler-caught fish ingestion rate (g/kg BW per day)
4.  $Gf$  = Gastrointestinal absorption factor (unitless)
5.  $L$  = Fraction of fish caught at exposed site (unitless)
6.  $10^{-6}$  = Conversion factor (mg/ $\mu\text{g}$ , kg/g)
7.  $\text{ED}$  = Exposure duration for a specified age group: 2 yrs for 0<2, 14 yrs for 2<16 and 54 yrs for 16-70
8.  $\text{AT}$  = Averaging time for chronic exposure – 70 yrs

**a: Recommended default values for Equation 5.4.3.4.2:**

1.  $C_t$  = Calculated above in Equation 5.3.4.7
2.  $I_{\text{fish}}$  = See Table 5.20 (point estimates)
3.  $Gf$  = Default set to 1
4.  $L$  = Default set to 1 for fraction of fish caught locally, although a site-specific survey is recommended for this variate

**b: Recommended nursing mother default modifications to EQ 5.4.3.4.2:**

1. For the dose to mother's milk through fish consumption, use the  $I_{\text{fish}}$  for age 16-30 years in Table 5.20.
2. The  $\text{ED}$  and  $\text{AT}$  variates in EQ 5.4.3.4.2 are left out for the dose via fish consumption in the mother's milk pathway.

Following calculation of the angler-caught fish consumption dose contribution for each age group, 0<2 yr, 2<16 yr and 16-70 yr fish consumption doses are summed together to obtain the residential chronic dose:

$$(\text{I}_{\text{fish}} \text{ for age } 0<2 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 2 / 70) +$$

$$(\text{I}_{\text{fish}} \text{ for age } 2<16 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 14 / 70) +$$

$$(\text{I}_{\text{fish}} \text{ for age } 16-70 \text{ yrs} \times C_t \times Gf \times L \times 10^{-6} \times 54 / 70) = \text{Chronic Dose}_{\text{fish}}$$

**Table 5.20 Point Estimate Values for Angler-Caught Fish Consumption (g/kg-day) by Age Group**

#### 5.4.3.5 Mother's Milk

Exposure through mother's milk ingestion (Dose-Im) is a function of the average concentration of the substance in mother's milk and the amount of mother's milk ingested. The minimum pathways that the nursing mother is exposed to include inhalation, soil ingestion, and dermal, since the chemicals evaluated by the mother's milk pathway are multipathway chemicals. Other pathways may be appropriate depending on site conditions (e.g., the presence of vegetable gardens or home grown chickens). The compounds currently considered for the mother's milk pathway are:

1. Dioxins and Furans (PCDDs and PCDFs)
2. Polychlorinated biphenyls (PCBs)
3. Polycyclic Aromatic Hydrocarbons (PAHs), including creosotes
4. Lead

These compound classes represent the chemicals of greatest concern for the mother's milk pathway under the Hot Spots program, and for which data are available to estimate transfer coefficients. It is expected that additional transfer coefficients will be developed for other multipathway chemicals in the Hot Spots Program as data becomes available and is reviewed. The nursing mother in the mother's milk pathway is not herself subject to the mother's milk pathway. The summed average daily dose (mg/kg BW-day) from all pathways is calculated for the nursing mother using the equations that follow.

5.4.3.5.1 *Cancer Risk Dose to Infant via Mother's Milk***A. Equation 5.4.3.5.1:**

$$\text{Dose-Im} = C_m \times \text{BMI}_{\text{bw}} \times \text{EF} \times 10^{-3}$$

1. Dose-Im = Dose to infant through ingestion of mother's milk (mg/kg BW per day)
2.  $C_m$  = Concentration of contaminant in mother's milk (mg/kg milk)
3.  $\text{BMI}_{\text{bw}}$  = Daily breast-milk ingestion rate (g/kg BW-day)
4. EF = Frequency of exposure (days / 365 days)
5.  $10^{-3}$  = Conversion factor (kg to g)

**a: Recommended default values for EQ 5.4.3.5.1:**

1.  $C_m$  = See EQ 5.3.4.8
2.  $\text{BMI}_{\text{bw}}$  = See Table 5.22 for point estimates. For distribution (parametric model) for Tier 3 stochastic risk assessments see Table 5.23.
3. EF = 1 (all 365 days of the first year of birth)

**b: Assumptions for EQ 5.4.3.5.1:**

1. For the MEIR, mother is exposed from birth up to 25 years of age when the infant is born. The exposed infant is then fully breastfed only during the first year of life.
2. For cancer risk assessment, exposure of breast-feeding infants to contaminants in breast milk applies only to the first year of the 0<2 yr age group for calculation of risk to this group, which then can be summed with the risk calculated for the other age groups (See Chapter 8).

5.4.3.5.2 *Chronic Noncancer Dose to Infant via Mother's Milk*

For oral noncancer hazard assessment, exposure of the infant through mother's milk ingestion occurs during the first year of life. After one year of age, the mother's milk pathway is not a factor for noncancer assessment.

**A. Equation 5.4.3.5.2:**

$$\text{Dose-Im} = C_m \times \text{BMI}_{\text{bw}} \times 10^{-3}$$

1. Dose-Im = Dose to infant through ingestion of mother's milk (mg/kg BW/d)
2.  $C_m$  = Concentration of contaminant in mother's milk (mg/kg milk)
3.  $\text{BMI}_{\text{bw}}$  = Daily breast-milk ingestion rate (g/kg BW-day)
4.  $10^{-3}$  = Conversion factor (kg to g)

**a: Recommended default values for EQ 5.4.3.5.2:**

1.  $C_m$  = See EQ 5.3.4.8
2.  $\text{BMI}_{\text{bw}}$  = See Table 5.22 for point estimates

**Table 5.22 Default Point Estimates for Breast Milk Intake ( $\text{BMI}_{\text{bw}}$ ) for Breastfed Infants**

Infant Group	Intake (g/kg-day)
<i>Fully breastfed over the first year (i.e., fed in accordance with AAP recommendations)</i>	
Mean	101
95 <sup>th</sup> percentile	139

**Table 5.23 Recommended Distribution of Breast Milk Intake Rates Among Breastfed Infants for Stochastic Assessment\* (Averaged Over an Individual's First Year of Life)**

	Mean (SD)	Percentile							
		5	10	25	50	75	90	95	99
Intake (g/kg-day)	101 (23)	62	71	85	101	116	130	139	154

\* For stochastic analysis, the mother's milk data are normally distributed.

## 6 - Dose-Response Assessment for Noncarcinogenic Endpoints

### 6.1 Derivation of Toxicity Criteria for Noncancer Health Effects

Dose-response assessment describes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of an adverse health impact (the response). Dose-response information for noncancer health effects is used to determine Reference Exposure Levels (RELs). Inhalation RELs are air concentrations or doses at or below which adverse noncancer health effects are not expected even in sensitive members of the general population under specified exposure scenarios. The acute RELs are for infrequent 1 hour exposures that occur no more than once every two weeks in a given year, although this time frame of exposure does not necessarily apply to chemicals that can bioaccumulate (e.g., dioxins and furans, PCBs, and various metals). The chronic RELs are for 24 hour per day exposures for at least a significant fraction of a lifetime, defined as about 8 years ( $\geq 12$  percent of a 70-year lifespan). The 8-hour RELs are for repeated 8-hour exposures for a significant fraction of a lifetime such as the exposures that offsite workers might typically receive. Eight-hour RELs are only available for 10 chemicals at present, but OEHHA will develop 8-hour RELs as we re-evaluate our existing RELs to ensure they are protective of children's health, and as we develop RELs for new chemicals. There are oral chronic RELs for some chemicals in the Hot Spots program that are semivolatile or nonvolatile and thus subject to deposition and oral ingestion or dermal exposure. The methodology for developing RELs is similar to that used by U.S. EPA in developing the inhalation Reference Concentrations (RfCs) and oral Reference Doses (RfDs).

Review and revision of RELs to take into account new information and sensitive subpopulations including infants and children is an ongoing process. All draft RELs for individual chemicals revised under the current noncancer methodology will undergo public comment and peer review, as mandated by the Hot Spots Act.

The first step in determining an acute, 8-hour, or chronic REL is to determine a point of departure. The point of departure is preferably determined by the benchmark concentration procedure applied to human or animal studies, but if this method of calculation cannot be used with a particular data set, a no observed adverse effect level (NOAEL) or lowest observed adverse effect level (LOAEL) may be used as the point of departure. The benchmark concentration method (also referred to as the benchmark dose method for oral exposures) is a preferred method to estimate a point of departure because it takes all of the available dose-response data into account to statistically estimate, typically, a 5 percent response rate.

Dosimetric or toxicokinetic adjustments are often made to the point of departure to adjust for differences in dosimetry or kinetics across species or among humans. Time adjustments are generally applied to adjust experimental exposure to the exposure of

interest for the REL (e.g., 1 hour for acute, continuous for chronic). A modified Haber's equation is used where needed to adjust studies with different exposure times to the one-hour period needed for acute RELs. A simple Haber's law ( $C \times T$ ) adjustment for exposure period duration is used for most 8-hour and chronic RELs.

The time and dosimetry adjusted point of departure is divided by uncertainty factors that reflect the limitations in the current toxicology of the chemical. For example, an interspecies uncertainty factor is applied to account for the differences between humans and animals when an animal study is used. An intraspecies uncertainty factor is usually included to account for differences in susceptibility among the human population. In addition, where benchmark dose modeling is not suitable and a NOAEL is not available, a LOAEL to NOAEL uncertainty factor may be applied when the LOAEL serves as the point of departure. If a chronic study is not available to serve as a basis for a chronic REL, then a subchronic uncertainty factor (for chronic and 8-hour RELs only) may also be applied. Finally, if there are data deficiencies, for example, lack of a developmental toxicity study for a chemical, then a database deficiency factor may be applied. The individual uncertainty factors, which range from 2 to 10 depending on the limitations in the data, are multiplied together for a total uncertainty factor. The point of departure is then divided by the total UF to obtain the REL.

The most sensitive toxicological end point is selected as the basis for the REL when there are multiple adverse health effects. The selection of the most sensitive endpoint as the basis for a REL helps ensure that the REL is protective for all health effects. The use of uncertainty factors helps ensure that the REL is protective for nearly all individuals, including sensitive subpopulations, within the limitations of current scientific knowledge. For detailed information on the methodology and derivations for RELs, including guidance on selection of uncertainty factors, see the Air Toxics Hot Spots Risk Assessment Guidelines Technical Support Document for the Derivation of Noncancer Reference Exposure Levels (OEHHA, 2008).

It should be emphasized that exceeding the acute or chronic REL does not necessarily indicate that an adverse health impact will occur. The REL is not the threshold where population health effects would first be seen. However, levels of exposure above the REL have an increasing but undefined probability of resulting in an adverse health impact, particularly in sensitive individuals (e.g., depending on the toxicant, the very young, the elderly, pregnant women, and those with acute or chronic illnesses). The significance of exceeding the REL is dependent on the seriousness of the health endpoint, the strength and interpretation of the health studies, the magnitude of combined safety factors, and other considerations. In addition, there is a possibility that a REL may not be protective of certain small, unusually sensitive human subpopulations. Such subpopulations can be difficult to identify and study because of their small numbers, lack of knowledge about toxic mechanisms, and other factors. It may be useful to consult OEHHA staff when a REL is exceeded (hazard quotient or hazard index is greater than 1.0). Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a hazard quotient (HQ) and hazard indices (HI).

Tables 6.1 through 6.3 list the currently adopted acute, 8-hour, and chronic inhalation RELs. Some substances that pose a long-term inhalation hazard may also present a chronic hazard via non-inhalation (oral, dermal) routes of exposure. The oral RELs for these substances are presented in Table 6.3. Appendix L provides a consolidated listing of all the acute, 8-hour, and chronic RELs with the respective target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web site at [www.oehha.ca.gov](http://www.oehha.ca.gov) (look under "Air", then select "Hot Spots Guidelines") to determine if any new or updated RELs have been adopted since the last guideline update.

## 6.2 Acute Reference Exposure Levels

OEHHA developed acute RELs for assessing potential noncancer health impacts for short-term, one-hour peak exposures to facility emissions (OEHHA, 2008; <http://www.oehha.ca.gov/air/allrels.html>). By definition, an acute REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or  $\mu\text{g}/\text{m}^3$ ) for the specified exposure duration on an intermittent basis.

The target organ systems and the acute RELs for each substance are presented in Table 6.1. Many acute RELs are based on mild adverse effects, such as mild irritation of the eyes, nose, or throat, or may result in other mild adverse physiological changes. For most individuals, it is expected that the mild irritation and other adverse physiological changes will not persist after exposure ceases. For RELs that have been recently developed or revised, the notation "sensory irritation" has been added in parenthesis in Table 6.1 for those chemicals that have an acute REL based on sensory irritation of the respiratory system (i.e., nose, throat) and/or eyes.

Other acute RELs are based on reproductive/developmental endpoints, such as teratogenicity or fetotoxicity, which are considered severe adverse effects. The inhalation pathway is the only pathway to assess for acute exposure. Other non-inhalation pathways of exposure are evaluated for worker and residential scenarios where the exposures are chronic or repeated daily in nature. The oral RELs are used to evaluate the non-inhalation pathways of exposure. Noninhalation (oral) RELs are discussed in Section 6.5. Chapter 8 discusses the methods used for determining noncancer acute health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

**Table 6.1 Acute Inhalation Reference Exposure Levels (RELs) and Acute Hazard Index Target Organ System(s)**

Substance	Chemical Abstract Service Number (CAS)	Acute Inhalation REL ( $\mu\text{g}/\text{m}^3$ )	Acute Hazard Index Target Organ Systems(s)

### 6.3 8-hour Reference Exposure Levels

OEHHA has developed 8-hour RELs for assessing potential noncancer health impacts for exposures to the general public that occur on a recurrent basis, but only during a portion of each day (OEHHA, 2008; <http://www.oehha.ca.gov/air/allrels.html>). Eight-hour RELs are compared to air concentrations that represent an average (daily) 8-hour exposure. They were designed to address off-site worker exposure at the MEIW, but may also be used at the Districts' discretion to characterize 8-hour residential noncancer exposures, particularly for non-continuous facility operations where exposure is based on air concentrations during facility operation (i.e., the zero emission hours are not included) rather than averaged over 24-hours/day, 7 days/week as assessed for chronic exposure. The 8-hour RELs can also be used to assess exposure of students and teachers while at school (OEHHA, 2008). These RELs were developed because of concerns that applying the chronic REL in some scenarios was

overly conservative. By definition, an 8-hour REL is an exposure that is not likely to cause adverse health effects in a human population, including sensitive subgroups, exposed to that concentration (in units of micrograms per cubic meter or  $\mu\text{g}/\text{m}^3$ ) for an 8-hour exposure duration on a regular (including daily) basis.

The RELs, target organ systems, and the averaging time for substances that can present a potential hazard from inhalation for 8 hours on a daily basis are presented in Table 6.2. Chapter 8 discusses the methods used for determining noncancer 8-hour health impacts. Appendix I presents an example calculation used to determine an HQ and HI.

Any substances in Table 6.2 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development".

**Table 6.2 Eight-Hour Inhalation Reference Exposure Levels (RELs) and 8-Hour Hazard Index Target Organ System(s)**

Substance	Chemical Abstract Service Number (CAS)	Chronic Inhalation REL ( $\mu\text{g}/\text{m}^3$ )	Chronic Inhalation Hazard Index Target Organ System(s)

#### 6.4 Chronic Reference Exposure Levels

OEHHA has developed chronic RELs for assessing noncancer health impacts from long-term exposure. (OEHHA, 2008; see also <http://www.oehha.ca.gov/air/allrels.html>) A chronic REL is a concentration level (expressed in units of micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) for inhalation exposure and in a dose expressed in units of milligrams per kilogram-day (mg/kg-day) for oral exposures) at or below which no adverse health effects are anticipated following long-term exposure. Long-term exposure for these purposes has been defined by U.S. EPA as at least 12% of a lifetime, or about eight years for humans. Table 6.3 lists the chronic noncancer RELs that should be used in

the assessment of chronic health effects from inhalation exposure. Appendix L provides a consolidated listing of all the acute, 8-hour and chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA. See OEHHA's web site <http://www.oehha.ca.gov/air/allrels.html> to determine if any new or updated RELs have been adopted since the last guideline update.

The organ system(s) associated with each chronic REL are also presented in Table 6.3. Any substances in Table 6.3 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

**Table 6.3 Chronic Inhalation Reference Exposure Levels (RELs) and Chronic Hazard Index Target Organ System(s)**

Substance	Chemical Abstract Service Number (CAS)	Chronic Inhalation REL ( $\mu\text{g}/\text{m}^3$ )	Chronic Inhalation Hazard Index Target Organ System(s)
Acetaldehyde <sup>a</sup>	75-07-0	$1.4 \times 10^{+2}$	Respiratory System

Xylenes (m, o, p-isomers)	1330-20-7	$7.0 \times 10^{+2}$	Nervous System; Respiratory System; Eyes

<sup>a</sup> These peer-reviewed values were developed under the Toxic Air Contaminant (TAC) Program mandated by AB1807 (California Health and Safety Code Sec. 39650 *et seq.*).

<sup>b</sup> The OEHHA has adopted the World Health Organization Toxicity Equivalency Factor (TEF) scheme for evaluating the cancer risk and noncancer hazard due to exposure to samples containing mixtures of polychlorinated dibenzo-*p*-dioxins (PCDD) (also referred to as chlorinated dioxins and dibenzofurans), polychlorinated dibenzofurans (PCDF) and polychlorinated biphenyls (PCBs). The TEF values are revised from time to time to reflect new data and increased scientific knowledge. Currently OEHHA recommends use of the 2005 revision to the WHO TEF values (WHO<sub>05</sub>-TEF). See Appendix E for more information about the scheme and for the methodology for calculating 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD) equivalents for PCDD and PCDFs. For

convenience, OEHHA has calculated chronic REL values for speciated PCDDs, PCDFs and PCBs based on the WHO<sub>05</sub> TEF values and the chronic REL for 2,3,7,8-TCDD using the procedure discussed in Appendix E. The chronic REL values can be used to calculate a hazard index when the mixtures are speciated from individual congener ground level concentrations. In those cases where speciation of dioxins and furans has not been performed, then 2,3,7,8-TCDD serves as the surrogate for dioxin and furan emissions.

N/A Not Applicable

## 6.5 Chronic Oral (Noninhalation) Reference Exposure Levels

As specified throughout the guidelines, estimates of long-term exposure resulting from facility air emissions of specific compounds must be analyzed for both inhalation and noninhalation (multipathway) pathways of exposure for humans. Facilities often emit substances under high temperature and pressure in the presence of particulate matter. While some of these substances are expected to remain in the vapor phase, other substances such as metals and semi-volatile organics can be either emitted as particles, form particles after emission from the facility, or adhere to existing particles. Some substances will partition between vapor and particulate phases. Substances in the particulate phase can be removed from the atmosphere by settling and, thus, potentially present a significant hazard via noninhalation pathways.

Particulate-associated chemicals can be deposited directly onto soil, onto the leaves or fruits of crops, or onto surface waters. Exposure via the oral route is the predominant noninhalation pathway, resulting in the noninhalation RELs being referred to as 'oral RELs' in this document. The oral RELs are used for both ingestion and dermal exposures, and are applied using the chronic non-inhalation exposures in the residential scenario and the worker scenarios. The oral RELs are expressed as doses in milligrams of substance (consumed and dermally absorbed) per kilogram body weight per day (mg/kg-day).

Table 6.4 lists the chronic noncancer RELs to be used in the assessment of chronic health effects from noninhalation pathways of exposure. Any substances in Table 6.4 with Development or Reproductive System as a target organ system are represented in HARP and in the Appendix L REL tables under the single endpoint "Reproductive/Development". Appendix L provides a consolidated listing of all chronic RELs and target organs that are approved for use by OEHHA and ARB for the Hot Spots Program. Periodically, new or updated RELs are adopted by OEHHA and these guidelines will be updated to reflect those changes. See OEHHA's web page at <http://www.oehha.ca.gov/air/allrels.html> to determine if any new or updated RELs have been adopted since the last guideline update. Chapter 8 discusses the methods used for determining potential noncancer health impacts and Appendix I presents example calculations used to determine a HQ and HI.

Substance	Chemical Abstract Service No. (CAS)	Chronic Oral REL (mg/kg-day)	Chronic Oral Hazard Index Target Organ System(s)
Selenium and Selenium Compounds (other than hydrogen selenide)	7782-49-2	$5.0 \times 10^{-3}$	Alimentary System (Liver); Cardiovascular System; Nervous System

<sup>a</sup> The OEHHA has adopted the World Health Organization Toxicity Equivalency Factor (TEF) scheme for evaluating the cancer risk and noncancer risk due to exposure to samples containing mixtures of polychlorinated dibenzo-*p*-dioxins (PCDD) (also referred to as chlorinated dioxins and dibenzofurans), polychlorinated dibenzofurans (PCDF), and polychlorinated biphenyls (PCBs). The TEF values are revised from time to time to reflect new data and increased scientific knowledge. Currently OEHHA recommends use of the 2005 revision to the WHO TEF values (WHO<sub>05</sub>-TEF). See Appendix E for more information about the scheme and for the methodology for calculating 2,3,7,8-equivalents for PCDD and PCDFs. For convenience, OEHHA has calculated chronic ‘oral’ REL values for speciated PCDDs, PCDFs, and PCBs based on the WHO<sub>05</sub> TEF values and the chronic ‘oral’ REL for 2,3,7,8-tetrachlorodibenzo-*p*-dioxin using the procedure discussed in Appendix E. The chronic ‘oral’ REL values can be used to calculate a hazard index when the mixtures are speciated from individual congener ground level concentrations. In those cases where speciation of dioxins and furans has not been performed, then 2,3,7,8-TCDD serves as the surrogate for dioxin and furan emissions.

## 7 - Dose-Response Assessment for Carcinogens

### 7.1 Introduction

Dose-response assessment characterizes the quantitative relationship between the amount of exposure to a substance (the dose) and the incidence or occurrence of injury (the response). The process often involves establishing a toxicity value or criterion to use in assessing potential health risk. The toxicity criterion, or health guidance value, for carcinogens is the cancer potency slope (potency factor), which describes the potential risk of developing cancer per unit of average daily dose over a 70-year lifetime. Cancer inhalation and oral potency factors have been derived by the Office of Environmental Health Hazard Assessment (OEHHA) or by the United States Environmental Protection Agency (U.S. EPA) and approved by the State's Scientific Review Panel on Toxic Air Contaminants. They are available for many of the substances listed in Appendix A (List of Substances) as carcinogens. Table 7.1 and Appendix L list the inhalation and oral cancer potency factors that should be used in multipathway health risk assessments (HRAs) for the Hot Spots Program.

The details on the methodology of dose-response assessment for carcinogens and the approved cancer potency factors are provided in the Air Toxics Hot Spots Risk Assessment Guidelines. Part II. Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures. May, 2009. (OEHHA, 2009; see [http://www.oehha.ca.gov/air/hot\\_spots/tsd052909.html](http://www.oehha.ca.gov/air/hot_spots/tsd052909.html)).

### 7.2 Carcinogenic Potency

Cancer potency factors used for both the inhalation and oral routes in the Hot Spots program are generally the 95% upper confidence limits (UCL) on the modeled dose-response slope at the low dose range. The cancer slope factor assumes continuous lifetime exposure to a substance, and is expressed in units of inverse dose [i.e.,  $(\text{mg}/\text{kg}/\text{day})^{-1}$ ]. Another common potency expression is in units of inverse concentration [ $(\mu\text{g}/\text{m}^3)^{-1}$ ] when the slope is based on exposure concentration rather than dose; this is termed the unit risk factor. To accommodate the use of age-specific exposure variates, the Hot Spots program has translated the unit risk factors based on concentration to units of inverse dose. This allows calculation of risk for age groupings, as exposure varies with age. It also allows for application of Age Sensitivity Factors for early life exposures.

It is assumed in cancer risk assessments that risk is directly proportional to dose and that, for most carcinogens, there is no threshold for carcinogenesis. The derivation of inhalation and oral cancer potency factors takes into account information on pharmacokinetics, when available, and on the mechanism of carcinogenic action.

Table 7.1 and Appendix L list inhalation and oral cancer potency factors that should be used in risk assessments for the Hot Spots Program. Chapter 8 describes procedures for use of potency factors in estimating potential cancer risk.

### **7.2.1 Inhalation Cancer Potency Factors**

The risk assessment methodology and algorithms presented in Chapter 8 express the inhalation cancer slope factors in units of inverse dose (i.e.,  $(\text{mg}/\text{kg}/\text{day})^{-1}$ ). Breathing rates, expressed in units of liters per kilogram of body weight-day ( $\text{L}/\text{kg}\text{-day}$ ), are multiplied with the air concentrations, coupled with the appropriate unit conversion factor, to estimate dose in  $\text{mg}/\text{kg}\text{-day}$ . This allows estimation of average and high-end cancer risk point estimates. Estimation of a distribution of cancer risk based on variability in breathing rate can be obtained by Monte Carlo methods using the distributions of breathing rates in  $\text{L}/\text{kg}\text{-day}$ , which can then be converted to a dose distribution in  $\text{mg}/\text{kg}$  BW based on the intake rate. Unit risk factors [in the units of inverse concentration (i.e.,  $(\mu\text{g}/\text{m}^3)^{-1}$ ), which were used in previous guidelines for the Hot Spots program, are still listed in the TSD (OEHHA, 2009) and may prove useful in other risk assessment applications.

The average daily inhalation dose ( $\text{mg}/\text{kg}\text{-day}$ ) multiplied by the cancer potency factor ( $\text{mg}/\text{kg}\text{-day}$ )<sup>-1</sup> will give the inhalation cancer risk (unitless), which is an expression of the chemical's cancer risk during a 70-year lifespan of exposure. For example, an inhalation cancer risk of  $5 \times 10^{-6}$  is the same as stating that an individual has an estimated probability of developing cancer from their exposure of 5 chances per million people exposed. A more complete description of how potential cancer risk is calculated from the exposure dose and cancer potency factors is provided in Chapter 8. Appendix I presents an example calculation for determining cancer risk.

A list of current inhalation potency factors is provided in Table 7.1. Periodically, new or revised cancer potency factors will be peer reviewed by the State's Scientific Review Panel on Toxic Air Contaminants (SRP) and adopted by the Director of OEHHA. For new or updated numbers, consult the OEHHA web site at ([http://www.oehha.ca.gov/air/hot\\_spots/tsd052909.html](http://www.oehha.ca.gov/air/hot_spots/tsd052909.html)) to determine if any new or updated cancer potency factors have been adopted since this guideline update. New cancer potency factors that have been approved by the SRP and adopted by the Director of OEHHA should be incorporated into Hot Spots risk assessment for facilities that emit those chemicals.

### **7.2.2 Oral Cancer Potency Factors**

Under the Hot Spots Program, a few substances are evaluated for exposure and risk from non-inhalation pathways – these are referred to as multipathway substances. Multipathway substances have the potential to impact a receptor through inhalation and noninhalation (oral and dermal) exposure routes. These substances include heavy metals and semi-volatile organic substances such as dioxins, furans, and polycyclic aromatic hydrocarbons (PAHs). These substances commonly exist in the particle

phase or partially in the particle phase when emitted into the air. They can therefore be deposited onto soil, vegetation, and water. Noninhalation exposure pathways considered under the Hot Spots Program include the ingestion of soil, homegrown produce, meat, milk, surface water, breast milk, and fish as well as dermal exposure to contaminants deposited in the soil. See Table 5.1 for a list of the multipathway substances.

Table 7.1 and Appendix L list oral cancer potency factors in units of  $(\text{mg}/\text{kg}\text{-day})^{-1}$  that should be used for assessing the potential cancer risk for these substances through noninhalation exposure pathways. The cancer risk from these individual pathways is calculated by multiplying the dose  $(\text{mg}/\text{kg}\text{-day})$  times the oral cancer potency factor  $(\text{mg}/\text{kg}\text{-day})^{-1}$  to yield the potential cancer risk (unitless) from non-inhalation exposures. Chapter 5 provides all of the algorithms to calculate exposure dose through all of the individual exposure pathways. Appendix I provides a sample calculation for dose and cancer risk using the inhalation exposure pathway.

Three carcinogens (cadmium, beryllium, and nickel), although subject to deposition, are only treated as carcinogenic by the inhalation route and not by the oral route. Therefore, there are no oral cancer potency factors for these substances. However, the oral doses of these substances need to be estimated because of their noncancer toxicity. See Chapters 6 and 8, and Appendices I and L for dose-response factors, and calculations to address these substances.

2,4,6-Trichlorophenol	88-06-2	7.0 x 10 <sup>-2</sup>	
Urethane	51-79-6	1.0 x 10 <sup>+0</sup>	
Vinyl chloride	75-01-4	2.7 x 10 <sup>-1</sup>	

**Notes for Table 7.1**

- # Asbestos:  $[100 \text{ PCM fibers/m}^3]^{-1}$  A unit risk factor of  $2.7 \times 10^{-6} (\mu\text{g/m}^3)^{-1}$  and an inhalation cancer potency factor of  $2.2 \times 10^{+2} (\text{mg/kg BW}\cdot\text{day})^{-1}$  are available (see Appendix C for explanation).
- BaP PAHs and PAH Derivatives: Many have potency equivalency factors relative to benzo[a]pyrene (see Appendix G). For multipathway chemicals, including PAHs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.
- A Polychlorinated Dibenzo-*p*-dioxins, Polychlorinated Dibenzofurans and speciated polychlorinated biphenyls: (see Appendix E). For convenience, OEHHA has calculated cancer potency factors for speciated polychlorinated dibenzo-*p*-dioxin, polychlorinated dibenzofuran and polychlorinated biphenyl congeners using the procedure in Appendix E.
- B Diesel Exhaust is listed as a Toxic Air Contaminant by the Air Resources Board as "Particulate Matter from Diesel-Fueled Engines". (See Appendix D)
- \* Creosote: Can be calculated using Potency Equivalency Factors contained in the benzo[a]pyrene Toxic Air Contaminant document and in Appendix G of these guidelines.
- P1 Polychlorinated Biphenyls (PCBs): High Risk is for use in cases where congeners with more than four chlorines do not comprise less (are greater) than one-half percent of total PCBs. The high risk number is the default for unspciated PCB mixtures.
- P2 The low risk number is generally not applicable to the Hot Spots program. The Hot Spots program addresses PCBs emitted by stationary facilities. It cannot be assumed that such emissions would occur by simple evaporation. There is a dermal absorption factor applied in evaluation of the dermal pathway for PCBs so the medium risk would not apply to dermal exposure (OEHHA, 2009). The water pathway does not include an assumption that PCB isomers are water soluble, so the medium number would not apply to the water pathway.
- P3 Polychlorinated Biphenyls (PCBs): Lowest Risk is for use in cases where congeners with more than four chlorines comprise less than one-half percent of total PCBs. In order for the low number to be used, scientific justification needs to be presented.
- P4 Number in parentheses is the IUPAC #, the PCB nomenclature is IUPAC. For multipathway chemicals, including PCBs, the oral slope factor is considered the same as the inhalation potency factor unless otherwise noted in the Table.

## 8 - Risk Characterization for Carcinogens and Noncarcinogens and the Requirements for Hot Spots Risk Assessments

### 8.1 Introduction

Risk characterization is the final step of the health risk assessment (HRA). In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks to the general public from emissions. In the Hot Spots program, OEHHA conducts the dose-response assessment during the development of cancer potency factors and Reference Exposure Levels. These are used in conjunction with the exposure estimates to estimate cancer risk and evaluate hazard from noncancer toxicity of emitted chemicals. Under the Air Toxics Hot Spots (Hot Spots) Act, risk characterizations should present both individual and population-wide health risks (Health and Safety Code Section (HSC) 44306). Persons preparing HRAs for the Hot Spots Program should consult the local Air Pollution Control or Air Quality Management District (District) to determine if the District has special guidelines to assist with HRA format or other requirements of the Hot Spots Program.

OEHHA is recommending that a 30-year exposure duration be used as the basis for estimating cancer risk at the maximum exposed individual resident (MEIR) in the Hot Spots Program. This exposure duration represents the time of residency for 90 to 95% of Californians at a single location and should provide adequate public health protection against individual risk. We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

This chapter provides guidance on how to evaluate the risk characterization component of risk assessments required by the Hot Spots Program. A general summary of the risk characterization components includes the following items and information.

- The locations of the point of maximum impact (PMI), the MEIR, and the maximum exposed individual worker (MEIW) are to be identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices (averaging times for acute 1-hour, repeated 8-hour, and chronic hazard indices) may not be the same location; all should be identified.

- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities - contact the District or reviewing authority for more information) should be identified
- Estimates of population-wide cancer risk and noncancer hazard

This information must be clearly presented in cross-referenced text, tables, figures, and maps. Chapter 9 provides an outline that specifies the content and recommended format of HRA results. The HARP software is the recommended model for calculating HRA results for the Hot Spots Program. Information on obtaining the HARP software can be found under the Air Toxics Program on the ARB's web site at [www.arb.ca.gov](http://www.arb.ca.gov).

### 8.1.1 Tiered Approach to Risk Assessment

The tiered approach for risk assessment that is presented in detail in the TSD (OEHHA, 2012) and summarized here should be reviewed prior to conducting the health risk assessment. The tiered approach to risk assessment and the health impacts evaluation described here are included in the HARP software.

The tiered approach provides a risk assessor with flexibility and allows consideration of site-specific differences (Table 8.1). The four-tiered approach to risk assessment is intended to primarily apply to residential cancer risk assessment, both for inhalation and noninhalation pathways. Risk assessors can tailor the level of effort and refinement of an HRA by using either the point estimate exposure assumptions as the basis of the exposure and risk assessment, or both the point estimate and a stochastic treatment of exposure factor distributions.

**Table 8.1 The Tiered Approach to Risk Assessment**

<b>Tier</b>	<b>Description</b>	<b>When Applied</b>
Tier 1	Utilizes OEHHA default point estimates of exposure variates	All risk assessments must include a Tier 1 assessment
Tier 2	Utilizes site-specific point estimates for exposure variates (justified, and approved by OEHHA)	A Tier 2 approach may be presented in addition to Tier 1
Tier 3	Utilizes OEHHA distributions of exposure variates	A Tier 3 approach may be presented in addition to Tier 1
Tier 4	Utilizes site-specific distributions of exposure variates (justified, and approved by OEHHA)	A Tier 4 approach may be presented in addition to Tier 1

Tier 1 is a standard point estimate approach that uses the recommended exposure variate (e.g., breathing or water ingestion rate) point estimates presented in this document. Derivations of these values are described in detail in OEHHA (2012). The results of the Tier 1 evaluations are required to be presented in the risk characterization section for all HRAs prepared for the Hot Spots Program. Thus, persons preparing an HRA using Tier 2 through Tier 4 evaluations must also include the risk characterization results of a Tier 1 evaluation in the HRA.

As discussed in OEHHA (2012), if the risk characterization results from a Tier 1 assessment are above a regulatory level of concern, the risk assessor may want to proceed with more site-specific analysis as described in Tier 2, or use a more resource-intensive stochastic modeling effort described in Tier 3 and Tier 4 (for cancer risk). While further evaluation may provide more information to the risk manager on which to base decisions, the Tier 1 evaluation is useful in comparing risks among a large number of facilities and must be included in all HRAs.

Tier 2 analysis allows the use of available and justifiable site-specific exposure variates (e.g., fish consumption), when presenting the potential health impacts. The site-specific information applied in a Tier 2 assessment must be adequately justified and approved by OEHHA and the District. In Tier 3, a stochastic approach to exposure assessment is taken using the distributions for the exposure pathways presented in the TSD (OEHHA, 2012) and in Chapter 5 of this Guidance Manual. The exposure distributions apply only to a residential receptor and are used only for the determination of cancer risk. OEHHA has not developed exposure intake distributions for workers to use in the offsite worker exposure scenario. Tier 4 is also a stochastic approach for the residential exposure scenario but allows for utilization of site-specific exposure variate distributions if they are justifiable and more appropriate for the site under evaluation than those derived in OEHHA (2012). Alternative site-specific distributions must be approved by OEHHA and the District. For an off-site worker cancer risk evaluation, Tiers 3 and 4 do not apply. Tier 3 and Tier 4 analyses show what a distribution of potential cancer risk may be to an individual or population based on a distribution of exposure inputs (e.g., water ingestion rate) rather than specific point estimates of exposure.

Table 8.2 summarizes OEHHA's recommendations for use of the four Tiers in cancer and noncancer risk assessment.

**Table 8.2 Tiers for Residential and Offsite Worker Cancer and Noncancer Hot Spots Risk Assessments**

Tier	Cancer		Non Cancer Chronic and 8-Hour	
	Inhalation	Noninhalation	Inhalation	Noninhalation
Tier-1	X	X	X	X
Tier-2	X	X		X <sup>b</sup>
Tier-3	X <sup>a</sup>	X <sup>a</sup>		
Tier-4	X <sup>a</sup>	X <sup>a</sup>		

<sup>a</sup> Applies to residential exposure scenario only

<sup>b</sup> Applies to chronic noncancer exposure only

OEHHA has not developed a stochastic approach (Tier 3 or 4) for estimating noncancer health impacts using acute, 8-hour, and chronic Reference Exposure Levels (RELs). Tier 1 is the only option for determining noncancer health impacts from inhalation exposure since calculating the hazard quotient involves dividing the ground level air concentrations for the specified exposure duration by the appropriate RELs. However, chronic noninhalation noncancer risks involve a calculation of dose from oral or dermal pathways to which site-specific evaluations could be considered under a Tier 2 approach.

#### Small foot-print facilities – Tier 2 or Tier 4

Some facilities subject to the Air Toxics Hot Spots Act (e.g., some in the industry-wide categories such as gas stations or dry cleaners) have very small zones of impact. In some of these instances, there will be very few receptors within the zone of impact. It isn't possible to develop special recommendations for exposure variates for all possible exposure scenarios. Alternative breathing rates (point estimates or distributions) may be used as part of Tier 2 or Tier 4 risk assessments with appropriate supporting justification in the case of a very small zone of impact. OEHHA is willing to work with risk managers at ARB and the Districts on this issue.

## **8.2 Risk Characterization for Carcinogens**

Cancer risk is calculated by multiplying the daily inhalation or oral dose (calculated in Chapter 5), by a cancer potency factor, the age sensitivity factor, the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk (see section 8.2.4). As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location. A brief description of the age sensitivity factors, exposure duration, and frequency of time spent at home are included in Sections 8.2.1 to 8.2.3 below. These factors are discussed in detail in OEHHA (2009) and OEHHA (2012).

### **8.2.1 Adjustment for Early Life Stage Exposures to Carcinogens**

Studies have shown that young animals are more sensitive than adult animals to exposure to many carcinogens (OEHHA, 2009). Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure (Table 8.3). These factors were developed and described in detail in OEHHA (2009). In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood.

**Table 8.3 Age Sensitivity Factors by Age Group for Cancer Risk Assessment**

Age Group	Age Sensitivity Factor (unitless)
3 <sup>rd</sup> Trimester	10
0<2 years	10
2<9 years	3
2<16 years	3
16<30 years	1
16-70 years	1

For specific carcinogens where data indicate enhanced sensitivity during life stages other than the immediate postnatal and juvenile periods, or for which data demonstrate ASFs different from the default ASFs, the chemical-specific data should be used in order to adequately protect public health.

The risk assessments generated under the Air Toxics Hot Spots Act are reviewed by OEHHA. If a risk assessor had data indicating there are no windows of susceptibility early in life or that a different ASF should be used for a specific carcinogen and wanted to use these data, OEHHA would review the material as part of the review of the risk assessment.

### 8.2.2 Fraction of Time Spent at Home for Cancer Risk Assessment

OEHHA and ARB evaluated information from activity patterns databases to estimate the fraction of time at home (FAH) during the day (OEHHA, 2012). This information can be used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. From the third trimester to age <2 years, 85% of time is spent at home (Table 8.4). From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. Facilities with any school within the  $1 \times 10^{-6}$  (or greater) isopleth should use FAH = 1 for the child age groups (3<sup>rd</sup> Trimester, 0<2 years, and 2<16 years). See Appendix I for an example calculation using the FAH.

**Table 8.4 Recommendations for Fraction of Time at Home (FAH) for Evaluating Residential Cancer Risk**

Age Range	Fraction of Time at Residence
3 <sup>rd</sup> Trimester, and 0<2 years	0.85 <sup>1</sup>
2<16 years <sup>2</sup>	0.72 <sup>1</sup>
16-70 years <sup>3</sup>	0.73

<sup>1</sup> Use FAH = 1 if a school is within the  $1 \times 10^{-6}$  (or greater) cancer risk isopleth

<sup>2</sup> Also use FAH = 0.72 for 2<9 yr age group.

<sup>3</sup> Also use FAH = 0.73 for 16<30 yr age group.

The FAH is calculated based on a diary of trips taken over a 24-hour period on the survey day. Ninety-five percent of the diary days were on weekdays. Participants can select “vacation” as one of their trips. However, vacation time represented only a fraction (0.68%) of the over 175,000 trips recorded in the survey. Because much of these vacation trips were presumed to be within-day trips and were only a small fraction of total trips, there is likely little overlap with the Exposure Frequency (EF) variate used in the dose equations in Chapter 5.

### 8.2.3 *Exposure Duration for Estimating Cancer Risk to Residents and Off-Site Workers*

OEHHA recommends that an exposure duration (residency time) of 30 years be used to estimate individual cancer risk for the maximally exposed individual resident (MEIR) (Table 8.5). OEHHA also recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans. The Districts, however, may opt to use the 70 year cancer risk for notification and risk reduction audits and plans.

Note that the 30-year exposure duration starts in the third trimester to accommodate the increased susceptibility of exposures in early life (OEHHA, 2009), and would apply to both the point estimate and stochastic approaches.

**Table 8.5 Summary of Recommendations for Exposure Duration for Individual Cancer Risk at the MEIR and MEIW**

<b><i>Receptor</i></b>	<b><i>Recommendation</i></b>
Resident (MEIR)	30 years
Resident (supplemental Information)	9 years for central tendency; 70 years for maximum (lifetime)
Worker (MEIW)	25 years

Exposure durations of 9-years and 70-years are also recommended to be evaluated for the MEIR to show the range of cancer risk based on residency periods. If a facility is notifying the public regarding cancer risk, the 9- and 70-year cancer risk estimates are useful for people who have resided in their current residence for periods shorter and longer than 30 years.

The 9-, 30-, and 70-year exposures are chosen to coincide with U.S. EPA’s estimates of the average (9 years), high-end estimates (30-years) of residence time, and a lifetime residency (70 years). These estimates are also consistent with what is known about residence time in California. Together, the 9-, 30-, and 70-year cancer risk calculations provide a useful presentation of cancer risk and the relationship to duration of residency and, thus, exposure to a facility’s emissions.

For the maximally exposed individual worker (MEIW), OEHHA recommends using an exposure duration of 25 years to estimate individual cancer risk for the off-site worker scenario (Table 8.5). This duration represents approximately the 95th percentile of job tenure with the same employer in the U.S.

### 8.2.4 Calculating Residential and Offsite Worker Inhalation Cancer Risk

#### Residential Receptors

For residential inhalation exposure, cancer risk must be separately calculated for specified age groups (Eq. 8.2.4A, see Section 8.2.1), because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure. The following equation illustrates the formula for calculating residential inhalation cancer risk. See Appendix I for a detailed example calculation.

**A. Equation 8.2.4 A:** 
$$\text{RISK}_{\text{inh-res}} = \text{DOSE}_{\text{air}} \times \text{CPF} \times \text{ASF} \times \text{ED/AT} \times \text{FAH}$$

- 7.  $\text{RISK}_{\text{inh-res}}$  = Residential inhalation cancer risk
- 8.  $\text{DOSE}_{\text{air}}$  = Daily inhalation dose (mg/kg-day)
- 9. CPF = Inhalation cancer potency factor (mg/kg-day<sup>-1</sup>)
- 10. ASF = Age sensitivity factor for a specified age group (unitless)
- 11. ED = Exposure duration (in years) for a specified age group
- 12. AT = Averaging time for lifetime cancer risk (years)
- 13. FAH = Fraction of time spent at home (unitless)

#### **a: Recommended default values for EQ 8.2.4 A:**

- 5.  $\text{DOSE}_{\text{air}}$  = Calculated for each age group from Eq. 5.4.1
- 6. CPF = Substance-specific (see Table 7.1)
- 7. ASF = See Section 8.2.1
- 8. ED = 0.25 years for 3<sup>rd</sup> trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70
- 9. AT = 70 years\*
- 10. FAH = See Table 8.4

\*Although AT actually sums to 70.25 years when the 3<sup>rd</sup> trimester (0.25 years) is included, OEHHA recommends rounding AT = 70 years (and rounding residential exposure durations at 9- and 30-years rather than 9.25- and 30.25-years) to simplify the calculation without causing a significant adjustment. Note that the dose for the 3<sup>rd</sup> trimester is based on the breathing rate of pregnant women using the assumption that the dose to the fetus during the 3<sup>rd</sup> trimester is the same as that to the mother.

Cancer risks calculated above for individual age groups are summed to estimate cancer risk for 9-, 30- and 70-year exposures as shown below. Note that this example includes the Fraction of Time Spent at Home (FAH) for each age grouping.

**Calculation of Inhalation Cancer Risk from the Third Trimester to Age Nine:**

$$\text{RISK}_{\text{inh-res}} = (\text{DOSE}_{\text{air third trimester}} \times \text{CPF} \times 10 \times 0.25/70 \text{ years} \times \text{FAH}_{3\text{rd tri } <2}) \\ + (\text{DOSE}_{\text{air age } 0<2} \times \text{CPF} \times 10 \times 2/70 \times \text{FAH}_{3\text{rd tri } <2}) + (\text{DOSE}_{\text{air age } 2<9} \times \\ \text{CPF} \times 3 \times 7/70 \text{ years} \times \text{FAH}_{2<9})$$

**Calculation of Inhalation Cancer Risk from Third Trimester to Age 30:**

$$\text{RISK}_{\text{inh-res}} = (\text{DOSE}_{\text{air third trimester}} \times \text{CPF} \times 10 \times 0.25/70 \text{ years} \times \text{FAH}_{3\text{rd tri } <2}) \\ + (\text{DOSE}_{\text{air age } 0<2} \times \text{CPF} \times 10 \times 2/70 \times \text{FAH}_{3\text{rd tri } <2}) + (\text{DOSE}_{\text{air age } 2<16} \times \\ \text{CPF} \times 3 \times 14/70 \times \text{FAH}_{2<16}) + (\text{DOSE}_{\text{air age } 16<30} \times \text{CPF} \times 1 \times 14/70 \text{ years} \times \\ \text{FAH}_{16-30})$$

**Calculation of Inhalation Cancer Risk from Third Trimester to Age 70:**

$$\text{RISK}_{\text{inh-res}} = (\text{DOSE}_{\text{air third trimester}} \times \text{CPF} \times 10 \times 0.25/70 \text{ years} \times \text{FAH}_{3\text{rd tri } <2}) \\ + (\text{DOSE}_{\text{air age } 0<2} \times \text{CPF} \times 10 \times 2/70 \times \text{FAH}_{3\text{rd tri } <2}) + (\text{DOSE}_{\text{air age } 2<16} \times \\ \text{CPF} \times 3 \times 14/70 \times \text{FAH}_{2<16}) + (\text{DOSE}_{\text{air age } 16<70} \times \text{CPF} \times 1 \times 54/70 \text{ years} \times \\ \text{FAH}_{16-70})$$

Expressing cancer risk in “chances per million” is useful as a risk communication tool for the public, but cancer risk can also be expressed in other ways, such as “chances per 100,000” (cancer risk  $\times 10^5$ ) or “chances per 10 million” (cancer risk  $\times 10^7$ ). To convert the resulting cancer risk estimate to chances of developing cancer per million individuals exposed, multiply the cancer risk by  $10^6$ :

$$\text{Cancer risk} \times 10^6 = \text{chances per million}$$

For exposure to multiple carcinogenic substances, Table 8.7 and Table I.5 in Appendix I are examples of how cancer risks of individual substances are summed to determine the total cancer risk.

**Worker Receptors**

For assessment of off-site worker cancer risk at the MEIW, the default assumes working age begins at 16 years. Note that the residential FAH factor in Eq. 8.2.4.A above does not apply for workers. The daily inhalation dose ( $\text{DOSE}_{\text{air}}$ ) (as calculated in Chapter 5, EQ 5.4.1.2) is based on the adjusted 8-hour concentration at the MEIW (for non-continuous sources) and amount of time the offsite worker’s schedule overlaps with the facility’s emission schedule. The duration of exposure at the MEIW receptor is 25 years, as discussed in the TSD (OEHHA, 2012).

**B. Equation 8.2.4 B:** 
$$\text{RISK}_{\text{inh-work}} = \text{DOSE}_{\text{air}} \times \text{CPF} \times \text{ASF} \times \text{ED/AT}$$

1.  $\text{RISK}_{\text{inh-work}}$  = Worker inhalation cancer risk

**a: Recommended default values for EQ 8.2.4 B:**

1.  $\text{DOSE}_{\text{air}}$  = Calculated for workers in Eq. 5.4.1.2
2. CPF = Substance specific (see Table 7.1)
3. ASF = 1 for working age 16-70 yrs (See Section 8.2.1)
4. ED = 25 years
5. AT = 70 yrs for lifetime cancer risk

**Work Locations with Daycare Facilities:**

An additional risk management consideration for offsite worker cancer risk assessment of a Hot Spots facility is whether there are women of child bearing age at the MEIW location and whether the MEIW has a daycare center. In the case of women of child-bearing age at the MEIW, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy (i.e., use of an ASF=10 for third trimester exposure). If there is onsite daycare at the MEIW, then the risks to the children will be underestimated using the offsite adult worker scenario. In this case, the Districts may wish to include a cancer risk assessment for the children in the onsite daycare, assuming they could be there from 0 to age 6 years (ED = 6 years) and using the appropriate exposure factors to calculate  $\text{DOSE}_{\text{air}}$ , fraction of time at worksite (e.g., hrs at daycare per 24 hrs), and ASFs in EQ 8.2.4 B to account for the higher susceptibility of infants and children to carcinogens.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included. See section 8.2.6 for more discussion of multipathway risk assessment methods.

**8.2.5 Calculation of Noninhalation Cancer Risk**

A small subset of Hot Spots substances is subject to deposition onto the soil, plants, and water bodies (see Table 5.1). These substances need to be evaluated by the appropriate noninhalation pathways, as well as by the inhalation pathway, and the risk characterization results must be presented in all HRAs. These substances include semi-volatile organic chemicals and heavy metals.

For all multipathway substances, the exposure pathways that must be evaluated at every residential and worker site (in addition to inhalation) are soil ingestion and dermal exposure. If PAHs (and creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory for residential receptors. OEHHA has developed transfer coefficients for these chemicals from the mother to breast milk (see OEHHA, 2012 for details). The other exposure pathways (e.g.,

ingestion of homegrown produce or fish) are only evaluated for residential receptors if the facility impacts that exposure medium and the receptor under evaluation can be exposed to that medium or pathway. For example, if the facility does not impact a fishable body of water within the isopleth of the facility, or the impacted water body does not sustain fish that are consumed by fishers, then the fish pathway will not be considered for that facility or receptor.

Table 8.6 identifies the residential receptor exposure pathways that are mandatory and those that are dependent on the available routes of exposure. Table 8.6 also identifies the three exposure pathways that are relevant for a worker receptor. The cancer risk estimates should be presented in the risk characterization section of the risk assessment for all the appropriate pathways.

**Table 8.6 Mandatory and Site/Route Dependent Exposure Pathways**

Mandatory Exposure Pathways	Site/Route Dependent Exposure Pathways
<ul style="list-style-type: none"> <li>• Inhalation<sup>w</sup></li> <li>• Soil Ingestion<sup>w</sup></li> <li>• Dermal Exposure to Contaminated Soil<sup>w</sup></li> <li>• Breast Milk Consumption<sup>*</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Homegrown Produce Ingestion</li> <li>• Angler-Caught Fish Ingestion</li> <li>• Drinking Water Ingestion</li> <li>• Home-Raised Animal Product Ingestion (Dairy (Cow's) Milk, Meat (Beef, Pork, Chicken) and Egg).</li> </ul>

(w) Identifies the appropriate exposure pathways that should be evaluated for a worker. These pathways are inhalation, dermal exposure, and the soil ingestion pathway.

(\*) If PAHs (including creosotes), lead, dioxins, furans, or PCBs are emitted, then the breast-milk consumption pathway becomes mandatory.

The noninhalation residential cancer risk is calculated using the same steps as inhalation cancer risk described in Section 8.2.4. A dose (see Chapters 4 and 5) from the pathway under evaluation (e.g., soil ingestion) is multiplied by the substance-specific oral slope factor, expressed in units of inverse dose (i.e.,  $(\text{mg}/\text{kg}/\text{day})^{-1}$ ) (Table 7.1), the appropriate age sensitivity factor (ASF), and exposure duration divided by averaging time to yield the cancer risk for a specified age grouping. Cancer risk for each age group is summed as appropriate for the exposure duration. The FAH factor is relevant only to the inhalation pathway and is not appropriate to use in the noninhalation pathways.

Equation 8.2.5 illustrates the formula for calculating noninhalation cancer risk. Details (data, algorithms, and guidance) for each exposure pathway are presented in Chapter 5 and in OEHHA (2012).

**A. Equation 8.2.5:**  $RISK_{noninh} = DOSE_{noninh} \times CPF_{oral} \times ASF \times ED/AT$

1.  $RISK_{noninh}$  = Noninhalation pathway cancer risk
2.  $DOSE_{noninh}$  = Daily dose (mg/kg-day) for a specified non-inhalation pathway for each age group
3.  $CPF_{oral}$  = Oral cancer potency (slope) factor (mg/kg-day<sup>-1</sup>)
4. ASF = Age sensitivity factor for a specified age group (unitless)
5. ED = Exposure duration (in years) for a specified age group
6. AT = Averaging time for lifetime cancer risk

**a: Recommended default values for EQ 8.2.5:**

1.  $DOSE_{noninh}$  = Calculated in Chapter 5 dose algorithms for each age group and for each noninhalation route in Table 8.6 the receptor is exposed to
2.  $CPF_{oral}$  = Substance-specific (see Table 7.1)
3. ASF = See Section 8.2.1
4. ED = Residents: 0.25 years for 3<sup>rd</sup> trimester, 2 years for 0<2, 7 years for 2<9, 14 years for 2<16, 14 years for 16<30, 54 years for 16-70  
= Offsite worker: 25 yrs
5. AT = 70 years

Estimating cancer risk for 9-, 30- and 70-years by summing the individual age-group cancer risks is the same as that shown for the inhalation route in Section 8.2.4. The exception is that the FAH variate is only appropriate for the residential inhalation pathway and is not a factor for oral and dermal exposure pathways.

**Calculation of Noninhalation Cancer Risk from Third Trimester to Age 30:**

$$RISK_{noninh-res} = (DOSE_{noninh} \text{ third trimester} \times CPF \times 10 \times 0.25/70 \text{ years}) + (DOSE_{noninh} \text{ age } 0<2 \times CPF \times 10 \times 2/70) + (DOSE_{noninh} \text{ age } 2<16 \times CPF \times 3 \times 14/70) + (DOSE_{noninh} \text{ age } 16<30 \times CPF \times 1 \times 14/70 \text{ years})$$

To convert this estimated probability of risk to chances per million of developing cancer, multiply the estimated cancer risk for each noninhalation exposure route by 10<sup>6</sup>. This result is useful communication tool to compare risks for each pathway of exposure.

$$\text{Cancer risk} \times 10^6 = \text{cancer risk expressed as chances per million}$$

For assessment of the offsite worker the typical noninhalation pathways that apply for worker cancer risk are the dermal exposure pathway and the soil ingestion pathway.

Children at a MEIW daycare may also be assessed for noninhalation exposures. Typically, soil ingestion and dermal exposure will be the most common noninhalation pathways. However, all pathways that are present at the daycare should be included.

### 8.2.6 *Multipathway Cancer Risk Methodology*

Under a Tier 1 assessment, it is necessary to calculate the total cancer risk from both inhalation and noninhalation exposures if multipathway substances are emitted from the facility. The calculation of cancer risk that includes exposure to a multipathway substance or substances has three steps:

- 1) Calculate cancer risk for the inhalation pathway (EQ 8.2.4 A for residents, EQ 8.2.4 B for off-site workers) for all substances, and the noninhalation pathways that apply (EQ 8.2.5) for all multipathway substances, using high-end point estimates of intake rates.
- 2) For each multipathway substance, identify the two exposure pathways with the highest risk. These are the dominant pathways that are to be assessed using high-end point estimates of intake rates for the total cancer risk. For all other pathways, the average point estimate of intake rates may be used to calculate the pathway cancer risk (See OEHHA (2012) for more information).
- 3) To calculate total cancer risk, all inhalation and noninhalation pathways are summed together for all substances.

The final cancer risk calculation using a combination of high-end and average exposure parameters is referred to as the derived risk in the HARP software. This is described in Chapter 1, Section 1.4.1 of OEHHA (2012). The inhalation route is almost always one of the two dominant pathways in a multipathway cancer risk assessment. Therefore, in most cases only one noninhalation pathway would be calculated using a high-end dose point estimate. For all other pathways, the average point estimate may be used to calculate the pathway cancer risk.

For example, if dermal exposure and soil ingestion risks are calculated, then the cancer risks from these pathways would be summed along with the inhalation cancer risks to give the total cancer risk for the single multipathway substance:

$$\text{Cancer Risk (inhalation)} + \text{Cancer Risk (dermal)} + \text{Cancer Risk (soil)} = \text{Total Risk}$$

The mother's milk pathway also becomes a mandatory pathway to assess risk in nursing infants if the mother is exposed to specific substances (see Table 5.1).

Many facilities will emit multiple carcinogenic substances. If multiple substances are emitted, the substance-specific cancer risks for all exposure pathways are summed to give the (total) multipathway cancer risk at the receptor location. The HARP software will display not only the multipathway risk for each carcinogenic substance, but also show a breakdown of the cancer risk from each exposure pathway. Table 8.7 shows the results of a multipathway risk assessment for a hypothetical facility. While not presented in the following table, it is critical to identify the driving exposure pathways and the driving substances in a multipathway cancer risk assessment when summarizing and presenting the HRA results. See Chapter 9 for more information.

**Table 8.7 Multipathway Assessment of a Hypothetical Facility 30-Year Cancer Risk**

Substance	Cancer Risk <sup>a</sup>	Cancer risk <sup>b</sup> (chances per million)
Arsenic	$1.1 \times 10^{-5}$ (i)	11 (i)
	$3 \times 10^{-7}$ (ni)	0.3 (ni)
Benzene	$2.92 \times 10^{-4}$ (i)	292 (i)
2,3,7,8-TCDD (dioxin)	$1.06 \times 10^{-4}$ (i)	106 (i)
	$5.7 \times 10^{-5}$ (ni)	57 (ni)
1,3-Butadiene	$6.0 \times 10^{-6}$ (i)	6 (i)
<b>Total Facility Cancer Risk</b>	<b><math>4.723 \times 10^{-4}</math></b>	<b>472</b>

<sup>a</sup> As calculated in EQ 8.2.4 A or EQ 8.2.5

<sup>b</sup> Calculated as: cancer risk  $\times 10^6$  = chances per million

i = inhalation pathway contribution

ni = noninhalation pathway contribution

Cancer risk in Table 8.7 for the multipathway substances, arsenic and 2,3,7,8-TCDD, is arranged by the inhalation pathway risk and the sum of all noninhalation pathway risks. The total facility multipathway cancer risk is the sum of all inhalation and noninhalation pathways.

Cancer risks from different substances are treated additively in risk assessment generally, and in the Hot Spots Program in part because many carcinogens act through the common mechanism of DNA damage. The additive assumption is reasonable from a public health point of view. Other possible interactions of multiple carcinogens include synergism (effects are greater than additive) or antagonism (effects are less than additive). The type of interaction is both chemical and dose dependent and in most cases the data are not available to adequately characterize these interactions.

### **8.2.7 Multipathway Cancer Risk for Infant Exposure to Mother's Milk**

The mother's milk pathway becomes mandatory if the nursing mother is exposed to one or more of the following multipathway substances: dioxins and furans, PCBs, PAHs including creosotes, and lead. The default assumption inherent in the intake rate is that the infant's only source of food is breast for the first year (e.g., is fully breastfed, see OEHHA, 2012, for details), which is one-half of the 0-2 year age group used in the Hot Spots program. Thus, the cancer risk by the mother's milk pathway will need to be calculated with a modified cancer risk equation using a different exposure duration:

**A. Equation 8.2.7:**  $RISK_{mm} = Dose-lm \times CPF_{oral} \times ASF \times ED/AT$

1.  $RISK_{mm}$  = Infant cancer risk via mother's milk pathway
2.  $Dose-lm$  = Daily dose (mg/kg-day) to infant from mother's milk
3.  $CPF_{oral}$  = Oral cancer slope factor (mg/kg-day<sup>-1</sup>)
4.  $ASF$  = Age sensitivity factor for infant (unitless)
5.  $ED$  = Exposure duration (in years) for infant
6.  $AT$  = Averaging time for lifetime cancer risk

**a: Recommended default values for EQ 8.2.7:**

6.  $Dose-lm$  = Calculated from EQ 5.4.3.5.2, dose to infant via mother's milk
7.  $CPF_{oral}$  = Substance-specific (see Table 7.1)
8.  $ASF$  = 10 (See Section 8.2.1)
9.  $ED$  = 1 yr (1<sup>st</sup> yr of 0<2 yr age group)
10.  $AT$  = 70 years

Once the cancer risk is determined for the mother's milk pathway for each applicable substance, the pathway risk is summed with other pathway risks.

For Tier 1, the derived approach for cancer risk assessment should be used if the mother's milk pathway applies. As outlined in Section 8.2.6, the two dominant pathways will be calculated using high-end point estimates of intake rates; all additional pathways may be calculated using average point estimates of intake rates. There will be four mandatory pathways to assess (inhalation, mother's milk, soil ingestion and dermal exposure) for cancer risk when exposure to dioxins/furans, PCBs, PAHs including creosotes, and/or lead occurs. Therefore, if the infant is exposed to no other additional site-specific noninhalation pathway(s), only the two dominant pathways among the four will be assessed for cancer risk using high-end point estimates of intake rates; and the others would be assessed using the average point estimate of intake rate.

In short, multipathway cancer risk for a substance is estimated by summing the potential inhalation and noninhalation cancer risks for the receptor location of interest. See the discussion of Tier 1 in Section 8.2.6 or the TSD for more information on the method used to determine the multipathway cancer risk.

### **8.2.8 Cancer Risk Characterization for Stochastic Risk Assessment**

Risk characterization for a stochastic risk assessment is similar to that described for the point-estimate approach. However, the stochastic risk assessment produces a distribution of risk that accounts for some of the natural variability in exposure-related factors, such as breathing rates or water intake. The cancer risk distribution for inhalation cancer risk, for example, is generated by multiplying randomly selected values from the breathing rate distribution by the ground level air concentration, and the cancer potency factor. A variation of the Monte Carlo method called Latin hypercube sampling is the method by which the values from the breathing rate distribution are

selected. If noninhalation pathways need to be evaluated, the same process is followed for each pathway and the risk is summed to give an overall inhalation and noninhalation cancer risk distribution. Further, the specification of Age Sensitivity Factors and the need to separately calculate risks require that a Monte Carlo sampling be conducted for each age group and the cancer risk distributions are then summed across age groups.

The HARP software will perform an HRA using a Monte Carlo analysis with either OEHHA-provided or user-provided data distributions and will include the statistics for the distributions. In risk assessments that have chosen to use the distribution of exposure variates, the cancer risk distribution for a 30-year residential exposure duration (MEIR) should be presented in the risk characterization section. We also recommend including the 9 and 70-year cancer risk at the MEIR as supplemental information. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk. A stochastic approach has not been developed for acute, 8-hour, and chronic noncancer health impacts or worker (MEIW) exposures.

### **8.2.9 Use of Individual Cancer Risk and Population-wide Cancer Risk**

Cancer risk for an individual receptor and a representation of population-wide cancer risk are both important components of a risk assessment. The individual receptor approach reflects the exposures that may occur to an individual receptor over a period of time at a specific location. The individual cancer risk approach has some inherent limitations in terms of illustrating and potentially protecting population-based public health. For example, a facility with a small emissions footprint may impact a few individuals with a high individual potential cancer risk; whereas, a facility with a larger emission footprint may have a lower potential cancer risk for an individual receptor but expose many more people to those levels. Since this larger emitting facility can impact many more people, the population-wide health impacts are magnified due to the larger number of people exposed to the facility's emissions. This potential for higher population impacts is not captured by the individual receptor risk methodology. Therefore, the individual and population-wide health impacts should be presented for all facilities to provide a more complete illustration of the facility's health impacts.

#### **8.2.9.1 Population Risk**

For facilities with large emission footprints (e.g., refineries, ports, or rail yards, etc.), population-based health impacts are critical to provide a better illustration of the potential impacts of emissions since large numbers of people may be exposed to the emissions. The individual cancer risk approach has some inherent limitations in terms of protecting public health. A small facility with a single stack can impact a few individuals with an individual cancer risk that is unacceptable, whereas a large facility may have an individual cancer risk that is below the acceptable limit for individual risk but exposes many more people. Thus, the population-wide impacts are larger for the large facility. Population-wide risk is independent of individual risk, and assumes that a population (not necessarily the same individuals) will live in the impacted zone over a

70-year period. Thus, a 70-year exposure duration is required for estimates of population-wide risks.

To evaluate population risk, one method that regulatory agencies have used is the cancer burden method to account for the number of excess cancer cases that could occur in a population.

### Cancer Burden

The cancer burden can be calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is intended to estimate of the number of potential cancer cases within the population that was exposed to the emissions for a lifetime (70 years).

The cancer burden is calculated on the basis of lifetime (70-year) risks (whereas individual cancer risk at the MEIR is based on 30-year residential exposure). Cancer burden is independent of how many people move in or out of the vicinity of an individual facility. For example, if 10,000 people are exposed to a carcinogen at a concentration with a  $1 \times 10^{-5}$  cancer risk for a lifetime the cancer burden is 0.1, and if 100,000 people are exposed to a  $1 \times 10^{-5}$  risk the cancer burden is 1.

### Estimate of Population Wide Risk

An estimate of the number of people exposed at various cancer risk levels can provide perspective on the magnitude of the potential public health threat posed by a facility. This approach is intended as a replacement for or addition to the cancer burden calculation used by some Districts in the past. The new approach provides a much easier way for the general public to interpret results when compared to cancer burden estimates. A facility in a sparsely populated area can have a public health impact different from the same facility in a highly populated area; however, under the cancer burden method, those differences may not be seen. Some suggested approaches and methods for performance of a screening or refined population exposure analyses are provided in Section 4.6.

The District or reviewing authority should be consulted before beginning the population exposure estimates and, as results are generated, further consultation may be necessary. Note that a 70-year exposure duration is required to estimate cancer burden or provide an estimate of population-wide risk.

The zone of impact for estimating the number of persons exposed to a cancer risk from facility emissions should be set at a minimum of a  $10^{-6}$  cancer risk level (see Section 4.6.1). Some Districts may prefer to use a cancer risk of  $10^{-7}$  to define the carcinogenic zone of impact. The total number of persons exposed to a series of potential risk levels can be presented to aid risk managers in understanding the magnitude of the potential public health impacts.

The HARP software can provide population-level risk estimates as cancer burden or as the number of persons exposed to a selected (user-identified) cancer risk level at block level centroids.

#### 8.2.9.2 Population Estimates for Noncancer Health Impacts

A noncancer chronic, 8-hour, and acute population estimate of the number of people exposed to acute, 8-hour, and chronic HQs or HIs exceeding 0.5 or 1.0, in increments of 1.0, should also be presented. For example, a facility with a maximum chronic HI of 4.0 would present the number of people exposed to a chronic HI of 0.5, 1.0, 2.0, 3.0, and 4.0. The isopleths used in this determination should be drawn using the smallest feasible grid size. The same methods that are described in Chapter 4 and Section 8.2.9 (for the population exposure estimate for cancer risk) should be used in the chronic, 8-hour and acute population estimates. Population estimates for acute, 8-hour, and chronic health impacts should be presented separately.

#### 8.2.9.3 Factors That Can Impact Population Risk – Cumulative Impacts

Although the Hot Spots program is designed to address the impacts of single facilities and not aggregate or cumulative impacts, there are a number of known factors that influence the susceptibility of the exposed population and thus may influence population risk. Socioeconomic status influences access to health care, nutrition, and outcome after cancer diagnosis. Community unemployment can affect exposure and residency time near a facility. Factors that affect the vulnerability of the population are discussed in the report *Cumulative Impacts: Building a Scientific Foundation* (OEHHA, 2010). Information on many of these factors is relatively easy to obtain at the census tract level. The OEHHA recommends that these types of factors be considered by the risk manager, along with the quantitative measures of population risk. OEHHA is in the process of developing guidance on quantification of the impact of these factors.

#### **8.2.10 Cancer Risk Evaluation of Short Term Projects**

The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises.

Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime. There are some studies indicating that dose rate changes the potency of a given dose of a carcinogenic chemical. In others words, a dose delivered over a short time period may have a different potency than the same dose delivered over a lifetime.

The OEHHA's evaluation of the impact of early-in-life exposure has reduced some of the uncertainty in evaluating the cancer risk to the general population for shorter-term exposures, as it helps account for susceptibility to carcinogens by age at exposure (OEHHA, 2009).

Due to the uncertainty in assessing cancer risk from very short-term exposures, we do not recommend assessing cancer risk for projects lasting less than two months at the MEIR. We recommend that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009). Thus, for example, if the District is evaluating a proposed 5-year mitigation project at a hazardous waste site, the cancer risks for the residents would be calculated based on exposures starting in the third trimester through the first five years of life.

For the MEIW, we recommend using the same minimum exposure requirements used for the residential receptor (i.e., no evaluation for projects less than 2 months; projects longer than 2 months but less than 6 months are assumed to last 6 months; projects longer than 6 months would be evaluated for the duration of the project). Although the off-site worker scenario assumes that the workers are 16 years of age or older with an Age-Sensitivity Factor of 1, another risk management consideration for short-term project cancer assessment is whether there are women of child bearing age at the worksite and whether the MEIW receptor has a daycare center. In this case, the Districts may wish to treat the off-site MEIW in the same way as the residential scenario to account for the higher susceptibility during the third trimester of pregnancy, and for higher susceptibility of infants and children.

Finally, the risk manager may want to consider a lower cancer risk threshold for risk management for very short-term projects. Typical District guidelines for evaluating risk management of Hot Spots facilities range around a cancer risk of 1 per 100,000 exposed persons as a trigger for risk management. Permitting thresholds also vary for each District. There is valid scientific concern that the rate of exposure may influence the risk – in other words, a higher exposure to a carcinogen over a short period of time may be a greater risk than the same total exposure spread over a much longer time period. In addition, it is inappropriate from a public health perspective to allow a lifetime acceptable risk to accrue in a short period of time (e.g., a very high exposure to a carcinogen over a short period of time resulting in a  $1 \times 10^{-5}$  cancer risk). Thus, consideration should be given for very short term projects to using a lower cancer risk trigger for permitting decisions.

### 8.3 Noncancer Acute, 8-Hour, and Chronic Inhalation Health Impacts – the Hazard Index Approach

All substances in the Hot Spots Program that have noncancer health impacts at a receptor must be evaluated through the inhalation pathway. Estimates of noncancer inhalation health impacts are determined by dividing an airborne concentration at the receptor by the appropriate Reference Exposure Level (REL). This is termed the Hazard Index Approach. A REL is used as an indicator of potential noncancer health impacts and is defined as the concentration at which no adverse noncancer health effects are anticipated. When a health impact calculation is performed for a single substance, then it is called the hazard quotient (HQ). Each REL for a substance will have one or more target organ systems (e.g., respiratory system, nervous system, etc.) where the substance can have a noncancer health impact. Thus, all HQs have specified target organ systems associated with them. The sum of the Hazard Quotients of all chemicals emitted that impact the same target organ is termed the Hazard Index. Inhalation RELs for noncancer health impacts have been developed for acute, 8-hour, and chronic exposures to a number of Hot Spots substances. Acute RELs are designed to protect against the maximum 1-hour ground level concentration at the receptor. Eight-hour RELs are designed to protect people with daily 8-hour schedules, such as offsite workers, in an impacted zone. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. Chronic RELs protect against long-term exposure to the annual average air concentration spread over 24 hours/day, 7 days/week.

OEHHA has added 8-hour RELs to the set of noncancer RELs that were previously comprised of acute and chronic RELs (OEHHA, 2008). Specifically, 8-hour RELs are air concentrations at or below which health impacts would not be expected even for sensitive subpopulations in the general population with repeated daily 8-hour exposures over a significant fraction of a lifetime. The 8-hour RELs can be used to evaluate the potential for health impacts (including effects of repeated exposures) in offsite workers, and to children and teachers exposed during school hours. Although not required in the HRA, they could also be applied by the Districts to a residential scenario where a facility operates only a portion of the day and exposure to residences is not adequately reflected by averaging concentrations over a 24 hour day. The number of chemicals with 8-hour RELs will increase as OEHHA re-evaluates RELs for chemicals under SB-25 to ensure that they are protective of children's health.

Acute, 8-hour, and chronic RELs are needed because the dose metrics and even the health impact endpoints may be different with the different exposure durations of acute, daily 8-hour, and chronic exposures. Also, although chronic REL values are lower or set the same as 8-hour RELs, there are some cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) or intermittent exposures where the 8-hour REL may be more protective than the chronic REL.

Chapter 4 describes air dispersion modeling and both Chapter 6 and Appendix L list the needed dose-response information to evaluate non-cancer hazards. Appendix I presents sample calculations for determining acute HQs and HIs, 8-hour HQs and HIs, and chronic multipathway HQs and HIs. Chapter 9 provides an outline of information required for risk characterization. The HARP software will calculate the HQ and HI for Hot Spots risk assessments.

### 8.3.1 Calculation of Noncancer Inhalation Hazard Quotient and Hazard Index

To calculate the acute HQ, the maximum 1-hour ground level concentration (in  $\mu\text{g}/\text{m}^3$ ) of a substance at a receptor is divided by the acute 1-hour REL (in  $\mu\text{g}/\text{m}^3$ ) for the substance:

$$\text{Acute Hazard Quotient} = \frac{\text{1-Hour Max Concentration } (\mu\text{g}/\text{m}^3)}{\text{Acute REL } (\mu\text{g}/\text{m}^3)}$$

To calculate the chronic HQ, the annual average ground level concentration of a substance is divided by the chronic REL for the substance:

$$\text{Chronic Hazard Quotient} = \frac{\text{Annual Average Concentration } (\mu\text{g}/\text{m}^3)}{\text{Chronic REL } (\mu\text{g}/\text{m}^3)}$$

To calculate the 8-hour HQ, the adjusted annual average ground level concentration of a substance (represented as “Adjusted  $C_{\text{air}}$ ” in EQ 5.4.1.4 A) is divided by the 8-hour REL for the substance:

$$\text{8-hour Hazard Quotient} = \frac{\text{Adjusted Annual Average Concentration } (\mu\text{g}/\text{m}^3)}{\text{8-hour REL } (\mu\text{g}/\text{m}^3)}$$

The daily 8-hour average ground level concentrations used for calculating the 8-hour HQs are derived as described in Chapter 4.

An HQ of 1.0 or less indicates that adverse health effects are not expected to result from exposure to emissions of that substance. As the HQ increases above one, the probability of human health effects increases by an undefined amount. However, it should be noted that a HQ above one is not necessarily indicative of health impacts due to the application of uncertainty factors in deriving the RELs.

If a receptor is exposed to multiple substances that target the same organ system, then the HQs for the individual substances are summed to obtain a Hazard Index (HI) for that target organ.

Table 8.8 is an example of an HRA spreadsheet showing acute inhalation HQs arranged by target organ system for several substances. The bottom row shows the summed HQs by target organ system to derive the HIs.

**Table 8.8 Individual Hazard Quotients and Total Hazard Index for Acute Inhalation Exposure**

Substance	Reproductive/ Developmental	Nervous System	Cardiovascular System	Respiratory System	Eye
Ammonia				0.6	0.6
Arsenic	0.2	0.2	0.2		
Benzene	0.02				
Chlorine				0.7	0.7
<b>Total Hazard Index</b>	<b>0.22</b>	<b>0.2</b>	<b>0.2</b>	<b>1.3</b>	<b>1.3</b>

A more detailed example of calculating HQs and HIs and of determining noncancer health impacts is shown in Appendix I.

Hazard quotients or HIs for different target organs are not summed together (e.g., do not add the impacts for the eye to the cardiovascular system). Chapter 6 and Appendix L have lists of the organ systems affected by each substance. Unlike the cancer risk algorithms, no exposure duration adjustment (e.g., 9 yrs / 70 yrs) should be made for noncancer assessments.

There are limitations to this method of assessing cumulative noncancer health impacts. The impact on organ systems may not be additive if health effects occur by different mechanisms. However, the impact on organ systems could also be synergistic. An analysis by a trained health professional familiar with the substance's toxicological literature is usually needed to determine the public health significance of an HQ or HI above one. It is recommended that the Air District contact OEHHA if this situation presents itself. For assessing the noncancer health impacts of lead, different procedures are used; please see Appendix F.

### **8.3.2 Calculating Noninhalation (oral) Noncancer Hazard Quotient and Hazard Index**

Similar to the situation with multipathway carcinogenic substances, multipathway substances that present a noncancer hazard are assessed by noninhalation routes of exposure (see Table 8.6). Noninhalation routes of exposure are assessed only for chronic exposure. There are no oral acute RELs since it is generally anticipated that health effects from a single exposure via the oral route at typical environmental levels resulting from deposition of facility emissions would be insignificant relative to the inhalation route. The multipathway substances with noninhalation RELs, called chronic oral RELs, are shown in Table 6.4. Similar to inhalation exposure, the hazard quotient

for a noninhalation pathway is obtained by dividing the dose in milligrams per kilogram-day (mg/kg-day) by the oral REL also expressed in units of mg/kg-day:

$$\text{Chronic Non-inhalation HQ} = \frac{\text{Chronic Noninhalation Dose (mg/kg-day)}}{\text{Chronic Oral REL (mg/kg-day)}}$$

The calculated chronic oral HQs are combined with the chronic inhalation HQs for determining the chronic HIs for each affected target organ (see Section 8.3.4). The point estimates and algorithms for calculating the oral dose for all applicable exposure pathways and receptors (e.g., workers or residents) are explained in Chapter 5.

The chronic oral dose calculated in mg/kg-day is based on a time-weighted average 70-year residential exposure combining the 0<2, 2<16 and 16-70 year age groups. Unlike the assessment of cancer risk, no exposure duration adjustment should be made when estimating HQs. In other words, the variates ED and AT in the cancer risk EQ 8.2.5 in Section 8.2.5 are not used for estimating the noncancer HQs. See Appendix I for an example calculation.

### 8.3.3 *Multipathway Noncancer Risk Methodology*

To determine multipathway chronic noncancer health impacts, it is necessary to calculate the total hazard index from both inhalation and noninhalation exposures. The calculation of HIs has several steps:

- 1) First, the inhalation HQ is calculated for each substance emitted (Section 8.3.1).
- 2) Second, if the substance has an oral REL, then the non-inhalation HQ is calculated as shown above using high-end point-estimates for intake rates for each noninhalation pathway that applies.
- 3) Third, if there are more than two noninhalation pathways to consider for a multipathway substance, then the oral HQ is calculated using high-end point estimates in the dose equation for the two dominant pathways. For any additional noninhalation pathways, the HQs are calculated using average point estimates in the dose equation. This step applies only to residential receptors.
- 4) Fourth, all noninhalation pathway HQs for a multipathway substance are then summed together by target organ to obtain the total noninhalation HQ for a multipathway substance.
- 5) The final step is to sum the inhalation and noninhalation HQs together by target organ to determine the HIs. This step is displayed in Table 8.9. If there is only one substance, then the multipathway HQ is the same as the HI.

**Table 8.9 Substance-Specific Chronic Inhalation and Noninhalation Hazard Quotients and the Hazard Index by Target Organ System**

Substance	Respiratory System	Hematologic System	Alimentary System	Endocrine System	Development	Reproductive System	Nervous System	Cardiovascular System	Skin
Ammonia	0.8								
Arsenic					0.04(i) 0.1(ni)		0.04(i) 0.1(ni)	0.04(i) 0.1(ni)	0.04(i) 0.1(ni)
Benzene		0.08			0.08		0.08		
2,3,7,8-TCDD (dioxin)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)	0.1(i) 0.2(ni)			
Nickel	0.4(i)	0.4(i)	0.1(ni)						
<b>Hazard Index</b>	<b>1.50</b>	<b>0.78</b>	<b>0.40</b>	<b>0.3</b>	<b>0.52</b>	<b>0.30</b>	<b>0.22</b>	<b>0.14</b>	<b>0.14</b>

i = inhalation pathway contribution

ni = noninhalation pathway contribution

Table 8.9 shows the calculated chronic HIs by combining the chronic inhalation HQs and chronic oral HQs. The HQs or HIs for different target organs are not added together (e.g., do not add the impacts for the respiratory system to the nervous system). The noninhalation pathways for TCDD and arsenic in Table 8.9 have all the noninhalation pathways that apply incorporated into their HQ values. For example, the noninhalation value for arsenic (HQs = 0.1) includes at least the soil ingestion and dermal soil pathways in the HQs because these are the mandatory noninhalation pathways to take into account with exposure to a multipathway substance. For TCDD, the mother's milk pathway is an additional mandatory noninhalation pathway to take into account (See Table 5.1). If there are exposures to any of the site-specific pathways, then these would be included too. A more detailed example calculation of HIs is shown in Appendix I.

When exposure to more than two noninhalation pathways occur, using the high-end point estimates of intake rates for only the two dominant noninhalation pathways will lessen the issue of compounding high-end exposure estimates, while retaining a health-protective approach for the more important exposure pathways. It is unlikely that an individual receptor would be on the high-end of exposure for all the non-inhalation intake parameters (exposure pathways).

### **8.3.4 Summary - Acute, 8-Hour and Chronic Hazard Index Calculation at the MEIR and MEIW**

Eight-hour RELs were developed principally for exposure of individuals during 8-hour work schedules. The 8-hour RELs should be used for typical daily work shifts of 8-9 hours. For further questions, assessors should contact OEHHA, the District, or reviewing authority to determine if the 8-hour RELs should be used in your HRA. Any discussions or directions to exclude the 8-hour REL evaluation should be documented in the HRA. There are currently only a limited number of substances with an 8-hour inhalation REL. Over time as the science supporting REL values for individual substances is reviewed and the RELs are revised by OEHHA, more 8-hour RELs will be developed.

Therefore, for the MEIR, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and the chronic RELs, and the oral RELs for multipathway substances

An 8-hour hazard index based on the daily average 8-hour exposure is not required for the MEIR, but can be performed at the discretion of the District for exposure to non-continuously operating facilities using the adjusted annual average air concentration (See EQ 5.4.1.4 A and B or method in App. M). Eight-hour hazard assessments are not recommended for exposure to continuously operating facilities.

For the MEIW, we recommend:

- Estimating the acute Hazard Index based on the maximum 1-hour air concentration and 1-hour RELs
- Estimating the 8-hour Hazard Index based on daily average 8-hour exposure for those chemicals with 8-hour RELs
- Estimating the chronic Hazard Index based on the annual average air concentration and chronic RELs, and oral RELs for multipathway substances

Until there are 8-hour RELs for many of the Hot Spots substances that have a chronic REL value, we recommend determining the chronic HI for the MEIW to adequately protect the offsite worker.

### **8.3.5 Evaluation of Background Criteria Pollutants**

The District should be contacted to determine if the contribution of background criteria pollutants to respiratory health effects is required to be included in an HRA for the Hot Spots Program. If inclusion is required, the methods for calculating the health impact from acute and chronic exposure (respiratory endpoint) is the standard HI approach (see Sections 8.3.1 and 8.3.4). There are currently no 8-hour RELs for criteria

pollutants, so 8-hour health impacts from criteria pollutants are not assessed in HRAs. The background criteria pollutant contribution should be calculated if the HI from the facility's emissions exceeds 0.5 in either the acute or chronic assessment for the respiratory endpoint.

The most recent criteria pollutant concentration data should be obtained from the ARB's ambient air monitoring network and can be found in the *California Almanac of Emissions and Air Quality* on their web site at [www.arb.ca.gov](http://www.arb.ca.gov). For determining the criteria pollutant contribution in HI calculations, the annual average concentration data should be taken from a monitoring site near the facility. If background contributions are unavailable, the District may direct the risk assessor to make an alternative assumption. The criteria pollutants that should be included in acute and chronic assessments for the respiratory endpoint are ozone, nitrogen dioxide, sulfur dioxide, sulfates, and hydrogen sulfide.

#### **8.4 Uses of Exposure Duration Adjustments for Onsite Receptors**

Onsite workers are protected by CAL OSHA and typically are not evaluated under the Hot Spots program. Exceptions may include a worker who also lives on the facility property such as at prisons, military bases, and universities that have worker housing within the facility. Another scenario where the District may require assessment of on-site worker exposure and risk is when a facility (e.g., airport) has multiple businesses owned by different entities within the facility/property (e.g., rental car agencies, restaurants, etc.). In these situations the evaluation of onsite cancer risks, and/or acute, 8-hour, and chronic noncancer hazard indices is appropriate under the Hot Spots program. If the onsite receptor under evaluation can be exposed through a noninhalation exposure pathway, then that exposure pathway must also be included. When a receptor lives and works on the facility, site, or property, then these receptors should be evaluated and reported under both residential and worker scenarios and the one that is most health-protective should be used for risk management decisions.

The cancer risk estimates for the on-site residents may use a 30-year exposure duration while the 25-year exposure duration is used for a worker. Under a Tier 2 analysis, alternate exposure durations may be evaluated and presented with all assumptions supported. See section 8.2.10 for more discussion of short-term exposures.

Other situations that may require on-site receptor assessment include the presence of locations where the public may have regular access for the appropriate exposure period (e.g., a lunchtime café, store, or museum for acute exposures). The District or reviewing authority should be consulted on the appropriate evaluations for the risk for all onsite receptors.

## 9 - Summary of the Requirements for a Modeling Protocol and a Health Risk Assessment Report

The AB 2588 program is a community right-to-know act. Although risk assessment is a technical field, AB 2588 risk assessments need to be clear and understandable to the educated lay person. An Executive Summary that explains the process and the results of the risk assessment in lay terms is necessary. Clear risk communication is imperative in situations where the facility is required to notify the surrounding community. In addition, the risk assessment is by law reviewed by the local Air Pollution Control or Air Quality Management District (District) and OEHHA in order to ensure that AB 2588 risk assessment procedures have been followed. This chapter clarifies the type of information that is needed for District and OEHHA review of modeling protocols and health risk assessments (HRAs).

The material presented here is intended to promote transparent, consistent presentation and efficient review of the modeling protocol and the health risk assessment report (products). We recommend that persons preparing these products consult with the local District to determine if the District has modeling or HRA guidelines that supersede these products. If the District does not have guidelines for these products, then we recommend Section 9.1 be used for modeling protocols and Section 9.2 be used for the presentation of HRAs. Persons preparing modeling protocols and HRAs should specify the guidelines that were used to prepare their products.

### 9.1 Submittal of a Modeling Protocol

It is strongly recommended that a modeling protocol be submitted to the District for review and approval prior to extensive analysis with an air dispersion model. The modeling protocol is a plan of the steps to be taken during the air dispersion modeling and risk assessment process. We encourage people who are preparing protocols to take advantage of the protocol step and fully discuss anticipated methodologies for any portion of your project that may need special consideration. Below, we have provided an example of the format that may be followed in the preparation of the modeling protocol. **Consult with the District to confirm format and content requirements or to determine the availability of District modeling guidelines before submitting the protocol.**

### 9.1.1 *Outline for a Modeling Protocol*

#### *I. Introduction*

Include the facility name, address, and a brief overview describing the facility's operations.

- Provide a description of the terrain and topography surrounding the facility and potential receptors.
- Indicate the format in which data will be provided. Ideally, the report and summary of data will be on paper and all data and model input and output files will be provided electronically (e.g., compact disk or CD).
- Identify the guidelines used to prepare the protocol (e.g., District Guidelines).

#### *II. Emissions*

***For each pollutant and process whose emissions are required to be quantified in the HRA, list the annual average emissions (pounds/year and grams/second) and the maximum one-hour emissions (pounds/hour and grams/second)<sup>1</sup>. Maximum 1-hour emissions are used for acute noncancer health impacts while annual emissions are used for chronic exposures (i.e., chronic and 8-hour noncancer health impacts or cancer risk assessment).***

- Identify the reference and method(s) used to determine emissions (e.g., source tests, emission factors, etc.). Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report. In this event, a revised emission inventory report will need to be submitted to the District.
- Identify if this will be a multipathway assessment based on emitted substances.

---

<sup>1</sup> Except radionuclides, for which annual and hourly emissions are reported in Curies/year and millicuries/hour, respectively.

**III. Models / Modeling Assumptions*****Specify the model and modeling assumptions***

- Identify the model(s) to be used, including the version number.
- Identify the model options that will be used in the analysis.
- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all of the receptors of interest.
- Indicate complex terrain options that may be used, if applicable.
- Identify the source type(s) that will be used to represent the facility's operations (e.g., point, area, or volume sources, flare options or other).
- Indicate the preliminary source characteristics (e.g., stack height, gas temperature, exit velocity, dimensions of volume source, etc.).
- Identify and support the use of urban or rural dispersion coefficients for those models that require dispersion coefficients. For other models, identify and support the parameters required to characterize the atmospheric dispersion due to land characteristics (e.g., surface roughness, Monin-Obukhov length).

**IV. Meteorological Data*****Specify the type, source, and year(s) of hourly meteorological data (e.g., hourly surface data, upper air mixing height information).***

- State how the data are representative for the facility site.
- Describe QA/QC procedures.
- Identify any gaps in the data; if gaps exist, describe how the data gaps are filled.

**V. Deposition**

- Specify the method to calculate deposition (if applicable).

## VI. *Receptors*

***Specify the type and location of receptors. Include all relevant information describing how the individual and population-related receptors will be evaluated.***

- Identify and describe the location(s) of known or anticipated potential sensitive receptors, the point of maximum impact (PMI), the maximum exposed individual residential (MEIR), and worker (MEIW) receptors. Identify any special considerations or grids that will be used to model these receptors. This information should correspond with information provided in Section III (e.g., fine receptor spacing of 20 meters at the fence line and centered on the maximum impacts; coarse receptor spacing of 100 meters out to 2,000 meters; extra coarse spacing of 1,000 meters out to 20,000 meters).
- Identify if spatial averaging will be used. Include necessary background information on each receptor including how the domain and spacing will be determined for each receptor or exposure pathway.
- Describe how the cancer burden or population impact estimates are calculated. Clarify the same information for the presentation of noncancer population impacts (e.g., centroids of the census tracts in the area within the zone of impact).
- Specify that actual UTM coordinates and the block/street locations (i.e., north side of 3,000 block of Smith Street), where possible, will be provided for specified receptor locations.
- Identify and support the use of any exposure adjustments (e.g., time at location, diurnal).
- Include the list of anticipated exposure pathways that will be included and indicate which substance will be evaluated in the multipathway assessment. Identify if sensitive receptors are present and which receptors will be evaluated in the HRA.

## VII. *Maps*

***Identify how the information will be graphically presented.***

- Indicate which cancer risk isopleths will be plotted for the cancer zone of impact (e.g.,  $10^{-7}$ ,  $10^{-6}$  see Section 4.6.1).
- Indicate the hazard quotients or hazard indices to be plotted for the noncancer acute, 8 hour, and chronic zones of impact (e.g., 0.5, 1.0, etc.).

## 9.2 Health Risk Assessment Report

The purpose of this section is to provide an outline to assist with the preparation and review of HRAs. This outline specifies the key components that should be included in HRAs. All information used for the report must be presented in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Persons preparing HRAs for the Hot Spots Program should consult the District to determine if HRA guidelines or special formats are to be followed when preparing and presenting the HRA's results.

If District guidelines or formats do not exist that supersede this outline, then the HRA should follow the format presented here. If the HRA is prepared for other programs, the reviewing authority should be consulted for clarification of format and content. We recommend that those persons preparing HRAs specify the guidelines that were used to prepare their product. **The HRA may be considered deficient by the reviewing authority if components that are listed here are not included.**

### 9.2.1 Outline for the Health Risk Assessment Report

#### I. Table of Contents

- Section headings with page numbers indicated.
- Tables of tables and Table of figures with page numbers indicated.
- Appendices with page numbers indicated.

#### II. Executive Summary

##### **Overview of all relevant information regarding the project or facility.**

- Facility identifier number (consult the District).
- Description of facility operations and a list identifying emitted substances including table of maximum 1-hour emissions, and annual average emissions.
- Provide a brief description of acute, 8-hour, chronic, and cancer health impacts of the emitted substances, based on OEHHA's descriptions in the appropriate Technical Support Documents.
- Text presenting overview of dispersion modeling and exposure assessment.
- Text describing estimated cancer risk for carcinogens, noncancer Hazard Quotients and Hazard Indices and a table showing target organ systems by substance for noncancer impacts.

- Summarize the individual and population-wide health impacts including the driving substance(s) and the driving exposure pathways:
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of the off-site point of maximum impact (PMI), maximum exposed individual resident (MEIR), and maximum exposed individual worker (MEIW).
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any on-site receptors that were evaluated at the facility (consult District or agency).
  - Location (block/street location; e.g., north side of 3,000 block of Smith Street) and description of any sensitive receptors that are required by the district or reviewing authorities (consult District or agency).

**NOTE: When presenting information described in the following bullets, cancer risk should be presented separately for a residential 30-year, Tier-1 analysis. Results of other exposure assumptions (e.g., 9 or 70-year) or other tier evaluations should also be presented, and must be clearly labeled. For the Hot Spots Program, while the 30-year exposure duration is recommended as the basis for public notification and risk reduction audits and plans, the District has discretion to use the 70 year exposure scenario for its decisions. In addition, the 70 year cancer risk must be calculated to estimate population-wide impacts.**

- Text presenting an overview of the total cancer risk (including multipathway substances, if present) at the PMI, MEIR, MEIW, and sensitive receptors. Provide a table of cancer risk by substance for the MEIR and MEIW (if applicable). Include a statement indicating which of the substances appear to contribute most to (drive) the potential health impacts. In addition, identify the exposure pathways evaluated in the HRA.
- Provide a map of the facility and surroundings and identify the location of the MEIR, MEIW, PMI, and other locations or receptors of interest.
- Provide a map of 30-year and 70-year cancer risk zone of impact(s), if applicable.
- Text presenting an overview of the acute and chronic noncancer hazard quotients and the (total) hazard indices for the PMI, MEIR, MEIW, and sensitive receptors. Additionally, include 8-hour hazard quotients and hazard indices for the MEIW. Include separate statements (for acute, 8-hour, and chronic exposures) indicating which

of the substances appear to drive the potential health impacts. In addition, clearly identify the primary target organ(s) that are impacted from acute, 8-hour, and chronic exposures.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.
- Table and text presenting an overview of estimates of population exposure (e.g., cancer burden or population estimates from HARP) (consult District or agency) (see Section 8.4).
- Version of the Risk Assessment Guidelines and computer program(s) used to prepare the risk assessment (e.g., HARP).

### **III. Risk Assessment Procedures**

#### **A. Hazard identification**

- Table and text identifying all substances emitted from the facility, plus any other substances required by the District or reviewing authority. Include the CAS number of the substance and the physical form of the substance if possible. [The Hot Spots substances are listed in Appendix A, and also in the ARB's Emission Inventory Criteria and Guidelines Regulations (Title 17, California Code of Regulations, Sections 93300-93300.5), and the Emission Inventory Criteria and Guidelines Report (EICG Report), which is incorporated by reference therein (ARB, 1997)].
- Table and text identifying all substances that are evaluated for cancer risk and/or noncancer acute, 8-hour, and chronic health impacts. In addition, identify any multipathway substances that present a cancer risk or chronic noncancer hazard via noninhalation routes of exposure.
- Describe the types and amounts of continuous or intermittent predictable emissions from the facility that occurred during the reporting year. As required by statute, releases from a facility include spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping (fugitive), leaching, dumping, or disposing of a substance into ambient air. Include the substance(s) released and a description of the processes that resulted in long-term and continuous releases.

#### **B. Exposure Assessment**

This section describes the information related to the air dispersion modeling process that needs to be reported in the risk assessment; the information is also presented in Chapter 4 (see Section 4.15). The District may have specific requirements regarding format and content (see Section 4.14). Sample calculations should be provided at each step to indicate how reported emissions

data were used. Reviewing agencies must receive input, output, and supporting files of various model analyses on computer-readable media (e.g., CD).

### **1. Information on the Facility and its Surroundings**

Report the following information regarding the facility and its surroundings:

- Facility Name
- Location (UTM coordinates and street address)
- Land use type (see Section 2.4)
- Local topography
- Facility plot plan identifying:
  - source locations
  - property line
  - horizontal scale
  - building heights
  - emission sources

### **2. Source and Emission Inventory Information**

#### **a. Release Parameters**

Report the following information for each release location in table format:

- Release location identification number
- Release name
- Release type (e.g., point, volume, area, line, pit, etc.)
- Source identification number(s) used by the facility for sources that emit out of this release location
- Release location using UTM coordinates
- Release parameters by release type (e.g., shown for point source):
- Stack height (m), stack diameter (building dimensions for downwash, exhaust gas exit velocity (m/s), exhaust gas volumetric flow rate (ACFM), exhaust gas exit temperature (K), etc.

#### **b. Source Description and Operating Schedule**

The description and operating schedule for each source should be reported in table form including the following information:

- Source identification number used by the facility
- Source name
- Number of operating hours per day and per year (e.g., 0800-1700, 2700 hr/yr)
- Number of operating days per week (e.g., Mon-Sat)

- Number of operating days or weeks per year (e.g., 52 wk/yr excluding major holidays)
- Release point identification number(s) for where source emissions are released
- Fraction of source emissions emitted at each release point by release point ID number

c. Emission Control Equipment and Efficiency

- Report emission control equipment and efficiency by source and by substance

d. Emissions Data Grouped By Source

Report emission rates for each toxic substance, grouped by source (i.e., emitting device or process identified in Inventory Report), in table form including the following information:

- Source name
- Source identification number
- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

e. Emissions Data Grouped by Substance

Report facility total emission rate by substance for all emitted substances listed in the Air Toxics “Hot Spots” Program including the following information:

- Substance name and CAS number (from Inventory Guidelines)
- Annual average emissions for each substance (lb/yr)
- Hourly maximum emissions for each substance (lb/hr)

f. Emission Estimation Methods

Report the methods used in obtaining the emissions data indicating whether emissions were measured or estimated. Clearly indicate any emission data that are not reflected in the previously submitted emission inventory report and submit a revised emission inventory report to the district. A reader should be able to reproduce the risk assessment without the need for clarification.

g. List of Substances

Include tables listing all "Hot Spots" Program substances which are emitted, plus any other substances required by the District. Indicate substances to be evaluated for cancer risks and noncancer effects.

h. Exposed Population and Receptor Location

Report the following information regarding exposed population and receptor locations:

- Description of zone of impact including map showing the location of the facility, boundaries of zone of impact, census tracts, emission sources, sites of maximum exposure, and the location of all appropriate receptors. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5 minute maps or GIS based maps are usually the most appropriate choices. (If significant development has occurred since the user's survey, this should be indicated.)
- Separate maps for the cancer risk zone of impact and the hazard index (noncancer) zone of impact(s). The cancer zone of impact should include isopleths down to at least the 1/1,000,000 risk level. Because some districts use a level below 1/1,000,000 to define the zone of impact, the District should be consulted. For the noncancer zone of impact, three separate isopleths (to represent chronic, 8-hour, and acute HI) should be created to define the zone of impact for the hazard index from both inhalation and noninhalation pathways greater than or equal to 0.5. The point of maximum impact (PMI), maximum exposed individual at a residential receptor (MEIR), and maximum exposed individual worker (MEIW) for both cancer and noncancer risks should be located on the maps.
- Tables identifying population units and sensitive receptors (UTM coordinates, receptor IDs or index from the modeling, and street addresses of specified receptors)
- Heights or elevations of the receptor points.
- **Spatial averaging:** For each receptor type (e.g., PMI, MEIR, and MEIW, or other location of interest) that will utilize spatial averaging, the domain size and grid resolution must be clearly identified. If another domain or grid resolution other than 20 meters by 20 meters with 5-meter grid spacing will be used for a receptor, then care should be taken to determine the proper domain size and grid resolution that should be used. For a worker, the HRA shall support all assumptions used, including, but not limited to, documentation for all workers

showing the area where each worker routinely performs their duties. The final domain size should not be greater than the smallest area of worker movement. Other considerations for determining domain size and grid spacing resolution may include an evaluation of the concentration gradients across the worker area. The grid spacing used within the domain should be sufficient in number and detail to obtain a representative concentration across the area of interest. When spatial averaging over the deposition area of a pasture, garden, or water body, care should be taken to determine the proper domain size to make sure it includes all reasonable areas of potential deposition. The size and shape of the pasture, garden, or water body of interest should be identified and used for the modeling domain. The grid spacing or resolution used within the domain should be sufficient in detail to obtain a representative deposition concentration across the area of interest. One way to determine the grid resolution is to include an evaluation of the concentration gradients across the deposition area. The HRA shall support all assumptions used, including, but not limited to, documentation of the deposition area (e.g., size and shape of the pasture or water body, maps, representative coordinates, grid resolution, concentration gradients, etc.). The use of spatial averaging is subject to approval by the reviewing authority. This includes the size of the domain and grid resolution that is used for spatial averaging of a worksite or multipathway deposition area.

### **3. Meteorological Data**

If meteorological data were not obtained directly from the District, then the report must clearly indicate the data source and time period used. Meteorological data not obtained from the District must be submitted in electronic form along with justification for their use including information regarding representativeness and quality assurance.

The risk assessment should indicate if the District required the use of a specified meteorological data set. All memos indicating the District's approval of meteorological data should be attached in an appendix.

### **4. Model Selection and Modeling Rationale**

The report should include an explanation of the model chosen to perform the analysis and any other decisions made during the modeling process. The report should clearly indicate the name of the models that were used, the level of detail (screening or refined analysis) and the rationale behind the selection.

Also report the following information for each air dispersion model used:

- Version number
- Selected options and parameters in table form

- Identify the modeling domain(s) and the spacing of receptor grid(s). Grid spacing should be sufficient in number and detail to capture the concentration at all receptors of interest.

## 5. Air Dispersion Modeling Results

The report should include tables, text, and appendices that clearly present all of the following information

- Maximum hourly and annual average concentrations of chemicals at appropriate receptors such as the residential and worker MEI receptors
- Annual average and maximum one-hour (and 30-day average for lead only) concentrations of chemicals at appropriate receptors listed and referenced to computer printouts of model outputs
- Model printouts (numbered), annual concentrations, maximum hourly concentrations
- Disk with input/output files for air dispersion program (e.g., the AERMOD input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.)
- Include tables that summarize the annual average concentrations that are calculated for all the substances at each site. The use of tables that present the relative contribution of each emission point to the receptor concentration is recommended. (These tables should have clear reference to the computer model which generated the data. It should be made clear to any reader how data from the computer output were transferred to these tables.) [As an alternative, the above two tables could contain just the values for sites of maximum impact (i.e., PMI, MEIR and MEIW), and sensitive receptors, if required. All the values would be found in the Appendices.]

### C. Health Values Used in Dose-Response and Dose Estimates

- Provide tables of the acute, 8-hour and chronic inhalation RELs, chronic oral RELs (if applicable), and cancer potency factors for each substance that is quantified in the HRA.
- Identify the guidelines (title and date) that were used to obtain these factors, or indicate whether newly approved values obtained from the OEHHA website were used.
- Provide a table of target organ systems for each noncancer substance, including acute (1 hour), 8-hour, and chronic inhalation, and chronic oral (if applicable).

- Include tables of the estimated dose for each substance by each exposure pathway at the PMI, MEIR, MEIW, and at any sensitive receptor locations (required by the District).

#### **D. Risk Characterization**

The Hot Spots Analysis and Reporting Program (HARP) will generate the risk characterization data needed for the outline below. Any data needed to support the risk characterization findings should be clearly presented and referenced in the text and appendices. A listing of HARP output files that meet these HRA requirements is provided in this outline under the section entitled "Appendices". All HARP files should be included in the HRA. Ideally, the HRA report and a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD). Information on obtaining copies of HARP is available on the California Air Resources Board's Internet web site under the Air Toxics Program at [www.arb.ca.gov](http://www.arb.ca.gov).

**NOTE:** The cancer risk for the PMI, MEIR, and sensitive receptors of interest must be presented in the HRA's text, tables, and maps. OEHHA recommends that cancer risk for a 30-year exposure duration be presented for the MEIR, and that cancer risk for 9-year and 70-year exposure durations for the MEIR be presented to provide the risk managers with supplemental information. Note that the assessment of population impacts must be based on a 70-year exposure duration; thus all risk assessments need to estimate cancer risk for a 70-year exposure duration in order to report the number of individuals residing in the risk isopleths, or to calculate cancer burden if the District so requires. In addition, some Districts may opt to make risk management decisions based on a 70-year exposure duration. The MEIW location should use a 25-year exposure period.

All HRAs must include the results of a Tier-1 exposure assessment (see Chapter 2 and 8, or the 2012 TSD). If the reviewing authority specifies that additional exposure periods should be presented, or if persons preparing the HRA would like to present additional information (i.e., exposure duration adjustments or the inclusions of risk characterizations using Tier-2 through Tier-4 exposure data), then this information should be presented in separate, clearly titled, sections, tables, and text.

***The following information should be presented in this section of the HRA. If not fully presented here, then by topic, clearly identify the section(s) and pages within the HRA where this information is presented.***

- Description of receptors to be quantified.
- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address

(e.g., north side of 3,000 block of Smith Street)] and description of the PMI, MEIR, and MEIW for both cancer and noncancer risks.

- Separate tables and text providing description of the PMI and MEIR for 30-year cancer risk, and 9- or 70-year cancer risk.
- Tables and text describing MEIW 25-year cancer risk.
- Table and text providing the location [UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)] and description of any sensitive receptor that is of interest to the District or reviewing authorities (consult District or agency).
- Provide any exposure information that is used for risk characterization (e.g., concentrations at receptors, emissions information, census information, figures, zone of impact maps, etc.). If multipathway substances are emitted, identify the site/route dependent exposure pathways (e.g., water ingestion) for the receptor(s), where appropriate (e.g., MEIR).
- Provide a summary of the site-specific inputs used for each exposure pathway (e.g., water or grazing intake assumptions). This information may be presented in an appendix with the information clearly presented and cross-referenced to the text. In addition, provide reference to the appendix (section and page number) that contains the modeling (i.e., HARP/dispersion modeling) files that show the same information.
- If any exposure parameters were used other than those provided in the Air Toxics Risk Assessment Guidelines: Technical Support Document for Exposure Assessment and Stochastic Analysis (2012), they must be presented in detail. The derivation and data used must be presented so that it is clear to the reviewer. The justification for using site-specific exposure parameters must be clearly presented.
- Table and text presenting the potential multipathway cancer risk by substance, by pathway, and total, at the PMI, MEIR, MEIW, and sensitive receptor locations (required by the District).
- Table and text presenting the acute (inhalation only) and chronic noncancer (inhalation and oral) hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs for the PMI, MEIR, MEIW, and sensitive receptors. For 8-hour exposure at the MEIW (inhalation only), table and text presenting hazard quotients (by substance, exposure pathways, and target organs) and the (total) hazard indices by substance and target organs. Note:

Chronic noncancer results should be shown with inhalation and oral contributions (shown separately) and for the combined (multipathway) impact.

- Identify any sensitive subpopulations (e.g., child daycare facilities, schools, nursing homes) of concern.
- Table and text presenting estimates of population exposure (e.g., population exposure estimates or cancer burden from HARP) (consult District or agency). Tables should indicate the number of persons exposed to a (total) cancer risk greater than  $10^{-7}$ ,  $10^{-6}$ ,  $10^{-5}$ ,  $10^{-4}$ , etc., and total hazard quotient or hazard index greater than 0.5, 1.0, 2.0, and 3.0, etc. Provide a table that shows excess cancer burden for each population unit and the total excess cancer burden, if cancer burden calculation is required.
- Provide maps that illustrate the HRA results for the three sub-bullet points below. These maps should be an actual street map of the area impacted by the facility with elevation contours and actual UTM coordinates, and the facility boundaries clearly labeled. In some cases the elevation contours will make the map too crowded and should therefore not appear. This should be a true map (one that shows roads, structures, etc.), drawn to scale, and not just a schematic drawing. USGS 7.5-minute maps are usually the most appropriate choice (see Section 4.6).
  - The facility (emission points and boundaries), the locations of the PMI, MEIR, MEIW, and sensitive receptors.
  - Maps of the cancer zone of impacts (e.g.,  $10^{-6}$  or  $10^{-7}$  levels - consult District or Agency). The map should clearly identify the zone of impact for the inhalation pathway, the minimum exposure pathways (soil ingestion, dermal exposure, and breast-milk consumption) if multipathway substances are emitted, and the zone of impact for all the applicable exposure pathways (minimum exposure pathways plus any additional site/route specific pathways) for multipathway analyses. Two maps may be needed to accomplish this. The legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways that were included in the assessment.
  - Maps of the noncancer hazard index (HI) zone of impacts (e.g., 0.5 or 1.0 - consult District or Agency). The noncancer maps should clearly identify the noncancer zones of impact. These include the acute (inhalation), 8-hour (inhalation), chronic (inhalation), and chronic (multipathway) zones of impact. For clarity, presentation of the noncancer zones of impact may require two or more maps. The

legend of these maps should state the level(s) used for the zone of impact and identify the exposure pathways.

- The risk assessor may want to include a discussion of the strengths and weaknesses of the risk analyses and associated uncertainty directly related to the facility HRA.
- If appropriate, comment on the possible alternatives for control or remedial measures. How do the risks compare?
- If possible, identify any community concerns that influence public perception of risk.
- Sample calculations may be needed for all analyses in the HRA if proprietary software other than HARP was used. The District should be consulted. These calculations should be clearly presented and referenced to the findings they are supporting in the HRA text.
- Version of the Risk Assessment Guidelines and computer program used to prepare the risk assessment.
- If software other than HARP is used for the health assessment modeling, all supporting material must be included with the HRA (e.g., all algorithms and parameters used in a clear, easy to review format).

#### **E. References**

Include any references used for the HRA in this section.

#### **F. Appendices**

The appendices should contain all data, sample calculations, assumptions, and all modeling and risk assessment files that are needed to reproduce the HRA results. Ideally, a summary of data used in the HRA will be on paper and all data and model input and output files will be provided electronically (e.g., CD), unless otherwise specified by the district or reviewing authority. All appendices and the information they contain should be referenced, clearly titled, and paginated.

#### ***Potential Appendix Topics (if not presented elsewhere in the HRA report):***

- List of all receptors locations (UTM coordinates, receptor ID number or index from the modeling, and the block/street address (e.g., north side of 3,000 block of Smith Street)) for the PMI, MEIR, MEIW, and sensitive receptors.
- List of all emitted substances.
- All emissions files.

- List of dose-response factors (Reference Exposure Levels and cancer potency factors).
- All air dispersion modeling input and output files. Detailed discussions of meteorological data, regulatory options, emission parameters, receptor locations, etc.
- Census data.
- Maps.
- Identify the site/route dependent exposure pathways for the receptor(s), where appropriate (e.g., MEIR). Provide a summary of the site-specific inputs used for each pathway (e.g., water or grazing intake assumptions) and the data to support them.
- All calculations used to determine emissions, concentrations, and potential health impacts at the PMI, MEIR, MEIW, and sensitive receptors.
- All HRA model input and output (HARP) files for receptors of concern.
- (Total) cancer and noncancer impacts by receptor, substance, and exposure pathway (by endpoint for noncancer) at all receptors.
- Presentation of alternate risk assessment methods (e.g., alternate exposure durations, or Tier-2 to Tier-4 evaluations with supporting information).

## List of Abbreviations

A - Area

AB2588 - Air Toxics "Hot Spots" Information and Assessment Act, 1987

ACFM - Actual Cubic Feet per Minute

ADL - Annual Dermal Load

AQMD - Air Quality Management District (District)

ARB - Air Resources Board

ASF - Age Sensitivity Factor

AT - Average Time for Lifetime Cancer Risk

BAF - Bioaccumulation Factor

BG - Urban Block Groups

BLP - Buoyant Line and Point Source Dispersion Model

BMI - Breast Milk Intake

BPIP - Building Profile Input Program

BPIPPRM - Building Profile Input Program for PRIME

BSA - Body Surface Area

BW - Bodyweight

$C_{air}$  - annual average air concentration

CALMPRO - Calms processor program

CAPCOA - California Air Pollution Control Officer's Association

CAS - Chemical Abstracts Service

CERCLA - Comprehensive Environmental Response, Compensation and Liability Act

$C_f$  - Average concentration of a substance in fish

$C_m$  - Average concentration of a substance in mother's milk (misabeled on 114 as  $C_f$ )

$C_{fa}$  - Average concentration of a substance in animal products

CONST2 - Constant in the Briggs' stable plume rise equation using BLP

CONST3 - Constant in the Briggs' neutral plume rise equation using BLP

CPF - Cancer Potency Factor

CRIT - Convergence criterion for the line source calculations using BLP

$C_s$  - Concentration of Substance in the Soil

CTDMPLUS - Complex Terrain Dispersion Model

CTSCREEN - Complex Terrain Screening Model

$C_v$  - Average concentration of a substance in and on vegetation

$C_w$  - Concentration of a Substance in the Water

DECFACT - Pollutant decay factor for use with BLP

DF - Discount Factor

$DOSE_{air}$  - Daily inhaled dose

$DOSE_{fa}$  - Exposure through ingesting home-raised or farm animal products

$DOSE_{fish}$  - Exposure through ingestion of angler-caught fish

Dose- $lm$  - Exposure through mother's milk ingestion

$DOSE_p$  - Exposure through ingesting home-grown produce

$DOSE_{water}$  - Exposure through ingesting water

DTHTA - Vertical potential temperature gradient  
DTSC - Department of Toxic Substance Control  
EASA - Exposure Assessment and Stochastic Analysis

**Subject:** RE: 401 Santa Clara - Phase 1 Questions - NEPA Review

Hello Adrian, nice to hear from you. I would be happy to answer your colleague's questions. First I will define a REC so we can have some clarity on what a constitutes a REC. As defined in the ASTM E1527-21 standard, which all Phase I ESAs are required to follow, a REC is defined as *"(1) the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment."*

Pertaining to the database listings (FINDS, ECHO, HWTS, HAZNET, RCRA NonGen / NLR), the reason these are not considered RECs is because, although hazardous materials and waste were handled and generated from the Site, there is no record nor observation of any spill, leak, or release to the environment. The presence of hazardous waste or materials alone is not considered a REC.

As for the off-site dry cleaning facilities, seven historical dry cleaning facilities were found in the vicinity of the Site, however all of them were downgradient of the Site, and the closest dry cleaner was 170 feet away. Due to the downgradient relationship to the Site, and the distance from the Site, these are not considered RECs. Additionally no records of any releases to the environment associated with the dry cleaners were found.

As for the 50-gallon used cooking oil AST, this was used to store used cooking oil generated by the

Site kitchen. The AST was located in the parking garage. I do not know if it will be needed in the future use of the Site building, that is a question for the Oakland Housing Authority.

Hopefully that answers all of the questions. Please let me know if there is any other way I can be of assistance. Thanks

**Luke Swickard**

**Subject:** 401 Santa Clara - Phase 1 Questions - NEPA Review

Hi Luke and Brandon,

Hope you are well. Your team prepared the Phase I for 401 Santa Clara for the Authority back in May. We are in the middle of our NEPA review with our consultant Raney (cc'd), and our City of Oakland contact has the following comments/questions (in bold underlined font):

Regarding the analysis of potential impacts related to Contamination and Toxic Substances, she would like clarification on why the listing of the project site on various environmental databases is not considered a Recognized Environmental Condition (REC).

- “With respect to the review of applicable environmental databases, a computerized environmental information database search for the project site and vicinity was conducted by Environmental Data Resources (EDR) as part of the Phase I ESA. According to the EDR search results, the project site is listed on the RCRA NonGen/NLR, FINDS, and ECHO databases for handling – but not generating – hazardous waste, in 2016, 2022, and 2023; on the HWTS database for having tracked hazardous waste on-site in 2008, 2014, and 2016; and on the HAZNET database for storing, transferring, and disposing of several tons of pharmaceutical waste, and asbestos-containing waste from 2008 to 2020. The Phase I ESA determined that none of the foregoing database listings are considered RECs” – **Why aren't they “RECs”, especially since this was before the fire so unrelated to that?**

Additionally, concerning off-site facilities identified as part of the Phase I ESA's environmental database search:

- “Additionally, several off-site facilities were identified as part of the EDR search, including properties with records for handling – but not generating – hazardous waste, which is not considered a REC. Several off-site facilities were identified as listed laundry service facilities; however, none were considered a REC, as none of the listings included reports of release of hazardous materials.” **Why isn't dry cleaning considered an “REC”?**

Finally, regarding the on-site 50-gallon AST:

- The project itself contains a 50-gallon AST” – **Why does the property contain a 50-gallon AST? Is it still needed and where is it located?**

Thank you,  
Adrian

Summary by Map Unit — Alameda County, California, Western Part (CA610)				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
151	Urban land-Tierra complex, 5 to 15 percent slopes	Not prime farmland	1.0	100.0%
<b>Totals for Area of Interest</b>			<b>1.0</b>	<b>100.0%</b>
<b>Description — Farmland Classification</b>				
Farmland classification identifies map units as prime farmland, farmland of statewide importance, farmland of local importance, or unique farmland. It identifies the location and extent of the soils that are best suited to food, feed, fiber, forage, and oilseed crops. NRCS policy and procedures on prime and unique farmlands are published in the "Federal Register," Vol. 43, No. 21, January 31, 1978.				
<b>Rating Options — Farmland Classification</b>

# DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/).

## Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

## Tools and Guidance

Effective Distance	214		
Distance to Stop Sign			
Average Speed	65		
Average Daily Trips (ADT)	154000		
Night Fraction of ADT	15		
Road Gradient (%)			
Vehicle DNL	72	0	0
<b>Calculate Road #1 DNL</b>	72	<b>Reset</b>	

[Add Road Source](#) [Add Rail Source](#)

Airport Noise Level	<input type="text"/>
Loud Impulse Sounds?	<input type="radio"/> Yes <input type="radio"/> No
Combined DNL for all Road and Rail sources	<input type="text" value="0"/>
Combined DNL including Airport	<input type="text"/>
Site DNL with Loud Impulse Sound	<input type="text"/>

## Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
  - **Contact your Field or Regional Environmental Officer**  
(</programs/environmental-review/hud-environmental-staff-contacts/>)
  - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
  - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
  - Incorporate natural or man-made barriers. See *The Noise Guidebook*  
(</resource/313/hud-noise-guidebook/>)
  - Construct noise barrier. See the **Barrier Performance Module**  
(</programs/environmental-review/bpm-calculator/>)

# Acceptable Separation Distance (ASD) Electronic Assessment Tool

The Environmental Planning Division (EPD) has developed an electronic-based assessment tool that calculates the Acceptable Separation Distance (ASD) from stationary hazards. The ASD is the distance from above ground stationary containerized hazards of an explosive or fire prone nature, to where a HUD assisted project can be located. The ASD is consistent with the Department's standards of blast overpressure (0.5 psi-buildings) and thermal radiation (450 BTU/ft<sup>2</sup> - hr - people and 10,000 BTU/ft<sup>2</sup> - hr - buildings). Calculation of the ASD is the first step to assess site suitability for proposed HUD-assisted projects near stationary hazards. Additional guidance on ASDs is available in the Department's guidebook "Siting of HUD- Assisted Projects Near Hazardous Facilities" and the regulation 24 CFR Part 51, Subpart C, Siting of HUD-Assisted Projects Near Hazardous Operations Handling Conventional Fuels or Chemicals of an Explosive or Flammable Nature.

**Note:** Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the ASD result fields with the mouse.

## Acceptable Separation Distance Assessment Tool

Is the container above ground? Yes:  No:

Is the container under pressure? Yes:  No:

Does the container hold a cryogenic liquified gas? Yes:  No:

Is the container diked? Yes:  No:

What is the volume (gal) of the container?

What is the Diked Area Length (ft)?

What is the Diked Area Width (ft)?

Diked Area (sqft)

ASD for Blast Over Pressure (ASDBOP)

ASD for Thermal Radiation for People (ASDPPU)

ASD for Thermal Radiation for Buildings (ASDBPU)

ASD for Thermal Radiation for People (ASDPNPD)

ASD for Thermal Radiation for Buildings (ASDBNPD)

**For mitigation options, please click on the following link:** [Mitigation Options \(/resource/3846/acceptable-separation-distance-asd-hazard-mitigation-options/\)](/resource/3846/acceptable-separation-distance-asd-hazard-mitigation-options/)

## Providing Feedback & Corrections

After using the ASD Assessment Tool following the directions in this User Guide, users are encouraged to provide feedback on how the ASD Assessment Tool may be improved. Users are also encouraged to send comments or corrections for the improvement of the tool.

Please send comments or other input using the **Contact Us** (<https://www.hudexchange.info/contact-us/>) form.

# Environmental Justice & Supplemental Indexes

The environmental justice and supplemental indexes are a combination of environmental and socioeconomic information. There are thirteen EJ indexes and supplemental indexes in EJScreen reflecting the 13 environmental indicators. The indexes for a selected area are compared to those for all other locations in the state or nation. For more information and calculation details on the EJ and supplemental indexes, please visit the [EJScreen website](#).

## EJ INDEXES

The EJ indexes help users screen for potential EJ concerns. To do this, the EJ index combines data on low income and people of color populations with a single environmental indicator.

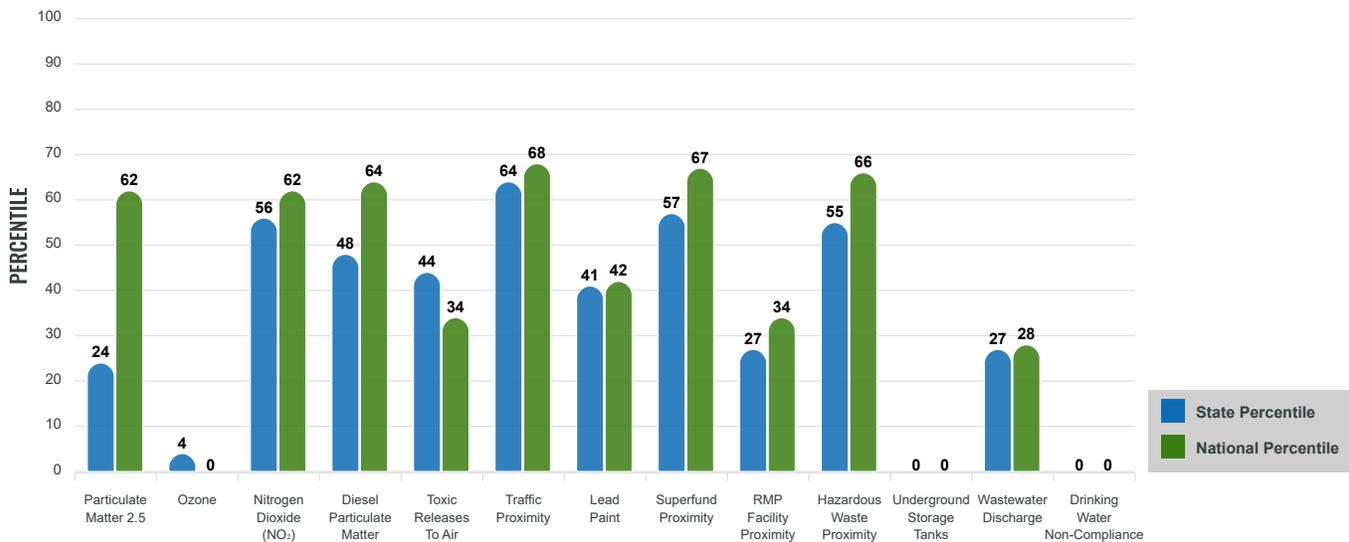

### EJ INDEXES FOR THE SELECTED LOCATION

## SUPPLEMENTAL INDEXES

The supplemental indexes offer a different perspective on community-level vulnerability. They combine data on percent low income, percent persons with disabilities, percent less than high school education, percent limited English speaking, and percent low life expectancy with a single environmental indicator.

### SUPPLEMENTAL INDEXES FOR THE SELECTED LOCATION

Report for Blockgroup: 060014039003

Report produced September 11, 2024 using EJScreen Version 2.3

# EJScreen Environmental and Socioeconomic Indicators Data

SELECTED VARIABLES	VALUE	STATE AVERAGE	PERCENTILE IN STATE	USA AVERAGE	PERCENTILE IN USA
<b>ENVIRONMENTAL BURDEN INDICATORS</b>					
Particulate Matter 2.5 (µg/m <sup>3</sup> )	11.2	12.3	30	8.45	91
Ozone (ppb)	47.4	74.2	5	61.8	0
Nitrogen Dioxide (NO <sub>2</sub> ) (ppbv)	12	9.1	86	7.8	88
Diesel Particulate Matter (µg/m <sup>3</sup> )	0.378	0.286	69	0.191	90
Toxic Releases to Air (toxicity-weighted concentration)	520	780	61	4,600	47
Traffic Proximity (daily traffic count/distance to road)	11,000,000	4,000,000	96	1,700,000	99
Lead Paint (% Pre-1960 Housing)	0.35	0.31	60	0.3	62
Superfund Proximity (site count/km distance)	0.48	0.68	76	0.39	83
RMP Facility Proximity (facility count/km distance)	0.16	0.83	31	0.57	40
Hazardous Waste Proximity (facility count/km distance)	18	11	77	3.5	96
Underground Storage Tanks (count/km <sup>2</sup> )	0	0.00036	0	3.6	0
Wastewater Discharge (toxicity-weighted concentration/m distance)	15	11000	34	700000	39
Drinking Water Non-Compliance (points)	0	0.5	0	2.2	0
<b>SOCIOECONOMIC INDICATORS</b>					
Demographic Index USA	1.13	N/A	N/A	1.34	48
Supplemental Demographic Index USA	0.99	N/A	N/A	1.64	15
Demographic Index State	1.28	1.83	29	N/A	N/A
Supplemental Demographic Index State	0.86	1.49	17	N/A	N/A
People of Color	49%	62%	34	40%	64
Low Income	15%	28%	32	30%	28
Unemployment Rate	4%	6%	45	6%	56
Limited English Speaking Households	4%	8%	48	5%	73
Less Than High School Education	11%	16%	52	11%	63
Under Age 5	3%	5%	34	5%	36
Over Age 64	26%	16%	85	18%	82

\*Diesel particulate matter index is from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the Air Toxics Data Update can be found at: <https://www.epa.gov/haps/air-toxics-data-update>.

## Sites reporting to EPA within defined area:

Superfund .....	0
Hazardous Waste, Treatment, Storage, and Disposal Facilities .....	0
Water Dischargers .....	0
Air Pollution .....	0
Brownfields .....	0
Toxic Release Inventory .....	0

## Other community features within defined area:

Schools .....	0
Hospitals .....	0
Places of Worship .....	1

## Other environmental data:

Air Non-attainment .....	Yes
Impaired Waters .....	No

Selected location contains American Indian Reservation Lands* .....	No
Selected location contains a "Justice40 (CEJST)" disadvantaged community .....	No
Selected location contains an EPA IRA disadvantaged community .....	No

# User's Guide for the AMS/EPA Regulatory Model (AERMOD)

EPA-454/B-24-007  
November 2024

User's Guide for the AMS/EPA Regulatory Model (AERMOD)

U.S. Environmental Protection Agency  
Office of Air Quality Planning and Standards  
Air Quality Assessment Division  
Research Triangle Park, NC

## **Notice**

Mention of trade names, products, or services does not convey, and should not be interpreted as conveying official EPA approval, endorsement, or recommendation. The following trademarks appear in this guide:

Microsoft Windows is a registered trademark of the Microsoft Corporation.

## **Preface**

This User's Guide for the AMS/EPA Regulatory Model (AERMOD) provides user instructions for the AERMOD model. The technical description of the AERMOD algorithms is provided in a separate AERMOD Model Formulation document (EPA, 2024a). Additional resources provided by the USEPA that may be helpful with respect to the application of AERMOD can be accessed via the Support Center for Regulatory Atmospheric Modeling (SCRAM) website at <https://www.epa.gov/scram>.

## Contents

Section	Page
1.0 Introduction.....	1-1
1.1 How to use the AERMOD manuals.....	1-1
1.1.1 Novice users.....	1-1
1.1.2 Experienced modelers.....	1-1
1.1.3 Management/decision makers.....	1-2
1.2 Overview of the AERMOD model.....	1-2
1.2.1 Regulatory applicability.....	1-3
1.2.2 Basic input data requirements.....	1-3
1.2.3 Computer hardware requirements.....	1-3
1.2.4 Dispersion options.....	1-4
1.2.5 Source options.....	1-4
1.2.6 Receptor options.....	1-5
1.2.7 Meteorology options.....	1-5
1.2.8 Output options.....	1-6
1.2.9 Source contribution analyses.....	1-7
2.0 Getting started - a brief tutorial.....	2-1
2.1 Controlling input and output files.....	2-1
2.1.1 Description of AERMOD input files.....	2-1
2.1.1.1 Input control file.....	2-1
2.1.1.2 Meteorological data files.....	2-2
2.1.1.3 Initialization file for model re-start.....	2-2
2.1.2 Description of AERMOD output files.....	2-2
2.1.2.1 Main output file.....	2-3
2.1.2.2 Detailed error message file.....	2-3
2.1.2.3 Intermediate results file for model re-start.....	2-3
2.1.2.4 Maximum value/threshold file.....	2-4
2.1.2.5 Sequential results file for postprocessing.....	2-5
2.1.2.6 High value summary file for plotting.....	2-6
2.1.2.7 TOXX model input files.....	2-6
2.1.3 Controlling file inputs and outputs (I/O).....	2-7

2.1.3.1 Controlling I/O on PCs.....	2-7
2.2 Description of keyword/parameter approach .....	2-8
2.2.1 Basic rules for structuring input control files.....	2-9
2.2.2 Advantages of the keyword approach.....	2-11
2.3 Regulatory default modeling options .....	2-12
2.4 Setting up a simple control file.....	2-13
2.4.1 A simple industrial source application.....	2-15
2.4.2 Selecting modeling options - CO pathway .....	2-15
2.4.3 Specifying source inputs - SO pathway .....	2-18
2.4.4 Specifying a receptor network - RE pathway .....	2-22
2.4.5 Specifying the meteorological Input - ME pathway .....	2-23
2.4.6 Selecting output options - OU pathway .....	2-24
2.4.7 Using the error message file to debug the input control file .....	2-28
2.4.8 Running the model and reviewing the results .....	2-32
2.5 Modifying an existing control file.....	2-40
2.5.1 Modifying modeling options.....	2-40
2.5.2 Adding or modifying a source or source group .....	2-40
2.5.3 Adding or modifying a receptor network.....	2-40
2.5.4 Modifying output options .....	2-41
3.0 Detailed keyword reference .....	3-1
3.1 Overview .....	3-1
3.2 Control pathway inputs and options .....	3-2
3.2.1 Title information .....	3-2
3.2.2 Dispersion options .....	3-2
3.2.2.1 DFAULT option.....	3-6
3.2.2.2 ALPHA options .....	3-7
3.2.2.3 BETA options .....	3-8
3.2.2.4 Options for capped and horizontal stack releases.....	3-8
3.2.2.5 Output types (CONC, DEPOS, DDEP and/or WDEP) .....	3-10
3.2.2.6 Deposition depletion options.....	3-10
3.2.2.7 NO <sub>2</sub> conversion options .....	3-10
3.2.2.8 FASTAREA and FASTALL.....	3-12
3.2.2.9 Urban transition and NOURBTRAN option .....	3-13

3.2.2.10 SCREEN mode.....	3-14
3.2.2.11 SCIM .....	3-14
3.2.2.12 Deposition Options.....	3-15
3.2.2.13 Definition of seasons for gaseous dry deposition.....	3-16
3.2.2.14 Definition of land use categories for gas dry deposition.....	3-17
3.2.2.15 Deposition velocity and resistance outputs .....	3-18
3.2.2.16 Remove displacement height from RLINE wind profile.....	3-19
3.2.3 Low wind parameters.....	3-19
3.2.4 Building downwash options.....	3-21
3.2.4.1 ORD building downwash options .....	3-22
3.2.4.2 AWMA building downwash options.....	3-24
3.2.5 Input parameters for NO <sub>2</sub> conversion options.....	3-26
3.2.5.1 Specifying ozone concentrations for PVMRM, OLM, TTRM/TTRM2, and GRSM options .....	3-29
3.2.5.2 Specifying NO <sub>x</sub> background concentrations for the GRSM option.....	3-33
3.2.5.3 Specifying the ambient equilibrium NO <sub>2</sub> /NO <sub>x</sub> ratio (PVMRM, OLM, TTRM/TTRM2) .....	3-38
3.2.5.4 Specifying the default in-stack NO <sub>2</sub> /NO <sub>x</sub> ratio (PVMRM, OLM, TTRM/TTRM2, GRSM) .....	3-38
3.2.6 Averaging time options.....	3-39
3.2.7 Performing multiple year analyses with MULTYEAR option .....	3-40
3.2.8 Urban modeling option .....	3-42
3.2.9 Specifying the pollutant type .....	3-43
3.2.10 Modeling with exponential decay .....	3-43
3.2.11 Flagpole receptor height option .....	3-44
3.2.12 Plume Rise from Aircraft Emissions .....	3-44
3.2.13 To run or not to run.....	3-45
3.2.14 Generating an input file for EVENT processing.....	3-46
3.2.15 The model re-start capability .....	3-47
3.2.16 Processing for particulate matter (PM) NAAQS .....	3-48
3.2.16.1 Processing for fine particulate matter (PM-2.5).....	3-48
3.2.16.2 Processing for particulate matter of 10 microns or less (PM-10).....	3-50
3.2.17 Processing for 1-hour NO <sub>2</sub> and SO <sub>2</sub> NAAQS.....	3-51
3.2.18 Debugging output options.....	3-52

3.2.19 Detailed error listing file .....	3-54
3.3 Source pathway inputs and options .....	3-55
3.3.1 Identifying source types and locations.....	3-55
3.3.2 Specifying source release parameters .....	3-60
3.3.2.1 POINT, POINTHOR, and POINTCAP source inputs .....	3-60
3.3.2.2 VOLUME source inputs.....	3-61
3.3.2.3 AREA source type .....	3-63
3.3.2.4 AREA source inputs .....	3-63
3.3.2.5 AREAPOLY source inputs .....	3-67
3.3.2.6 AREACIRC source inputs.....	3-68
3.3.2.7 OPENPIT source inputs .....	3-69
3.3.2.8 LINE source inputs.....	3-71
3.3.2.9 RLINE source inputs .....	3-71
3.3.2.10 RLINEXT source inputs.....	3-73
3.3.2.11 BUOYLINE source inputs.....	3-78
3.3.2.12 SWPOINT source inputs .....	3-81
3.3.3 Specifying gas deposition parameters.....	3-83
3.3.3.1 Source parameters for gas deposition (dry and/or wet).....	3-83
3.3.3.2 Option for specifying the deposition velocity for gas dry deposition .....	3-84
3.3.4 Specifying source parameters for particle deposition .....	3-85
3.3.4.1 Specifying particle inputs for Method 1 .....	3-85
3.3.4.2 Specifying particle inputs for Method 2 .....	3-86
3.3.5 Specifying Emission and Output Units.....	3-87
3.3.6 Source input parameters for NO <sub>2</sub> conversion options.....	3-88
3.3.6.1 Specifying in-stack NO <sub>2</sub> /NO <sub>x</sub> ratios by source for PVMRM, OLM, TTRM/TTRM2, and GRSM.....	3-88
3.3.6.2 Specifying combined plumes for OLM.....	3-89
3.3.6.3 Specifying ambient NO <sub>2</sub> /NO <sub>x</sub> ratios for the ARM2 option .....	3-90
3.3.7 Modeling NO <sub>2</sub> increment credits with PVMRM .....	3-91
3.3.7.1 Increment consuming and baseline sources.....	3-91
3.3.7.2 Calculating increment consumption under the PSDCREDIT option .....	3-92

## **1.0 Introduction**

This section provides an overall introduction to the AERMOD model and to the AERMOD user's guide. Some suggestions are offered on how various users would best benefit from using the manuals. Additionally, an overview of the model's applicability, range of options, and basic input data and hardware requirements are provided. The input file required to run the AERMOD model (commonly referred to as the control file) is based on an approach that uses descriptive keywords and allows for a flexible structure and format.

### **1.1 How to use the AERMOD manuals**

The AERMOD model user's guide has been designed to meet the needs of various users with differing levels of experience with the model. This section describes briefly how users can benefit from using the manual.

#### **1.1.1 Novice users**

Novice users are those with limited exposure to or experience with the AERMOD model. They may be new to dispersion modeling applications in general, or new to the AERMOD model and therefore unfamiliar with the keyword/parameter approach utilized for the input file. These users should review the remainder of this Introduction to gain an overall perspective of the use of the AERMOD model, particularly for regulatory modeling applications. They should then focus their attention on Section 2.0, which provides an overview of the types of input and output files and setting up an input file that illustrates the more commonly used options of the AERMOD model. Section 2.0 provides a basic description of the input file structure and explains some of the advantages of the keyword/parameter approach to specifying modeling options and inputs. Section 3.0 then provides a more detailed and complete reference of the various options for running the model.

#### **1.1.2 Experienced modelers**

Experienced modelers have considerable experience in applying the AERMOD model in various situations. They should have basic familiarity with the overall goals and purposes of regulatory modeling and with the scope of options available in the AERMOD model. Experienced modelers who are new to the AERMOD model will benefit from first reviewing the contents of Section 2.0 of this guide, which

provides a basic orientation to the structure, organization, and philosophy of the keyword/parameter approach used for the input control file. Once they have a basic grasp of the input file structure and syntax rules, they will benefit most from using Section 3.0 of this volume as a reference to learn the overall capabilities of the model, or to understand the mechanics for implementing specific options. The information in Section 3.0 has functional organization with detailed descriptions of each of the individual keyword options by functional pathway. Once they are familiar with the keywords, they may find the functional keyword reference provided in APPENDIX A useful to quickly review the proper syntax and available options/parameters for a particular keyword.

Experienced modelers may also need to refer to the description of model formulation for AERMOD (EPA, 2024a) to gain a more complete understanding of the technical basis for the AERMOD model.

### 1.1.3 Management/decision makers

Those involved in a management or decision-making role for dispersion modeling applications will be especially interested in the remainder of this section, which provides an overview of the model, including its role in various regulatory programs, a brief description of the range of available options, and basic input and output data and computer hardware requirements needed to run the model. From this information, they should understand the basic capabilities of the AERMOD model well enough to judge the suitability of the model for specific applications. They may also want to review the overview provided in Section 2.0 to learn about the nature and structure of the input control file to better review the modeling results.

## **1.2 Overview of the AERMOD model**

This section provides an overview of the AERMOD model, including a discussion of the regulatory applicability of the model, a description of the basic options available for running the model, and an explanation of the basic input data and hardware requirements needed for executing the model.

### 1.2.1 Regulatory applicability

The U.S. Environmental Protection Agency (EPA) maintains a *Guideline on Air Quality Models* (EPA, 2017b), hereafter, Guideline, which is published as Appendix W to 40 CFR Part 51 (as revised). The Guideline provides the agency's guidance on regulatory applicability of air quality dispersion models. In general, regulatory modeling applications should be carried out in accordance with a modeling protocol that is reviewed and approved by the appropriate agency prior to conducting the modeling. The modeling protocol should identify the specific model, modeling options, and input data (e.g., meteorology, emission source parameters, etc.) to be used for a particular application.

### 1.2.2 Basic input data requirements

One of the basic inputs to AERMOD is the control file which contains the selected modeling options, as well as source location and parameter data, receptor locations, meteorological data file specifications, and output options. Another type of basic input data needed to run the model is the meteorological data. AERMOD requires two types of meteorological data files that are provided by the AERMET meteorological preprocessor program (EPA, 2024e). One file consists of surface scalar parameters, and the other file consists of vertical profiles of meteorological data. These meteorological data files are briefly described later in this section, and in more detail in Sections 2.0 and 3.0. For applications involving elevated terrain effects, the receptor and terrain data will need to be processed by the AERMAP terrain preprocessing program (EPA, 2018) before input to the AERMOD model.

### 1.2.3 Computer hardware requirements

The current version of the AERMOD model was developed within the Microsoft Windows operating system (Windows) and has been designed to run on Windows PCs within a Command-prompt using command-line arguments to initiate a model run. The amount of storage space required on the hard disk for a particular application will depend greatly on the output options selected. Some of the optional output files of concentration data can be rather large. More information on output file products is provided in Sections 2.1 and 3.7.

The AERMOD model includes a wide range of options for modeling air quality impacts of pollution sources, making it a popular choice among the modeling community for a variety of

applications. The following sections provide a brief overview of the options available within the AERMOD model.

#### 1.2.4 Dispersion options

Since the AERMOD model is designed to support the EPA's regulatory modeling programs, the regulatory modeling options will be the default mode of operation for the model. These options include the use of stack-tip downwash and a routine for processing averages in cases of calm winds or missing meteorological data. The model also includes various non-default options (e.g., suppress the use of stack-tip downwash, deposition modeling, NO<sub>2</sub> conversion, special processing for low wind conditions, and disable the date checking for non-sequential meteorological data files, to list a few). The latter option listed is needed to facilitate model evaluation. The AERMOD model also includes a non-default screening mode added specifically for integration with the AERSCREEN model interface (EPA, 2021). The user can specify several short-term averages to be calculated in a single run of the AERMOD model, as well as request the overall period (e.g., annual) averages.

#### 1.2.5 Source options

The model is capable of handling multiple sources, including point, volume, area, open pit, and both buoyant and non-buoyant line source types. AERMOD models non-buoyant line sources as elongated area sources or a series of volume sources. If elongated area sources are used to represent a narrow non-buoyant line source, the user can specify a line source in the control file, and the input required to define the source is simplified from the typical input required for an area source.

The buoyant line source algorithm from the Buoyant Line and Point Source (BLP) model (Schulman and Scire, 1980) has been incorporated into the AERMOD model beginning with version 15181. Several source groups may be specified in a single run, with the source contributions combined for each group. This is particularly useful for PSD applications where combined impacts may be needed for a subset of the modeled background sources that consume increment, while the combined impacts from all background sources (and the permitted source) are needed to demonstrate compliance with the National Ambient Air Quality Standards (NAAQS). The model contains algorithms for modeling the effects of aerodynamic downwash due to nearby buildings on point source emissions and depositional effects on particulate emissions.

Source emission rates can be treated as constant throughout the modeling period, or may be varied by month, season, hour-of-day, or other optional periods of variation. Variable emission rate factors may be specified for a single source or for a group of sources. The user may also specify a separate file of hourly emission rates for all source or some subset of sources that are included in a model run.

#### 1.2.6 Receptor options

The AERMOD model has considerable flexibility in the specification of receptor locations. The user has the capability of specifying multiple receptor networks in a single run and may also mix Cartesian grid receptor networks and polar grid receptor networks in the same run. This is useful for applications where the user may need a coarse grid over the whole modeling domain, but a denser grid over the area of maximum expected impacts. There is also flexibility in specifying the location of the origin for polar receptors, other than the default origin at (0,0) in x,y, coordinates.

The user can input elevated receptor heights to model the effects of terrain above (or below) the stack base elevation and may also specify receptor elevations above ground level to model flagpole receptors. There is no distinction in AERMOD between elevated terrain below release height and terrain above release height, as is with earlier regulatory models that distinguished between simple terrain and complex terrain. For applications involving elevated terrain, the user must also input a hill height scale along with the receptor elevation. To facilitate the generation of hill height scales for AERMOD, a terrain preprocessor, called AERMAP, has been developed (EPA, 2018).

#### 1.2.7 Meteorology options

The AERMOD model utilizes a file of surface boundary layer parameters and a file of profile variables including wind speed, wind direction, and turbulence parameters. These two types of meteorological inputs are generated by the meteorological preprocessor for AERMOD, which is called AERMET (EPA, 2024e). Both meteorological input files are sequential ASCII files, and the model automatically recognizes the format generated by AERMET as the default format. The model will process all available meteorological data in the specified input file by default, but the user can easily specify selected days or ranges of days to process.

### 1.2.8 Output options

The basic types of printed output available by AERMOD are:

- Summaries of high values (highest, second highest, etc.) by receptor for each different combinations of averaging period and source group;
- Summaries of overall maximum values (e.g., the maximum 50) for each averaging period and source group combination; and
- Tables of concurrent values summarized by receptor for each combination of averaging period and source group, for each day of data processed. These "raw" concentration values may also be output to unformatted (binary) files, as described below.

The summaries of high values by receptor and summaries of maximum values can be output for one or more groups of sources and individual sources in the same model simulation. In addition, when maximum values for individual sources are output, the user has the option of specifying whether the maximum source values are to be the maximum values for each source independently, the contribution of each source to the maximum group values, or both.

In addition to the tabular printed output products described above, the AERMOD model provides options for several types of file output products. One of these options for AERMOD is to output an unformatted ("binary") file of all concentration values as they are calculated. These files are often used for special postprocessing of the data. In addition to the unformatted concentration files, AERMOD provides options for several additional types of file outputs. One option is to generate a file of (X, Y) coordinates and design values (e.g., the second highest values at each receptor for a particular averaging period and source group combination) that can be easily imported into many graphic plotting packages to generate contour plots of the concentration values. Separate files can be specified for all the averaging period and source group combinations of interest to the user.

Another output file option from the AERMOD model is to generate a file of all occurrences when a concentration value equals or exceeds a user-specified threshold. Again, separate files are generated for only those combinations of averaging period and source group that are of interest to the user. These files include the date on which the threshold violation occurred, the receptor location, and the concentration value.

AERMOD includes options for two types of output files that are designed to facilitate model evaluation. One type of file lists concentrations by rank, where only one value per date is included. This file may be used to generate Q-Q (quantile) plots of results, where values from different models and/or observed data are paired by rank. The other type of output file provides arc maxima results, along with detailed information about the plume characteristics associated with the arc maximum.

Finally, there are output options specifically for comparing model results to the 24-hour PM<sub>2.5</sub>, 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> NAAQS. The forms of these standards are based on averages of ranked values across years which complicates their evaluation, especially the 1-hour NO<sub>2</sub> and SO<sub>2</sub> standards which are based on ranked values from the distribution of daily maximum 1-hour averages.

### 1.2.9 Source contribution analyses

In air quality dispersion modeling applications, the user may have a need to know the contribution that a particular source makes to an overall concentration value for a group of sources. This section provides a brief introduction to how these types of source contribution (sometimes referred to as source culpability) analyses are performed using the AERMOD model. More detailed information about exercising these options is provided in Section 3.0.

The AERMOD model provides the option of specifying source groups for which the model calculates high values independently. However, users may often have to run the model a second time selecting only specific days where the high values occurred and setting up each source in its own source group to obtain source contribution results. An EVENT processor has been incorporated into AERMOD to simplify this task when required. Also, special processing and output options, mentioned above, are included that are specific to determining source contributions with respect to the PM<sub>2.5</sub>, NO<sub>2</sub> and SO<sub>2</sub> standards.

## **2.0 Getting started - a brief tutorial**

This section provides a brief tutorial for setting up a simple application problem with the AERMOD model, which serves as an introduction for novice users to the AERMOD model. The example illustrates the usage of the more commonly used options in the AERMOD model. A more complete description of the available options for setting up the AERMOD model is provided in Section 3.0.

The example problem presented in this section is a simple application of the AERMOD model to a single point source. The source is a hypothetical stack at a small, isolated facility in a rural setting. Since the stack is below the Good Engineering Practice (GEP) stack height, the emissions from the source are subject to the influence of aerodynamic downwash due to the presence of nearby buildings. The tutorial guides the user through selection and specification of modeling options, specification of source parameters, definition of receptor locations, specification of the input meteorological data, and selection of output options. Since this discussion is aimed at novice users of the AERMOD model, general overviews of input and output files, as well as control file keyword/parameter approach, is provided first.

### **2.1 Controlling input and output files**

This section describes the various input and output files used by the AERMOD model and discusses control of input and output (I/O) in the Microsoft Windows PC environment. Much of this discussion also applies to operating the model in other environments.

#### **2.1.1 Description of AERMOD input files**

The two basic types of input files required to run the AERMOD model are: 1) the input control file containing the modeling options, source data and receptor data, and 2) the meteorological data files including a file of surface parameters and a separate file of multilevel parameters. Each of these is discussed below, as well as a third file type that may be used to initialize the AERMOD model with intermediate results from a previous run.

##### **2.1.1.1 Input control file**

The input control file contains the user-specified options for running the various AERMOD model (with a default filename, AERMOD.INP), includes the source parameter data and source group information, defines the receptor locations, specifies the location and parameters regarding the

meteorological data, and specifies the output options. Details regarding the keywords and parameters used in the input control file are provided in Section 3.0, and APPENDIX A.

#### 2.1.1.2 Meteorological data files

The input meteorological data is read into the AERMOD model from two separate data files, one corresponding to surface (scalar) parameters, and the other corresponding to multi-level profiles of data. The meteorological data filenames and formats are specified within the input control file using the ME SURFFILE and PROFFILE keywords. The AERMOD model accepts meteorological data that has been preprocessed by the AERMET meteorological preprocessor program (EPA, 2024e). The data are read from formatted ASCII files of hourly sequential records.

#### 2.1.1.3 Initialization file for model re-start

The AERMOD model has an optional capability to store intermediate results to an unformatted (sometimes called binary) file for later re-starting of the model in the event of a power failure or user interrupt. This unformatted file may, therefore, be used as an input file to initialize the model. This option is controlled by the SAVEFILE (saves intermediate results to a file) and the INITFILE (initialize result arrays from a previously saved file) keywords on the CO pathway.

When initializing the model for the re-start option, the user specifies the name of the unformatted results file on the INITFILE keyword. The default filename used if no parameter is provided is TMP.FIL.

#### 2.1.2 Description of AERMOD output files

The AERMOD model can produce a variety of output files, including a main file of model results, an unformatted file of intermediate results for later re-start of the model (AERMOD only), and several output data files for specialized purposes. These files are described below.

### 2.1.2.1 Main output file

The AERMOD model produces a standard output file of model results called AERMOD.OUT, by default, unless a unique name is provided by the user when AERMOD is executed at the command prompt. The contents and organization of this file are shown in Figure 2-5. This file includes a duplication of the contents of the input control up unless 'NO ECHO' is encountered in the input control file. The contents of the input control file will be duplicated in the output file up to the place in the file where 'NO ECHO' is specified. The contents of the input control file beyond 'NO ECHO' will not be duplicated in the output file. A summary of control file setup messages and a summary of the inputs follow the echo of inputs. The input summary includes a summary of modeling options, source data, receptor data, and meteorological data, following the same order as the pathways in the control file. If model calculations are performed, then the model results are summarized next. The content and order of the model result summaries depend on the output options selected. Following the detailed model results are summary tables of the high values for each averaging period and source group. The final portion of the main output file is the summary of messages for the complete model run.

### 2.1.2.2 Detailed error message file

The user may select an option for the model to save a separate file of detailed error and other messages, through use of the CO ERRORFIL keyword. The format and syntax of these messages is described in APPENDIX B. The order of messages within the file is the order in which they were generated by the model. The file includes all types of messages that were generated.

### 2.1.2.3 Intermediate results file for model re-start

The AERMOD model has an optional capability to store intermediate results to an unformatted (sometimes called binary) file for later re-starting of the model in the event of a power failure or user interrupt. This unformatted file may therefore be used as an input file to initialize the model. This option is controlled by the SAVEFILE (saves intermediate results to a file) and the INITFILE (initialize result arrays from a previously saved file) keywords on the CO pathway.

When saving the intermediate results for the re-start option, the user specifies the name of the unformatted results file on the SAVEFILE keyword. The user has the option of specifying a single filename, two filenames (for alternate saves), or specifying no filename. The default filename used if no parameter is provided is TMP.FIL. If a single file is used, then the intermediate results file is overwritten

on each successive dump, with the chance that the file will be lost if the interrupt occurs during the time that the file is opened. If two filenames are provided, then the model also saves to the second file on alternate dumps, so that the next most recent dump will always be available.

#### 2.1.2.4 Maximum value/threshold file

The user may select an option for the AERMOD model to generate a file or files of concentration values exceeding a user-specified threshold. The OU MAXIFILE keyword controls this option. The user may select separate files for each averaging period and source group combination for which a list of threshold violations may be needed. Each file includes several records with header information identifying the averaging period, source group and threshold value, and then a record for every occurrence where the result for that averaging period/source group equals or exceeds the threshold value. Each of these records includes the averaging period, source group ID, date for the threshold violation (ending hour of the averaging period), the x, y, z and flagpole receptor height for the receptor location where the violation occurred, and the concentration value.

The structure of the threshold violation file is described in more detail in APPENDIX C. Each of the files selected by the user is opened explicitly by the model as a formatted file. The filenames are provided on the input control file command. The user may specify the file unit on the MAXIFILE card through the optional FUNIT parameter. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If no file unit is specified, then the file unit is determined internally according to the following formula:

$$\text{IMXUNT} = 100 + \text{IGRP} * 10 + \text{IAVE}$$

where IMXUNT is the Fortran unit number, IGRP is the source group number (the order in which the group is defined in the control file), and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula was developed for up to nine source groups and up to nine short-term averaging periods, therefore the range of possible internally generated file units for MAXIFILE is 100 to 199.

#### 2.1.2.5 Sequential results file for postprocessing

The user may select an option for the AERMOD model to generate a file or files of concentration values suitable for postprocessing. The OU POSTFILE keyword controls this option. The user may select separate files for each averaging period and source group combination for which postprocessing may be needed. For each file requested, the user has the option of specifying whether to use unformatted files suitable for postprocessing or to use a plot format which could allow for importing the x, y concentration files into a graphics package for plotting. For the unformatted file option, each file consists of sequential unformatted records of values at each receptor location for every averaging period calculated. For the plot file format option, each file consists of formatted records listing the x-coordinate, y-coordinate and concurrent concentration values for each receptor and for all averaging periods calculated. For certain applications, these files may become quite large, and should only be used when needed, especially when using the plot format.

The structure of both types of postprocessing file is described in more detail in APPENDIX C. Each of the postprocessing files selected by the user is opened explicitly by the model as either an unformatted or a formatted file, depending on the option selected. The filenames are provided on the input control file command. The user may specify the file unit on the POSTFILE card through the optional FUNIT parameter. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If no file unit is specified, then the file unit is determined internally according to the following formulas:

$$\text{IPSUNT} = 200 + \text{IGRP} * 10 + \text{IAVE} \text{ for short-term averages}$$

$$\text{IAPUNT} = 300 + \text{IGRP} * 10 - 5 \quad \text{for PERIOD averages}$$

where IPSUNT and IAPUNT are the Fortran unit numbers, IGRP is the source group number (the order in which the group is defined in the control file), and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula will not cause any conflict with other file units used by the model for up to 9 source groups and up to 9 short-term averaging periods. This formula was developed for up to nine source groups and up to nine short-term averaging periods, therefore the range of possible internally generated file units for POSTFILE is 200 to 299 or 300 to 385 for PERIOD averaging periods.

#### 2.1.2.6 High value summary file for plotting

The user may select an option for the AERMOD model to generate a file or files of the highest concentration values at each receptor suitable for importing into a graphics package in order to generate contour plots. The OU PLOTFILE keyword controls this option. The user may select separate files for each averaging period, source group and high value combination for which a plot file may be needed. Each file includes several records with header information identifying the averaging period, source group and high value number of the results, and then a record for each receptor which contains the x and y coordinates for the receptor location, the appropriate high value at that location, and the averaging period, source group and high value number.

The structure of the plot file is described in more detail in APPENDIX C. Each of the plot files selected by the user is opened explicitly by the model as a formatted file. The filenames are provided on the input control file command. The user may specify the file unit on the PLOTFILE card through the optional FUNIT parameter. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If no file unit is specified, then the file unit is determined internally according to the following formulas:

$$\begin{aligned} \text{IPLUNT} &= (\text{IVAL}+3)*100 + \text{IGRP}*10 + \text{IAVE} && \text{for short-term averages} \\ \text{IPPUNT} &= 300 + \text{IGRP}*10 && \text{for PERIOD averages} \end{aligned}$$

where IPLUNT and IPPUNT are the Fortran unit numbers, IVAL is the high value number (1 for FIRST highest, 2 for SECOND highest, etc.), IGRP is the source group number (the order in which the group is defined in the control file), and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula was developed for up to nine source groups and up to nine short-term averaging periods, therefore the range of possible internally generated file units for PLOTFILE is 400 to 499 or 300 to 385 with the use of PERIOD AVERTIME.

#### 2.1.2.7 TOXX model input files

The user may select an option for the AERMOD model to generate an unformatted file or files of concentration values exceeding a user-specified threshold for use with the TOXX model component of TOXST. The OU TOXXFILE keyword controls this option. The user may select separate files for each

averaging period for which a threshold violation file may be needed. Each file includes several records with header information identifying the title, averaging period, threshold value, and receptor network information, and then records including every occurrence where the result of any source group for that averaging period equals or exceeds the threshold value. Records are also output that identify the averaging period (hour number of the year), source group number and receptor number corresponding to the concentration values.

The structure of the threshold exceedance file for use with the TOXX model component of TOXST is described in more detail in APPENDIX C. Each of the files specified by the user is opened explicitly by the model as an unformatted file. The filenames are provided in the input control file. The user may specify the file unit on the TOXXFILE card through the optional FUNIT parameter. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If no file unit is specified, then the file unit is determined internally according to the following formula:

$$ITXUNT(INDAVE) = 300 + INDAVE$$

where ITXUNT is a Fortran array that stores the Fortran unit number for each output file specified and INDAVE index reference for the ITXUNT array representing the averaging period based on the order each averaging period is specified on the CO AVERTIME card.

### 2.1.3 Controlling file inputs and outputs (I/O)

#### 2.1.3.1 Controlling I/O on PCs.

The main input control file and the main output print file are specified internally by AERMOD as AERMOD.INP and AERMOD.OUT by default, respectively. The user has the option to provide command-line arguments when executing the model at the command prompt to specify a user-defined input control input filename and main output filename. When using the default names of AERMOD.INP and AERMOD.OUT, a standard command line to execute the AERMOD model might look something like this:

C:\>AERMOD

where the command prompt has been given as "C:\>", but may look different on different systems, or may include a subdirectory specification. Refer to Section 2.4.8 for details on specifying user-defined filenames when running AERMOD from the command prompt.

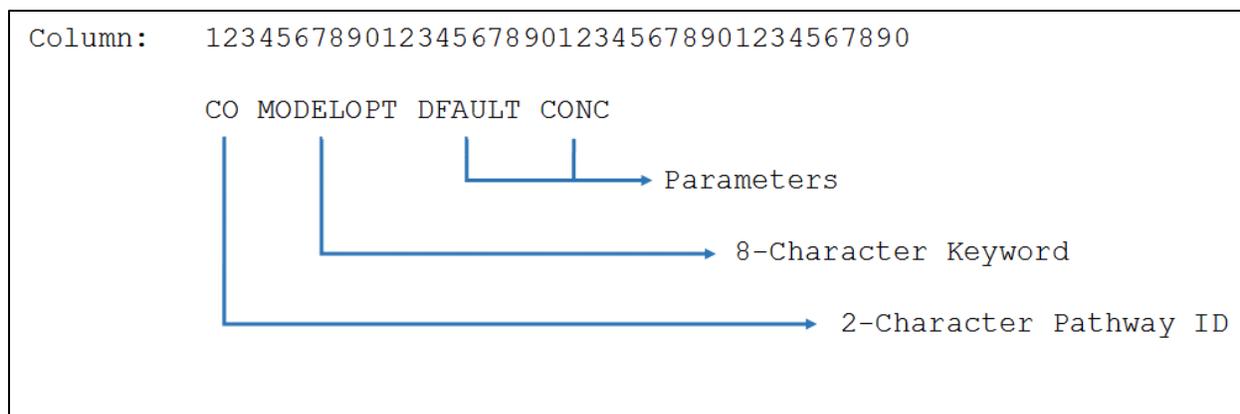

## 2.2 Description of keyword/parameter approach

The input control file for the AERMOD model makes use of a keyword/parameter approach to specifying the options and input data for running the model. The descriptive keywords and parameters that make up this control file may be thought of as a command language through which the user communicates with the model what he/she wishes to accomplish for a particular model run. The keywords specify the type of option or input data being entered on each line of the input file. An individual line or record in the control file is often referred to as a "card" throughout this manual and is commonly identified by the primary keyword associated with the information entered on the record. The parameters following the keyword define the specific options selected or the actual input data. Some of the parameters are also input as descriptive secondary keywords.

The control file is divided into five functional "pathways." These pathways are identified by a two-character pathway ID placed at the beginning of each line of the control file. The pathways and the order in which they are input to the model are as follows:

- CO** - for specifying overall job **C**ontrol options;
- SO** - for specifying **S**ource information;
- RE** - for specifying **R**eceptor information;
- ME** - for specifying **M**eteorology information;
- EV** - for specifying **E**vent processing;
- OU** - for specifying **O**utput options.

Each line of the input control file consists of a pathway ID, an 8-character keyword, and a parameter list. An example of a line of input from a control file, with its various parts identified, is shown below:

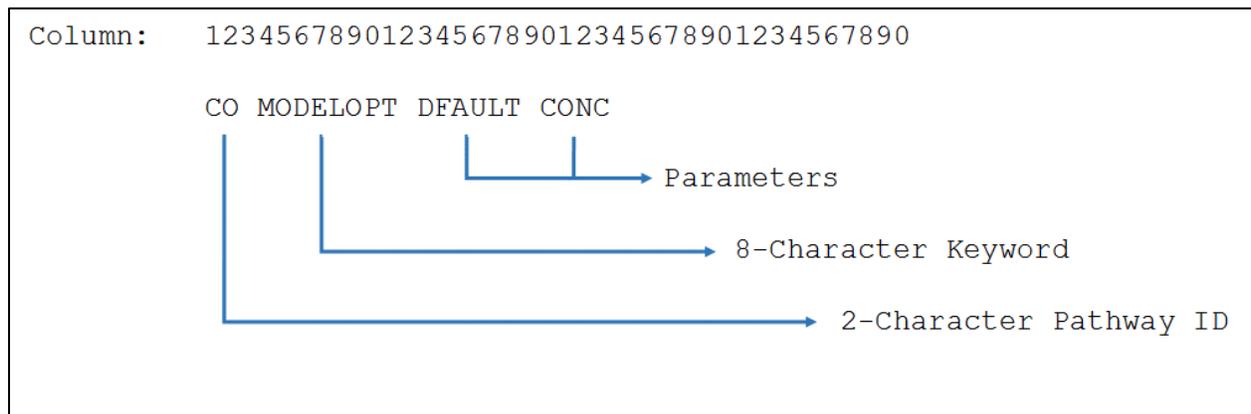

The following sections describe the rules for structuring the input control file and explain some of the advantages of the keyword/parameter approach.

### 2.2.1 Basic rules for structuring input control files

While the input control file has been designed to provide the user with considerable flexibility in structuring the input file, there are some basic syntax rules that need to be followed. These rules serve to maintain some consistency between input files generated by different users, to simplify the job of error handling performed by the model on the input data, and to provide information to the model in the appropriate order wherever order is critical to the interpretation of the inputs. These basic rules and the various elements of the input control file are described in the paragraphs that follow.

One of the most basic rules is that all inputs for a particular pathway must be “grouped within that specific pathway” and occur in the expected order, i.e., all inputs for the CO pathway must come first, followed by the inputs for the SO pathway, and so on. The beginning of each pathway is identified with a "STARTING" keyword, and the ending of the pathway with the "FINISHED" keyword. Thus, the first functional record of each input file must be "CO STARTING" and the last record of each input file must be "OU FINISHED." The rest of the input control file commands will define the options and input data for a particular run.

Each record in the input control file is read into the model as a 512-character image beginning with version 09292. The information on each input image consists of a "pathway," a "keyword," and one or more "parameters." Each of these "fields" on a line in the control file command must be separated from other fields by at least one blank space. To simplify the interpretation of the control file command by the model, the control file must be structured with the two-character pathway in columns 1 and 2, the eight-character keyword in columns 4 through 11, followed by the parameters beginning in column 13 through the end of image, limited to 512 characters. For most keywords, the order of parameters following the keyword is important -- the exact spacing of the parameters is not important as long as they are separated from each other by at least one blank space and do not extend beyond the 512-character limit. The example of a control file command from the CO pathway shown above is repeated here:

Alphabetical characters can be input as either lower case or uppercase letters. The model converts all character input to upper case letters internally, except the title fields and file names to be discussed later. Throughout this document, the convention of using upper case letters is followed. For numeric input data, it should be noted that all data are assumed to be in metric units, i.e., length units of meters, speed units of meters per second, temperature units of degrees Kelvin, and emission units of grams per second. In a few instances, the user has the option of specifying units of feet for length and the model will perform the conversion to meters. These exceptions are the input of receptor heights for elevated terrain and the specification of anemometer height since these values are often more readily available in feet than in meters.

Certain keywords are mandatory and must be present in every control file, such as the MODELOPT keyword shown in the example above which identifies the modeling options. There are

also keywords that are optional and are only needed to exercise specific options, such as the option to allow for the input of flagpole receptor heights. Some of the keywords are repeatable, such as the keywords to specify source parameters, while other keywords may only appear once. The keyword references are provided in Section 3.0 and APPENDIX A.

With a few exceptions that are described below, the order of keywords within each pathway is not critical. For the SO pathway, the LOCATION keyword must be specified before other keywords for a particular source, and the SRCGROUP keyword must be the last keyword before SO FINISHED unless the PSDCREDIT keyword is specified on the MODELOPT card, in which case, SRCGROUP is replaced with the PSDGROUP keyword. For keywords on the SO pathway that accept a range of source IDs, the source parameters specified by those keywords will only be applied to the sources already defined and will exclude any sources that are specified later in the input file.

The PARAMETER ILEN\_FLD is used to specify the maximum length of individual fields on the input control file command and to declare the length of all filename and format variables. This PARAMETER is currently assigned a value of 200 beginning with version 09292 and is in MODULE MAIN1 in MODULES.FOR.

### 2.2.2 Advantages of the keyword approach

The keyword approach provides some advantages over the type of input file used by other models that require formatted input of several numeric switches. One advantage is that the keywords are descriptive of the options and inputs being used for a particular run, making it easier for a reviewer to ascertain what was accomplished in a particular run by reviewing the input file. Another advantage is that the user has considerable flexibility in structuring the inputs to improve their readability and understandability if they adhere to the few basic rules described above.

Some special provisions have been made to increase the flexibility to the user in structuring the input files. One provision is to allow for blank records in the input file. This allows the user to separate the pathways from each other, or to separate a group of images, such as source locations, from the other images. Another provision is for the use of "comment lines," identified by a "\*\*\*" in the pathway field. Any input image that has "\*\*\*" for the pathway ID will be ignored by the model. This is especially useful for labeling the columns in the source parameter input images, as illustrated in the example problem later in this section. It may also be used to "comment out" certain options for a particular run without deleting the options and associated data (e.g., elevated terrain heights) completely from the input file. Because of

the descriptive nature of the keyword options and the flexibility of the inputs it is generally much easier to make modifications to an existing input control file to obtain the desired result.

Another reason for improved "user-friendliness" is that detailed error-handling has been built into the model. The model provides descriptions of the location and nature of all the errors encountered for a particular run. Rather than stopping execution at each occurrence of an input error, the model will read through and attempt to process all input records and report all errors encountered. If a fatal error occurs, then the model will not attempt to execute the model calculations.

### **2.3 Regulatory default modeling options**

The regulatory default option is controlled from the MODELOPT keyword on the CO pathway. As its name implies, this keyword controls the selection of modeling options. It is a mandatory, non-repeatable keyword, and it is an especially important keyword for understanding and controlling the operation of the AERMOD model. Unless specified otherwise through the available keyword options, the AERMOD model implements the following default options:

- Use the elevated terrain algorithms requiring input of terrain height data;
- Use stack-tip downwash (except for building downwash cases);
- Use the calms processing routines;
- Use the missing data processing routines; and
- Use a 4-hour half-life for exponential decay of SO<sub>2</sub> for urban sources.

**Note that beginning with AERMOD version 18081, the 4-hour half-life is included by default for SO<sub>2</sub> urban sources for regulatory default applications and non-regulatory applications.**

The parameters used to specify options on the MODELOPT keyword are character strings, called "secondary keywords," that are descriptive of the option being selected. For example, to ensure that the regulatory default options listed above are used for a particular model simulation, the user would include the secondary keyword "DFAULT" on the MODELOPT input. Upon initial execution, the model reads the control file to identify any conflicts in the options specified. In most cases, the model will issue an error message to inform the user of the conflict and abort before the simulation begins. For regulatory modeling applications, it is strongly suggested that the DFAULT switch be set to ensure the regulatory default options listed above are used and non-regulatory options are not used.

In addition to the default regulatory options listed above, AERMOD includes several other regulatory options that are application dependent and are required to be set explicitly by the user in the control file. Most of these can be set with the use of secondary keywords associated with the MODELOPT keyword. The MODELOPT keyword is described in more detail in the Section 3.2.2. Throughout this user's guide, there has been an effort to clearly distinguish regulatory options that are required to be set by the user and can be used simultaneously with the DFAULT keyword from non-regulatory options that cannot be used along with the DFAULT keyword. These non-regulatory options are sometimes referred to as "non-DFAULT" options since they cannot be used along with the DFAULT keyword.

## **2.4 Setting up a simple control file**

This section goes through a step-by-step description of setting up a simple application problem, illustrating the more commonly used options of the AERMOD model. The example problem is based on a simple industrial source application. The input file for AERMOD for the example problem is shown in Figure 2-1. The remainder of this section explains the various parts of the input file for the AERMOD model and illustrates some of the flexibility in structuring the input file.

**Figure 2-1. Example Input File for AERMOD for Sample Problem**

### 2.4.1 A simple industrial source application

For this simple tutorial, an application is selected involving a single point source of SO<sub>2</sub> that is subject to the influences of building downwash. The source consists of a 50-meter stack with a buoyant release that is adjacent to a building. It is assumed that the stack is situated in flat terrain in a rural setting. A polar receptor network will be placed around the stack location to identify areas of maximum impact.

### 2.4.2 Selecting modeling options - CO pathway

The modeling options are input to the model on the Control pathway. The mandatory keywords for the CO pathway are listed below. A complete listing of all keywords is provided in Section 3.2 and APPENDIX A

- STARTING - Indicates the beginning of inputs for the pathway; this keyword is mandatory on each of the pathways.
- TITLEONE - A user-specified title line (up to 68 characters) that will appear on each page of the printed output file (an optional second title line is also available with the keyword TITLE TWO).
- MODELOPT - Controls the modeling options selected for a particular run through a series of secondary keywords.
- AVERTIME - Identifies the averaging periods to be calculated for a particular run.
- POLLUTID - Identifies the type of pollutant being modeled. At the present time, this option has no influence on the results.
- RUNORNOT - A special keyword that tells the model whether to run the full model executions or not. If the user selects not to run, then the control file will be processed and any input errors reported, but no dispersion calculations will be made.
- FINISHED - Indicates that the user is finished with the inputs for this pathway; this keyword is also mandatory on each of the other pathways.

The first two keywords are self-explanatory. As discussed above in Section 2.3, the MODELOPT keyword on the CO pathway is pivotal to controlling the modeling options used for a particular run. For this example, we intend to use the regulatory default option, and have specified for the model to output concentration values. After the first three input records our input file will look something like this:

```
CO STARTING
CO TITLEONE A Simple Example Problem for the AERMOD-PRIME Model
CO MODELOPT CONC FLAT
```

Note that the title parameter field does not need to be in quotations, even though it represents a single parameter. The model simply reads whatever appears beginning in column 13 out to a length of 200 characters of the TITLEONE card as the title field, without changing the lower case to upper case letters. Leading blanks are therefore significant if the user wishes to center the title within the field. Note that in the output files, only the first 68 characters of TITLEONE are printed. Note also that the spacing and order of the secondary keywords on the MODELOPT card are not significant. A MODELOPT card that looked like this:

```
CO MODELOPT CONC FLAT
```

would have an identical result as the example above. It is suggested that the user adopt a style that is consistent and easy to read. A complete description of the available modeling options that can be specified on the MODELOPT keyword is provided in Section 3.0.

For this example, the average values are calculated for 3-hour and 24-hour and the full period that is modeled. The control file might, therefore, look similar to this after adding two more keywords:

```
CO STARTING
CO TITLEONE A Simple Example Problem for the AERMOD-PRIME Model
CO MODELOPT CONC FLAT
CO AVERTIME 3 24 PERIOD
CO POLLUTID SO2
```

Note again that the order of the parameters on the AVERTIME keyword is not critical, although the order of the short-term averages given on the AVERTIME keyword will also be the order in which the results are presented in the output file. The order of the keywords within each pathway is also not critical in most cases, although the intent of the input control file may be easier to decipher if a consistent and logical order is followed. It is suggested that users follow the order in which the keywords are presented in Section 3.0, in APPENDIX A, and in the Quick Reference, unless there is a clear advantage to doing otherwise.

The only remaining mandatory keywords for the CO pathway are RUNORNOT and FINISHED. We will set the RUNORNOT switch to RUN for this example. If a user is unsure about the operation of certain options or is setting up a complex control file to run for the first time, it may be desirable to set the model NOT to run, but simply to read and analyze the input file and report any errors or warning messages that are generated. Once the input file has been debugged using these descriptive error/warning messages, then the RUNORNOT switch can be set to RUN, avoiding a possible costly waste of resources generating erroneous results. Even if the model is set NOT to run, all the inputs are summarized in the output file for the user to review.

Our complete control file for the CO pathway may look something like this:

```
CO STARTING
CO TITLEONE A Simple Example Problem for the AERMOD-PRIME Model
CO MODELOPT CONC FLAT
CO AVERTIME 3 24 PERIOD
CO POLLUTID SO2
CO RUNORNOT RUN
CO FINISHED
```

The following set of control file options has a more structured look, but it is equivalent to the example above:

```
CO STARTING
  TITLEONE A Simple Example Problem for the AERMOD-PRIME Model
  MODELOPT CONC FLAT
  AVERTIME 3 24 PERIOD
  POLLUTID SO2
  RUNORNOT RUN
CO FINISHED
```

Since the pathway ID is required to begin in column 1 (see Section 2.4.8 for a discussion of this restriction), the model will assume that the previous pathway is in effect if the pathway field is left blank. The model will do the same for blank keyword fields, which will be illustrated in the next section, Section 2.4.3.

In addition to these mandatory keywords on the CO pathway, the user may select optional keywords to allow the use of receptor heights above ground-level for flagpole receptors, to specify a decay coefficient or a half-life for exponential decay, and to generate an input file containing events for EVENT processing. The user also has the option of having the model periodically save the results to a file for later re-starting in the event of a power failure or other interruption of the model's execution. These options are described in more detail in Section 3.0 of this volume.

### 2.4.3 Specifying source inputs - SO pathway

Besides the STARTING and FINISHED keywords that are mandatory for all pathways, the Source pathway has the following mandatory keywords:

- LOCATION - Identifies a particular source ID and specifies the source type and location of that source.
  
- SRCPARAM - Specifies the source parameters for a particular source ID identified by a previous LOCATION card.
  
- SRCGROUP - Specifies how sources will be grouped for calculational purposes.  
There is always at least one group, even though it may be the group of ALL sources and even if there is only one source.

Since the hypothetical source in this example problem is influenced by a nearby building, we also need to include the optional keywords BUILDHGT and BUILDWID in our input file.

The input file for the SO pathway for this example will like the following:

```
STARTING
```

LOCATION	STACK1	POINT	0.0	0.0	0.0		
SRCPARAM	STACK1	500.0	65.00	425.	15.0	5.0	
BUILDHGT	STACK1	50.00	50.00	50.00	50.00	50.00	50.00

There are a few things to note about these inputs. First, the source ID (STACK1 in this example) is an alphanumeric parameter (up to 12 characters) that identifies the inputs for different keywords with a particular source. It is crucial that the source be identified with a LOCATION card before any other keyword references the source, since this identifies the source type (POINT in this case), and therefore, which parameters the model will allow. See Section 3.3.1 for a complete list and descriptions of the valid source types. If the effects of elevated terrain were included in this analysis, it would be important to specify the source base elevation above mean sea level (MSL) on the LOCATION card. For this example, the source base elevation is 0.0 meters MSL.

Another thing to note is that since the model uses direction-specific building dimensions for all sources with downwash, there are 36 building heights and 36 building widths entered on the appropriate keywords, one value for each 10-degree sector beginning with the 10-degree flow vector (direction toward which the wind is blowing) and continuing clockwise. Since the user could not fit all 36 values on a single record, the pathway, keyword, and source ID were repeated as many times as were necessary. In this case there were six values given on each of the six lines for each of the building dimensions. There could have been fewer or more lines if exactly 36 values were entered before starting with a new keyword. Since the building height was the same across the sectors (fairly realistic for the height but not

for widths, unless the structure was circular), there is a short cut available for specifying numeric input in the control files for the model. The user can specify "repeat values" by entering a field such as "36\*50.0" as a parameter for the BUILDHGT keyword. The model will interpret this as "36 separate entries, each with a value of 50.0," and store the values in the appropriate arrays within the model. Since the model must identify this as a single parameter field, there must not be any spaces between the repeat-value and the value to be repeated.

The final keyword before finishing the SO pathway must be the SRCGROUP keyword (unless the PSDCREDIT keyword is specified on the MODELOPT card, in which case SRCGROUP is replaced with the PSDGROUP keyword). In this example, since there is only one source, we have taken advantage of a short cut provided by the model by specifying a source group ID (which may be up to eight characters) of ALL. Whenever this card appears in an input file, it will generate a source group with a source-group ID of ALL, consisting of all sources defined for that run. The sources do not have to be explicitly identified. In a run involving multiple sources, the user may specify multiple source groups by repeating the SRCGROUP keyword. The use of the SRCGROUP card is explained in more detail in Section 3.0.

Using some of the formatting options discussed above, the SO pathway for this example may look like this, with the same result as above:

```

SO STARTING
LOCATION      STACK1  POINT  0.0 0.0 0.0

SRCGROUP ALL
SO FINISHED

```

This example of the SO pathway inputs illustrates the use of the comment card to label the stack parameters on the SRCPARAM card, i.e., QS for emission rate (g/s), HS for stack height (m), TS for stack exit temperature (K), VS for exit velocity (m/s), and DS for stack diameter (m). A complete description of the source parameter card, with a list of parameters for each source type, is provided in Section 3.3 and in APPENDIX A.

Other optional inputs that may be entered on the SO pathway include specifying variable emission rate factors for sources whose emissions vary as a function of month, season, hour-of-day, or season and hour-of-day (see Section 3.3.11 for more details). The number of factors entered depends on the option selected, and factors may be input for single sources or for a range of sources.

#### 2.4.4 Specifying a receptor network - RE pathway

As mentioned above, this example will illustrate the use of a single polar receptor network centered on the stack location. Other options available on the REceptor pathway include specifying a Cartesian grid receptor network and specifying discrete receptor locations in either a polar or a Cartesian system. These other options are described in more detail in Section 3.4.

The RE pathway for this example will look like this:

```
RE STARTING
  GRIDPOLR POL1 STA
  GRIDPOLR POL1 ORIG STACK1
  GRIDPOLR POL1 DIST 175. 350. 500. 1000.
  GRIDPOLR POL1 GDIR 36 10 10
  GRIDPOLR POL1 END
RE FINISHED
```

Looking at the example for the RE pathway, the first thing to note about these inputs is that there is a new set of keywords, including something that looks like a STArting and ENdIng. In fact, the GRIDPOLR keyword can be thought of as a "sub-pathway," in that all of the information for a particular polar network must be in contiguous records, and that the start and end of the sub-pathway are identified. Like the main pathways, the order of secondary keywords within the sub-pathway is not critical. Each card must be identified with a network ID (up to eight alphanumeric characters), in this case it is "POL1." Multiple networks may be specified in a single model run. The model waits until the END secondary keyword is encountered to set the variables, which may include terrain heights for receptors on elevated terrain or flagpole receptor heights if those options are being exercised by the user. The use of these optional secondary keywords is described in detail in Section 3.4.

For this example, the ORIG secondary keyword specifies the location of the origin for the polar network being defined as being the location of the source STACK1. The origin can also be specified as X and Y-coordinates. The ORIG keyword is optional, and the model will default to an origin of (0.0, 0.0) if it is omitted. The DIST keyword identifies the distances along each direction radial at which the receptors will be located. In this case there are four distances. More distances could be added by adding values to that input card or by including a continuation card with the DIST keyword, if needed. The GDIR keyword specifies that the model will Generate DIRection radials for the network, in this case there will be 36 directions, beginning with the 10-degree flow vector and incrementing every 10 degrees

clockwise. The user may elect to define Discrete DIRection radials instead by using the DDIR keyword in place of the GDIR keyword.

#### 2.4.5 Specifying the meteorological Input - ME pathway

The MEteorology pathway has the following four mandatory keywords in addition to the common STARTING and FINISHED keywords:

SURFFILE - Specifies the filename and format for the input surface meteorological data file.

PROFFILE - Specifies the filename and format for the input profile meteorological data file.

SURFDATA - Specifies information about the surface meteorological data which will be used in the modeling.

UAIRDATA - Specifies information about the upper air meteorological data which will be used in the modeling.

PROFBASE - Specifies the base elevation above MSL for the potential temperature profile.

For the purposes of this example, it is assumed that the meteorological data files are for Albany, NY and that an on-site location called Hudson has also been used. It is also assumed that the surface and profile data files were generated by the AERMET preprocessor and are in the default format for AERMOD. The filename of the surface file is AERMET2.SFC and it consists of four days of data for Albany/Hudson from March 1988. The filename of the profile file is AERMET2.PFL. The data files used in this example correspond with the on-site example files used for the AERMET preprocessor program. The control file commands for the MEteorology pathway would look like the following:

```
ME STARTING
SURFFILE  AERMET2.SFC
PROFFILE  AERMET2.PFL
SURFDATA  14735  1988  ALBANY,NY
UAIRDATA  14735  1988  ALBANY,NY
SITEDATA  99999  1988  HUDSON
PROFBASE  0.0  METERS
ME FINISHED
```

The first parameters on the SURFFILE and PROFFILE keywords are the filenames for the surface and profile data file, respectively, which can be entered as a full DOS pathname, including the drive specification and subdirectories, up to a total of 200 characters (with the maximum number of characters controlled by the ILEN\_FLD PARAMETER located in MODULE MAIN1 - see Section 2.2.1). Since there is no second parameter, the model will assume the default ASCII format for the data files. The format of the surface and profile data files is described in APPENDIX C.

The next two mandatory inputs identify the location and data period of the input meteorological data. A separate keyword is used for the surface meteorological data and for the upper air (mixing height) data. The parameters on these cards are the station number (e.g., WBAN number for NWS stations), the data period (year), and a station name. In order to identify potential errors in the model inputs, the model compares the station number from the control input file with values provided in the first record of the surface meteorology file, and issues warning messages if there are any mismatches. The user may also optionally input the (X,Y) coordinates for the location of the station(s), although these values are not currently used by the model. In this case, we have also included the optional SITEDATA keyword to identify the location for the on-site meteorological data that were preprocessed by AERMET.

The final mandatory keyword is PROFBASE, which is used to specify the base elevation (above MSL) for the potential temperature profile generated by AERMOD for use in the plume rise calculations. This should correspond to the base elevation for the main meteorological tower, which in this example is specified as 0.0 meters and is the same as the source base elevation.

Other optional keywords available on the ME pathway provide the user with options to specify selected days to process from the meteorological data file, and a wind direction rotation correction term. These optional inputs are described in more detail in Section 3.5.

#### 2.4.6 Selecting output options - OU pathway

All the keywords on the Output pathway are optional, although the model will warn the user if no printed outputs are requested and will halt processing if no outputs (printed results or file outputs) are selected. The user has considerable flexibility to select only the outputs that are needed for a particular application. The printed table keywords are:

RECTABLE - Specifies the selection of high value by receptor table output options.

- MAXTABLE - Specifies the selection of overall maximum value table output options.
- DAYTABLE - Specifies the selection of printed results (by receptor) for each day of data processed (this option can produce very large files and should be used with caution).

The RECTABLE keyword provides the highest, second highest and third highest values, etc., by receptor. The MAXTABLE keyword provides a table of the overall maximum *n* number of values. For both keywords, the user has additional flexibility to specify for which short-term averaging periods the outputs are selected. For the MAXTABLE keyword the user can also specify the number of overall maximum values to summarize for each averaging period selected, up to a maximum number controlled by a parameter in the computer code. In the example below, the highest and second-highest values by receptor and the maximum 50 values for all averaging periods are specified.

```

OU STARTING
  RECTABLE  ALLAVE  FIRST  SECOND
  MAXTABLE  ALLAVE  50
OU FINISHED

```

To simplify the input for users who request the same printed table output options for all averaging periods, these keywords recognize the secondary keyword "ALLAVE" as the first parameter for that purpose. To obtain the overall maximum 10 values for the 24-hour averages only, the OU pathway input would look like the following example:

```

OU STARTING
  RECTABLE  ALLAVE  FIRST  SECOND
  MAXTABLE  24  10
OU FINISHED

```

It should also be noted that these output table options apply only to the short-term averaging periods, such as the 3-hour and 24-hour averages used in our example. If the user has selected that PERIOD averages be calculated (on the CO AVERTIME keyword), then the output file will automatically include a table of period averages summarized by receptor (the RECTABLE option does not apply since there is only one period value for each receptor). In addition, the printed output file will include tables summarizing the highest values for each averaging period and source group.

Other options on the OU pathway include several keywords to produce output files for specialized purposes, such as generating contour plots of high values, identifying occurrences of

violations of a particular threshold value (e.g., a NAAQS), and for postprocessing of the raw concentration data. These options are described in detail in Section 3.7.

The complete input control file for this simple example is shown in Figure 2-2. Note that a consistent style has been used for formatting and structuring the file to improve its readability. This input file is comparable to the version shown earlier in Figure 2-1, which used a somewhat different style.

**Figure 2-2. Example Input control file for Sample Problem**

#### 2.4.7 Using the error message file to debug the input control file

The previous sections in this tutorial have provided a step-by-step construction of a sample control input file for AERMOD. This simple example problem illustrated the usage of the more commonly used options of the AERMOD model. However, many real-time applications of the model will be much more complex than this example, perhaps involving multiple sources and source groups, multiple receptor networks, the addition of discrete receptor locations, and/or elevated terrain heights. To reduce errors in modeling applications, an effort has been made to develop detailed error handling capabilities for the AERMOD model.

The error handling capabilities of the AERMOD model are designed to accomplish two things for the user. First, the model reads through the complete input file and report all occurrences of errors or suspect entries before stopping, rather than stopping on the first instance (and every instance thereafter) of an error in the input file. Second, the model provides error and warning messages that are detailed and descriptive enough that they will help the user in his/her effort to debug the input file. The remainder of this section provides a brief introduction to the use of the model's error handling capabilities.

APPENDIX B of this volume provides more details about the error handling provided by the AERMOD model.

The AERMOD model generates messages during the processing of the input data and during the execution of model calculations. These messages inform the user about a range of possible conditions including:

- Errors that will halt any further processing, except to identify additional error conditions;
- Warnings that do not halt processing but indicate possible errors or suspect conditions; and
- Informational messages that may be of interest to the user but have no direct bearing on the validity of the results.

As the model encounters a condition for which a message is generated, the model writes the message to a temporary storage file. At the completion of the setup processing for a run, and at the completion of the model calculations, the model rereads the message file and generates a summary of the messages which is included in the main printed output file. If the processing of the model setup information indicates no errors or warnings, and the user has selected the option to RUN the model calculations on the CO RUNORNOT card, then the model will simply write a statement to the print file that the model setup was completed successfully. Otherwise, the model will report a summary of the

In deciphering the error and warning messages, the line number provided as part of the message may be particularly helpful in locating the error within the input file. However, if it is an error of omission that is caught by the error checking performed at the completion of inputs for a pathway, then the line number will correspond to the last record for that pathway. The user may need to examine all of the messages carefully before locating the error or errors, especially since a single occurrence of certain types of errors may lead to other error conditions being identified later in the input file which do not really constitute errors in themselves. An example of this is provided in Figure 2-4, which shows some inputs for the SO pathway where the building dimension keywords have been typed incorrectly, and the associated list of error messages. Since continuation cards (cards or records that require multiple entries and the input continues on subsequent lines) were used for the building width inputs, and the keyword was entered incorrectly on the first line, the subsequent records were also taken by the model to be invalid keyword inputs. While the error messages are the same for these records, the message originates from a different part of the model (SUBROUTINE SOCARD) for the records with the blank keyword.

Since the detailed error and warning messages are listed in the output file as part of the message summary table, there will generally not be a need for the user to examine the contents of the detailed message file. For this reason, the default operation of the model is to write the messages that are generated by a particular run to a temporary file that is deleted when the run is completed. If the user wishes to examine the complete list of detailed messages (of all types), there is an optional keyword available on the CO pathway for that purpose. The ERRORFIL keyword, which is described in detail in Section 3.2.19, allows the user to save the complete list of detailed messages to a user-specified filename.

**Figure 2-4. Example of Keyword Error and Associated Message Summary Table**

#### 2.4.8 Running the model and reviewing the results

Now that we have a complete and error-free control input file, we are ready to run the model and then review the results. The PC-executable file available on the SCRAM website opens the control input and printed output files and the model can be executed from the command prompt three ways as follows:

*Path-to-AERMOD.EXE\AERMOD*

*Path-to-AERMOD.EXE\AERMOD runstream\_input\_filename*

*Path-to-AERMOD.EXE\AERMOD runstream\_input\_filename output\_filename*

The first example above is applicable for all versions of AERMOD and assumes that the control input and printed output files are AERMOD.INP and AERMOD.OUT (not case sensitive in DOS and case sensitive on Unix and Linux systems). The other two examples apply to AERMOD versions beginning with 18081 in which the user can specify the control input filename and optionally the output filename as well. The filenames can include a directory pathname if the files reside in a different directory than the working directory. If the output filename is not specified, AERMOD will use the control input filename (including pathname) and replace the input filenames extension (e.g., “.INP”) with a “.OUT” extension. Otherwise, if both files are specified, they can be in different locations. The important points are that the AERMOD.EXE file either be in the directory from which you are attempting to run the model or in a directory that is included on the DOS PATH command when the system is "booted-up." The control input file (AERMOD.INP) must also be located in the directory which the model is being executed when the control input filename is not specified. When the default control file and main output filenames are used and reside in the working directory with AERMOD.EXE, the model can also be executed by double clicking on the executable file from Windows Explorer.

As mentioned above, the SCRAM PC-executable file for AERMOD opens the input and output files explicitly. One reason for this is to allow for the model to write an update on the status of processing to the PC terminal screen. For the AERMOD model, the model first indicates that setup information is being processed and then gives the Julian day currently being processed. If no status message is displayed, then the model did not load into memory properly. If the model stops after completing the setup processing, then the RUNORNOT option was set NOT to run. If a fatal error is encountered during the setup processing, then a message to that effect will be written to the screen and model execution will be stopped. Another reason for not sending the printed output to the default output device (i.e., to the screen or redirected to a file), is so that any DOS error messages will be visible on the screen and not be

written to the printed file. One such message might be that there is insufficient memory available to run the program. Handling of DOS error messages may require some knowledge of DOS, unless the meaning of the message is obvious.

The order of contents and organization of the main output file for the AERMOD model is presented in Figure 2-5.

**Figure 2-5. Organization of the AERMOD Model Output File**

Each page of the output file, except for the echo of the input file entries, is labeled with the model name and version number, user-specified title(s), page number, and, for the PC version of the model, the date and time of the particular run. Also included as part of the header information for each page is a one-line summary of the modeling options used for that particular run. The modeling options are listed as the secondary keywords used to control the options, such as DFAULT, CONC, etc.

Since the complete input file is normally echoed back as part of the output file, and since processing of the inputs stops when the OU FINISHED card is reached, the run can be duplicated by simply specifying the output filename as the input control file. Alternatively, the input records could be "cut and pasted" from the output file to a separate file using a text editor.

By default, the model will echo each line of the input control file to the printed output file. This provides a convenient record of the inputs as originally read into the model, without any rounding of numerical values that may appear in the input summary tables. As noted above, it also means that the output file can be used as an input file to the model to reproduce a particular application. However, for some applications, the length of the input control file may be too cumbersome to include the entire set of inputs at the beginning of each output file. This may happen, for example, if a large number of sources are being defined or if a large number of discrete receptor locations are used. For this reason, the user is provided with the option to "turn off" the echoing of the input file at any point within the control file. This is accomplished by entering the keywords "NO ECHO" in the first two fields anywhere within the control file. In other words, place NO in the pathway field, followed by a space and then ECHO. None of the input control file options after the NO ECHO will be echoed to the output file. Thus, a user may choose to place NO ECHO after the Control pathway in order to keep the control options echoed but suppress echoing the rest of the input file.

The details of the message summary tables were discussed in the previous section. A portion of the summary of modeling option inputs is shown in Figure 2-6 for the simple example described in this section. The summary of source parameter input data includes separate tables for each source type, rather than combining all sources onto a single table. In this way the column headings are specific to the source type.

Figure 2-7 presents an example of the results output for the first highest values by receptor for our sample problem. These values are the first highest 3-hour averages at each receptor location. The number in parentheses following each concentration value is the date corresponding to each value. The

date is given as an eight-digit integer variable that includes the year (2-digits), month, day, and hour corresponding to the end of the averaging period.

For each of the different types of model result tables, the controlling keyword is identified in Figure 2-5 at the end of the description. All of the outputs of the same type, e.g., high values by receptor, are printed together, and the order of tables loops through all source groups for a particular averaging period, and then loops through all averaging periods. The summary tables of high values at the end of the model results follow the same order of loops. An example of the summary tables for our sample problem is shown in Figure 2-8.

**Figure 2-8. Example of Result Summary Tables for the AERMOD Model**

## **2.5 Modifying an existing control file**

As noted earlier, one of the advantages of the keyword/parameter approach and the flexible format adopted for the input control file is that it will be easier for the user to make modifications to the control file and obtain the desired result. This section briefly illustrates some examples of how a control file can be modified. It is assumed that the reader is familiar with the operation of and basic editing commands for a text editor (i.e., a program that edits ASCII files), and is familiar with the previous sections of this tutorial.

### 2.5.1 Modifying modeling options

Depending on the type of analysis being performed, the user may need to modify the modeling options and run the model again. Because of the descriptive nature of the keywords and the secondary keywords used to control the modeling options, this can easily be done with the new control file, and usually without having to refer back to the user's guide each time a modification is attempted.

### 2.5.2 Adding or modifying a source or source group

Modifying the input file to add a source or a source group, or to add a source to a source group, is as simple as just adding it. There is no need to specify the total number of sources in the run, which would then have to be changed if more sources were added. The same applies to the number of groups, or the number of sources per group. If the user attempts to input more than the total number of sources or groups allowed for a particular run, an error message will be generated to that effect. Also, modifying a source group to delete a source is as easy as just deleting it from the input card, without having to change any other inputs.

Another way of "deleting" a source or a group from an input file is to place a "\*\*\*" in the pathway field of the card or cards which define the source or group to "comment out" those inputs. This approach, which was discussed above in Section 2.2.2, has the advantage of leaving the input data for the source or group in the input file for possible later use. It doesn't matter whether the "\*\*\*" is entered with the text editor in "insert" mode, in which case the other inputs of that line are moved over, or if it is in "overtyping" mode, which would replace the pathway ID that was already there.

### 2.5.3 Adding or modifying a receptor network

As with source data, adding to or modifying the receptor information in the AERMOD model is relatively straight forward. The problem of having to make several changes to accomplish one small modification, such as adding a distance to a polar receptor network, has been avoided in the new model. All

that the user needs to do is to add the new distance on the appropriate input card, which is easily identifiable because of the use of descriptive keywords. The model checks to ensure that the user does not attempt to specify more than the maximum number of receptors for a particular run and generates an appropriate message if too many are input.

#### 2.5.4 Modifying output options

Modifying the output options involves many of the same principles that are described above. In addition, all the output options are structured in a way that allows the user to select options for specific averaging periods, so that the user may find it useful to copy a record or group of records set up for one averaging period and simply change the averaging period parameter. The other important short cut that is available for the printed table output options is to use the secondary keyword ALLAVE to indicate that the option applies to all averaging periods that are calculated. In this way, there will be no need to change the output options if a new averaging period is added to a run or if one is deleted.

### 3.0 Detailed keyword reference

This section of the AERMOD user's guide provides a detailed reference for all the input keyword options for the AERMOD model. The information provided in this section is more detailed than the information provided in the Brief Tutorial in Section 2.0. Since this section is intended to meet the needs of experienced modelers who may need to understand completely how particular options are implemented in the model, the information for each keyword should stand on its own. This section assumes that the reader has a basic understanding of the keyword/parameter approach used by the model for specification of input options and data. Novice users should first review the contents of Section 2.0 to obtain that understanding.

#### 3.1 Overview

The information in this section is organized by function, i.e., the keywords are grouped by pathway, and are in a logical order based on their function within the model. The order of keywords presented here is the same as the order used in the functional keyword reference in APPENDIX A. The syntax for each keyword is provided, and the keyword type is specified - either mandatory or optional and either repeatable or non-repeatable. Unless noted otherwise, there are no special requirements for the order of keywords within each pathway, although the order in which the keywords are presented here and in APPENDIX A is recommended. Any keyword which has special requirements for its order within the pathway is so noted following the syntax and type description.

The syntax descriptions in the following sections use certain conventions. Parameters that are in all capital letters and underlined in the syntax description are secondary keywords that are to be entered as indicated for that keyword. Other parameters are given descriptive names to convey the meaning of the parameter and are listed with an initial capital letter. Many of the parameter names used correspond to variable names used in the computer code of the model. Parentheses around a parameter indicate that the parameter is optional for that keyword. The default that is taken when an optional parameter is left blank is explained in the discussion for that keyword.

### 3.2 Control pathway inputs and options

The **CO** pathway contains the keywords that provide the overall control of the model run. These include the dispersion options, averaging time options, terrain height options, and others that are described below. The **CO** pathway must be the first pathway in the control input file.

#### 3.2.1 Title information

There are two keywords that allow the user to specify up to two lines of title information that will appear on each page of the main output file from the model. The first keyword, **TITLEONE**, is mandatory, while the second keyword, **TITLETWO**, is optional. The syntax and type for the keywords are summarized below:

<b>Syntax:</b>	CO TITLEONE Title1 CO TITLETWO Title2
<b>Type</b>	TITLEONE - Mandatory, Non-repeatable TITLETWO - Optional, Non-repeatable

The parameters Title1 and Title2 are character parameters of length 200, which are read as a single field starting at column 13. The title information is taken as it appears in the control file without any conversion of lower case to upper case letters. If the **TITLETWO** keyword is not included in the control file, then the second line of the title in the output file will appear blank. Note that in the output files, only the first 68 characters of **TITLEONE** and **TITLETWO** are printed.

#### 3.2.2 Dispersion options

The dispersion options are controlled by the **MODELOPT** keyword on the **CO** pathway and are specified using secondary keywords that represent each of the different options. The secondary keywords and syntax are shown and described below. Some related options are mutually exclusive, others can be specified in combination with each other, and some are dependent on others and must be specified together.

<b>Syntax:</b>	CO MODELOPT <u>DFAULT</u> <u>ALPHA</u> <u>BETA</u> <u>CONC</u> <u>AREADPLT</u> <u>FLAT</u> <u>NOSTD</u> <u>NOCHKD</u> <u>NOWARN</u> <u>SCREEN</u> <u>SCIM</u> <u>NOMINO3</u> <u>RLINEFDH</u> <u>ELEV</u> <u>WARNCHKD</u> <u>NOURBTRAN</u> <u>VECTORWS</u> <u>PSDCREDIT</u> <u>FASTALL</u> <u>FASTAREA</u> <u>GSRM</u> <u>TTRM</u> <u>TTRM2</u> <u>PVMRM</u> <u>OLM</u> <u>ARM2</u> <u>DEPOS</u> <u>DDEP</u> <u>WDEP</u> <u>DRYDPLT</u> <u>WETDPLT</u> <u>NODRYDPLT</u> <u>NOWETDPLT</u> <u>AREAMNDR</u> <u>HBP</u>
<b>Type:</b>	Mandatory, Non-repeatable
<b>Order:</b>	Must precede POLLUTID, HALFLIFE and DCAYCOEF

where the secondary keyword parameters are described below (the order and spacing of these parameters is not critical):

- DFAULT - Specifies that the regulatory default options will be used; note that specification of the DFAULT option will override some non-DFAULT options that may be specified in the input file, while other non-DFAULT options will cause fatal errors when DFAULT is specified (see below for details).
- ALPHA - Non-regulatory option flag that allows the input control file to include research/experimental options for review and evaluation by the user community; (e.g., LOW\_WIND, PSDCREDIT, ORD\_DWNW, AWMADWNW, PLATFORM, METHOD 2 particle deposition, gas deposition, RLINEFDH, and RLINEXT with options for modeling barriers and depressed roadways) and cannot be used with DFAULT keyword.
- BETA - Non-regulatory option flag that allows the input control file to include options that have been vetted through the scientific community and are waiting to be promulgated as regulatory options. Prior to promulgation, BETA options require alternative model approval for use in regulatory applications and cannot be used with DFAULT keyword.
- CONC - Specifies that concentration values will be calculated.
- DEPOS - Specifies that total deposition flux values (both dry and wet) will be calculated.
- DDEP - Specifies that dry deposition flux values will be calculated.
- WDEP - Specifies that wet deposition flux values will be calculated.
- AREADPLT - Specifies that a non-regulatory method for optimized plume depletion due to dry removal mechanisms will be included in calculations for area sources (cannot be used simultaneously with the DFAULT keyword).
- FLAT - Specifies that the non-regulatory option of assuming flat terrain will be used; Note that FLAT and ELEV may be specified in the same model run to allow specifying the non-regulatory FLAT terrain option on a source-by-source basis; FLAT sources are identified by specifying the keyword FLAT in the MODELOPT line on the CO pathway and in place of the source elevation field on the SO LOCATION keyword (cannot be used simultaneously with the DFAULT keyword).
- ELEV - Specifies that the default option of assuming elevated terrain will be used; Note that FLAT and ELEV may be specified in the same model run to allow

- specifying the non-regulatory FLAT terrain option on a source-by-source basis (the ELEV option is set as a regulatory option with the DFAULT keyword)
- NOSTD - Specifies that the non-regulatory option of no stack-tip downwash will be used (cannot be used with the DFAULT keyword).
- NOCHKD - Specifies that the non-regulatory option of suspending date checking will be used for non-sequential meteorological data files (cannot be used with the DFAULT keyword).
- WARNCHKD - Specifies that the option of issuing warning messages rather than fatal errors will be used for non-sequential meteorological data files.
- NOWARN - Specifies that the option of suppressing the detailed listing of warning messages in the main output file will be used (the number of warning messages is still reported, and warning messages are still included in the error file controlled by the CO ERRORFIL keyword).
- SCREEN - Non-regulatory option for running AERMOD in a screening mode for AERSCREEN (cannot be used when the DFAULT keyword is specified).
- SCIM - Sampled Chronological Input Model – non-regulatory option used only with the ANNUAL average option to reduce runtime by sampling meteorology at a user-specified regular interval; SCIM sampling parameters must be specified on the ME pathway (cannot be used with the DFAULT keyword).
- PVMRM - Specifies that the Plume Volume Molar Ratio Method (PVMRM) for NO<sub>2</sub> conversion will be used (regulatory option, can be used simultaneously with DFAULT); cannot be used with OLM, ARM2, or GRSM; cannot be used with TTRM without TTRM2.
- OLM - Specifies that the Ozone Limiting Method (OLM) for NO<sub>2</sub> conversion will be used (regulatory option, can be used simultaneously with DFAULT keyword); cannot be used with PVMRM, ARM2, or GRSM; cannot be used with TTRM without TTRM2.
- ARM2 - Specifies that the Ambient Ratio Method - 2 (ARM2) for NO<sub>2</sub> conversion will be used (regulatory option, can be used with DFAULT keyword); cannot be used with PVMRM, OLM, or GRSM; cannot be used with TTRM without TTRM2.
- TTRM - Specifies that the non-regulatory Travel Time Reaction Method (TTRM) will be used for NO<sub>2</sub> conversion (non-regulatory ALPHA option, requires the ALPHA keyword and cannot be used with the DFAULT keyword); cannot be used with PVMRM, OLM, ARM2 without TTRM2; cannot be used with GRSM; cannot be used with TTRM2 without PVMRM, OLM, or ARM2.
- TTRM2 - Specifies that the non-regulatory Travel Time Reaction Method (TTRM) will be paired with one of OLM, PVMRM, or ARM2 for NO<sub>2</sub> conversion (non-regulatory ALPHA option, requires the ALPHA keyword and cannot be used with the DFAULT keyword); cannot be used with TTRM alone or GRSM; must be paired with one of PVMRM, OLM, or ARM2 and does not require TTRM keyword when pairing.
- GRSM - Specifies that the Generic Reaction Set Method (GRSM) will be used for NO<sub>2</sub> conversion; cannot be used with PVMRM, OLM, TTRM, TTRM2, or ARM2.

- PSDCREDIT - Specifies that the non-regulatory ALPHA option will be used to calculate the increment consumption with PSD credits using the PVMRM option (cannot be used with the DFAULT keyword).
- FASTALL - Non-regulatory option to optimize model runtime through use of an alternative implementation of horizontal meander for POINT and VOLUME sources; also optimizes model runtime for AREA/AREAPOLY/AREACIRC/LINE, OPENPIT, RLINE, and RLINEXT sources (formerly associated with TOXICS option, now controlled by the FASTAREA and FASTALL option, cannot be used with the DFAULT keyword).
- FASTAREA - Non-regulatory option to optimize model runtime through hybrid approach for AREA/ AREAPOLY/AREACIRC and OPENPIT sources (formerly associated with TOXICS option, cannot be used with the DFAULT keyword).
- DRYDPLT - Option to incorporate dry depletion (removal) processes associated with dry deposition algorithms; this requires specification of dry deposition source parameters and additional meteorological variables; dry depletion will be used by default if dry deposition algorithms are invoked; cannot be used with NODRYDPLT.
- NODRYDPLT - Option to disable dry depletion (removal) processes associated with dry deposition algorithms; cannot be used with DRYDPLT.
- WETDPLT - Option to incorporate wet depletion (removal) processes associated with wet deposition algorithms; this requires specification of wet deposition source parameters and additional meteorological variables; wet depletion will be used by default if wet deposition algorithms are invoked; cannot be used with NOWETDPLT.
- NOWETDPLT - Option to disable wet depletion (removal) processes associated with wet deposition algorithms; cannot be used with WETDPLT.
- NOURBTRAN - Non-regulatory option to ignore the transition from nighttime urban boundary layer to daytime convective boundary layer (i.e., to revert to the urban option as implemented prior to version 11059) (cannot be used with the DFAULT keyword).
- VECTORWS - Option to specify that input wind speeds are vector mean (or resultant) wind speeds, rather than scalar means. Under the VECTORWS option, the adjustments to wind speeds based on Equation 112 of the AERMOD Model Formulation document (EPA, 2024a) will be applied (can be used with the DFAULT keyword).
- NOMINO3 - Option to remove the minimum ozone used for Tier 2 & 3 NO<sub>2</sub> options. Without this option, AERMOD will use a minimum value of 40 ppb of ozone for nighttime stable conditions, regardless of the value in an hourly input file (can be used with the DFAULT keyword).
- RLINEFDH - Option to have wind profile calculations without a displacement height for RLINE and RLINEXT source types. This makes the wind profile closer to other AERMOD source types, which do not use a displacement height in wind profile (requires the ALPHA keyword and cannot be used with the DFAULT keyword).

AREAMNDR - Option to apply plume meander to AREA, AREAPOLY, AREACIRC, and LINE source types. Note that AREAMNDR and FASTAREA or FASTALL can be specified in the same model run, but in that case, meander will not be applied to those source types listed,

HBP - Option for highly buoyant plumes (HBP) when plume penetrates the top of the mixed layer. Limited to point source types (POINT, POINTHOR, POINTCAP). Compares convective mixing height for the current hour and next hour to determine how much of the penetrated plume has been captured by the CBL by the end of the current hour (requires the ALPHA keyword and cannot be used with the DFAULT keyword).

### 3.2.2.1 DFAULT option

As previously discussed, the regulatory DFAULT option in AERMOD informs the model that certain regulatory options will be invoked including stack-tip downwash, effects of elevated terrain, and calms and missing data processing. The DFAULT option in AERMOD also forces the use of a 4-hour half-life when modeling SO<sub>2</sub> in an urban source and does not allow for exponential decay for other applications. If exponential decay is requested via the DCAYCOEFF or HALFLIFE keyword, AERMOD will issue a warning that the DFAULT overrides the requested exponential and will run the model without exponential decay. If exponential decay is desired, then the DFAULT keyword cannot be included. The DFAULT option also imposes a restriction on the optional urban roughness length parameter to be 1 meter for regulatory applications. If the urban roughness length parameter is not 1 m with the DFAULT keyword, AERMOD issues a warning and resets it to 1 m.

The missing data processing routines that are included in the AERMOD model allow the model to handle missing meteorological data in the processing of short-term averages. The model treats missing meteorological data in the same way as the calms processing routine, i.e., it sets the concentration values to zero for that hour and calculates the short-term averages according to EPA's calms policy, as set forth in the Guideline. Calms and missing values are tracked separately for the purpose of flagging the short-term averages. An average that includes a calm hour is flagged with a 'c', an average that includes a missing hour is flagged with an 'm', and an average that includes both calm and missing hours is flagged with a 'b'. If the number of hours of missing meteorological data exceeds 10 percent of the total number of hours for a given model run, a cautionary message is written to the main output file, and the user is referred to Section 5.3.2 of "Meteorological Monitoring Guidance for Regulatory Modeling Applications" (EPA, 2004). An hour is considered missing if one or more of the following surface variables have missing value indicators for the hour: wind speed, wind direction, ambient temperature, Monin-Obukhov length, mechanical mixing height,

surface friction velocity ( $u^*$ ), convective mixing height (convective hours only), or convective velocity scale ( $w^*$ ; for convective hours only).

The DFAULT keyword cannot be used simultaneously with either the ALPHA or BETA secondary keywords or other secondary keywords that enable a specific ALPHA or BETA option.

### 3.2.2.2 ALPHA options

Beginning with version 18081, a new secondary keyword, ALPHA, was added to the MODELOPT keyword. When included, ALPHA indicates one or more options are being used that are in a special category of options. These can include but are not limited to:

- Scientific/formulation updates that are in the research phase and have not been fully evaluated and peer reviewed by the scientific community; and
- Non-scientific model options in development that still need rigorous testing and for which EPA is seeking feedback from the user community.

Different ALPHA options are enabled in the control file in different ways. Some ALPHA options, as indicated above, are enabled by specifying the appropriate secondary keyword with the MODELOPT keyword, while others are specified as either a primary keyword on the CO pathway (e.g., LOW\_WIND, AWMADWNW) or as source type with the LOCATION keyword (e.g., RLINEXT, SWPOINT) on the SO pathway or as a primary keyword on the SO pathway to enter source-specific inputs (e.g., PLATFORM, RBARRIER). AERMOD version 24142 includes the following ALPHA options:

- Prevention of Significant Deterioration Credit (PSDCREDIT)
- Low Wind Parameters (LOW\_WIND)
- A&WMA Downwash Options (AWMADWNW)
- EPA Office of Research and Development Downwash Options (ORD\_DWNW)
- Offshore Platform Downwash (PLATFORM, applies to point sources only)
- Extended RLINE Source Type (RLINEXT)
- Depressed Roadway (RDEPRESS, used only with RLINEXT)
- Roadway Barrier (RBARRIER, used only with RLINEXT)
- Removal of Displacement Height from RLINE Wind Profile (RLINEFDH)
- Particle Deposition - Method 2 (METHOD\_2)

- Gas deposition (GDSEASON, GDLANUSE, GASDEPDF, GASDEPOS, GASDEPVD keywords)
- Travel Time Reaction Method (TTRM, for NO<sub>2</sub> conversion, stand-alone method)
- Travel Time Reaction Method 2 (TTRM2, for NO<sub>2</sub> conversion, applies TTRM to ARM2, OLM, or PVMRM conversion methods)
- Sidewash Point Source (SWPOINT, experimental source type)
- AREA Source Meander (AREAMNDR)
- Highly Buoyant Plume (HBP)
- Aircraft Plume Rise (ARCFTOPT, can be applied to AREA and VOLUME source types only via SO ARCFTSRC grouping and an hourly emission file)

As noted above, METHOD 2 particle deposition and gas deposition are ALPHA options beginning with version 19191 of AERMOD. In previous versions of AERMOD, these two deposition options were non-default and could be used without the ALPHA or BETA keywords. The reason that these two options are now ALPHA options is that they have not been rigorously tested and evaluated since their inclusion in AERMOD's initial promulgation. Thus, it was decided to make the options ALPHA while deposition is further evaluated in AERMOD. Note that METHOD 1 particle deposition is unaffected and can still be used with AERMOD in default mode (i.e., with the DFAULT keyword).

### 3.2.2.3 BETA options

BETA options refer to scientific updates to the formulation of AERMOD that have been fully vetted through the scientific community with appropriate evaluation and peer review. BETA options are planned for future promulgation as regulatory options. However, until they are promulgated, they require alternative model approval by the EPA Regional Office and concurrence by the Model Clearing House. AERMOD version 24142 does not include any BETA options.

### 3.2.2.4 Options for capped and horizontal stack releases

Options are included in AERMOD, beginning with version 06341, for modeling releases from capped and horizontal stacks. For sources that are not subject to building downwash influences, the plume rise for these capped and horizontal stacks is simulated based on an EPA Model Clearinghouse Memorandum, dated July 9, 1993. The Model Clearinghouse procedure for these sources entails setting the exit velocity very low (0.001 m/s) to account for suppression of vertical momentum of the plume and using an effective stack diameter that maintains the actual flow rate of the plume. Maintaining the flow rate will

also serve to maintain the buoyancy of the plume to provide a more realistic estimate of plume rise. The Model Clearinghouse procedure also addresses the issue of stack-tip downwash for these cases.

The Model Clearinghouse procedure is not considered to be appropriate for sources subject to building downwash influences with the PRIME downwash algorithm for the following reason. The PRIME algorithm uses the specified stack diameter to define the initial radius of the plume for the numerical plume rise calculation, and the initial radius of the plume can significantly influence plume rise based on the PRIME algorithm. As a result, use of an effective diameter adjusted to maintain the flow rate is not appropriate and could produce unrealistic results. For PRIME downwash sources modeled using the options for capped and horizontal releases, the basic premise of the Model Clearinghouse procedure, i.e., that the vertical momentum is suppressed while the buoyancy of the plume is conserved has been adapted for the PRIME numerical plume rise formulation. For capped stacks the initial radius of the plume is assumed to be 2 times the actual stack diameter to account for the interaction of the exiting plume with the cap. The initial vertical velocity of the plume is set at 0.001 m/s, and the initial lateral velocity of the plume is set at 25% of the initial exit velocity of the plume. For horizontal stacks, the initial vertical velocity of the plume is set at 0.001 m/s, the total exit velocity of the plume is assigned to the initial lateral velocity, and the plume is assumed to be emitted in the downwind direction. Although this adaptation of the Model Clearinghouse procedure to PRIME downwash sources has not been validated by field tracer or wind tunnel data, analyses have shown that simply setting the exit velocity to 0.001 m/s without any further adjustment when downwash is applied, as suggested in Section 6.1 of the AERMOD Implementation Guide (EPA, 2024b), may lead to overly conservative results (EPA, 2007).

The user selects the options for capped and/or horizontal releases by specifying one of the new source types on the SO LOCATION card: POINTCAP for capped stacks, and POINTHOR for horizontal releases. For each of these options, the user specifies the actual stack parameters [release height (m), exit temperature (K), exit velocity (m/s), and stack diameter (m)] using the SO SRCPARAM card as if the release were a non-capped vertical point source. The syntax of the SO LOCATION and SRCPARAM keywords is described in Sections 3.3.1 and 3.3.2 and is also summarized in APPENDIX A. The AERMOD model performs the necessary adjustments internally to account for plume rise and stack-tip downwash. For horizontal releases, the model currently assumes that the release is oriented with the wind direction, and the model does not account for directional effects that may occur with horizontal releases. The model also does not account for stacks oriented at a non-horizontal angle relative to vertical. For PRIME downwash sources, the user-specified exit velocity for horizontal releases is treated initially as horizontal momentum in the downwind direction.

### 3.2.2.5 Output types (CONC, DEPOS, DDEP and/or WDEP)

The user may select any or all of the output types (CONC, DEPOS, DDEP and/or WDEP) to be generated in a single model run. The order of these secondary keywords on the MODELOPT card has no effect on the order of results in the output files – the outputs will always be listed in the order of CONC, DEPOS, DDEP, and WDEP. Appropriate deposition parameters must be specified in order to output deposition fluxes using the DEPOS, DDEP, and/or WDEP keywords (see Sections 3.3.3 and 3.3.4 for more details). Deposition has not been implemented for RLINE/RLINEXT, BUOYLINE, or SWPOINT source types, thus the user can only run CONC with these source types.

### 3.2.2.6 Deposition depletion options

Beginning with version 04300, the dry and wet removal (depletion) mechanisms (the DRYDPLT and WETDPLT options in earlier versions of AERMOD) will automatically be included in the calculated concentrations or deposition flux values if the dry and/or wet deposition processes are considered, unless the user specifies the NODRYDPLT and/or NOWETDPLT options. Note that dry and wet removal effects on calculated concentration values can be included even if deposition flux values are not being calculated. However, the additional data requirements for dry and wet deposition, described in Sections 3.3.3 and 3.3.4, must be met in order for dry and wet removal to be included in the concentration calculations. The use of the NODRYDPLT and/or NOWETDPLT options will result in a more conservative estimate of concentrations and/or deposition fluxes for applications involving deposition processes, but the degree of additional conservatism will vary depending on the source characteristics, meteorological conditions, receptor locations and terrain influences. However, the inclusion of particle deposition effects may increase ground-level concentrations for some sources compared to the same source modeled as a gaseous emission due to gravitational settling on the particulate plume. The magnitude of this effect will depend on the source characteristics (elevated or low-level) and particle size distribution. As of version 19191, deposition has not been implemented for RLINE/RLINEXT, BUOYLINE, or SWPOINT sources, thus the user can only run CONC with these source types.

### 3.2.2.7 NO<sub>2</sub> conversion options

Beginning with version 16216r, the PVMRM and OLM Tier 3 NO<sub>2</sub> conversion methods, as well as the Tier 2 ARM2 method are regulatory options that can be specified with the DFAULT keyword. PVMRM, OLM, and ARM2 assume the reaction involving NO and available O<sub>3</sub> to form NO<sub>2</sub> occurs instantaneously. Although this chemical reaction is relatively rapid, it is not actually instantaneous and depends on the transport time to the downwind receptor of interest. Beginning with version 21112, TTRM was added as an

ALPHA option for NO<sub>2</sub> conversion that considers the distance and the travel time from the emission source to each receptor. In general, much of the conversion of NO to NO<sub>2</sub> occurs within the first minute of travel which limits the effectiveness of this method to the near field receptors.

In version 21112, TTRM, the Travel Time Reaction Method, was implemented as a stand-alone ALPHA option which can determine the initial fraction of NO to NO<sub>2</sub> conversion in the travel time of each source emissions to each receptor. The conversion is capped at an upper limit, which is typically reached after a few tens of seconds of plume travel. Beyond the distance the fraction reaches the upper limit of the equilibrium fraction (generally 0.9), TTRM is no longer effective, and another method is needed for receptors beyond that distance. Beginning with version 22112, TTRM was integrated to be used simultaneously with PVMRM, OLM, or ARM2. This integration was added as the ALPHA option, TTRM2, separate from TTRM which was retained as a stand-alone option. When TTRM2 is specified along with PVMRM, OLM, or ARM2, TTRM will be implemented for near field receptors where the fraction of conversion has not reached the upper limit, and the other specified method will be used for all other receptors.

In addition to TTRM and TTRM2, beginning with version 21112, GRSM, the Generic Reaction Set Method, was added as an ALPHA option, updated as a BETA option beginning with version 22112, and promulgated as a regulatory option in version 24142. GRSM was adapted from the Atmospheric Dispersion Model Method (ADMMSM), documented by Carruthers et al., 2017, which accounts for the equilibrium between NO, NO<sub>2</sub>, and ozone in the atmosphere. GRSM treats plume entrainment of ozone similar to PVMRM but provides for treatment of reaction rates based on ozone and solar radiation intensity, NO<sub>2</sub> photolysis, and travel time from source to receptor. The reaction rate is based on the generic reaction set (GRS) chemistry scheme, which is a semi-empirical photochemical model developed originally by CSIRO in Australia (Azzi and Johnson, 1992; Venkatram et al., 1994) for multiple step conversions between NO, NO<sub>2</sub>, and O<sub>3</sub>. The integration of GRSM into AERMOD is documented in EPA's related Technical Support Document (TSD) (2024d).

Only one of ARM2, TTRM, OLM, PVMRM, or GRSM options for NO<sub>2</sub> conversion can be specified for a given model run. Alternatively, the TTRM2 ALPHA option (which invokes TTRM), can be paired with ARM2, OLM, or PVMRM by specifying the TTRM2 keyword along with the ARM2, PVMRM, or OLM with the MODELOPT keyword. Because GRSM accounts for travel time between the emission source and receptor, it cannot be paired with TTRM2. All NO<sub>2</sub> conversion options require that the pollutant ID be

specified as 'NO2' on the CO POLLUTID card (see Section 3.2.9.) These options have additional input requirements as described in Section 3.3.6.

### 3.2.2.8 FASTAREA and FASTALL

The FASTAREA secondary keyword on the MODELOPT keyword is used to select the non-regulatory option to optimize model runtime for AREA sources (including AREA, AREAPOLY, AREACIRC and OPENPIT source types, as well as LINE sources introduced with version 12345 (see Section 3.3.1)). When FASTAREA is specified, the area source integration routine is optimized to reduce model runtime by incorporation of a three-tiered approach using the Romberg numerical integration, a 2-point Gaussian Quadrature routine for numerical integration, or a point source approximation, depending on the location of the receptor relative to the source. In the regulatory default mode, the Romberg numerical integration is utilized for all receptors. The FASTAREA approach does not include meander in the AREA, AREAPOLY, AREACIRC, or LINE source types even if the AREAMNDR keyword has been included. Also beginning with version 09292, a non-regulatory option to optimize model runtime for POINT and VOLUME sources was included, which is selected with the FASTALL secondary keyword on the MODELOPT keyword. Specification of the FASTALL option also activates the FASTAREA option if AREA sources are including in the model inputs. Both FASTALL and FASTAREA skip receptors that are more than 80 kilometers from the source. Beginning with version 22112, the RLINE and RLINEXT sources also include a FAST option activated with the FASTALL keyword.

The FASTALL option for POINT/POINTHOR/POINTCAP and VOLUME sources uses an alternative implementation of the horizontal meander algorithm based on an effective horizontal dispersion coefficient ( $\sigma_{yeff}$ ) that replicates the centerline concentration based on the full meander approach. Use of the effective  $\sigma_y$  allows the model runtime to be optimized by skipping receptors that are more than  $4\sigma_{yeff}$  off the plume centerline. Based on tests conducted to date, comparisons of concentrations based on the FASTALL option for POINT and VOLUME sources with concentrations using the DFAULT option are similar to comparisons of concentrations for AREA sources using the FASTAREA option. The average ratio of FASTALL concentrations to DFAULT values is about 1.02 for high ranked values, showing a slight bias toward over prediction for the FASTALL option. However, the range of ratios for high ranked values shows both over predictions and under predictions relative to the DFAULT option, and differences at specific receptors may be much larger.

The FASTALL option for RLINE and RLINEXT uses an approximation to estimate the values for the horizontal and vertical dispersion coefficients ( $\sigma_y$  and  $\sigma_z$ , respectively) and the effective plume wind

speed. These estimates are made by interpolating between values of these variables computed at three distances from the source (1 m, 10 m, and 500 m). **Note that, as of version 19191, the FASTALL option has not been implemented for the BUOYLINE and SWPOINT source types and is not applicable with the PLATFORM keyword.**

#### 3.2.2.9 Urban transition and NOURBTRAN option

The urban option within AERMOD was modified, beginning with version 11059, to address potential issues associated with the transition from the nighttime urban boundary layer to the daytime convective boundary layer. Prior to version 11059, the enhanced dispersion due to the urban heat island during nighttime stable conditions was ignored once the rural boundary layer became convective. This could result in an unrealistic drop in the mixing height for urban sources during the morning transition to a convective boundary layer, which could contribute to overly conservative concentrations for low-level sources under such conditions. This potentially anomalous behavior was observed in a few cases during the application of AERMOD for the Risk and Exposure Assessment (REA) conducted in support of a review for the NO<sub>2</sub> National Ambient Air Quality Standard (NAAQS) (EPA, 2008). The potential significance of this issue for AERMOD applications in support of air quality permitting increased with the promulgation of the more recent 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> NAAQS in 2010.

To address this issue, AERMOD was modified to continue applying the urban boundary layer option for urban sources until the daytime (rural) convective boundary exceeds the population-dependent urban boundary layer height. This modification to the urban option within AERMOD has been evaluated using the 1985 Indianapolis SF<sub>6</sub> field study data (Murray and Bowne, 1988), and shows improved model performance during daytime convective conditions compared to the original implementation of the urban option. Model-to-monitor comparisons of 1-hour NO<sub>2</sub> concentrations from the Atlanta NO<sub>2</sub> REA also exhibit improved model performance with this modification to the urban option in AERMOD. A summary of these model evaluation results is provided in the AERMOD Model Formulation document (EPA, 2024a).

The NOURBTRAN non-regulatory option has been included to allow users to revert to the urban option as implemented prior to version 11059, which ignores the transition from the nighttime urban boundary layer to the daytime convective boundary layer.

### 3.2.2.10 SCREEN mode

The screening mode of AERMOD, which is controlled by the SCREEN keyword on the MODELOPT card, forces the model calculations to represent values for the plume centerline, regardless of the source-receptor-wind direction orientation. This option is included in AERMOD to facilitate the use of the model with the AERSCREEN (EPA, 2021) to estimate worst case impacts. Its use outside of that context is not recommended. Since the screening model is designed to be used with a non-sequential meteorological data file, representing a matrix of conditions, the SCREEN option also forces the use of the NOCHKD option described above, even if NOCHKD is not included on the MODELOPT card. The SCREEN option also restricts the averaging period options to 1-hour averages only on the AVERTIME card (see Section 3.2.2.10). Note that the SCREEN mode is only applicable for point type sources (POINT, POINTCAP, and POINTHOR) and VOLUME sources. For all other source types, screening is not invoked, and results are unchanged from non-screening mode.

### 3.2.2.11 SCIM

The AERMOD model includes the non-regulatory Sampled Chronological Input Model (SCIM) option to reduce model runtime for some uses of the model. The SCIM option can only be used with the ANNUAL average option and is primarily applicable to multi-year model simulations. The approach used by the SCIM option is to sample the meteorological data at a user-specified regular interval to approximate the long-term (i.e., ANNUAL) average impacts. Studies have shown that the uncertainty in modeled results introduced by use of the SCIM option is generally lower for area sources than for point sources.

When only the regular sampling is selected, hourly concentrations are calculated in the normal fashion for each sampled hour. The annual average concentration is then simply calculated by dividing the cumulative concentration for the sampled hours by the number of hours sampled (arithmetic average), i.e.,

$$C = \sum C_S / N_S$$

where:

- $C$  = Calculated concentration
- $\sum C_S$  = Cumulative impacts for the sampled hours
- $N_S$  = Number of sampled hours

To use the SCIM option, the user must include the SCIM keyword on the CO MODELOPT card and the SCIM sampling parameters on the ME SCIMBYHR card. The format and syntax of the ME SCIMBYHR keyword are described in Section 3.5.7.

#### 3.2.2.12 Deposition Options

The AERMOD model includes algorithms for both dry and wet deposition of both particulate and gaseous emissions. The deposition algorithms incorporated into AERMOD are based on the draft Argonne National Laboratory (ANL) report (Wesely et al., 2002), with modifications based on peer review. Treatment of wet deposition was revised from Wesely et al. (2002) based on recommendations by peer review panel members (Walcek et al., 2001). A full technical description of the deposition algorithms implemented in AERMOD is provided in an EPA report specific to these algorithms (EPA, 2003).

Based on the guidance provided for application of the AERMOD model in the Guideline (EPA, 2017b), and the history of the deposition algorithms in the AERMOD and ISC models, the particle deposition algorithms with a user-specified particle size distribution (referred to below as “Method 1”) can be applied simultaneously with the regulatory DFAULT keyword. Method 1 is comparable to the particle deposition algorithm in the ISCST3 model (EPA, 1995a). The gas deposition algorithms and the “Method 2” option for particle deposition based on the ANL draft report (Wesely, et al, 2002) are non-regulatory ALPHA options in AERMOD, and beginning with version 19191, the model will issue a fatal error message and abort processing if the ALPHA keyword is not specified with the gas deposition or Method 2 particle deposition options.

For gaseous dry deposition, the user must define seasonal categories for each of the calendar months, direction-specific land use categories, and several pollutant-specific parameters. An optional keyword is also provided to override default values for three parameters used in the gas deposition algorithm. The input requirements for “Method 1” particle deposition in AERMOD are the same as for the particle deposition algorithm in the ISCST3 model. For “Method 2” particle deposition, the user must define the fraction of the particle mass in the fine particle category (less than 2.5 microns) and a representative mass mean diameter for the particles. Table 3-1 summarizes the required keywords for the various deposition options within AERMOD and whether they are allowed under the DFAULT option. For all keywords associated with METHOD 2 or gas deposition, the ALPHA keyword must be used along with the MODELOPT keyword. The keywords used to define inputs for deposition specified on the CO pathway are described in the sections that follow. The keywords associated with deposition specified on the SO pathway are described in sections 3.3.3 through 3.3.5.

**Table 3-1 Summary of Deposition Options**

<b>Pollutant Type</b>	<b>Model Output Type</b>	<b>Required Keywords</b>	<b>Allowed under DFAULT?</b>
Gaseous	CONC w/dry depletion DDEP	CO GASDEPVD or CO GDSEASON, CO GDLANUSE, and SO GASDEPOS	No <sup>1</sup>
Gaseous	CONC w/wet depletion WDEP	SO GASDEPOS	No <sup>1</sup>
Gaseous	CONC w/dry & wet depletion DEPOS	CO GDSEASON, CO GDLANUSE, and SO GASDEPOS	No <sup>1</sup>
Particulate ("Method 1")	CONC w/dry and/or wet depletion DEPOS DDEP WDEP	SO PARTDIAM, SO PARTDENS, and SO MASSFRAX	Yes <sup>2</sup>
Particulate ("Method 2")	CONC w/dry and/or wet depletion DEPOS DDEP WDEP	SO METHOD_2	No <sup>1</sup>

The user should be aware that one or more of the following meteorological parameters are needed for deposition: precipitation code, precipitation rate, relative humidity, surface pressure, and cloud cover.

### 3.2.2.13 Definition of seasons for gaseous dry deposition

The gas deposition algorithms in AERMOD include land use characteristics and gas deposition resistance terms based on five seasonal categories defined in Table 2 of the ANL report as:

Seasonal Category 1: Midsummer with lush vegetation

Seasonal Category 2: Autumn with unharvested cropland

Seasonal Category 3: Late autumn after frost and harvest, or winter with no snow

Seasonal Category 4: Winter with snow on ground (with generally continuous snow cover)

<sup>1</sup> The ALPHA option must be included.

<sup>2</sup> While "Method 1" is allowed under the regulatory "DFAULT" option within AERMOD, the use of "Method 1" for particulate emissions in regulatory modeling applications should follow the guidance provided in Section 7.2.1.3 of the Guideline (EPA, 2017b).

Seasonal Category 5: Transitional spring with partial green coverage or short annuals

The user correlates these seasonal definitions to calendar months through the GDSEASON keyword on the CO pathway. The syntax and type of the GDSEASON keyword are:

<b>Syntax:</b>	CO GDSEASON Jan Feb Mar ... Dec
<b>Type:</b>	Optional, Non-repeatable

where a numeric value from 1 to 5 is entered for each of the twelve calendar months to associate it with the seasonal definitions given above. This keyword is optional for the model, but mandatory when applying the gas deposition algorithms, unless the GASDEPVD option for user-specified dry deposition velocity on the CO pathway is used, described below in Section 3.3.3.2. Note that some of the seasonal categories defined above may not apply for certain regions, such as Category 4, winter with continuous snow cover, for moderate climates.

3.2.2.14 Definition of land use categories for gas dry deposition

The gas deposition algorithms also require direction-specific land use categories based on the following land use codes and definitions (from Table 1 of the ANL report):

<u>Land Use Category</u>	<u>Description</u>
1	Urban land, no vegetation
2	Agricultural land
3	Rangeland
4	Forest
5	Suburban areas, grassy
6	Suburban areas, forested
7	Bodies of water
8	Barren land, mostly desert
9	Non-forested wetlands

The user defines the land use categories by direction sector through the GDLANUSE keyword on the CO pathway. The syntax and type of the GDLANUSE keyword are:

<b>Syntax:</b>	CO GDLANUSE Sec1 Sec2 Sec3 ... Sec36
<b>Type:</b>	Optional, Non-repeatable

where a numeric value from 1 to 9 is entered for each of the 36 direction sectors (every 10 degrees) to associate it with the land use definitions given above. This keyword is optional for the model, but mandatory when applying the gas deposition algorithms, unless the GASDEPVD option for user-specified deposition velocity is used. The first value, Sec1, corresponds with the land use category, downwind of the application site, for winds blowing toward 10 degrees, plus or minus 5 degrees. The downwind sectors are defined in clockwise order, with Sec36 corresponding to winds blowing toward 360 degrees (North) and should generally reflect conditions downwind relative to the source location. The user can specify "repeat values" by entering a field such as "36\*3" as a parameter for the GDLANUSE keyword. The model will interpret this as "36 separate entries, each with a value of 3." Since the model must identify this as a single parameter field, there must not be any spaces between the repeat-value and the value to be repeated. Option for overriding default parameters for gas dry deposition

An optional keyword is available on the Control (CO) pathway to allow the user to override the default values of the reactivity factor ( $f_o$ ), and the fraction (F) of maximum green leaf area index (LAI) for seasonal categories 2 (autumn/unharvested cropland) and 5 (transitional spring), for use with the gas dry deposition algorithms.

The syntax and type of the GASDEPDF keyword are summarized below:

<b>Syntax:</b>	CO GASDEPDF React F_Seas2 F_Seas5 (Refpoll)
<b>Type:</b>	Optional, Non-repeatable

where the parameter React is the value for pollutant reactivity factor ( $f_o$ ), and F\_Seas2 and F\_Seas5 are the fractions (F) of maximum green LAI for seasonal categories 2 and 5, respectively. The parameter Refpoll is the optional name of the pollutant. If the optional GASDEPDF keyword is omitted, then the default value of 0 is used for React, and default values of 0.5 and 0.25 are used for F\_Seas2 and F\_Seas5, respectively. A value of F=1.0 is used for seasonal categories 1, 3, and 4. A reactivity factor value of 1 should be input for ozone (O<sub>3</sub>), titanium tetrachloride (TiCl<sub>4</sub>), and divalent mercury (Hg<sup>2+</sup>), and a value of 0.1 should be input for nitrogen dioxide (NO<sub>2</sub>).

### 3.2.2.15 Deposition velocity and resistance outputs

In order to facilitate review and testing of the deposition algorithms in the AERMOD model, the model includes an option to output the main resistance terms and deposition velocities for gaseous and particle sources. These optional outputs are generated if the user specifies the 'CO DEBUGOPT MODEL'

option described in Section 3.2.18. The gas deposition data are written to a file called GDEP.DAT, which includes the values of  $R_a$ ,  $R_b$ ,  $R_c$ , and  $V_{dg}$  (see Wesely, et al, 2002, for definitions) for each source and for each hour modeled. A header record is included to identify the columns. The particle deposition data are written to a file called PDEP.DAT, which includes the values of  $R_a$ ,  $R_p$ ,  $V_g$ , and  $V_d$  for each source and for each hour modeled. The particle outputs are labeled as being based on either Method 1 or Method 2. For Method 1, results are output for each particle size category. The filename and file units for these data files are hardcoded in the model, and the files are overwritten each time the model is executed. Since these files include data for each source for each hour, file sizes may become large.

### 3.2.2.16 Remove displacement height from RLINE wind profile

Beginning with version 22112, the ALPHA option RLINEFDH was added to calculate the wind profile for RLINE sources without a displacement height. The displacement height is used in the wind profile to modify the wind profile below five times the surface roughness. When the surface roughness is large, such as in urban environments this displacement height could significantly impact the calculated windspeeds when the mean plume height is below five times the surface roughness length. RLINEFDH removes the displacement height and the wind speed profile is similar to the wind speed profile used in other AERMOD source types. RLINEFDH must be used along with the ALPHA keyword and cannot be used with the DFAULT keyword.

### 3.2.3 Low wind parameters

An ALPHA option, LOW\_WIND (see Section 3.2.3), is included in AERMOD (beginning with the version dated 18081 and updated in versions 21112 and 22112) related to concerns regarding model performance under low wind speed conditions. Inclusion of the LOW\_WIND keyword is intended to facilitate further testing and evaluation of AERMOD in low wind conditions in order to better understand the relationships of certain variables and potentially develop additional regulatory low wind options that will improve AERMOD's performance in low wind conditions. The LOW\_WIND keyword has been added to the CO pathway to allow users to override the default values for seven different parameters that can potentially affect performance under low wind speed conditions with user-defined values. Model default values can be overridden with user-defined values for the following parameters:

- Minimum sigma-v value (SVmin) within a range of 0.01 to 1.0 m/s),
- Minimum wind speed value (WSmin) within a range from 0.01 to 1.0 m/s,
- Maximum value for the meander factor (FRANmax), within a range of 0.0 to 1.0,

- Minimum sigma-w value (SWMin), within a range of 0.0 to 3.0 m/s, and
- Time period (BigT) used to calculate the time scale TRAN, within a range of 0.5 to 48.0 hours.
- Minimum value for the meander factor (FRANmin), within a range of 0.0 to 1.0 but must be less than or equal to FRANmax
- Alternate momentum balance (PBAL) approach to determine plume meander which overrides the default energy balance approach.

Absent user-specified values on the LOW\_WIND keyword, a default value of 0.2828 m/s is used for WSmin, consistent with the default applied in previous versions of AERMOD based on  $\text{SQRT}(2 \cdot \text{SVmin} \cdot \text{SVmin})$ .

The default value of SVmin = 0.2 m/s, FRANMax = 1.0, SWMin = 0.02 m/s, BigT = 24.0 hours, and FRANMin = 0.0.

The syntax and type of the LOW\_WIND keyword is:

<b>Syntax:</b>	CO LOW_WIND SVmin [WSmin] <i>or</i>
	CO LOW_WIND SVmin WSmin [FRANmax] <i>or</i>
	CO LOW_WIND SVmin WSmin FRANmax [SWmin] <i>or</i>
	CO LOW_WIND SVmin WSmin FRANmax SWmin [BigT] <i>or</i>
	CO LOW_WIND SVmin WSmin FRANmax SWmin BigT [FRANmin] <i>or</i>
	CO LOW_WIND SVmin WSmin FRANmax SWmin BigT FRANmin [PBAL]
<b>Type:</b>	Optional, Non-repeatable

where SVmin is the minimum value of sigma-v, within a range of 0.01 to 1.0 m/s. WSmin is the minimum wind speed and can range from 0.01 to 1.0 m/s. FRANmax is the maximum meander factor, within a range of 0.0 to 1.0. BigT is the time scale used to calculate TRAN and can range from 0.5 to 48 hours, FRANmin is the minimum meander factor within a range of 0.0 to 1.0 and is required to be less than or equal to FRANmax. PBAL is a secondary keyword to replace the default energy balance approach for determining meander with a momentum balance approach. The syntax allows one of six ways to specify one or more of the LOW\_WIND parameter values. For each syntax option, the parameter listed in square brackets, [], is optional, but the preceding parameters are required. For example, to override the default value for SWMin, you must also provide values for SVMIn, WSMIn, and FRANmax preceding the value for SWMin, in the order listed above.

**Note: The LOW\_WIND keyword was previously implemented as a BETA option to supplement the former LOWWIND1, LOWWIND2, and LOWWIND3 BETA options. These options have since been removed from AERMOD, and the LOW\_WIND keyword was retained and changed to an ALPHA option.**

In addition to the LOW\_WIND ALPHA option, an option has been incorporated in the AERMET meteorological processor (first as a BETA option beginning with version 12345 and a regulatory option in version 16216) to address concerns regarding model performance under low wind conditions. The ADJ\_U\* option in AERMET adjusts the surface friction velocity ( $U^*$ ) under low wind/stable conditions based on Qian and Venkatram (2011). The ADJ\_U\* option may be used as a regulatory option in AERMET with NWS data or with site-specific data that does not include turbulence (i.e., sigma-w and/or sigma-theta). When the ADJ\_U\* option is used in the absence of turbulence data, AERMOD can accept the data with the regulatory DFAULT option enabled. Beginning with version 16216 of AERMET, an adjustment to  $U^*$  under the ADJ\_U\* option is also available as a regulatory option for applications utilizing the Bulk Richardson Number (BULKRN) method, based on Luhar and Raynor (2009) (see also AECOM (2010)) when used with site-specific data that does not include turbulence parameters. The ADJ\_U\* option, when used with site-specific data that does include turbulence parameters, is currently considered a non-regulatory option and is therefore, subject to the alternative model provisions in Section 3.2 of Appendix W (40 CFR Part 51). During processing, AERMET includes a flag in the header of the surface meteorological data file (.SFC) to inform AERMOD that the data were processed using the ADJ\_U\* option. If AERMOD then encounters turbulence data in the profile file (PFL) generated by AERMET and the DFAULT flag is set, AERMOD will record the error and abort processing. Refer to the AERMET user's guide for additional details regarding the ADJ\_U\* option in AERMET.

#### 3.2.4 Building downwash options

Beginning with version 19191, two distinct sets of ALPHA building downwash options are included in AERMOD and are enabled using the ORD\_DWNW and AWMADWNW keywords. These are research grade options that have been identified as having potential to refine and improve the performance of the PRIME downwash algorithm in AERMOD in certain situations. They have been made available to users for testing and evaluation and require that the secondary keyword, ALPHA, be included with the MODELOPT keyword. The options associated with ORD\_DWNW were developed by the EPA's Office of Research and Development (ORD) and the AWMADWNW options were developed by a research subcommittee of the Air and Waste Management Association (AWMA) formed for the purpose of conducting research that will lead to the improvement of the treatment of building downwash in AERMOD.

In addition to the ALPHA building downwash options implemented in AERMOD by ORD and AWMA, the research and development performed by both groups of researchers used an alternative method for determining the equivalent building dimensions for a rectangular building that is oblique to the wind from the method used by the building preprocessor, BPIPPRM. The alternative method uses the along wind building length and actual building width, for a given wind direction, as the equivalent building length and width, whereas BPIPPRM, for the same wind direction, uses the maximum projected length and maximum projected width. The alternate method reduces the footprint of the building which is reflected in the building parameters that are input into AERMOD.

The alternate method for determining equivalent building dimensions for a rectangular building used by ORD and AWMA has been implemented by ORD in a draft version of BPIPPRM (19191\_DRFT) which can be downloaded from the EPA SCRAM website at: <https://www.epa.gov/scram/air-quality-dispersion-modeling-related-model-support-programs#bippprm>. It is important to note that this draft version of BPIPPRM (19191\_DRFT) is a research grade version that has been provided to the modeling community for testing, evaluation, and feedback and may not be used in a regulatory context. The changes implemented in this draft version affect only the building parameters generated for rectangular buildings or tiers. It is also important to note that this draft version of BPIPPRM (19191\_DRFT) is completely independent of the ALPHA downwash options implemented by ORD and AWMA. Any of the ALPHA downwash options can be tested and evaluated with and without the use of this draft version of BPIPPRM.

The remainder of this section describes the usage of these keywords (ORD\_DWNW and AWMADWNW), the ALPHA building downwash options associated with each, and the corresponding secondary keywords used to enable them for testing and evaluation. While, for the most part, the different downwash options are independent of one another and can be used in various combinations with one another, any conflicts and dependencies between options are noted in the sections below.

#### 3.2.4.1 ORD building downwash options

The first is an initiative led by the EPA's Office of Research and Development (ORD). ORD has performed wind tunnel experiments and embedded large eddy simulations (LES) to better understand how to parameterize buildings that are elongated and angled relative to the wind flow and the parameterization of the plume in the cavity and far wake regions. The ORD studies are concentrated on single rectangular buildings, specifically investigating changes in plume parameters at discrete downwind distances from the building and source, longitudinal and lateral plume profiles, the lateral plume shift on the lee side of rotated buildings, and building characterization in BPIPPRM (Heist et al., 2016). To date, this research has led to

recommended changes to the building preprocessor, BPIPFRM, as well as changes to the building downwash algorithm in the AERMOD program.

ORD has performed wind tunnel experiments and embedded large eddy simulations (LES) to better understand how to parameterize buildings that are elongated and angled relative to the wind flow and the parameterization of the plume in the cavity and far wake regions. The ORD studies focused on single rectangular buildings and investigated changes in plume parameters at discrete downwind distances from the building and source and building characterization.

As previously stated, the ORD building options associated with the ORD\_DWNW keyword are research grade ALPHA options and require the ALPHA secondary keyword included with the MODELOPT keyword. There are three distinct ORD options that can be enabled individually or in combination with one another. For detailed information on ORD’s research and the options implemented in AERMOD, refer to Heist et al., 2016; Monbureau et al., 2018; and Perry et al., 2018. The usage of the ORD\_DWNW keyword and associated secondary keywords is as follows:

<b>Syntax:</b>	CO ORD_DWNW	ORDUEFF ORDTURB ORDCAV	and/or and/or
<b>Type:</b>	Optional, Non-repeatable		

where:

ORDUEFF - Redefines the height at which the wind speed is taken from the profile wind speed used in the calculation of concentrations from the primary plume. The PRIME algorithm currently uses the wind speed at the stack height. ORDUEFF uses the average of the profiled wind speed between the height of the receptor and the plume centerline, allowing the wind speed of the plume to change with a changing environment.

**NOTE: ORDUEFF cannot be used in combination with the AWMADWNW option AWMAUEFF.**

ORDTURB - Redefines the maximum value of the non-dimensional vertical turbulence intensity in the wake, reduced from 0.07, the current value in PRIME, to 0.06 based on Wiel (1996).

ORDCAV- Redefines point downwind at which the vertical and lateral dispersion coefficients begin to grow with downwind distance from the lee edge of the building to the end of the cavity. PRIME considers a cavity plume and a re-emitted plume to simulate two distinct regions with a weighted distribution of mass between the two plumes. The cavity and re-emitted plumes initially have the same lateral and vertical dispersion on the leeward side of the building. The re-emitted plume grows with downwind distance while the dispersion of the cavity plume remains unchanged throughout the cavity which creates a discontinuity of the two plumes at the near-wake boundary and results in a reduction in ground level concentrations. This option sets the dispersion coefficients for the two plumes equal to each other at the cavity edge eliminating the discontinuity between the two plumes.

**NOTE: Each of the three ORD\_DWNW options listed are optional, but at least one must be included if the ORD\_DWNW keyword is specified in the control file.**

#### 3.2.4.2 AWMA building downwash options

AWMA's research focused on the reanalysis of existing wind tunnel data, as well as the completion of new wind tunnel experiments to investigate the decay of the building wake above the top of the building, appropriate height at which approach turbulence and wind speed are calculated, the reduction of wake effects for streamlined structures, and the effect of approach roughness on the wake.

Five ALPHA building downwash options developed by the AWMA have been implemented in AERMOD and require the ALPHA secondary keyword included with the MODELOPT keyword. For detailed information on AWMA's research and the development of these ALPHA building downwash options, refer to Petersen et al., 2017 and Petersen et al., 2018. The usage of the AWMADWNW keyword and the associated secondary keywords to enable the AWMA building downwash ALPHA options is as follows:

<b>Syntax:</b>	CO AWMADWNW AWMAUEFF and/or AWMAENTRAIN and/or ((AWMAUTURB or AWMAUTURBHX) w/wo STREAMLINE(D))
<b>Type:</b>	Optional, Non-repeatable

where:

AWMAUEFF - Redefines the height at which the wind speed is taken from the profile wind speed used in the calculation of concentrations from the primary plume. The PRIME algorithm currently uses the wind speed at the stack height. AWMAUEFF uses the wind speed at the height of the plume centerline.

**NOTE: AWMAUEFF cannot be used in combination with the ORD\_DWNW option ORDUEFF.**

AWMAENTRAIN - AWMAENTRAIN changes beta (B) entrainment coefficient for PRIME downwash from default value of 0.60 to 0.35.

AWMAUTURB - Enables enhanced calculations of turbulence and wind speed using the minimum of the final momentum plume rise or a representative PRIME plume rise height for all calculations. Also, uses the final momentum plume rise height used to compute effective wind speed (UEFF), effective  $\sigma_w$  (SWEFF), effective  $\sigma_v$  (SVEFF), effective potential temperature gradient (TGEFF), and initial turbulence intensities (ambiy and ambiz) and computes mean wind speed,  $\sigma_w$ , and  $\sigma_v$  at 30 meters (U30, SW30 and SV30, respectively).

AWMAUTURBHX - Enables enhanced calculations of turbulence and wind speed using the PRIME plume rise at the downwind distance X, for all calculations. Uses the final momentum plume rise height to initially compute effective wind speed (UEFF), effective  $\sigma_w$  (SWEFF), effective  $\sigma_v$  (SVEFF), effective potential temperature gradient (TGEFF), and initial turbulence intensities (ambiy and ambiz) and then then uses the PRIME computed plume rise at each downwind distance. Also, computes mean wind speed,  $\sigma_w$ , and  $\sigma_v$  at 30 meters (U30, SW30 and SV30, respectively).

**NOTE: If AWMAUTURB and AWMAUTURBHX are both specified, AERMOD will issue a warning and continue processing using the AWMAUTURBHX option.**

STREAMLINE(D) - Reduces dispersion in the wake of streamlined structures such as storage tanks and cooling towers. Uses alternate formulations for turbulence enhancement and velocity deficit associated with the AWMUTURB and AWMATURBHX options with modifications for streamlined structures. When specified, all structures will be treated as streamlined structures.

**NOTE: The STREAMLINE option can only be specified in conjunction with the AWMAUTURB and AWMAUTURBHX options. When specified, AERMOD assumes all buildings defined in the input control file are streamlined structures.**

**NOTE: Each of the AWMADWNW options listed are optional, but at least one must be included if the AWMADWNW is used.**

Refer to Section 3.2.18 for debug output options associated with the ALPHA building downwash options.

### 3.2.5 Input parameters for NO<sub>2</sub> conversion options

This section provides a description of the AERMOD inputs related to the PVMRM, OLM, GRSM, and ARM2 regulatory options for modeling the conversion of NO to NO<sub>2</sub>, as well as the ALPHA options, TTRM and TTRM2. TTRM and GRSM were both added as ALPHA options beginning with version 21112. Beginning with version 22112, GRSM was updated to a BETA option, and TTRM2 was added as an ALPHA option to invoke TTRM simultaneously with ARM2, PVMRM, or OLM. GRSM was updated to a regulatory option beginning in version 24142. As a stand-alone option, TTRM is only effective for near field receptors. TTRM2 paired with ARM2, PVMRM, or OLM, will invoke TTRM for near field receptors and use the other method specified for all other receptors. While TTRM as a method has now been integrated to be paired with these other options using the TTRM2 keyword, the TTRM keyword has been retained as a stand-alone option for testing and diagnostic purposes. Note that the TTRM2 option cannot be paired with GRSM. Also note that beginning with version 16216r, ARM2 replaced the original Ambient Ratio Method (ARM) Tier 2 option for NO conversion to NO<sub>2</sub>. ARM is no longer an option in AERMOD.

A technical description of the PVMRM algorithm as incorporated within AERMOD is provided in the AERMOD Model Formulation document (EPA, 2024a). Additional information regarding the regulatory options for NO<sub>2</sub> modeling are provided in Technical Support Document (TSD) for NO<sub>2</sub>-related AERMOD Modifications (EPA, 2015). Background on the original development of the PVMRM option is provided by Hanrahan (1999a and 1999b).

The ARM2 option is based on work sponsored by API (API, 2013) to develop a method to adjust the modeled NO<sub>x</sub> concentrations based on an empirical relationship between ambient NO<sub>x</sub> and ambient NO<sub>2</sub> concentrations. A key difference between the PVMRM and OLM methods, as compared to the ARM2 method, is that ARM2 does not require the user to input background ozone (O<sub>3</sub>) concentrations or in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios, as required by PVMRM and OLM; however, the default minimum ratio utilized in the ARM2 method may not be appropriate in cases where the sources being modeled are known to have relatively high in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios. ARM2 sums all NO<sub>x</sub> impacts from all sources modeled in a single model run to determine the NO<sub>2</sub>/NO<sub>x</sub> ratio that's applied for each source group (SRCGROUP) specified. While the SRCGROUP keyword is required with at least one source group defined, if source group 'ALL' is omitted, AERMOD will automatically assume a source group 'ALL' internally and apply ARM2 to that assumed source group. In this case, AERMOD will generate a warning message to indicate that source group 'ALL' is missing but not required. Thus, ARM2 will not be calculated based on separate source groups NO<sub>x</sub> impacts. For example, if NO<sub>x</sub> emissions from five stacks are modeled with the ARM2 option, and only one source group is specified for one stack, ARM2 will first determine the total NO<sub>x</sub> impact from all five stacks, calculate the empirically derived NO<sub>2</sub>/NO<sub>x</sub> ratio from the total NO<sub>x</sub> impact (using a 5<sup>th</sup> order polynomial equation discussed in API, 2013), and the final NO<sub>2</sub> impact concentration for the single stack source group would be calculated as the product of the NO<sub>2</sub>/NO<sub>x</sub> ratio and the discrete NO<sub>x</sub> impact for the single stack source group.

The ARM2 has been implemented as a regulatory Tier 2 option while the PVMRM, OLM, and GRSM algorithms have been implemented as regulatory Tier 3 screening options. Therefore, any one of the four options can be used with the DFAULT keyword. TTRM/TTRM2 have been added as non-regulatory ALPHA options and cannot be used with the DFAULT keyword. As with all other ALPHA options, they require the use of the ALPHA keyword. With exception to daytime GRSM NO<sub>2</sub> calculations, it is important to note that the OLM, PVMRM, ARM2, and TTRM/TTRM2 options are NOT applied to the background NO<sub>2</sub> concentrations input through the SO BACKGRND option (described in Section 3.3.8.2). The background NO<sub>2</sub> concentrations, if provided, will be added to the modeled NO<sub>2</sub> concentrations after the NO-NO<sub>2</sub> conversion has been calculated. GRSM daytime NO<sub>2</sub> model concentrations are calculated based on the

net production of NO<sub>2</sub> from the following: NO<sub>2</sub> in-stack ratio, ozone entrainment and conversion of NO<sub>x</sub> to NO<sub>2</sub>, photolysis of NO<sub>2</sub> to NO, and time-of-travel of the NO<sub>x</sub> plume from source to receptor. GRSM nighttime NO<sub>2</sub> model concentrations are calculated similar to OLM and PVMRM, i.e., limited by ozone conversion of NO to NO<sub>2</sub> with background NO<sub>2</sub> concentrations (as specified through SO BACKGRND pathway) simply added to the post-chemistry total NO<sub>2</sub> concentration.

It should be noted that not all NO<sub>2</sub> conversion options have been implemented for all source types in AERMOD. Table 3-2 summarizes which NO<sub>2</sub> conversion options have been implemented for each of the AERMOD source types and which options have not.

**Table 3-2. Implemented NO<sub>2</sub> Conversion Options by AERMOD Source Type**

<b>AERMOD Source Type</b>	<b>Implemented NO<sub>2</sub> Options</b>	<b>Not Implemented Warning Issued</b>
POINT (inc. POINTCAP and POINTHOR)	ALL	NONE
AREA (inc. AREAPOLY, AREACIRC, and LINE)	ALL	NONE
VOLUME	ALL	NONE
OPENPIT	ARM2, PVMRM, OLM, TTRM, GRSM	TTRM2 (unpaired or paired with ARM2, OLM, or PVMRM), TTRM2 by itself produces zero-values!
RLINE/RLINEXT	ARM2	PVMRM, OLM, TTRM, TTRM2, GRSM
BUOYLINE	ARM2	PVMRM, OLM, TTRM, TTRM2, GRSM
SWPOINT	NONE	ARM2, PVMRM, OLM, TTRM, TTRM2, GRSM

As described in Section 3.3.7, the ALPHA model option, PSDCREDIT, has been included for testing and evaluation for increment consumption with PSD credits using PVMRM. The special source grouping required for the PSDCREDIT option is also described below in Section 3.3.7.

3.2.5.1 Specifying ozone concentrations for PVMRM, OLM, TTRM/TTRM2, and GRSM options

The background ozone concentrations for the PVMRM, OLM, TTRM/TTRM2, and GRSM options can be input as a single value through the OZONEVAL keyword on the CO pathway, as temporally varying values through the O3VALUES keyword on the CO pathway, or as hourly values from a separate data file specified through the OZONEFIL keyword on the CO pathway. The user must specify background ozone concentrations through the OZONEVAL, O3VALUES, or OZONEFIL keyword to use the PVMRM, OLM, TTRM/TTRM2, or GRSM option. The OZONEVAL or O3VALUES keyword may also be specified with the OZONEFIL keyword, in which case the value(s) entered on the OZONEVAL or O3VALUES keyword will be used to substitute for hours with missing ozone data in the hourly ozone data file. Users are strongly encouraged to utilize the OZONEVAL or O3VALUES keyword with the OZONEFIL keyword to substitute for missing ozone concentrations in the hourly data file. Beginning with version 13350 users can vary background ozone concentrations by wind sector. For applications that include sector-varying background ozone concentrations, the sectors are defined based on the CO O3SECTOR keyword, as follows:

<b>Syntax:</b>	CO O3SECTOR StartSect1 StartSect2 . . . StartSectN, where $N \leq 6$
<b>Type:</b>	Optional, Non-Repeatable

For applications that include sector-varying background concentration the minimum sector width allowed is 30 degrees and warning messages will be issued for sector widths less than 60 degrees. **Sector-varying background concentrations will be selected based on the flow vector, i.e., the downwind direction based on the wind direction specified in the surface meteorological data file.**

The syntax of the OZONEVAL keyword is as follows:

<b>Syntax:</b>	CO OZONEVAL O3Value (O3Units) (w/o sectors)
	or CO OZONEVAL SECT $x$ O3Value (O3Units), where $x \leq 6$ (w/ sectors)
<b>Type:</b>	Optional, Non-repeatable

where the O3Value parameter is the background ozone concentration in the units specified by the optional O3Units parameter (PPM, PPB, or UG/M3), and SECT $x$  refers to the user-specified sector defined on the

optional O3SECTOR keyword for which the O3Value inputs are applied. Implement as SECT1 or SECT2 ...or SECT $x$  where  $x \leq 6$ , and  $x$  is an integer and corresponds to the Nth sector defined by O3SECTOR. If the optional O3Units parameter is missing, then the model will assume units of micrograms/cubic-meter (UG/M3) for the background ozone values. If units of PPM or PPB are used, then the model will convert the concentrations to micrograms/cubic-meter based on reference temperature (25 C) and pressure (1013.25 mb). If O3SECTOR has been implemented, then OZONEVAL can only be applied for a single sector. However, if using multiple sectors user should use O3VALUES.

The syntax of the O3VALUES keyword is as follows, and is similar to the EMISFACT keyword on the SO pathway (Section 3.3.11) for specifying temporally varying emission rates:

<b>Syntax:</b>	CO O3VALUES O3Flag O3values(i), i=1, $n$ (w/o sectors)
	or CO O3VALUES SECT $x$ O3Flag O3values(i), i=1, $n$ where $x \leq 6$ (w/ sectors)
<b>Type:</b>	Optional, Repeatable

where the SECT $x$  parameter specifies the applicable sector as defined on the optional O3SECTOR keyword. Implement as SECT1 or SECT2 ...or SECT $x$  where  $x \leq 6$ , and  $x$  is an integer and corresponds to the Nth sector defined by O3SECTOR. The parameter O3Flag is the variable ozone concentration flag, and must be specified as one of the following secondary keywords (the number in parentheses indicates the number of values required for each option):

- ANNUAL - annual ozone value ( $n = 1$ ); equivalent to OZONEVAL keyword in PPB,
- SEASON - ozone values vary seasonally ( $n = 4$ ),
- MONTH - ozone values vary monthly ( $n = 12$ ),
- HROFDY - ozone values vary by hour-of-day ( $n = 24$ ),
- WSPEED - ozone values vary by wind speed ( $n = 6$ ),
- SEASHR - ozone values vary by season and hour-of-day ( $n = 96$ ),
- HRDOW - ozone values vary by hour-of-day, and day-of-week [M-F, Sat, Sun] ( $n = 72$ ),
- HRDOW7 - ozone values vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] ( $n = 168$ ),
- SHRDOW - ozone values vary by season, hour-of-day, and day-of-week [M-F, Sat, Sun] ( $n = 288$ ),
- SHRDOW7 - ozone values vary by season, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] ( $n = 672$ ),

MHRDOW - ozone values vary by month, hour-of-day, and day-of-week [M-F, Sat, Sun] ( $n = 864$ ), and

MHRDOW7 - ozone values vary by month, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] ( $n = 2,016$ ).

The O3Values array is the array of ozone values, where the number of values is shown above for each O3Flag option. The seasons are defined in the following order: Winter (Dec., Jan., Feb.), Spring (Mar., Apr., May), Summer (Jun., Jul., Aug.), and Fall (Sep., Oct., Nov.). The wind speed categories used with the WSPEED option may be defined using the ME WINDCATS keyword. If the WINDCATS keyword is not used, the default wind speed categories are defined by the upper bound of the first five categories as follows (the sixth category is assumed to have no upper bound): 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The O3VALUES keyword may be repeated as many times as necessary to input all of the ozone values and repeat values may be used for the numerical inputs.

The order of inputs specified for the hour-of-day/day-of-week options (HRDOW, SHRDOW, SHRDOW7, etc.) are by hour-of-day, then season or month, if applicable, and then by day-of-week. For the HRDOW/SHRDOW/MHRDOW options, the days of the week are specified in the order of Weekdays (M-F), Saturdays, and Sundays. For the HRDOW7/SHRDOW7/ MHRDOW7 options, the days of the week are specified in the order of Mondays, Tuesdays, etc., through Sundays. Section 3.3.11 below includes an example illustrating the order of inputs for these options for the EMISFACT keyword.

Ozone concentrations specified on the O3VALUES keyword are assumed to be in units of PPB unless the OZONUNIT keyword is specified.

The syntax of the OZONUNIT keyword is as follows:

<b>Syntax:</b>	CO OZONUNIT OzoneUnits
<b>Type:</b>	Optional, Non-repeatable

where the OzoneUnits parameter specifies the units as parts-per-billion (PPB), parts-per-million (PPM), or micrograms/cubic-meter (UG/M3). Units specified on the CONCUNIT keyword are only applied to ozone concentrations input through O3VALUES keyword, which assumes default units of PPB if the OZONUNIT keyword is not specified. Ozone concentrations specified in units of PPB or PPM are converted to UG/M3 based on reference temperature (25 C) and pressure (1013.25 mb).

Hourly ozone concentrations can be input through the optional OZONEFIL keyword. The syntax of the OZONEFIL keyword is as follows:

<b>Syntax:</b>	CO OZONEFIL O3FileName (O3Units) (O3Format) (w/o sectors) or CO OZONEFIL SECT $x$ O3FileName (O3Units) (O3Format), where $x \leq 6$ (w/ sectors)
<b>Type:</b>	Optional, Non-repeatable

where the O3FileName parameter is the filename for the hourly ozone concentration file, the optional O3Units parameter specifies the units of the ozone data (PPM, PPB, or UG/M3, with UG/M3 as the default), and the optional O3Format parameter specifies the Fortran format to read the ozone data. If sector-varying ozone concentrations are being used, based on the CO O3SECTOR keyword, then the applicable sector ID needs to be specified, e.g., 'SECT1' indicates that values are specified for the first downwind sector. The O3FileName can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (“”) at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces.

The hourly ozone file must include the year, month, day, and hour, followed by the ozone concentration, in that order (unless specified differently through the O3Format parameter). The year can be specified as either a 2-digit or 4-digit year. If an optional Fortran format is specified using the O3Format parameter, the year, month, day, and hour variables must be read as integers using the Fortran 'I' format specifier, and the ozone concentration must be read as a real variable, using the Fortran 'F,' 'E,' or 'D' format specifiers, e.g., (4I2, F8.3). Note that ozone values that do not include decimal places can be read as F $x$ .0, where  $x$  is the length of the data field. However, ozone values that do not include decimal places may be read incorrectly if the O3Format specified for reading the data includes decimal places. For example, a value of '1234' would be interpreted as '123.4' if a format of F4.1 was used. The O3Format parameter must include the open and close parentheses as shown in the example and may also include embedded spaces if double quotes (“”) are used to delimit the field. A warning message will be generated if the specified format does not meet these requirements, and AERMOD may also issue a fatal error message when reading the file in cases where real variables are read with an integer format, or vice versa.

If the optional O3Format parameter is missing, then the model will read the ozone data using a Fortran 'free' format, i.e., assuming commas or spaces separate the data fields, and that the fields are in the order given above. The date sequence in the ozone data file must match the date sequence in the hourly meteorological data files. As with the OZONEVAL keyword, if units of PPM or PPB are used, then the

model will convert the concentrations to micrograms/cubic-meter based on reference temperature (25 C) and pressure (1013.25 mb).

Values of ozone concentrations in the ozone data file that are less than zero or greater than or equal to 900.0 will be regarded as missing. If background ozone values have been specified using the OZONEVAL and/or O3VALUES keyword, then the appropriate value will be used to substitute for missing ozone data from the ozone file. If no OZONEVAL or O3VALUES keywords are used, then the model will assume full conversion of NO to NO<sub>2</sub> for hours with missing ozone data.

AERMOD will apply a minimum ozone value for NO conversion during stable hours, based on the maximum minimum of 40 ppb and the maximum hourly ozone from the previous 24-hours of ozone data. This minimum ozone restriction can be turned off with the NOMINO3 keyword. As with all NO<sub>2</sub> options, this option shall be used in agreement with the appropriate reviewing authority.

NOTE: The OLM method for estimating NO<sub>2</sub> concentrations, outlined by Cole and Summerhays (1979), assumes NO conversion to NO<sub>2</sub> by first dividing total NO<sub>x</sub> into a thermal NO<sub>2</sub> component directly emitted from a stack, with the remaining NO<sub>x</sub> assumed as NO and available for reaction with O<sub>3</sub>. If ambient O<sub>3</sub> is greater than the portion of NO<sub>x</sub> assumed as NO, all NO is converted to NO<sub>2</sub>, otherwise, the amount of NO converted to NO<sub>2</sub> is limited to available O<sub>3</sub>. AERMOD, for OLM processing, only incorporates user-defined, background ozone values in concentration calculations for hours that are “ozone-limited”, when sufficient atmospheric ozone is not present for NO<sub>x</sub> chemistry reactions. Determination of ozone-limited hours is dependent on the relative values of background ozone concentrations to NO<sub>2</sub> emissions multiplied by the in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio, described in Section 3.2.5.4, defined by the user. It is possible, therefore, to define scenarios that will result in an absence of ozone-limited hours. Users interested in evaluating concentrations sensitivities to background ozone should consider the potential that modification of the background ozone concentration may not appear to impact output concentrations if relatively low in-stack NO<sub>2</sub>/NO<sub>x</sub> and/or emissions rates are defined. This behavior does not apply to the AERMOD PVMRM method.

#### 3.2.5.2 Specifying NO<sub>x</sub> background concentrations for the GRSM option

The background NO<sub>x</sub> concentrations for the GRSM option is input similarly to the ozone background concentrations. The background NO<sub>x</sub> concentrations can be input as a single value through the NOXVALUE keyword on the CO pathway, as temporally varying values through the NOX\_VALS keyword on the CO pathway, or as hourly values from a separate data file specified through the NOX\_FILE keyword

on the CO pathway. The user may specify background NO<sub>x</sub> concentrations through the NOXVALUE, NOX\_VALS, or NOX\_FILE keyword in order to use the GRSM option. The NOXVALUE or NOX\_VALS keyword may also be specified with the NOX\_FILE keyword, in which case the value(s) entered on the NOXVALUE or NOX\_VALS keyword will be used to substitute for hours with missing NO<sub>x</sub> background data in the hourly NO<sub>x</sub> data file. Users are strongly encouraged to utilize the NOXVALUE or NOX\_VALS keyword with the NOX\_FILE keyword to substitute for missing NO<sub>x</sub> concentrations in the hourly data file. If no NO<sub>x</sub> input is supplied, GRSM will assume equilibrium with NO<sub>x</sub>. As with background ozone, users can vary background NO<sub>x</sub> concentrations by wind sector. For applications that include sector-varying background NO<sub>x</sub> concentrations, the sectors are defined based on the CO NOXSECTR keyword, as follows:

<b>Syntax:</b>	CO NOXSECTR StartSect1 StartSect2 . . . StartSectN, where $N \leq 6$
<b>Type:</b>	Optional, Non-Repeatable

For applications that include sector-varying background concentration the minimum sector width allowed is 30 degrees and warning messages will be issued for sector widths less than 60 degrees. **Sector-varying background concentrations will be selected based on the flow vector, i.e., the downwind direction, based on the wind direction specified in the surface meteorological data file.**

The syntax of the NOXVALUE keyword is as follows:

<b>Syntax:</b>	CO NOXVALUE NOXValue (NOXUnits) (w/o sectors)
	or CO NOXVALUE SECT <sub>x</sub> NOXValue (NOXUnits), where $x \leq 6$ (w/ sectors)
<b>Type:</b>	Optional, Non-repeatable

where the NOXValue parameter is the background NO<sub>x</sub> concentration in the units specified by the optional NOXUnits parameter (PPM, PPB, or UG/M3), and SECT<sub>x</sub> refers to the user-specified sector defined on the optional NOXSECTR keyword for which the NOXValue inputs are applied. Implement as SECT1 or SECT2 ...or SECT<sub>x</sub> where  $x \leq 6$ , and x is an integer and corresponds to the Nth sector defined by NOXSECTR. If the optional NOXUnits parameter is missing, then the model will assume units of micrograms/cubic-meter (UG/M3) for the background NO<sub>x</sub> values. If units of PPM or PPB are used, then the model will convert the concentrations to micrograms/cubic-meter based on reference temperature (25 C) and pressure (1013.25 mb).

The syntax of the NOX\_VALS keyword is as follows and is similar to the O3VALUES keyword described above in Section 3.2.5.1 for specifying temporally varying ozone background concentrations:

<b>Syntax:</b>	CO NOX_VALS NOXFlag NOXvalues(i), i=1, <i>n</i> (w/o sectors)
	or CO NOX_VALS SECT <sub><i>x</i></sub> NOXFlag NOXvalues(i), i=1, <i>n</i> and <i>x</i> ≤ 6 (w/ sectors)
<b>Type:</b>	Optional, Repeatable

where the SECT<sub>*x*</sub> parameter specifies the applicable downwind sector as defined on the optional NOXSECTR keyword and the parameter NOXFlag is the variable NO<sub>x</sub> concentration flag and must be specified as one of the following secondary keywords (the number in parentheses indicates the number of values required for each option):

- ANNUAL - annual NO<sub>x</sub> value (*n* = 1); equivalent to NOXVALUE keyword in PPB,
- SEASON - NO<sub>x</sub> values vary seasonally (*n* = 4),
- MONTH - NO<sub>x</sub> values vary monthly (*n* = 12),
- HROFDY - NO<sub>x</sub> values vary by hour-of-day (*n* = 24),
- WSPEED - NO<sub>x</sub> values vary by wind speed (*n* = 6),
- SEASHR - NO<sub>x</sub> values vary by season and hour-of-day (*n* = 96),
- HRDOW - NO<sub>x</sub> values vary by hour-of-day, and day-of-week [M-F, Sat, Sun] (*n* = 72),
- HRDOW7 - NO<sub>x</sub> values vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (*n* = 168),
- SHRDOW - NO<sub>x</sub> values vary by season, hour-of-day, and day-of-week [M-F, Sat, Sun] (*n* = 288),
- SHRDOW7 - NO<sub>x</sub> values vary by season, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (*n* = 672),
- MHRDOW - NO<sub>x</sub> values vary by month, hour-of-day, and day-of-week [M-F, Sat, Sun] (*n* = 864), and
- MHRDOW7 - NO<sub>x</sub> values vary by month, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (*n* = 2,016).

The NOX values array is the array of NO<sub>x</sub> values, where the number of values is shown above for each NOXFlag option. The seasons are defined in the following order: Winter (Dec., Jan., Feb.), Spring (Mar., Apr., May), Summer (Jun., Jul., Aug.), and Fall (Sep., Oct., Nov.). The wind speed categories used with the WSPEED option may be defined using the ME WINDCATS keyword. If the WINDCATS keyword

is not used, the default wind speed categories are defined by the upper bound of the first five categories as follows (the sixth category is assumed to have no upper bound): 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The NOX\_VALS keyword may be repeated as many times as necessary to input all the NO<sub>x</sub> values and repeat values may be used for the numerical inputs.

The order of inputs specified for the hour-of-day/day-of-week options (HRDOW, SHRDOW, SHRDOW7, etc.) are by hour-of-day, then season or month, if applicable, and then by day-of-week. For the HRDOW/SHRDOW/MHRDOW options, the days of the week are specified in the order of Weekdays (M-F), Saturdays, and Sundays. For the HRDOW7/SHRDOW7/ MHRDOW7 options, the days of the week are specified in the order of Mondays, Tuesdays, etc., through Sundays. Section 3.3.11 below includes an example illustrating the order of inputs for these options for the EMISFACT keyword.

NO<sub>x</sub> concentrations specified on the NOX\_VALS keyword are assumed to be in units of PPB unless the NOX\_UNIT keyword is specified.

The syntax of the NOX\_UNIT keyword is as follows:

<b>Syntax:</b>	CO NOX_UNIT NOXUnits
<b>Type:</b>	Optional, Non-repeatable

where the NOXUnits parameter specifies the units as parts-per-billion (PPB), parts-per-million (PPM), or micrograms/cubic-meter (UG/M3). Units specified on the CONCUNIT keyword are only applied to ozone concentrations input through NOX\_VALS keyword, which assumes default units of PPB if the NOX\_UNIT keyword is not specified. NO<sub>x</sub> concentrations specified in units of PPB or PPM are converted to UG/M3 based on reference temperature (25 C) and pressure (1013.25 mb).

Hourly NO<sub>x</sub> concentrations can be input through the optional NOX\_FILE keyword. The syntax of the NOX\_FILE keyword is as follows:

<b>Syntax:</b>	CO NOX_FILE NOXFileName (NOXUnits) (NOXFormat) (w/o sectors)
	or CO NOX_FILE SECT <sub>x</sub> NOXFileName (NOXUnits) (NOXFormat), where $x \leq 6$ (w/ sectors)
<b>Type:</b>	Optional, Non-repeatable

where the NOXFileName parameter is the filename for the hourly ozone concentration file, the optional NOXUnits parameter specifies the units of the ozone data (PPM, PPB, or UG/M3, with UG/M3 as the default), and the optional NOXFormat parameter specifies the Fortran format to read the NO<sub>x</sub> data. If sector-varying NO<sub>x</sub> concentrations are being used, based on the CO NOXSECTR keyword, then the applicable sector ID needs to be specified, e.g., 'SECT1' indicates that values are specified for the first downwind sector. The NOXFileName can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (") at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces.

The hourly NO<sub>x</sub> file must include the year, month, day, and hour, followed by the NO<sub>x</sub> concentration, in that order (unless specified differently through the NOXFormat parameter). The year can be specified as either a 2-digit or 4-digit year. If an optional Fortran format is specified using the NOXFormat parameter, the year, month, day, and hour variables must be read as integers using the Fortran 'I' format specifier, and the ozone concentration must be read as a real variable, using the Fortran 'F,' 'E,' or 'D' format specifiers, e.g., (4I2, F8.3). Note that NO<sub>x</sub> values that do not include decimal places can be read as Fx.0, where *x* is the length of the data field. However, NO<sub>x</sub> values that do not include decimal places may be read incorrectly if the NOXFormat specified for reading the data includes decimal places. For example, a value of '1234' would be interpreted as '123.4' if a format of F4.1 was used. The NOXFormat parameter must include the open and close parentheses as shown in the example and may also include embedded spaces if double quotes (") are used to delimit the field. A warning message will be generated if the specified format does not meet these requirements, and AERMOD may also issue a fatal error message when reading the file in cases where real variables are read with an integer format, or vice versa.

If the optional NOXFormat parameter is missing, then the model will read the NO<sub>x</sub> data using a Fortran 'free' format, i.e., assuming commas or spaces separate the data fields, and that the fields are in the order given above. The date sequence in the NO<sub>x</sub> data file must match the date sequence in the hourly meteorological data files. As with the NOXVALUE keyword, if units of PPM or PPB are used, then the model will convert the concentrations to micrograms/cubic-meter based on reference temperature (25 C) and pressure (1013.25 mb).

Values of NO<sub>x</sub> concentrations in the NO<sub>x</sub> data file that are less than zero will be regarded as missing. If background NO<sub>x</sub> values have been specified using the NOXVALUE and/or NOX\_VALS keyword, then the appropriate value will be used to substitute for missing NO<sub>x</sub> data from the NO<sub>x</sub> file. If no NOXVALUE

or NOX\_VALS keywords are used, then the model will assume equilibrium of NO<sub>x</sub> with NO<sub>2</sub> predicted from GRSM based on NO<sub>x</sub> emissions and hourly ozone for hours with missing NO<sub>x</sub> data.

### 3.2.5.3 Specifying the ambient equilibrium NO<sub>2</sub>/NO<sub>x</sub> ratio (PVMRM, OLM, TTRM/TTRM2)

The PVMRM option for modeling conversion of NO to NO<sub>2</sub> incorporate a default NO<sub>2</sub>/NO<sub>x</sub> ambient equilibrium ratio of 0.90. Beginning with version 11059 of AERMOD, a default equilibrium ratio of 0.90 has also been incorporated in the OLM option, as well as the TTRM option beginning with version 21112. A NO<sub>2</sub>/NO<sub>x</sub> equilibrium ratio other than 0.90 can be specified for the PVMRM, OLM, or TTRM/TTRM2 option through the optional NO2EQUIL keyword on the CO pathway. The syntax of the NO2EQUIL keyword is as follows:

<b>Syntax:</b>	CO NO2EQUIL NO2Equil
<b>Type:</b>	Optional, Non-repeatable

where the NO2Equil parameter is the NO<sub>2</sub>/NO<sub>x</sub> equilibrium ratio and must be between 0.10 and 1.0, inclusive. Note the NO2EQUIL option is invalid for GRSM simulations given that GRSM calculates the NO<sub>2</sub>/NO<sub>x</sub> conversion equilibrium ratio explicitly.

### 3.2.5.4 Specifying the default in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio (PVMRM, OLM, TTRM/TTRM2, GRSM)

The PVMRM, OLM, TTRM/TTRM2, and GRSM options for modeling conversion of NO to NO<sub>2</sub> require that an in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio be specified. Based on guidance issued June 28, 2010 (EPA, 2010b), regarding the 1-hour NO<sub>2</sub> NAAQS, AERMOD has been modified to require the user to specify in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios for each source under the OLM and PVMRM options, i.e., AERMOD no longer assumes a default in-stack ratio of 0.10 for the OLM or PVMRM option. This requirement has been carried forward with the addition of the TTRM/TTRM2 and GRSM options.

The in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio can be specified for the PVMRM, OLM, TTRM/TTRM2, or GRSM option by using either the CO NO2STACK keyword to specify a default value to be used for all sources, or by using the SO NO2RATIO keyword to specify a value on a source-by-source basis. The SO NO2RATIO keyword can also be used to override the default value for specific sources if the CO NO2STACK keyword has been specified. The syntax of the NO2STACK keyword is as follows:

<b>Syntax:</b>	CO NO2STACK NO2Ratio
<b>Type:</b>	Optional, Non-repeatable

where the NO2Ratio parameter is the default in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio that will be used, unless overridden on a source-by-source basis by the SO NO2RATIO keyword (described below). The value of NO2Ratio must be between 0.0 and 1.0, inclusive. Users should note that while CO NO2STACK is an optional keyword, the OLM, PVMRM, TTRM/TTRM2, and GRSM options require the user to specify an in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio for each source, using either the CO NO2STACK or SO NO2RATIO keyword (described in Section 3.3.6.1), or both.

### 3.2.6 Averaging time options

The averaging periods for AERMOD are selected using the AVERTIME keyword on the CO (Control) pathway. The syntax and type of the AVERTIME keyword are summarized below:

<b>Syntax:</b>	CO AVERTIME Time1 Time2 . . . TimeN <u>MONTH</u> <u>PERIOD</u> or <u>ANNUAL</u>
<b>Type:</b>	Mandatory, Non-repeatable

where the parameters Time1 . . . TimeN refer to the user-specified short-term averaging periods of 1, 2, 3, 4, 6, 8, 12, and/or 24 hours, the secondary keyword MONTH refers to monthly averages (for calendar months), the secondary keyword PERIOD refers to the average for the entire data period, and the secondary keyword ANNUAL refers to an annual average. Any of the short-term averaging periods listed above may be selected for a given run. Since the monthly averages are treated as short-term averages, the user can select appropriate output options, such as the second highest values by receptor, on the OU pathway. The location of the PERIOD or ANNUAL keyword in the parameter list is not critical. The order of the short-term averaging periods (including MONTH) is also not critical, although it does control the order of the averaging period result tables in the main output file. Generally, it is recommended that the short-term averaging periods be input in increasing order, unless there is a clear advantage in doing otherwise.

The user may specify either the PERIOD keyword or the ANNUAL keyword, but not both. For concentration calculations for a single year data file, the PERIOD and ANNUAL keywords produce the same results. **However, the ANNUAL average option applies only to complete years of data, and for multi-**

year data files, the ANNUAL average output is based on the average of the ANNUAL values across the years of data processed.

For deposition calculations, the PERIOD keyword will provide a total deposition flux for the full period of meteorological data that is modeled, including multi-year data files, with default units of g/m<sup>2</sup>, whereas the ANNUAL keyword will provide an annualized rate of the deposition flux with default units of g/m<sup>2</sup>/yr.

Use of the ANNUAL average option for meteorological data periods of less than a year will result in a fatal error. For meteorological data periods of longer than a year, if the meteorological data file does not contain complete years of data, any data remaining after the last complete year will be ignored for the ANNUAL average, and a warning message will be generated. The treatment of short-term averages with multiple-year data files is comparable to their treatment when the CO MULTYEAR option is used.

### 3.2.7 Performing multiple year analyses with MULTYEAR option

The MULTYEAR keyword on the CO pathway provides an option for the user to perform a multiple year analysis such as would be needed to determine the "high-sixth-high in five years" design value for determining PM-10 impacts without the need for postprocessing of multiple concentration files, and for multiple year analyses associated with the 24-hour PM2.5 NAAQS and 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS which are based on concentrations averaged across the number of years processed. More information regarding the 24-hour PM2.5 and 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS is provided in Sections 3.2.16 and 3.2.17. Since the multiple year option makes use of the model re-start capabilities described in the Section 3.2.15, the MULTYEAR keyword is not compatible with the SAVEFILE or INITFILE keywords. The model will generate a fatal error message if the user attempts to exercise both options in a single run. The syntax and type of the MULTYEAR keyword is summarized below:

<b>Syntax:</b>	CO MULTYEAR ( <u>H6H</u> ) Savfil (Inifil)
<b>Type:</b>	Optional, Non-repeatable

where the optional H6H field, formerly used to highlight the use of the MULTYEAR option for determining the High-6<sup>th</sup>-High (H6H) 24-hour average for the "pre-1997" PM-10 NAAQS, is no longer required since the "post-1997" PM-10 NAAQS was vacated. A warning message will be generated if the H6H field is included on the MULTYEAR keyword indicating that it is not required. The Savfil parameter specifies the filename for saving the results arrays at the end of each year of processing, and the Inifil parameter specifies the

filename to use for initializing the results arrays at the beginning of the current year. The Inifil parameter is optional and should be left blank for the first year in the multi-year series of runs. The MULTYEAR option works by accumulating the high short-term average results from year to year through the mechanism of the re-start save file. The model may be setup to run in a batch file with several years of meteorological data, and at the end of each year of processing, the short-term average results reflect the cumulative high values for the years that have been processed. The PERIOD average results are given for only the current year, but the model carries the highest PERIOD values from year to year and includes the cumulative highest PERIOD averages in the summary table at the end of the run.

When setting up a batch file to perform a multiple year analysis, the user would first create an input control file for the first year with all the applicable modeling options, the source inventory data, the receptor locations, the meteorology options for the first year and the output file options. To obtain the PM-10 design value, be sure to include the SIXTH highest value on the OU RECTABLE card (see Section 3.7.1). For the CO MULTYEAR card for the first year, the user would only specify the Savfil parameter, and may use a card such as:

```
CO MULTYEAR YEAR1.SAV
```

For the subsequent years, the user could copy the input file created for Year-1 and edit the files to change the year parameters and meteorology filename on the ME pathway (and possibly in the title information) and edit the MULTYEAR cards. For the subsequent years, both the Savfil and Inifil parameters must be specified, with the Savfil for Year-1 becoming the Inifil for Year-2, and so on. The MULTYEAR cards (one for each AERMOD run) might look like this:

```
CO MULTYEAR YEAR1.SAV (First year)
CO MULTYEAR YEAR2.SAV YEAR1.SAV (Second year)
CO MULTYEAR YEAR3.SAV YEAR2.SAV (Third year)
CO MULTYEAR YEAR4.SAV YEAR3.SAV (Fourth year)
CO MULTYEAR YEAR5.SAV YEAR4.SAV (Fifth year)
```

The MULTYEAR keyword option is separate from the ability of the AERMOD model to process a multiple-year meteorological data file in a single model run. The latter capability can be used for applications of the model to long term risk assessments where the average impacts over a long time period are of concern rather than the maximum annual average determined from five individual years. The MULTYEAR option can only

be used when PM10, PM-10, PM25, PM2.5, PM-2.5, PM-25, LEAD, NO2, SO2, or OTHER is specified as the pollutant ID.

### 3.2.8 Urban modeling option

The AERMOD model allows the user to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions. Beginning with version 06341, multiple urban areas can be specified within the same model run. Multiple areas may be applicable for large domains that encompass more than one identifiable urban area where the separation is large enough to warrant separate treatment of the urban boundary layer effects. Use of the option for multiple urban areas eliminates the need for post-processing for such applications. The urban area(s) are defined using one or more instances of the URBANOPT keyword on the CO pathway. The sources that are to be modeled with urban effects and the urban area that will be applied to each source are identified using the URBANSRC keyword on the SO pathway (see Section 3.3.10). The syntax and type of the URBANOPT keyword are summarized below:

<b>Syntax:</b>	<b><u>For Multiple Urban Areas:</u></b> CO URBANOPT UrbanID UrbPop (UrbName) (UrbRoughness)
	<b><u>For Single Urban Areas:</u></b> CO URBANOPT UrbPop (UrbName) (UrbRoughness)
<b>Type:</b>	Optional, Repeatable for multiple urban areas

where the UrbanID parameter is the alphanumeric urban ID defined by the user (up to eight characters) when multiple urban areas are defined, the UrbPop parameter specifies the population of the urban area, the optional UrbName parameter may be used to identify the name of the urban area, and the optional UrbRoughness parameter may be used to specify the urban surface roughness length. Note the UrbName must be specified if the user wants to specify the urban roughness length. A default value of 1.0 meter will be used for the urban roughness length if the UrbRoughness parameter is omitted. Beginning with version 09292, any value for the urban roughness length other than 1.0 meter will be treated as a non-regulatory option. Caution should be used when specifying a non-default urban roughness length and use of a non-default value should be clearly documented and justified. Note that the syntax of the URBANOPT keyword for single urban areas has not changed from previous versions of AERMOD, so that existing input files will not require modification.

### 3.2.9 Specifying the pollutant type

The POLLUTID keyword is used to identify the type of pollutant being modeled for a particular run. The syntax, type, and order of the POLLUTID keyword are summarized below:

<b>Syntax:</b>	CO POLLUTID Pollut (H1H or H2H or INC)
<b>Type:</b>	Mandatory, Non-repeatable

where the Pollut parameter may be a pollutant name of up to eight characters. Examples include SO2, NOX, CO, PM10, TSP, and OTHER. Some pollutant names, by themselves or in combination with other model options, have special meaning and will affect how AERMOD computes the final results based on the current NAAQS. The parameters H1H, H2H, and INC disable the special processing requirements associated the 1-hr NO<sub>2</sub> and SO<sub>2</sub> NAAQS and the 24-hr PM<sub>2.5</sub> NAAQS. Specifying one of these keywords will allow for modeling PM<sub>2.5</sub> 24-hr increments which are based on the H2H value, and also allow evaluating NO<sub>2</sub> options in AERMOD based on incomplete years of field measurements. The pollutants names with special meaning that will affect how AERMOD computes the results include:

- PM10 (or PM-10) with the multi-year option for generating the high-sixth-high in five years (see Section 3.2.16.2),
- PM25 (or PM-2.5, PM2.5, or PM-25) (see Section 3.2.16.1),
- NO2 when computing 1-hour averages (See Sections 3.2.7 and 3.2.17),
- NO2 is required when using the OLM, PVMRM, TTRM/TTRM2, or GRSM option for simulating the conversion of NO to NO<sub>2</sub> (see Section 3.2.2.7),
- SO2 when computing 1-hour averages (see Sections 3.2.7 and 3.2.17),
- SO2 triggers the use of a 4-hour half-life for SO<sub>2</sub> decay for urban applications under both the regulatory default options and non-default options(see Sections 3.2.2.1 and 3.2.10), and
- The MULTYEAR option can only be used when PM10, PM-10, PM25, PM2.5, PM-2.5, PM-25, LEAD, NO2, SO2, or OTHER is specified as the pollutant ID.

### 3.2.10 Modeling with exponential decay

The model provides the option to use exponential decay of the pollutant being modeled. Two keywords are available for this purpose, the HALFLIFE and DCAYCOEF keywords. The syntax, type, and order of these keywords are summarized below:

<b>Syntax:</b>	CO HALFLIFE Haflif CO DCAYCOEF Decay
<b>Type:</b>	Optional, Non-repeatable

where the Haflif parameter is used to specify the half life for exponential decay in seconds, and the parameter Decay is used to specify the decay coefficient in units of  $s^{-1}$ . The relationship between these parameters is  $DECAY = 0.693/HAFLIF$ .

Only one of these keywords may be specified in a given run. If more than one is encountered, a non-fatal warning message is generated, and the first specification is used in the modeling.

### 3.2.11 Flagpole receptor height option

The FLAGPOLE keyword specifies that receptor heights above local ground level (i.e., flagpole receptors) are allowed on the REceptor pathway. The FLAGPOLE keyword may also be used to specify a default flagpole receptor height other than 0.0 meters. The syntax and type of the FLAGPOLE keyword are summarized below:

<b>Syntax:</b>	CO FLAGPOLE (Flagdf)
<b>Type:</b>	Optional, Non-repeatable

where Flagdf is an optional parameter to specify a default flagpole receptor height. If no parameter is provided, then a default flagpole receptor height of 0.0 meters is used. Any flagpole receptor heights that are entered on the Receptor pathway will override the default value but are ignored if the FLAGPOLE keyword is not present on the Control pathway, and a non-fatal warning message is generated.

### 3.2.12 Plume Rise from Aircraft Emissions

An ALPHA option to simulate aircraft emissions was added to AERMOD beginning with version 23132. Aircraft emissions from jet engines experience plume rise from both momentum and buoyancy but are commonly modeled as AREA and VOLUME source types in AERMOD which do not account for either momentum or buoyancy. The aircraft plume rise ALPHA option extends the formulation of AREA (including AREAPOLY, AREACIRC, and LINE) and VOLUME source types with additional input parameters based on the work of Pandey, et. al. (2023). The option can be applied to AREA (including AREAPOLY, AREACIRC, and LINE) and VOLUME source types identified as aircraft sources by

specifying the primary keyword ARCFTOPT in the CO pathway. Aircraft sources are identified on the SO pathway with the primary keyword ARCFTSRC followed by a list of source IDs and/or a range of source IDs (see Section 3.3.18). The syntax for ARCFTOPT is summarized below:

<b>Syntax:</b>	CO ARCFTOPT (AirportID)
<b>Type:</b>	Optional, Non-Repeatable

Where AirportID is an optional alphanumeric character string that can be included to identify the airport at which the sources are located. The current implementation of aircraft plume rise requires that an additional seven aircraft parameters be supplied to AERMOD using an hourly varying emissions input file. The additional aircraft parameter variables are read from the hourly emissions file by AERMOD in the following order:

- MFUEL: Fuel burn rate (g/s)
- THRUST: Aircraft thrust (newtons)
- VAA: Aircraft speed (m/s)
- AFR: Air-fuel ratio
- BYPR: Bypass ratio (> 0 for turbofan and -999 for shaft-based engines)
- RPWR: Rated power (kW) (-99999 for turbofan and > 0 for shaft-based)
- SRCANGLE: Landing/takeoff angle with the ground (degrees) (airborne sources)

Note that AERMOD will issue a fatal error if ARCFTOPT and ARCFTSRC are specified and the aircraft parameters are missing from the hourly emissions file, or if the hourly emissions file is missing altogether.

### 3.2.13 To run or not to run

Because of the improved error handling and the "defensive programming" that has been employed in the design of the AERMOD model, the model will read through all of the inputs in the control file regardless of any errors or warnings that may be encountered. If a fatal error occurs in processing of the control file information, then further model calculations will be aborted. Otherwise, the model will attempt to run. Because of the great many options available in the AERMOD model, and the potential for wasted resources if a large run is performed with some incorrect input data, the RUNORNOT keyword has been included on the Control pathway to allow the user to specify whether to RUN the model and perform all of the

calculations, or NOT to run and only process the input control file commands and summarize the setup information. The NOT option allows the user to check the syntax of the model keywords without performing possible time-consuming model calculations. The syntax and type of the RUNORNOT keyword are summarized below:

<b>Syntax:</b>	CO RUNORNOT <u>RUN</u> or <u>NOT</u>
<b>Type:</b>	Mandatory, Non-repeatable

### 3.2.14 Generating an input file for EVENT processing

The EVENTFIL keyword can be included on the CO pathway to generate an input file for EVENT processing. The syntax and type of the EVENTFIL keyword are summarized below:

<b>Syntax:</b>	CO EVENTFIL (Evfile) (Evopt)
<b>Type:</b>	Optional, Non-repeatable

where the optional Evfile parameter specifies the name of the EVENT input file to be generated (the maximum length of the file name is set by the ILEN\_FLD parameter in MODULE MAIN1), and the optional parameter, Evopt, specifies the level of detail to be used in the EVENT output file. Valid inputs for the Evopt parameter are the secondary keywords of SOCONT and DETAIL (see the EVENTOUT keyword on the OUput pathway, Section 3.7.2). The default filename used if no parameters are specified is EVENTS.INP, and the default for the level of detail is DETAIL. If only one parameter is present, then it is taken to be the Evfile, and the default will be used for Evopt.

The primary difference between routine AERMOD and EVENT processing is in the treatment of source group contributions. The AERMOD model treats the source groups independently. EVENT processing is designed to provide source contributions to specific events such as the design concentrations determined from AERMOD or user specified events. The user may specify the "events" to process using the Event pathway, which lists specific combinations of receptor location, source group, and averaging period. By specifying the EVENTFIL keyword, an input control file will be generated that can be used directly for EVENT processing. The events included in the generated EVENT processing input file are the design concentrations defined by the RECTABLE keyword and the threshold violations identified by the MAXIFILE keyword on the OU pathway.

### 3.2.15 The model re-start capability

The AERMOD model has an optional capability to store intermediate results into an unformatted file, so that the model run can be continued later in case of a power failure or a user interrupt. This re-start option is controlled by the SAVEFILE and INITFILE keywords on the CO pathway. The syntax and type of these keywords are summarized below:

<b>Syntax:</b>	CO SAVEFILE (Savfil) (Dayinc) (Savfl2) CO INITFILE (Inifil)
<b>Type:</b>	Optional, Non-repeatable

The SAVEFILE keyword instructs the model to save the intermediate results to a file and controls the save options. All three parameters for this keyword are optional. If the user specifies only the Savfil parameter, then the intermediate results are saved to the same file (and overwritten) each time. If the user specifies both the Savfil and the Savfl2 parameters, then the model alternates between the two files for storing intermediate results. The latter approach requires additional disk space to handle two storage files. However, selecting two files avoids the potential problem like a power failure or interrupt that might occur while the temporary file is open, and the intermediate results are being copied to it. In such a case, the temporary results file would be lost.

The optional Dayinc parameter allows the user to specify the number of days between successive dumps. The default is to dump values at the end of each day, i.e., Dayinc = 1. For larger modeling runs, where the SAVEFILE option is most useful, the additional execution time required to implement this option is very small compared to the total runtime. To be most effective, it is recommended that results be saved at least every 5 days.

If no parameters are specified for the SAVEFILE keyword, then the model will store intermediate results at the end of each day using a default filename of TMP.FIL.

The INITFILE keyword works in conjunction with the SAVEFILE keyword and instructs the model to initialize the results arrays from a previously saved file. The optional parameter, Inifil, identifies the unformatted file of intermediate results to use for initializing the model. If no Inifil parameter is specified, then the model assumes the default filename of TMP.FIL. If the file doesn't exist or if there are any errors encountered in opening the file, then a fatal error message is generated, and processing is halted.

Note: It is important to note that if both the SAVEFILE and INITFILE keywords are used in the same model run, then different filenames must be specified for the Savfil and Inifil parameters. Otherwise, the model will encounter an error in opening the files, and further processing will be halted.

### 3.2.16 Processing for particulate matter (PM) NAAQS

#### 3.2.16.1 Processing for fine particulate matter (PM-2.5)

A NAAQS for fine particulate matter, with aerodynamic particle diameters of 2.5 microns or less (PM-2.5), was promulgated in 1997, and the 24-hour standard was revised in December 2006. For attainment demonstrations, the PM-2.5 standard is based on a 3-year average of the 98<sup>th</sup> percentile 24-hour average and a 3-year average of the annual mean concentration at each ambient monitor. EPA issued new recommendations in May 2014 (EPA, 2014b) regarding appropriate modeling procedures for use in modeling demonstrations of compliance with the PM2.5 NAAQS that is intended to supersede the earlier guidance issued in March 2010 (EPA, 2010a). The May 2014 guidance, which addresses the issue of secondary formation of PM2.5 due to precursor emissions, has modified the earlier guidance regarding use of the average of the first-highest 24-hour average concentrations across the number of years modeled to represent the modeled contribution for a cumulative impact assessment and recommends using the average of the eighth-highest (98<sup>th</sup> percentile) of 24-hour concentrations to represent the modeled contribution for a cumulative impact assessment. Use of the first-highest 24-hour average is still appropriate for significant contribution determinations. Note that the use of a 3-year average for monitored design values to determine attainment of the NAAQS does not preempt the requirement in Section 8.3.1.2 of the Guideline (EPA, 2017b) for use of 5 years of National Weather Service (NWS) data, and the 5-year average of modeled impacts serves as an unbiased estimate of the 3-year average for purposes of modeling demonstrations of compliance with the NAAQS.

Based on EPA's May 2014 draft recommendations, the 24-hour modeled contribution to the design value for purposes of modeling demonstrations of compliance with the PM-2.5 NAAQS is based on the highest of the eighth-highest (H8H) concentrations at each receptor, if one year of site-specific meteorological data is input to the model, or the highest of the multi-year average of the eighth-highest (H8H) concentrations at each receptor, if more than one year of meteorological data is input to the model. In other words, the model calculates the eighth-highest 24-hour concentration at each receptor for each year modeled, averages those eighth-highest concentrations at each receptor across the number of years of meteorological data, and then selects the highest, across all receptors, of the N-year averaged eighth-highest values.

Similar to the 24-hour averages, an unbiased estimate of the 3-year average annual mean is simply the annual mean, if only one year of site-specific meteorological data is input to the model, or the multi-year average of the annual means if multiple years of meteorological data are used. The annual design value for PM-2.5 is then based on the highest annual average across the receptor domain for single-year meteorological data input, or the highest of the multi-year averaged annual means across the receptor domain for multi-year meteorological data input.

The special processing of the 24-hour and annual averages for the PM-2.5 NAAQS is triggered by specifying a pollutant ID of 'PM25', 'PM-2.5', 'PM2.5' or 'PM-25' on the CO POLLUTID card. In this case, the model will compute the 24-hour and annual average design values as described in the previous paragraphs. In order for the PM-2.5 processing to work correctly for multiple year periods, the yearly meteorological data files can be concatenated into a single multi-year file for input into the model, or the MULTYEAR option (Section 3.2.7) can be used with separate model runs for each year. There is no requirement to remove the header records between concatenated surface meteorological data files prior to running the model, and multi-year meteorological data files can also be generated by processing multi-year inputs in AERMET. (NOTE: While the MULTYEAR option with separate yearly meteorological data files can be used to determine the modeled design values for PM2.5, the OU MAXDCONT option (see Section 3.7.2.8) to determine contributions from other source groups to the cumulative modeled design value will not work with the MULTYEAR option or with separate meteorological data files for each year.) Processing the average of the individual annual mean values across multiple years for PM-2.5 also requires use of the ANNUAL average option on the AVERTIME keyword, rather than PERIOD average. The PERIOD option computes a single multi-year average concentration for each receptor, which may give slightly different results than the multi-year average of individual ANNUAL mean concentrations due to differences in the number of calms and/or missing data from year to year.

To comply with these processing requirements, the following restrictions are applied to the PM-2.5 NAAQS processing whenever a pollutant ID of 'PM25', 'PM2.5', 'PM-2.5' or 'PM-25' is specified on the CO POLLUTID keyword:

1. The averaging periods on the AVERTIME keyword are limited to the 24-hour and ANNUAL averages. Use of the PERIOD average or use of a short-term average other than 24-hour will result in a fatal error message being generated.
2. The FIRST (or 1ST) highest value should be requested on the RECTABLE keyword for 24-hour averages for estimating modeled PM2.5 contributions for compliance with the

NAAQS. However, the model places no restriction on the ranks requested on the RECTABLE keyword since selection of ranks lower than the FIRST highest may be needed to determine whether a source or group of sources is contributing significantly to modeled violations of the NAAQS.

3. The model will only process meteorological data for periods of record that span complete years, although the meteorological data period does not need to follow calendar years (i.e., the data period does not need to start on January 1, hour 1). If the period of record spans less than one complete year of data, a fatal error message will be generated, and the model run will be unsuccessful. If additional meteorological data remains after the end of the last complete year of data, the remaining data will be ignored, and a non-fatal warning message will be generated specifying the number of hours ignored.
4. The MULTYEAR keyword on the CO pathway can be used to calculate multi-year averages for the PM-2.5 NAAQS; however, the MAXDCONT option will not work with the MULTYEAR. Multiple year analyses are best accomplished by including the multiple years of meteorology in a single data file.
5. Since the 24-hour average design values for PM-2.5 analyses, based on the H1H averaged over N years, may consist of averages over a multi-year period, they are not compatible with the EVENT processor, and the high ranked values generated based on the RECTABLE keyword will not be included in the EVENTFIL. However, if the MAXIFILE option is used to output 24-hour averages exceeding a user-defined threshold, these individual exceedances may be used with the EVENT processor. Therefore, if the EVENTFIL option is used without the MAXIFILE option for PM-2.5 analyses, a non-fatal warning message will be generated, and the EVENTFIL option will be ignored.

#### 3.2.16.2 Processing for particulate matter of 10 microns or less (PM-10)

The 24-hour NAAQS for particulate matter with aerodynamic particle diameters of 10 microns or less (PM-10) is in the form of an expected exceedance value, which cannot be exceeded more than once per year on average over a three year period for purposes of monitored attainment demonstrations. Modeling demonstrations of compliance with the PM-10 NAAQS are based on the High- $N+1$ -High value over  $N$  years, or in the case of five years of NWS meteorological data, the High-6<sup>th</sup>-High (H6H) value over five years. In the AERMOD model, the H6H 24-hour average over five years can be modeled in one of two ways: 1)

running five individual years and combining the results using the CO MULTYEAR option, as described above in Section 3.2.7) using a single five-year meteorological data file and specifying the SIXTH (or 6TH) highest value on the OU RECTABLE card. If applied properly, the 24-hour average results of these two approaches will be equivalent. The special processing consisting of the 99<sup>th</sup> percentile 24-hour value averaged over *N* years for PM-10 in versions of AERMOD prior to 09292, referred to as the “Post-1997” PM-10 option, has been removed since that standard was vacated.

### 3.2.17 Processing for 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS

New 1-hour NAAQS for NO<sub>2</sub> and SO<sub>2</sub> were promulgated in February 2010 and June 2010, respectively. EPA has issued guidance related to dispersion modeling in support of these 1-hour standards (EPA, 2010b; EPA, 2010c; EPA, 2011; EPA, 2014a; and EPA, 2017a). The form of these 1-hour standards is similar, based on a percentile rank from the annual distribution of daily maximum 1-hour values, averaged across the number of years processed. For the 1-hour NO<sub>2</sub> standard, the modeled design value is based on the 98<sup>th</sup>-percentile of the daily maximum 1-hour values, which is represented by the eighth highest of the daily maximum 1-hour values across the year. The 1-hour SO<sub>2</sub> modeled design value is based on the 99<sup>th</sup>-percentile, or fourth highest, of the daily maximum 1-hour values across the year. For typical multi-year modeling analysis based on 5 years of NWS meteorological data, the modeled design value is the 5-year average of the eighth-highest values daily maximum 1-hour values for NO<sub>2</sub>, or fourth-highest values for SO<sub>2</sub>.

The form of these 1-hour standards complicates the process of determining the modeled design value as well as the analyses that may be required to determine whether a particular source or group of sources contributes significantly to any modeled violations of the standards, paired in time and space. Several enhancements have been incorporated into AERMOD, beginning with version 11059, to facilitate the modeling analyses required to demonstrate compliance with these new standards. These enhancements are described in Section 3.7.2. The ability of the model to exercise these options is facilitated by specifying ‘NO2’ or ‘SO2’ as the pollutant ID on the CO POLLUTID keyword, with the following restrictions. Whenever a pollutant ID of ‘NO2’ or ‘SO2’ is specified and 1-hour averages are selected, the options to calculate 1-hour NO<sub>2</sub> or SO<sub>2</sub> design values based on the distribution of daily maximum 1-hour values will be allowed, unless short-term averaging periods other than 1-hour are also specified on the AVERTIME keyword. If other short-term averages are specified, non-fatal warning messages will be generated and the options for processing 1-hour NO<sub>2</sub> or SO<sub>2</sub> design values will be disabled. In that case, the 1-hour modeled design values will be processed the same as other short-term averages, based on the overall distribution of hourly values. Also, if ANNUAL or PERIOD averages are specified on the AVERTIME keyword along with 1-hour averages, a non-fatal warning message will be generated unless the CO MULTYEAR keyword is

specified, since the annual NAAQS for NO<sub>2</sub> and SO<sub>2</sub> is based on the highest PERIOD or ANNUAL average from an individual year, rather than an average across the years modeled. However, the special processing based on daily maximum 1-hour values will be still applied for the 1-hour averages in these cases since the ANNUAL or PERIOD averages may be appropriate if only 1 year of site-specific meteorological data is modeled.

Modeling 1-hour 'SO<sub>2</sub>' or 'NO<sub>2</sub>' for less than a full year without specifying additional short-term averaging periods will result in an error during processing since AERMOD attempts to generate a 1-hour value based on the form of the SO<sub>2</sub> or NO<sub>2</sub> 1-hour standard. When modeling with a dataset that contains less than a full year of data or by restricting the days or hours that are modeled using the STARTEND or DAYRANGE keywords on the ME pathway, the NOCHKD option should be specified on the CO pathway along with the MODELOPT keyword to avoid an error during the processing phase (Refer to sections 3.2.2 and 3.5.4 for information on the use of the NOCHKD option and the STARTEND and DAYRANGE keywords).

### 3.2.18 Debugging output options

The DEBUGOPT keyword on the CO pathway allows the user to request detailed files of intermediate calculation results for debugging purposes. There are several types of debug information that AERMOD can generate. For each type specified, the user can also specify a filename of the file to which the debug output should be written. Filenames are optional with the exception of the DEPOS debug. If omitted, AERMOD will use a default filename. The syntax and type of the DEBUGOPT keyword are summarized below. Listed are the debug types and filename pairs. While multiple types of debugging information can be specified, note that there are some related types in which case only one type within the group can be specified:

<b>Syntax:</b>	CO DEBUGOPT <u>MODEL</u> (Dbgfil)	and/or
	METEOR (Dbmfil)	and/or
	PRIME (Prmfil)	and/or
	AWMADW (AwmaDwfil)	and/or
	PLATFORM (PlatfmDbgfil)	and/or
	DEPOS	and/or
	[AREA (AreaDbFil) or LINE (LineDbFil)]	and/or
	RLINE (RlineDbgFil)	and/or
	BLPDEBUG (BLPDbFil)	and/or
	URBANDB (UrbanDbFil)	and/or
	[PVMRM (Dbpvfil) (and TTRM2) or OLM (OLMfil) (and TTRM2) or ARM2 (ARM2fil) (and TTRM2) or TTRM (TTRMfil) or GRSM (GRSMfil)]	and/or
	SWPOINT (SWfil)	and/or
	HBPDBG (HBPfil)	and/or
	AIRCRAFT (DbARCFTfil)	
	<b>Type:</b>	Optional, Non-repeatable

where the types of debug information and optional filename references include:

- MODEL (Dbgfil): Model type debug data. Default filename: MODEL.DBG.
- METEOR (Dbmfile): Meteorological profile data. Default filename: METEOR.DBG.
- PRIME (Prmfil): PRIME downwash debug data. Default filename: PRIME.DBG.
- AWMADW (Awmafil): AWMA downwash debug data. Default filename: AWMADW.DBG
- PLATFORM (PlatfmDbgfil): Platform downwash debug file. Default filename: PLATFORM.DBG
- DEPOS: Deposition debug information. Only default filenames will be used: GDEP.DAT for gas deposition and PDEP.DAT for particle deposition. If the MODEL debug option is not chosen, a debug file containing wet deposition debug information is also created called DEPOS.DBG. If the MODEL debug option is chosen with the DEPOS debug option, the wet deposition debug information is included in the model debug file.
- AREA (AreaDbFil) or LINE (LineDbFil): Area or Line source debugging data (includes OPENPIT). May only specify one. Default filename: AREA.DBG (same default filename used for AREA, LINE, and OPENPIT sources)
- RLINE (RlineDbgFil): RLINE and RLINEXT source type debug file. Default filename: RLINE.DBG
- BLPDEBUG (BLPDbFil): Debug information for the BUOYLINE source. Default filename: BLPDEBUG.DBG
- URBANDB (UrbanDbFil): Debug information for the urban option (URBANOPT, see Section 3.2.8). This will produce three output files, one for the surface meteorology, two for the profile meteorology. If the filename is specified by the user, then the filename will be used for the

surface meteorology debug file. The same name will be assigned for the two profile debug files with a “1” and “2” appended to the filename, respectively. Default filenames: URBDBUG.DBG, URBDBUG1.DBG, and URBDBUG2.DBG.

- PVMRM (Dbpvfil) (and TTRM2) **or** OLM (OLMfil) (and TTRM2) **or** ARM2 (ARM2fil) (and TTRM2) **or** TTRM (TTRMfil) **or** GRSM (GRSMfil): NO to NO<sub>2</sub> conversion debug data. Default filenames: PVMRM.DBG, OLM.DBG, ARM2.DBG, TTRM.DBG, GRSM.DBG, respectively. May only specify one of PVMRM, OLM, ARM2, TTRM, or GRSM debug options, consistent with the NO<sub>2</sub> conversion option specified with the MODELOPT keyword. The TTRM2 debug option can be paired with PVMRM, OLM, or ARM2 debug options when both options are specified with the MODELOPT keyword. A user-defined filename cannot be specified for the TTRM2 debug option. The TTRM2 debug option will generate three separate debug files named AFTER\_TTRM.DBG, AFTER\_ *option*.DBG, and TTRM2\_MERGE.DBG, where *option* is the NO<sub>2</sub> conversion option with which TTRM2 is paired. (e.g., AFTER\_PVMRM.DBG).
- SWPOINT (SWfil): Sidewash point source type debug information and optional debug filename. Default filename: SWPOINT.DBG
- HBPDBG (HBPfil): Debug information for HBP option and optional debug filename. Default filename: HBP\_DEBUG.DBG.
- AIRCRAFT (DbARCFTfil): Debug information for the aircraft plume rise option (ARCFTOPT) and optional debug filename. Default filename: AIRCRAFT.DBG.

**CAUTION!! Use the DEBUGOPT keyword with extreme CAUTION: it can produce very large files!**

**Note that the model will overwrite the debug files, without warning, if they already exist.**

### 3.2.19 Detailed error listing file

The ERRORFIL keyword on the CO pathway allows the user to request a detailed listing file of all the messages generated by the model. This includes the error and warning messages that are listed as part of the message summaries provided in the main output file and any informational messages (such as occurrences of calm winds) and quality assurance messages that are generated. The syntax and type of the ERRORFIL keyword are summarized below:

<b>Syntax:</b>	CO ERRORFIL (Errfil)
<b>Type:</b>	Optional, Non-repeatable

where the Errfil parameter is the name of the detailed message file. If the optional Errfil parameter is left blank, then the model will use a default filename of ERRORS.LST. A complete description of the error and other types of messages generated by the model is provided in APPENDIX B.

### 3.3 Source pathway inputs and options

The **S**ource pathway contains the keywords that define the source information for a particular model run. The model currently handles six source types identified as point, volume, area sources (including non-buoyant line and open pit sources), non-buoyant line (e.g., roadway sources), buoyant line sources, and a newly added source type to research the sidewash effect from building downwash when the winds are oblique to the face of a building. The input parameters vary depending on the source type. For point sources, the user can also identify building dimensions for nearby structure that cause aerodynamic downwash influences on the source. The user can also identify groups of sources for which the model will combine the results.

The **L**ocation keyword, which identifies the source type and location, must be the first keyword entered for each source. In general, the order of the keywords is not important. However, there are some exceptions such as, the **S**rcGroup keyword must be the last keyword before the **S**o Finished keyword unless the **P**sdcCredit keyword is specified on the **M**odelOpt card, in which case **S**rcGroup is replaced with the **P**sdcGroup keyword. Additional exceptions are discussed in the sections specific to applicable keywords. The user may group all the **L**ocation cards together, then group the source parameter cards together, or they may want to group all input cards for a particular source together. All sources are given a source ID by the user, which is used to link the source parameter inputs to the correct source or sources. The source ID can be any alphanumeric string of up to 12 characters.

The number of sources is allocated dynamically at the time **A**erMod is run. This value, in concert with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

#### 3.3.1 Identifying source types and locations

The **L**ocation keyword is used to identify the source type and the location of each source to be modeled. The **L**ocation card must be the first card entered for each source since it identifies the source type and dictates which parameters are needed and/or accepted. The syntax, type and order of the **L**ocation keyword are summarized below:

<b>Syntax:</b>	<b>When Src typ = POINT, POINTHOR, POINTCAP, VOLUME, AREA, AREAPOLY, AREACIRC, OPENPIT, or SWPOINT</b> SO LOCATION Srcid Src typ Xs Ys (Zs) <b>When Src typ = LINE, RLINE, or BUOYLINE</b> SO LOCATION Srcid Src typ Xs1 Ys1 Xs2 Ys2 (Zs) <b>When Src typ = RLINEXT</b> SO LOCATION Srcid Src typ Xs1 Ys1 Zs1 Xs2 Ys2 Zs2 (Zs)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must be first card for each source input

where the Srcid parameter is the alphanumeric source ID defined by the user (up to 12 characters), Src typ is the source type, which is identified by one of the secondary keywords - POINT, POINTHOR, POINTCAP, VOLUME, AREA, AREAPOLY, AREACIRC, OPENPIT, LINE, RLINE, RLINEXT, BUOYLINE, or SWPOINT. Xs and Ys, are the x and y coordinates of the source location in meters for POINT, POINTHOR, POINTCAP, VOLUME, AREA, AREAPOLY, AREACIRC, OPENPIT, and SWPOINT source types. For the LINE and RLINE source type, Xs1 and Ys1 are the x and y coordinates for the midpoint of one end of the LINE or RLINE source while Xs2 and Ys2 are the x and y coordinates for the midpoint of the other end of the LINE or RLINE source. For the RLINEXT source type, Zs1 and Zs2 are the release heights for the endpoints of the source. For the OPENPIT source type, Zs is the elevation at the top of the pit, and the effective depth is calculated based on the lateral dimensions and volume of the pit.

Beginning with version 19191, the RLINE and RLINEXT source types were added to the SO pathway for roadway sources. Beginning with AERMOD version 24142, the RLINE source type was updated to a regulatory option while the RLINEXT source type is an ALPHA option and requires the ALPHA keyword with the MODELOPT keyword. The original implementation of RLINE and RLINEXT was based on the numerical integration and algorithms in the Research LINE-source model, version 1.2, for near-surface releases (Snyder et al., 2013). The implementation has since been updated to better harmonize the RLINE and RLINEXT source types with AERMOD similar to the POINT, AREA, and VOLUME source types as described in EPA’s related TSD (EPA, 2023). The R-LINE model was formulated for flat terrain, and the original implementation in AERMOD required terrain to be specified as FLAT. Beginning in AERMOD version 23132, RLINE/RLINEXT can account for elevated terrain; however, when modeling for project level transportation conformity and hot-spot analyses, refer to the EPA’s Office of Transportation and Air Quality (OTAQ) for the most up-to-date guidance on how to model roadway sources (<https://www.epa.gov/state-and-local-transportation/project-level-conformity-and-hot-spot-analyses>).

RLINEXT sources require the user to input the offset distance from road centerline, number of lanes, width per lane and initial vertical dispersion for each specified road link. These parameters are discussed in more detail in Section 3.3.2.10. Also, refer to the user's guide for R-LINE Model Version 1.2 (Snyder and Heist, 2013) and EPA's 2023 TSD (EPA, 2023) for detailed information about the original formulation of the RLINE source algorithms as well as the reformulation beginning in AERMOD version 23132.

Beginning with version 15181, the BUOYLINE source type was added to the SO pathway for buoyant line sources. The current implementation is based on the buoyant line source algorithm in the Buoyant Line and Point Source (BLP) dispersion model (Schulman and Scire, 1980) with very little modification and similar limitations. A buoyant line source is, comprised of one or multiple lines. Multiple lines are assumed to be parallel, though each line can have a different length, height, and base elevation. AERMOD will check to see if the lines in a single source are parallel, within a 5° tolerance, to the first line in the source. If an individual buoyant line exceeds the tolerance, AERMOD will issue a warning message, but will continue the model run. The BUOYLINE source type also requires the user to input average values of length, width, height, and separation distance for the set of lines that comprise the buoyant line source. These parameters are discussed in more detail in Section 3.3.2.11. Refer to the BLP user's guide (Schulman and Scire, 1980) for detailed information about the formulation of the buoyant line source algorithm.

Beginning with version 22112, the SWPOINT source type was added to the SO pathway as a research tool to study the sidewash effects of the recirculation cavity that forms on the lee side a building and shifts laterally when the wind is oblique to the face of the building. The SWPOINT source has been added for continued research and development and requires the ALPHA secondary keyword as a model option using the MODELOPT keyword on the CO pathway.

For the BUOYLINE source, the definitions of Xs1, Ys1, Xs2, and Ys2 are similar to the definitions for the LINE source, but there is a subtle difference due to the current implementation of the buoyant line source algorithm in AERMOD. When specifying a buoyant line source, the LOCATION keyword and parameters should be repeated for each individual line that comprises the buoyant line source. BUOYLINE should be specified as the source type (Srctyp), and each line should be given a unique source ID (Srcid). **Note that the order that the individual lines are entered using the LOCATION keyword in the control file is important.** Again, as in BLP, AERMOD assumes all of the buoyant lines are parallel. As noted above, AERMOD performs a check to see if the lines are within an allowable tolerance, currently 5°, and issues a warning message if a line exceeds this tolerance. For lines that are not oriented exactly north-south but are angled either southeast-to-northwest or southwest-to-northeast, the individual lines should be entered

in the order of their location from south to north. In other words, the southernmost line should be defined first in the control file, followed by the adjacent line to the north and so on, ending with the northernmost line. For an individual line, the most westerly endpoint should be entered first followed by the easterly endpoint where  $X_{s1}$  and  $Y_{s1}$  are the x and y coordinates of the most westerly endpoint of the line, and  $X_{s2}$  and  $Y_{s2}$  are the x and y coordinates of the most easterly endpoint of the line.  $Z_s$  is the optional elevation of the source above sea-level and is applicable for all source types.

**In the case where the buoyant lines are parallel to the Y axis**, the order that the lines should be entered is dependent on which endpoint is entered first, the southern or northern endpoint of the lines. **If the southern endpoint is entered first, the lines should be entered in the order of the easternmost line to the westernmost line. If the northern endpoint is entered first, lines should be ordered west to east.** The convention used for the first line should be used for all subsequent lines.

The three area source types (AREA, AREACIRC, and AREAPOLY), as well as the LINE source type use the same numerical integration algorithm for estimating impacts from area sources and are merely different options for specifying the shape of the area source. The AREA source keyword may be used to specify a rectangular-shaped area source with arbitrary orientation; the AREAPOLY source keyword may be used to specify an area source as an irregularly shaped polygon of up to 20 sides; and the AREACIRC source keyword may be used to specify a circular-shaped area source (modeled as an equal-area polygon of 20 sides). The LINE source type option allows users to specify line-type sources based on a start point and end point of the line and the width of the line, as an alternative to the current AREA source type for rectangular sources. The LINE source type utilizes the same routines as the AREA source type and will give identical results for equivalent source inputs. The LINE source type also includes an optional initial sigma-z parameter on the SRCPARAM keyword to account for initial dilution of the emissions. AREA, AREAPOLY, AREACIRC, LINE, and OPENPIT source types do not, by default, include the horizontal meander component in AERMOD. AREAMNDR was added in 23132 as an ALPHA option on the CO pathway which incorporates meander into the AREA, AREAPOLY, AREACIRC, and LINE sources if specified. Since the LINE source type utilizes the AREA source algorithms, the runtime optimizations associated with the FASTAREA option will also apply to LINE sources if included. The AREAMNDR option will not add meander to the AREA, AREAPOLY, AREACIRC, or LINE sources if the FASTAREA option has been included.

The RLINE and RLINEXT source types use the numerical integration algorithms described in Snyder et. al. 2013, intended mainly for roadway sources. Beginning with version 19191, the RLINE and

RLINEXT source types were added as an option to the SO pathway. Initial sigma-z (vertical dispersion/dilution) and width are specified using the SRCPARAM keyword on the SO pathway for an RLINE and RLINEXT source. The RLINEXT source requires an additional distance from the centerline parameter on the SRCPARAM keyword, used in the barrier and depressed roadway algorithms. The RLINE and RLINEXT source types contain a horizontal meander component for roadway sources.

The OPENPIT source algorithm can be used to model particulate or gaseous emissions from open pits, such as surface coal mines and rock quarries. The OPENPIT algorithm uses an effective area for modeling pit emissions, based on meteorological conditions, and then utilizes the numerical integration area source algorithm to model the impact of emissions from the effective area sources. A complete technical description of the OPENPIT source algorithm is provided in the ISC3 Model User's Guide - Volume II (EPA, 1995b).

Note that the source elevation,  $Z_s$ , is an optional parameter. If the default option to include elevated terrain effects is used and the source elevation is omitted, a warning message will be generated, and the source elevation will be given a value of 0.0. The source elevation is not used by the model if the non-default FLAT terrain option is used. While the default units of  $Z_s$  are meters, the user may also specify source elevations to be in feet by adding the SO ELEVUNIT FEET card immediately following the SO STARTING card. The x (east-west) and y (north-south) coordinates are for the center of the source for POINT, POINTHOR, POINTCAP, VOLUME, AREACIRC, SWPOINT sources, for one of the vertices of the source for AREA, AREAPOLY, and OPENPIT sources, and the endpoints for RLINE, RLINEXT, and BUOYLINE sources. The source coordinates may be input as Universal Transverse Mercator (UTM) coordinates or may be referenced to a user-defined origin.

Certain types of non-buoyant line sources can be handled in AERMOD using a string of volume sources, an elongated area source, or a roadway source. The volume source algorithms are most applicable to line sources with some initial plume depth, such as conveyor belts and rail lines. Section 1.2.2 of the ISC Model User's Guide - Volume II (EPA, 1995b) provides technical information on how to model a line source with multiple volume sources. The use of the AERMOD area source algorithm for elongated rectangles would be most applicable to near ground level line sources, such as a viaduct. The area source algorithm is applied identically to both AREA and LINE source types and AERMOD should produce the same results for an elongated area source defined as either an AREA or LINE source type.

The source ID entered on the LOCATION card identifies that source for the remainder of the SO pathway inputs. Since the model accepts alphanumeric strings of up to 12 characters for the source ID, the

sources can be identified with descriptive names, such as STACK1, STACK2, BOILER3, SLAGPILE, etc. This may also be useful if line sources are being modeled as multiple volume or areas, as discussed above. Since they are part of the same physical source, they can be given names that will identify them as being related, such as LINE1A, LINE1B, LINE1C, etc.

It should be noted that not all NO<sub>2</sub> conversion options have been implemented for all source types in AERMOD. Table 3-2 summarizes which NO<sub>2</sub> conversion options have been implemented for each of the AERMOD source types and which options have not.

### 3.3.2 Specifying source release parameters

The main source parameters are input on the SRCPARAM card, which is a mandatory keyword for each source being modeled. Since the input parameters vary depending on the source type, the different source types handled by the AERMOD model are discussed separately.

#### 3.3.2.1 POINT, POINTHOR, and POINTCAP source inputs

The AERMOD POINT source algorithms are used to model releases from stacks and isolated vents, as well as other kinds of sources. The syntax, type and order for the SRCPARAM card for POINT, POINTHOR, and POINTCAP sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Ptemis Stkhgt Stktmp Stkvel Stkdia
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Ptemis - point emission rate in g/s,
- Stkhgt - release height above ground in meters,
- Stktmp - stack gas exit temperature in degrees K,
- Stkvel - stack gas exit velocity in m/s, and
- Stkdia - stack inside diameter in meters.

An example of a valid SRCPARAM input card for a point source is given below:

SO SRCPARAM	STACK1	16.71	35.0	444.0	22.7	2.74
-------------	--------	-------	------	-------	------	------

where the source ID is STACK1, the emission rate is 16.71 g/s, the release height is 35.0 m, the exit temperature is 444.0 K, the exit velocity is 22.7 m/s, and the inside stack diameter is 2.74 m. All the parameters must be present on the input card.

If a value of 0.0 is input for the exit temperature, AERMOD will adjust the exit temperature for each hour to match the ambient temperature. This option allows the user to model a plume that is released at ambient temperature. The user may also model a plume with an exit temperature that exceeds the ambient temperature by a fixed amount by entering a negative value for exit temperature equal in magnitude to the temperature difference. The model will add the absolute value of a negative exit temperature to the ambient temperature for each hour to obtain the exit temperature used in computing the buoyancy flux of the plume. The AERMOD model does not include algorithms to model plumes that are released at temperatures below ambient temperature. Such releases should be modeled with a dense gas model.

AERMOD model uses direction-specific building dimensions for POINT, POINTHOR, and POINTCAP sources subject to building downwash. Building dimensions for these source types are entered on the BUILDHGT, BUILDWID, BUILDLEN, XBADJ, and YBADJ cards described below in Section 3.3.9. Offshore platform dimensions for these source types are entered for each source ID using the PLATFORM keyword as described below in Section 3.3.16.

### 3.3.2.2 VOLUME source inputs

The AERMOD VOLUME source algorithms are used to model releases from a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts. Beginning with AERMOD version 23132, the input parameters for VOLUME (and AREA) source types were expanded to characterize aircraft emissions to account for the effects of buoyancy and momentum (see Section 3.2.12). The additional parameters are required to be input as hourly data in the hourly emissions file (see Section 3.3.12). Thus, aircraft sources can only be modeled as a VOLUME source using an hourly emissions file that includes the non-aircraft VOLUME source parameters described in Section 3.3.12, as well as the extended set of parameters required to characterize the aircraft source as a VOLUME source as described in Section 3.3.12. The syntax, type, and order for the SRCPARAM card for VOLUME sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Vlemis Relhgt Syinit Szinit
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Vlemis - volume emission rate in g/s,
- Relhgt - release height (center of volume) above ground, in meters,
- Syinit - initial lateral dimension of the volume in meters, and
- Szinit - initial vertical dimension of the volume in meters.

Table 3-3, which is explained in more detail in Section 1.2.2 of the ISC Model User's Guide - Volume II, summarizes the suggested procedures to be used for estimating the initial lateral and vertical dimensions for various types of volume and line sources.

**Table 3-3. Summary of Suggested Procedures for Estimating Initial Lateral Dimensions  $\sigma_{yo}$  and Initial Vertical Dimensions  $\sigma_{zo}$  for Volume and Line Sources**

Type of Source	Procedure for Obtaining Initial Dimension	
(a) Initial Lateral Dimension ( $\sigma_{yo}$ )		
Single Volume Source	$\sigma_{yo} =$	length of side divided by 4.3
Line Source Represented by Adjacent Volume Sources (see Figure 1-8 (a) in EPA, 1995a)	$\sigma_{yo} =$	length of side divided by 2.15
Line Source Represented by Separated Volume Sources (see Figure 1-8(b) in EPA, 1995a)	$\sigma_{yo} =$	center to center distance divided by 2.15
(b) Initial Vertical Dimension ( $\sigma_{zo}$ )		
Surface-Based Source ( $h_e \sim 0$ )	$\sigma_{zo} =$	vertical dimension of source divided by 2.15
Elevated Source ( $h_e > 0$ ) on or Adjacent to a Building	$\sigma_{zo} =$	building height divided by 2.15
Elevated Source ( $h_e > 0$ ) not on or Adjacent to a Building	$\sigma_{zo} =$	vertical dimension of source divided by 4.3

### 3.3.2.3 AREA source type

The AERMOD area source algorithm is used to model low level or ground level releases with no plume rise (e.g., storage piles, slag dumps, and lagoons). The AERMOD model uses a numerical integration approach for modeling impacts from area sources. When the FASTAREA or FASTALL option is specified, the area source integration routine is optimized to reduce model runtime. This is accomplished by incorporation of a three-tiered approach using the Romberg numerical integration, a 2-point Gaussian Quadrature routine for numerical integration, or a point source approximation based on the location of the receptor relative to the source. In the regulatory default mode, the Romberg numerical integration is utilized for all receptors.

The AERMOD model includes various options for specifying the shape of an area source: the AREA source type may be used to specify rectangular areas that may also have a rotation angle specified relative to a north-south orientation; the LINE source type is a simplified representation of an elongated area source and does not utilize a rotation angle; the AREAPOLY source type may be used to specify an area source as an irregularly-shaped polygon of up to 20 sides; the AREACIRC source keyword may be used to specify a circular-shaped area source (modeled as an equal-area polygon of 20 sides); and the OPENPIT source type can be used to model open rectangular pits such as surface coal mines and rock quarries. The OPENPIT source type also includes an optional rotation angle. The source parameter inputs for each of the area source types is described below.

### 3.3.2.4 AREA source inputs

The rotation angle for rectangular AREA sources is specified relative to the vertex used to define the source location on the SO LOCATION card (e.g., the southwest corner). The syntax, type and order for the SRCPARAM card for AREA sources are summarized below:

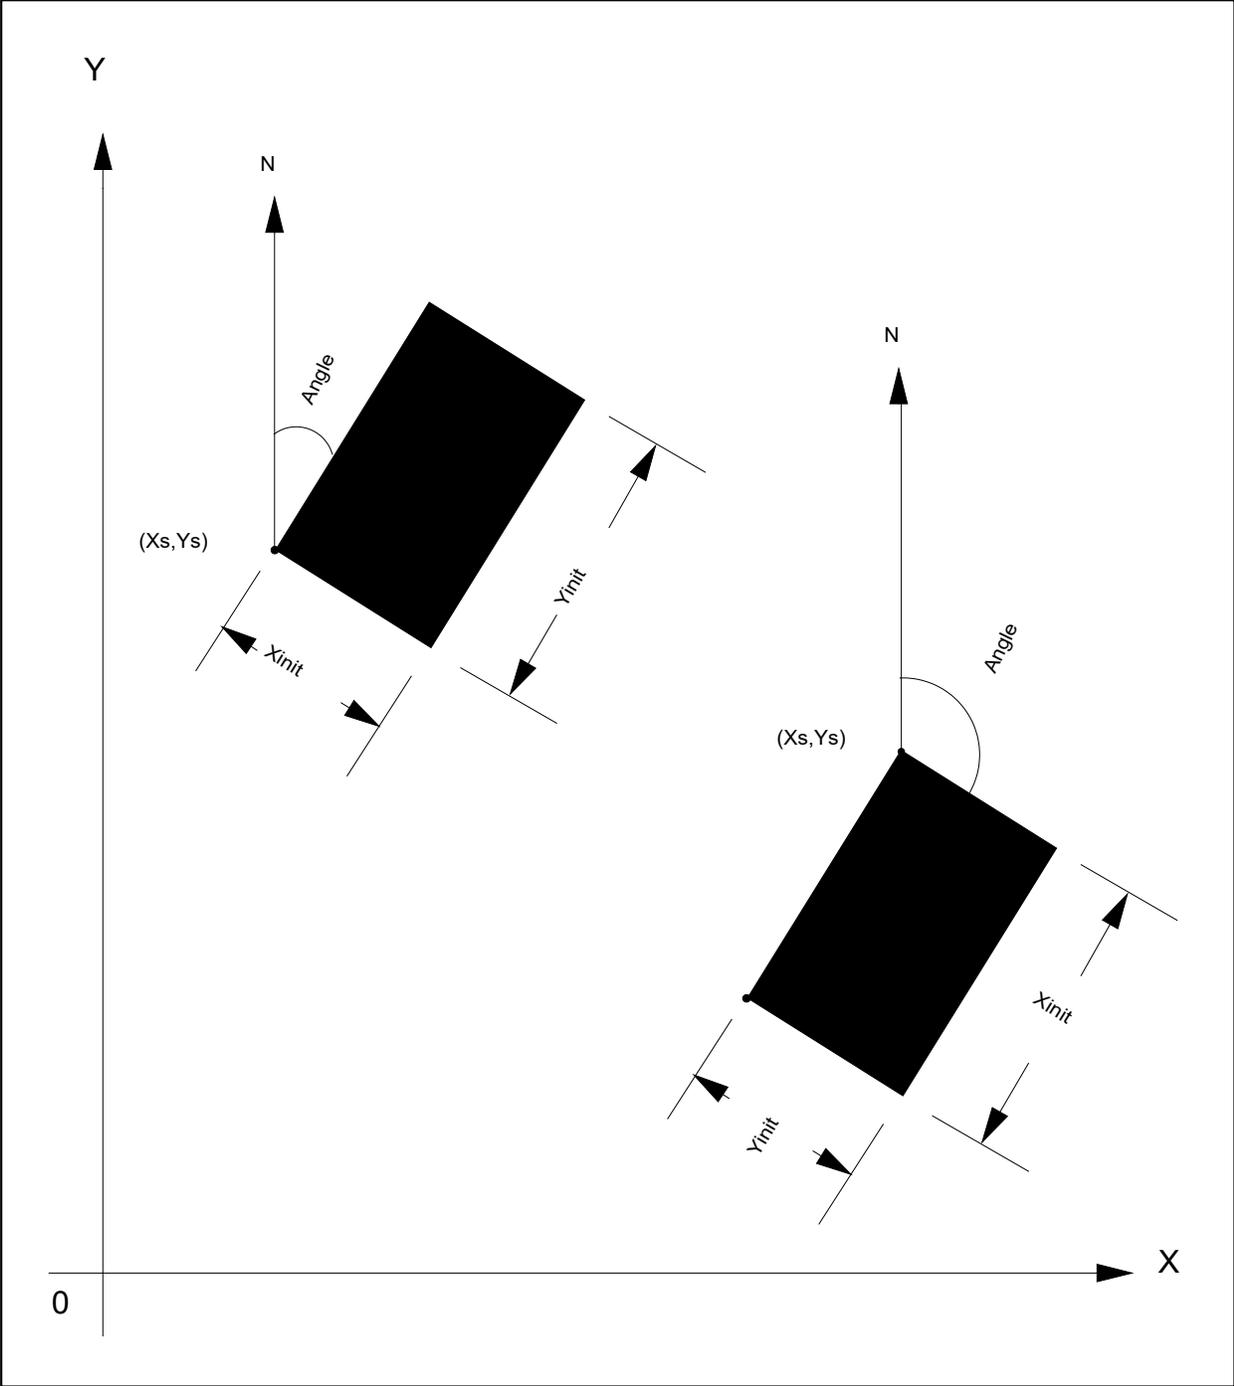

<b>Syntax:</b>	SO SRCPARAM Srcid Aremis Relhgt Xinit (Yinit) (Angle) (Szinit)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Aremis - area emission rate in  $\text{g}/(\text{s}\cdot\text{m}^2)$ ,
- Relhgt - release height above ground in meters,
- Xinit - length of X side of the area (in the east-west direction if Angle is 0 degrees) in meters,
- Yinit - length of Y side of the area (in the north-south direction if Angle is 0 degrees) in meters (optional),
- Angle - orientation angle for the rectangular area in degrees from North, measured positive in the clockwise direction (optional), and
- Szinit - initial vertical dimension of the area source plume in meters (optional).

It should be noted that the emission rate for the area source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source.

If the optional Yinit parameter is omitted, then the model assumes that the area is a square, i.e., Yinit = Xinit. If the optional Angle parameter is omitted, then the model assumes that the area is oriented in the north-south and east-west directions, i.e., Angle = 0.0. If the Angle parameter is input, and the value does not equal 0.0, then the model will rotate the area clockwise around the vertex defined on the SO LOCATION card for this source. Figure 3-1 illustrates the relationship between the Xinit, Yinit, and Angle parameters and the source location, (Xs,Ys), for a rotated rectangle. The Xinit dimension is measured from the side of the area that is counterclockwise along the perimeter from the vertex defined by (Xs,Ys), while the Yinit dimension is measured from the side of the area that is clockwise from (Xs,Ys). The Angle parameter is measured as the orientation relative to North of the side that is clockwise from (Xs,Ys), i.e., the side with length Yinit. The Angle parameter may be positive (for clockwise rotation) or negative (for counterclockwise rotation), and a warning message is generated if the absolute value of Angle is greater than 180 degrees. The selection of the vertex to use for the source location is not critical, as long as the relationship described above for the Xinit, Yinit, and Angle parameters is maintained.

**Figure 3-1. Relationship of Area Source Parameters for Rotated Rectangle**

By making the Yinit and Angle parameters optional, the area source input data for the previous versions of the ISC model can be used with the AERMOD model. The aspect ratio (i.e., length/width) for area sources should generally be less than about 100 to 1. If this is exceeded, then the model will generate a non-fatal warning message, and the user should consider subdividing the area to achieve a 100 to 1 aspect ratio (or less) for all subareas.

The optional Szinit parameter may be used to specify an initial vertical dimension to the area source plume, similar to the use of the Szinit parameter for volume sources. This parameter may be important when the area source algorithm is used to model mechanically generated emission sources, such as mobile sources. In these cases, the emissions may be turbulently mixed near the source by the process that is generating the emissions, and therefore occupy some initial depth. For more passive area source emissions, such as evaporation or wind erosion, the Szinit parameter may be omitted, which is equivalent to using an initial sigma-z of zero.

An example of a valid SRCPARAM input card for a rectangular area source is given as

SO SRCPARAM	SLAGPILE	0.00155.0	50.0	100.0	30.0
-------------	----------	-----------	------	-------	------

where the source ID is SLAGPILE, the emission rate is 0.0015 g/(s-m<sup>2</sup>), the release height is 5.0 m, the X-dimension is 50.0 m, the Y-dimension is 100.0 m, and the orientation angle is 30.0 degrees clockwise from North.

Since the numerical integration algorithm can handle elongated areas with aspect ratios of up to 100 to 1, the AERMOD area source algorithm may be useful for modeling certain types of line sources. User's now have the option of specifying a line-type source as either AREA or LINE. There are no restrictions on the placement of receptors relative to area sources for the AERMOD model. Receptors may be placed within the area and at the edge of an area. The AERMOD model will integrate over the portion of the area that is upwind of the receptor. However, since the numerical integration is not performed for portions of the area that are closer than 1.0 meter upwind of the receptor, caution should be used when placing receptors within or adjacent to areas that are less than a few meters wide. More technical information about the application of the AERMOD area source algorithm is provided in Sections 1.2.3 and 2.2.3 of the ISC Model User's Guide - Volume II (EPA, 1995b).

Beginning with AERMOD version 23132, the input parameters for AREA (and VOLUME) source types were expanded to characterize aircraft emissions to account for the effects of buoyancy and momentum (see Section 3.2.12). The additional parameters are required to be input as hourly values in the hourly emission rate file (see Section 3.3.12). Thus, aircraft sources can only be modeled using an hourly emissions file that includes the standard non-aircraft AREA source parameters described in Section 3.3.12, as well as the extended set of parameters required to characterize the aircraft source as an AREA source as described in Section 3.3.12.

### 3.3.2.5 AREAPOLY source inputs

The AREAPOLY source type may be used to specify an area source as an arbitrarily- shaped polygon of between 3 and 20 sides (the number of sides allowed may be increased by modifying the NVMAX parameter in MODULE MAIN1). This source type option provides the user with considerable flexibility for specifying the shape of an area source. The syntax, type and order for the SRCPARAM card for AREAPOLY sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Aremis Relhgt Nverts (Szinit)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Aremis - area emission rate in  $g/(s \cdot m^2)$ ,
- Relhgt - release height above ground in meters,
- Nverts - number of vertices (or sides) of the area source polygon,
- Szinit - initial vertical dimension of the area source plume in meters (optional).

As with AREA sources, the emission rate for the source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source. The locations of the vertices are specified by use of the AREAVERT keyword, which applies only to AREAPOLY sources.

The syntax, type and order for the AREAVERT keyword used for AREAPOLY sources are summarized below:

<b>Syntax:</b>	SO AREAVERT Srcid Xv(1) Yv(1) Xv(2) Yv(2) ... Xv(i) Yv(i)
<b>Type:</b>	Mandatory for <u>AREAPOLY</u> sources, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Xv(i) and Yv(i) are the x-coordinate and y-coordinate values of the vertices of the area source polygon. There must be Nverts pairs of coordinates for the area source, where Nverts is the number of vertices specified for that source on the SRCPARAM card. The first vertex, Xv(1) and Yv(1), must also match the coordinates given for the source location on the LOCATION card, Xs and Ys. The remaining vertices may be defined in either a clockwise or counter-clockwise order from the point used for defining the source location.

Receptors may be placed within the area and at the edge of an area. The AERMOD model will integrate over the portion of the area that is upwind of the receptor. However, since the numerical integration is not performed for portions of the area that are closer than 1.0 meter upwind of the receptor, caution should be used when placing receptors within or adjacent to areas that are less than a few meters wide.

### 3.3.2.6 AREACIRC source inputs

The AREACIRC source type may be used to specify an area source as a circular shape. The model will automatically generate a regular polygon of up to 20 sides to approximate the circular area source. The polygon will have the same area as that specified for the circle. The syntax, type and order for the SRCPARAM card for AREACIRC sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Aremis Relhgt Radius (Nverts) (Szinit)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Aremis - area emission rate in  $g/(s \cdot m^2)$ ,
- Relhgt - release height above ground in meters,
- Radius - radius of the circular area in meters,
- Nverts - number of vertices (or sides) of the area source polygon (optional, 20 sides will be used if omitted),
- Szinit - initial vertical dimension of the area source plume in meters (optional).

As with AREA sources, the emission rate for the source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source.

### 3.3.2.7 OPENPIT source inputs

The AERMOD model accepts rectangular pits with an optional rotation angle specified relative to a north-south orientation and the vertex used to define the source location on the SO LOCATION card (e.g., the southwest corner). The syntax, type and order for the SRCPARAM card for OPENPIT sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Opemis Relhgt Xinit Yinit Pitvol (Angle)
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Opemis - open pit emission rate in  $g/(s \cdot m^2)$ ,
- Relhgt - average release height above the base of the pit in meters,
- Xinit - length of X side of the open pit (in the east-west direction if Angle is 0 degrees) in meters,
- Yinit - length of Y side of the open pit (in the north-south direction if Angle is 0 degrees) in meters,
- Pitvol - volume of open pit in cubic meters, and
- Angle - orientation angle for the rectangular open pit in degrees from North, measured positive in the clockwise direction (optional).

The same emission rate is used for both concentration and deposition calculations in the AERMOD model. It should also be noted that the emission rate for the open pit source is an emission rate per unit area

as with the other area source types. This is different from the point and volume source emission rates, which are total emissions for the source. The Relhgt parameter cannot exceed the effective depth of the pit, which is calculated by the model based on the length, width, and volume of the pit. A Relhgt of 0.0 indicates emissions that are released from the base of the pit.

If the optional Angle parameter is input, and the value does not equal 0.0, then the model will rotate the open pit clockwise around the vertex defined on the SO LOCATION card for this source. The relationship between the Xinit, Yinit, and Angle parameters and the source location, (Xs,Ys), for a rotated pit is the same as for rectangular area sources. The Xinit dimension is measured from the side of the area that is counterclockwise along the perimeter from the vertex defined by (Xs,Ys), while the Yinit dimension is measured from the side of the open pit that is clockwise along the perimeter from (Xs,Ys). Unlike the area source inputs, the Yinit parameter is not optional for open pit sources. The Angle parameter is measured as the orientation relative to North of the side that is clockwise from (Xs,Ys), i.e., the side with length Yinit. The Angle parameter may be positive (for clockwise rotation) or negative (for counterclockwise rotation), and a warning message is generated if the absolute value of Angle is greater than 180 degrees. The selection of the vertex to use for the source location is not critical, as long as the relationship described above for the Xinit, Yinit, and Angle parameters is maintained.

The aspect ratio (i.e., length/width) of open pit sources should be less than 10 to 1. However, since the pit algorithm generates an effective area for modeling emissions from the pit, and the size, shape and location of the effective area is a function of wind direction, an open pit cannot be subdivided into a series of smaller sources. Aspect ratios of greater than 10 to 1 will be flagged by a warning message in the output file, and processing will continue. Since open pit sources cannot be subdivided, the user should characterize irregularly-shaped pit areas by a rectangular shape of equal area. **Receptors should not be located within the boundaries of the pit; concentration and/or deposition at such receptors will be set to zero.** Such receptors will be identified during model setup and will be flagged in the summary of inputs.

An example of a valid SRCPARAM input card for an open pit source is given below:

```
SO SRCPARAM NORTHFIT 1.15E-4 0.0 150.0 500.0 3.75E+6 30.0
```

where the source ID is NORTHFIT, the emission rate is 1.15E-4 g/(s-m<sup>2</sup>), the release height is 0.0 m, the X-dimension is 150.0 m, the Y-dimension is 500.0 m, the pit volume is 3.75E+6 cubic meters (corresponding to an effective pit depth of about 50 meters) and the orientation angle is 30.0 degrees clockwise from North.

Note, that unlike the ISC model formulation for OPENPIT sources, particle information (diameter, mass fraction, and density) are not needed by AERMOD except when modeling with particle deposition or depletion.

### 3.3.2.8 LINE source inputs

The syntax, type and order for the SRCPARAM card for LINE sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Lnemis Relhgt Width (Szinit)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Lnemis - line source emission rate in  $g/(s \cdot m^2)$ ,
- Relhgt - average release height above ground in meters,
- Width - width of the source in meters (with a minimum width of 1m),
- Szinit - initial vertical dimension of the line source in meters (optional).

As noted above, the LINE source type option in AERMOD uses the same algorithms as used for the AREA source type for rectangular sources and will give identical results for equivalent source definitions. The LINE source emission rate is in  $g/(s \cdot m^2)$  and the model assumes that emissions are uniformly distributed across the dimensions of the LINE source. As with the AREA source type, the LINE source type does not include the horizontal meander component that is incorporated for POINT and VOLUME sources unless the AREAMNDR and ALPHA keywords have been specified. Also, as with the AREA source type, the LINE source type will estimate concentrations (and/or deposition) at receptors located within the dimensions of the source.

### 3.3.2.9 RLINE source inputs

The AERMOD RLINE source algorithm is used to model near-surface releases from mobile sources and can be used to represent a travelled roadway with either single or multiple lanes of traffic. The AERMOD model simulates mobile source emissions using Romberg numerical integration of point sources,

with the number of points included in the integration determined by error analysis. Beginning with version 24142, the RLINE source type has been updated to a regulatory option and can be used with the DFAULT option.

RLINE was originally formulated as a flat terrain model, and in the original implementation, AERMOD required that the FLAT MODELOPT flag was specified. If FLAT and ELEV were both used, Zs for all RLINE sources needed to be = 0.0 or = 'FLAT'. Beginning with version 23132, the RLINE source type can account for terrain elevations. **However, when modeling for project level transportation conformity and hot-spot analyses, refer to the EPA's Office of Transportation and Air Quality (OTAQ) for current guidance on how to model and configure roadway sources (<https://www.epa.gov/state-and-local-transportation/project-level-conformity-and-hot-spot-analyses>).**

The syntax, type, and order for the SRCPARAM card for RLINE sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Lnemis Relhgt Width (Szinit)
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Lnemis<sup>3</sup> - line source emission rate in g/s/m<sup>2</sup>,
- Relhgt - average release height above ground in meters,
- Width - width of the source in meters (with a minimum width of 1m),
- Szinit - initial vertical dimension of the line source in meters (optional).

Notice these are identical to the LINE source type above, thus allowing the user to use the RLINE dispersion calculations by simply changing the source type from LINE to RLINE. The RLINE source emission rate is in grams/second/meter<sup>2</sup>, and the model assumes that emissions are uniformly distributed. If the keyword RLEMCONV is used on the SO pathway, then the emission units for all RLINE sources should be in g/hr/link (see Section 3.3.13).

---

<sup>3</sup> Alternatively, the user may specify emissions units of grams per link per hour for the RLINE and RLINE source types using the RLEMCONV keyword on the SO pathway (See Section 3.3.13.)

### 3.3.2.10 RLINEXT source inputs

Like the RLINE source type, the RLINEXT source type is used to model near-surface releases from mobile sources and can be used to represent a travelled roadway with either single or multiple lanes of traffic. Unlike RLINE, RLINEXT source type is a non-regulatory ALPHA option. The RLINEXT source type cannot be used with the DFAULT option and requires use of the non-regulatory ALPHA flag with the Control pathway MODELOPT keyword. RLINE and RLINEXT sources use the same dispersion calculations, but the parameter requirements to characterize each of the source types are different. Prior to version 23132, AERMOD also required that the FLAT MODELOPT flag was specified when using the RLINEXT source. If FLAT and ELEV were both used, Zs for all RLINEXT sources needed to be = 0.0 or = 'FLAT'. Beginning with version 23132, the RLINEXT source type can process terrain elevations as does the RLINE source type. **However, when modeling for project level transportation conformity and hot-spot analyses, refer to the EPA's Office of Transportation and Air Quality (OTAQ) for current guidance on how to model and configure roadway sources (<https://www.epa.gov/state-and-local-transportation/project-level-conformity-and-hot-spot-analyses>).**

The syntax, type, and order for the SRCPARAM card for RLINEXT sources are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Rlemis DCL Width Szinit
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Rlemis<sup>3</sup> - roadway source emission rate in g/s/m,
- DCL - distance from the roadway centerline to the center of the source (e.g., the center of the lane of traffic for a one-lane source) in meters,
- Width - width for each source in meters (e.g., for a one lane source, Width would be the width of the lane),
- Szinit - initial vertical dimension of the line source in meters.

All parameters are required for an RLINEXT source type, however, the user may enter "0" for any unused parameters. The RLINEXT source emission rate is in grams/second/meter and the model assumes

that emissions are uniformly distributed across the dimensions of the RLINEXT source. If the keyword RLEMCONV is used on the SO pathway, then the emission units for all RLINEXT sources should be in g/hr/link (see Section 3.3.13).

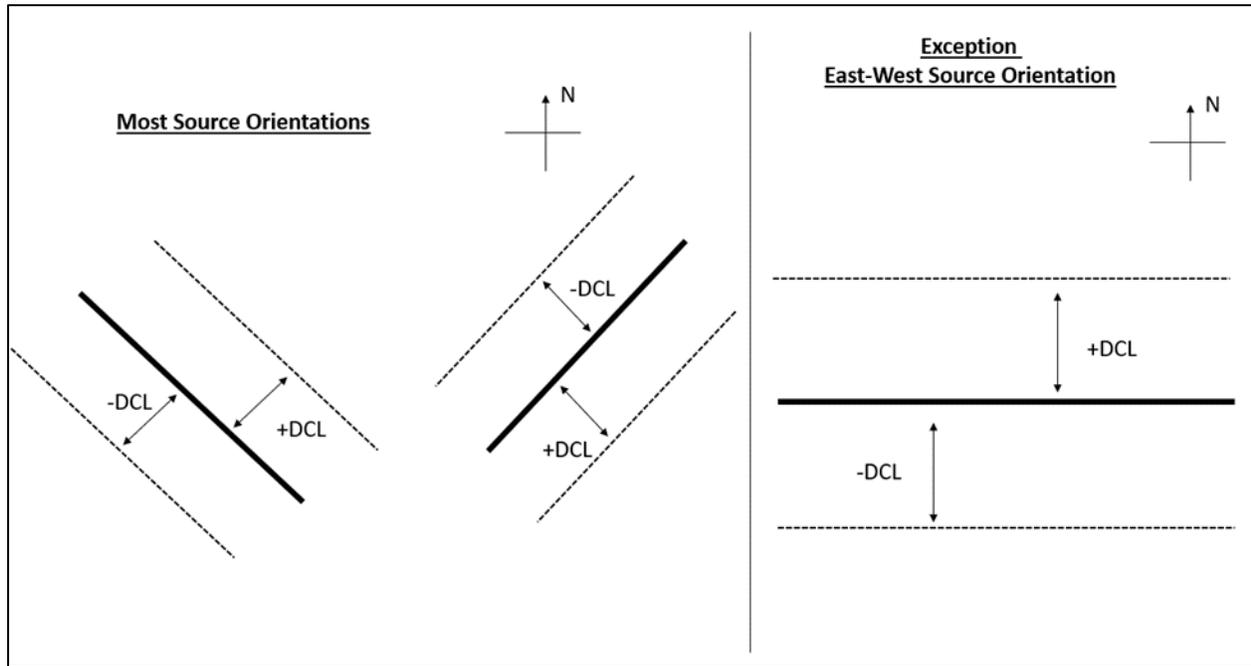

The distance from the centerline (DCL) parameter determines the offset from the roadway centerline for a source representing a single lane of traffic, as shown in Figure 3-2. For example, in the case of a multi-lane, divided highway with traffic travelling in the northbound and southbound directions, the centerline would be defined as the midpoint of the highway median. The DCL would be the perpendicular distance from the midpoint of the median to the midpoint of each source, i.e., middle distance between source end points. If a source is one lane, the DCL would be the distance from the midpoint of the median to the center of the lane. A positive DCL value indicates the source is to the east of the median for a north-south oriented source, or to the north of the median for an east-west oriented source. A negative DCL value means the source is to the west of the median for a north-south oriented source, or to the south of the median for an east-west oriented source.

Most Orientations	(+DCL) Source <b>East</b> of median	(-DCL) Source <b>West</b> of median
Exception: East-West Orientation	(+DCL) Source <b>North</b> of median	(-DCL) Source <b>South</b> of median

DCL can be 0 for lanes of traffic with defined source coordinates, unless the user includes the RDEPRESS keyword, explained below, in which case DCL must represent the distance from the roadway centerline for each individual source. In the multi-lane, divided highway example where each lane is a unique source, each source would have a DCL reflecting the distance from the midpoint of the median to the middle of the individual lane of traffic, with the easternmost-lane having the largest-magnitude positive DCL value and the westernmost-lane having the largest-magnitude negative DCL value.

It should be noted that use of the RDEPRESS keyword requires that all RLINEXT sources have coordinates reflecting the roadway centerline coordinates, and not coordinates representing the individual lane of traffic. DCL with the RDEPRESS keyword must, therefore, define the distance of each source to a

common location. The user may apply similar source characterization to RLINEXT sources without the use of RDEPRESS, so that DCL defines the location of each lane from a common set of coordinates.

**Figure 3-2. Definition of DCL for RLINEXT sources. Dashed lines represent lanes of a roadway with an offset (DCL) from the median (solid line).**

The Width parameter specifies the width of the RLINEXT source (e.g., the width of a lane or multiple lanes, depending on how the source is defined). A warning message is issued if Width is less than zero.

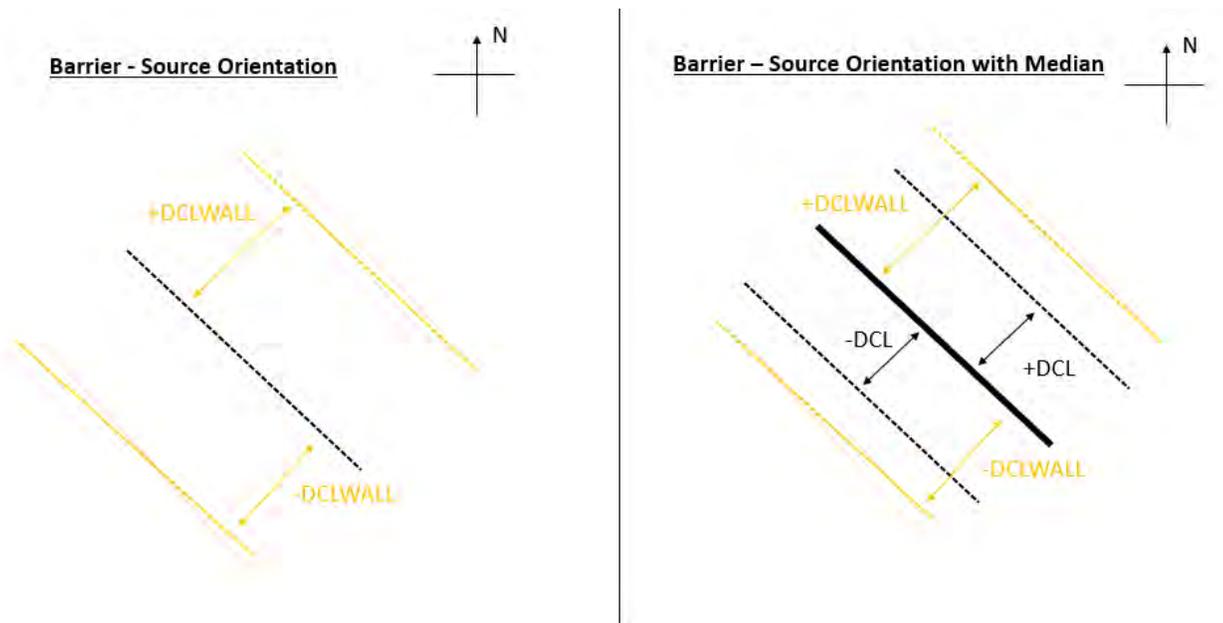

Optionally, RLINEXT sources can also contain source configurations to represent solid barriers or a depressed location. A roadside barrier is specified with the RBARRIER keyword. The syntax, type, and order for the RBARRIER card for RLINEXT sources are summarized below:

<b>Syntax:</b>	SO RBARRIER Srcid Htwall DCLwall (Htwall2 DCLwall2)
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the SRCPARAM card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Htwall - height of the solid barrier (wall) in meters,
- DCLwall - the distance from the centerline of the source to the barrier (wall) in meters,
- Htwall2 - height of a second solid barrier (wall) in meters, if present,
- DCLwall2 - the distance from the centerline of the source to the second barrier (wall) in meters.

RBARRIER inputs should be on opposite sides of the RLINEXT source (DCLwall and DCLwall2). If two RBARRIERs are input that are on the same side of the source, a warning will be issued, the closest of the two barriers will be kept and the other will be ignored.

**Figure 3-3. Definition of DCLWALL for RLINEXT sources. Dashed black lines represent roadway sources and dashed orange lines represent barriers with an offset (DCLWALL). The solid line in the right-hand panel represents the median**

From Figure 3-2, the DCL is defined and the DCLWALL is defined when there is a median. This median DCL is subtracted from the DCLWALL within the RLINE barrier processing, so only the relative distance between each source and wall (barrier) is used when estimating concentrations.

A roadside located in a depression is specified with the RDEPRESS keyword. The syntax, type and order for the RDEPRESS card for RLINEXT sources are summarized below

<b>Syntax:</b>	SO RDEPRESS Srcid Depth Wtop Wbottom
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the SRCPARAM card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

- Depth: depth of the depression in meters (should be negative),
- Wtop: width of the top of the depression containing the RLINE source in meters,
- Wbottom: width of the bottom of the depression containing the RLINE source in meters (must be less than, or equal to, Wtop).

The barrier and depressed roadway source configurations can only be used if the ALPHA flag is present with the MODELOPT keyword in the CO pathway.

Roadside barrier configurations are specified by the height of the barrier (Htwall) and the distance from the centerline to the wall (DCLwall). Currently, there is no limit to the Htwall parameter, but a fatal error message is issued if the height of the barrier is less than zero. If a second barrier is specified with Htwall2 and DCLwall2, this barrier should be on the opposite side of the roadway from barrier 1. Positive values of DCLwall (and DCLwall2) indicate barriers east of the roadway centerline (or north if the roadway runs directly east-west). Negative values indicate barriers west of the roadway centerline (or south if the roadway runs directly east-west).

Depressed roadway dimensions are specified by the Depth parameter, defining the depth of the roadway relative to surrounding terrain, in meters, and the Wtop and Wbottom parameters, defining the widths of the depression top and depression bottom, respectively. The Depth parameter must be a negative value, reflecting a lower elevation than the surrounding terrain. A fatal error is issued if the Depth parameter is greater than zero. A fatal error is issued if either the Wtop or Wbottom parameters are less than zero, or if the specified Wbottom parameter is greater than the Wtop parameter for the source. Wbottom can, however, have a greater value than the width of the roadway, if the inclusion of shoulders or other areas are considered within the depression.

### 3.3.2.11 BUOYLINE source inputs

The syntax, type and order for the SRCPARAM, BLPINPUT, and BLPGROUP cards for a BUOYLINE source are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Blemis Relhgt
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each line input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular line within the buoyant line source, and the other parameters are as follows:

- Blemis - buoyant line emission rate in g/(s) for the individual line,
- Relhgt - average release height of the individual line above ground in meters. Since the original BLP model was developed for elevated sources, a minimum release height of 2.0 m is enforced for the individual buoyant lines when AERMOD processes the buoyant line sources. If a release height less than 2.0 m is detected, AERMOD changes the height to 2.0 meters, issues a warning message, and continues processing.

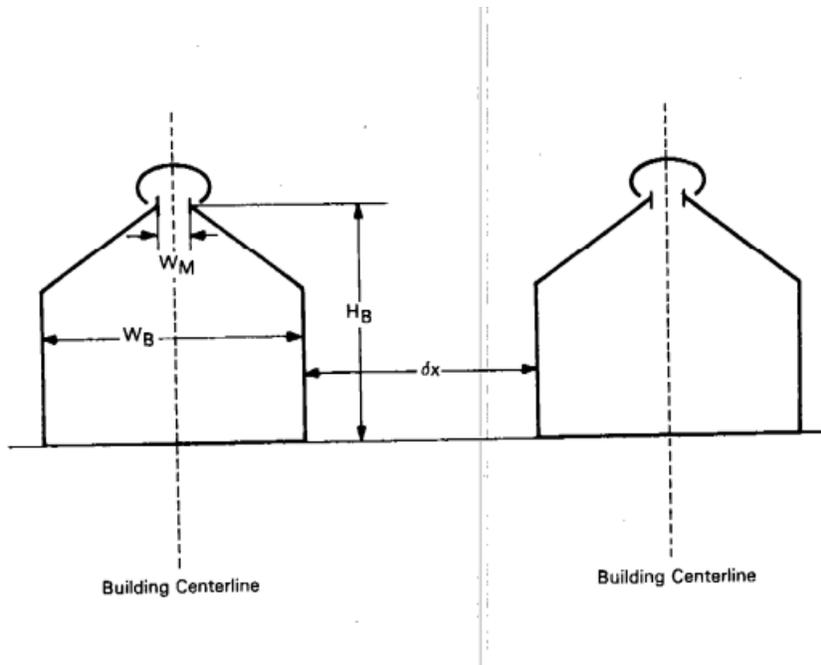

The buoyant line source also requires the user to enter average values representative of a buoyant line source as a whole and not for the individual lines that comprise the buoyant line source.

As of version 21112, the user can specify multiple buoyant line groups (i.e., multiple buoyant line sources) each comprised of individual buoyant lines. Each buoyant line source group (previously referred to as a buoyant line source) requires the user to enter average values representative of the group using the BLPINPUT keyword. The average parameters are applied to the buoyant line group by associating each individual buoyant line with a buoyant line group using the BLPGROUP keyword (described below) through the BLPGrpID. The BLPGrpID is optional on the BLPINPUT keyword *if only one buoyant line group is modeled*. Allowing BLPGrpID to be optional when a single buoyant line group is being modeled lets legacy control files run with AERMOD. These are entered as parameters on the BLPINPUT keyword:

<b>Syntax:</b>	SO BLPINPUT BLPGrpID Blavgblen Blavgbhgt Blavgbwid Blavglwid Blavgbsep Blavgfprm
<b>Type:</b>	Mandatory, Repeatable
<b>Order:</b>	BLPINPUT keywords must appear before the BLPGROUP keywords  The order of the BLPINPUT records and their associated buoyant lines (as defined on the BLPGROUP keywords and linked through the BLPGrpIDs) must be in the same order as the lines on the SO LOCATION records

where the parameters are defined as follows (the order shown is the same as the input in BLP with the variable names used in BLP shown in parentheses):

- BLPGrpID: buoyant line group ID,
- Blavgblen (L): average building length (m),
- Blavgbhgt (HB): average building height (m),
- Blavgbwid (WB): average building width (m),
- Blavglwid (WM): average line source width (m) (of the individual lines),
- Blavgbsep (DX): average building separation (m) (between the individual lines),
- Blavgfprm (FPRIME): average buoyancy parameter ( $m^4/s^3$ ).

When multiple buoyant line groups are in a model run, the order of the individual buoyant lines associated with the BLPINPUT keywords (as defined on the BLPGROUP keywords and linked via the

BLPGrpIDs) in the control file must be in the order of the individual buoyant lines defined by the SO LOCATION keywords. For example, assume a model run consists of SO LOCATION records for a 3-line buoyant line group followed by the SO LOCATION records for a 2-line buoyant line group (i.e., five total individual buoyant lines in two BL groups). The BLPINPUT records for the 3-line group must be specified before the BLPINPUT record for the 2-line group in the control file. If they are in the opposite order, AERMOD will issue an error message and fail to run.

The user should use caution in defining the average buoyancy parameter (FPRIME) above. This parameter should be calculated as in Equation 2-47 of the BLP user guide (Schulman and Scire, 1980), also shown below. The FPRIME parameter is dependent on BUOYLINE parameters listed above and additional source parameters that are not input to AERMOD such as the line source exit velocity and difference in exit and ambient temperatures.

$$FPRIME = \frac{g L W_m w (T_s - T_a)}{T_s}$$

Where:

FPRIME = average line source buoyancy parameter (m<sup>4</sup>/s<sup>3</sup>)

g = acceleration of gravity (9.81 m/s<sup>2</sup>)

L = line source length (m)

W<sub>m</sub> = line source width (m)

w = exit velocity (m/s)

T<sub>s</sub> = exit temperature (°K)

T<sub>a</sub> = ambient air temperature (°K)

Selection and computation of FPRIME should be done with caution and sufficiently justified before being used in an AERMOD BUOYLINE application. Also note, FPRIME should be computed for each line in a BUOYLINE and averaged for all lines in a BUOYLINE source and source group, as suggested in the BLP user guide (Schulman and Scire, 1980).

The BLPGROUP keyword associates one or more individual buoyant lines with a buoyant line group and a corresponding BLPINPUT keyword. To process two or more buoyant line sources this keyword is mandatory; for modeling a single buoyant line source the keyword is optional, i.e., when omitted all individual lines are treated as a single buoyant line source.

Syntax:	SO BLPGROUP BLPGrpID SrcID (or SrcRng) or SO BLPGROUP <u>ALL</u>
Type:	Mandatory, Repeatable
Order:	BLPGROUP keywords must appear after the BLPINPUT keywords

where BLPGrpID identifies a group individual buoyant lines to be treated as a single buoyant line source and the Srcid or Srcrng identifies the group of buoyant lines to be included in the BLP group. As with the SO SRCGROUP card, individual source IDs and source ranges may be used on the same record, and if more than one input record is needed to define the sources for a particular BLP group, then additional records may be input by repeating the pathway, keyword and BLPGrpID. A user can also specify a BLPGrpID of ALL, which means that all the individual line sources are to be treated as a single buoyant line source. There must be one, and only one, associated BLPINPUT record for BLPGrpID ALL. Another constraint for the BLPGROUP keyword is that a buoyant line source cannot be associated with more than one BLPGrpID. When using buoyant line sources in event processing the BLPGRP ID must be equivalent to the SRCGROUP ID, and the source IDs in each must be the same.

**Note: The secondary keyword, ALL, is used in different source grouping contexts (e.g., BLPGROUP, SRCGROUP, OLMGROUP). Refer to the appropriate section of this user’s guide to see the usage of the secondary keyword, ALL, for the group of sources to be identified. For SRCGROUP see Section 3.3.15. For OLMGROUP, see Section 3.3.6.2.**

### 3.3.2.12 SWPOINT source inputs

The SWPOINT source type has been added beginning with version 22112 as a research tool to further study the phenomena researchers have coined as “sidewash” which is a lateral shift of the building wake cavity that forms on the lee side a building that occurs when the wind is oblique to one of the longer sides of an elongated building. Yang et al. (2020) investigated the flow structures and concentration fields under oblique wind conditions. A key finding was that the flow is not only entrained downward (downwash) but also directed by the oblique wind along the building leeward surface (sidewash), which creates a sidewash-downwash (S-D) vortex. This S-D vortex causes the plume to shift in the lateral direction. The use of the SWPOINT source type requires the non-regulatory ALPHA flag to be entered as a model option with the MODELOPT keyword on the CO pathway. The syntax, type and order for the SRCPARAM cards for a SWPOINT source are summarized below:

<b>Syntax:</b>	SO SRCPARAM Srcid Swemis Stkhgt Bw Bl Bh Ba
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each line input

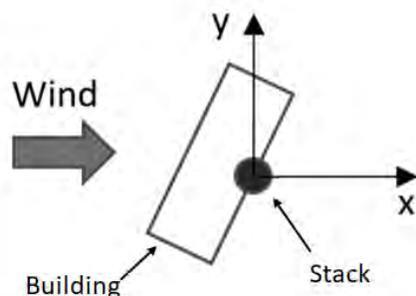

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular SWPOINT source, and the other parameters are as follows:

Swemis	Sidewash point source emission rate in g/s,
Stkhgt	Release height above ground in meters,
Bw	Building width in meters,
Bl	Building length in meters,
Bh	Building height in meters, and
Ba	Building angle in decimal degrees measured clockwise where north is 0 degrees.

As a research tool, the SWPOINT source has a number of limitations in the implementation in version 23132 that need to be highlighted for the user who uses the SWPOINT source type to investigate and study the sidewash effect. These limitations include the following:

- Produces downwind concentrations from short stacks assumed to be centered along the leeward side of elongated buildings. Refer to Figure X below for an illustration of the assumed stack location with respect to the building and wind flow orientation.
- Model concentrations are limited to the building wake cavity. Impacts at receptors outside or in the transition zone from the building wake cavity are not calculated.
- Terrain impacts are not considered.
- Plume rise due to mechanical and thermal buoyancy is not considered.
- Building representation is assumed to be rectangular.
- PRIME downwash is not applied.
- SWPOINT sources have not been configured for use with EVENT processing, NO<sub>x</sub>-to-NO<sub>2</sub> conversion methods, or the MAXDCONT source culpability processing.

- Stack top wind speeds below approximately 2 m/s have been shown to cause anomalously high concentrations. This parameter is quite sensitive and currently can shift from reasonable predicted concentrations to values several orders of magnitude with the adjustment of a few tenths of a meter per second.

**Figure 3-4. Fixed Stack location with respect to Building and Wind Flow Orientation**

### 3.3.3 Specifying gas deposition parameters

#### 3.3.3.1 Source parameters for gas deposition (dry and/or wet)

The input of source parameters for dry and wet deposition of gaseous pollutants is controlled by the GASDEPOS keyword on the SO pathway. The gas deposition variables may be input for a single source or may be applied to a range of sources.

The syntax, type, and order for the GASDEPOS keyword are summarized below:

<b>Syntax:</b>	SO GASDEPOS Srcid (or Srcrng) Da Dw rcl Henry
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid or Srcrng identify the source or sources for which the inputs apply, the parameter Da is the diffusivity in air for the pollutant being modeled ( $\text{cm}^2/\text{s}$ ), Dw is the diffusivity in water for the pollutant being modeled ( $\text{cm}^2/\text{s}$ ), rcl is the cuticular resistance to uptake by lipids for individual leaves ( $\text{s}/\text{cm}$ ), and Henry is the Henry's Law constant ( $\text{Pa m}^3/\text{mol}$ ). Values of the physical parameters for several common pollutants may be found in the appendices to the ANL report (Wesely, et. al, 2002).

As of version 21112, optional default gas deposition parameters (Da, Dw, rcl, Henry) are included for elemental mercury, divalent mercury, dioxins, polycyclic aromatic hydrocarbons (PAH),  $\text{SO}_2$ , and  $\text{NO}_2$ . There are two requirements to use the default gas deposition parameters. First, the POLLUTID keyword

must be set to a specific value, depending on the pollutant (see below). Second, the deposition parameter must be set to a value of 0 in the GASDEPOS keyword. If each parameter is to be a default value, a 0 must be entered for each parameter. The user can also specify a mix of default versus user-entered parameters. For example, the user can specify a value for diffusivity in air with the user entered value and a default value of diffusivity in water by entering a 0. If any default values are used for a particular source, the user will receive a message in the ERRORFIL.

The pollutants, POLLUTID, and default gas deposition parameters used are:

<b>Pollutant</b>	<b>POLLUTID</b>	<b>Diffusivity in air (Da)</b>	<b>Diffusivity in water (Dw)</b>	<b>Cuticular resistance (rcI)</b>	<b>Henry's Law (Henry)</b>
Elemental Mercury	HG0	0.055	6.4E-6	100000	719
Divalent Mercury	HGII	0.045	5.2E-6	100000	0.000072
Dioxin (as TCDD)	TCDD	0.05196	4.39E-6	9.67	1.46
PAH (as BaP)	BAP	0.0513	4.44E-6	0.441	0.046
SO <sub>2</sub>	SO2	0.1122	1.83E-5	732	72
NO <sub>2</sub>	NO2	0.1361	1.4E-5	12000	8444

Note, that for elemental mercury, the third character of the POLLUTID is a zero, not a capital O. The POLLUTID for SO<sub>2</sub> and NO<sub>2</sub> contains a capital O and not a zero.

### 3.3.3.2 Option for specifying the deposition velocity for gas dry deposition

An optional keyword is available on the Control (CO) pathway to allow the user to specify the dry deposition velocity for gaseous emissions. A single dry deposition velocity can be input for a given model run and is used for all sources of gaseous pollutants. Selection of this option will by-pass the algorithm for computing deposition velocities for gaseous pollutants and should only be used when sufficient data to run the algorithm are not available. Results of the AERMOD model based on a user-specified deposition velocity should be used with extra caution.

The syntax and type of the GASDEPVD keyword are summarized below:

<b>Syntax:</b>	CO GASDEPVD Uservd
<b>Type:</b>	Optional, Non-repeatable

where the parameter Uservd is the gaseous dry deposition velocity (m/s). A non-fatal warning message is generated by the model if a value of Uservd greater than 0.05 m/s (5 cm/s) is input by the user. When the GASDEPVD keyword is used, the GDSEASON, GDLANUSE, and GASDEPRF keywords for the CO pathway, and the GASDEPOS keyword for the SO pathway, are no longer applicable and cannot be used in the same model run. As a result, gas wet deposition processes (DEPOS, WDEP, and WETDPLT) cannot be simulated with the GASDEPVD option is used.

### 3.3.4 Specifying source parameters for particle deposition

The AERMOD model includes two methods for handling dry and/or wet deposition of particulate emissions. Method 1 is used when a significant fraction (greater than about 10 percent) of the total particulate mass has a diameter of 10 µm or larger, or when the particle size distribution is known. The particle size distribution must be known reasonably well in order to use Method 1. Method 2 may be used when the particle size distribution is not well known and when a small fraction (less than 10 percent of the mass) is in particles with a diameter of 10 µm or larger. The deposition velocity for Method 2 is calculated as the weighted average of the deposition velocity for particles in the fine mode (i.e., less than 2.5 µm in diameter) and the deposition velocity for the coarse mode (i.e., greater than 2.5 µm but less than 10 µm in diameter). As described in Section 3.2.2.2, use of the Method 2 option is considered a non-DEFAULT option and cannot be used when the DEFAULT keyword is specified.

#### 3.3.4.1 Specifying particle inputs for Method 1

The input of source variables for particle deposition using Method 1 is controlled by three keywords on the SO pathway, PARTDIAM, MASSFRAX, and PARTDENS. These inputs are comparable to the particulate inputs used in the ISCST3 model (EPA,1995a). The particle variables may be input for a single source or may be applied to a range of sources.

The syntax, type and order for these three keywords are summarized below:

<b>Syntax:</b>	SO PARTDIAM Srcid (or Srcrng) Pdiam(i), i=1,Npd SO MASSFRAX Srcid (or Srcrng) Phi(i), i=1,Npd SO PARTDENS Srcid (or Srcrng) Pdens(i), i=1,Npd
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid or Srcrng identify the source or sources for which the inputs apply, and where the Pdiam array consists of the mass-mean aerodynamic particle diameter (microns) for each of the particle size categories, the Phi array is the corresponding mass fractions (between 0 and 1) for each of the categories, and the Pdens array is the corresponding particle density (g/cm<sup>3</sup>) for each of the categories.

The number of particle size categories for a particular source is Npd. The user does not explicitly tell the model the number of categories being input, but if continuation cards are used to specify particle size variables, all inputs of a keyword for a particular source or source range must be contiguous, and the number of categories must agree for each of the three keywords input for a particular source. As many continuation cards as needed may be used to define the inputs for a particular keyword. The model checks the inputs to ensure that the mass fractions sum to 1.0 (within 2 percent) for each source input and issues a warning message if that range is exceeded. The model also ensures that mass fractions for each particle size category are within the proper range (between 0 and 1), and issues fatal error messages for any value exceeded that range.

#### 3.3.4.2 Specifying particle inputs for Method 2

The Method 2 particle information is input through the METHOD\_2 keyword on the SO pathway. The syntax, type, and order for the METHOD\_2 keyword are summarized below:

<b>Syntax:</b>	SO METHOD_2 Srcid (or Srcrng) FineMassFraction Dmm
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid or Srcrng identify the source or sources for which the inputs apply, the parameter FineMassFraction is the fraction (between 0 and 1) of particle mass emitted in the fine mode, less than 2.5 microns, and Dmm is the representative mass-mean aerodynamic particle diameter in microns. Estimated values of fine particle fractions and mass mean diameters for various pollutants are provided in Appendix B of the ANL report (Wesely, et al, 2002).

As of version 21112, optional default Method 2 particle deposition parameters (FineMassFraction and Dmm) are included for arsenic, cadmium, lead, mercury, and polycyclic aromatic hydrocarbons (PAH). There are two requirements to use the default Method 2 particle deposition parameters. First, the POLLUTID keyword must be set to a specific value, depending on the pollutant (see below). Second, the deposition parameter must be set to a value of 0 in the METHOD\_2 keyword. If each parameter is to be a default value, a 0 must be entered for each parameter. The user can also specify a mix of default versus user-entered parameters. For example, the user can specify a value for fine mass fraction with the user entered value and a default value of mean particle diameter by entering a 0. If any default values are used for a particular source, the user will receive a message in the ERRORFIL.

The pollutants, POLLUTID, and default Method 2 particle deposition parameters used are:

Pollutant	POLLUTID	Fine mass fraction	Mean particle diameter (Dmm)
Arsenic	AS	0.75	0.5
Cadmium	CD	0.70	0.6
Lead	PB	0.75	0.5
Mercury	HG	0.80	0.4
PAH (as POC)	POC	0.90	0.1

### 3.3.5 Specifying Emission and Output Units

Since the AERMOD model allows for both concentration and deposition to be output in the same model run, the EMISUNIT keyword (see Section 3.3.13) cannot be used to specify emission unit factors if more than one output type is being generated. The AERMOD model therefore allows for concentration and deposition units to be specified separately through the CONCUNIT and DEPOUNIT keywords, respectively. The syntax and type of the CONCUNIT keyword are summarized below:

<b>Syntax:</b>	SO CONCUNIT Emifac Emilbl Conlbl
<b>Type:</b>	Optional, Non-repeatable

where the parameter Emifac is the factor to convert emission rate input units to the desired output units, Emilbl is the label for the emission input units (up to 40 characters), and Conlbl is the output unit label (up to

40 characters) for concentration calculations. The default conversion is from g/s to  $\mu\text{g}/\text{m}^3$  and the value is  $1 \times 10^6$ . The conversion from g/s to  $\text{mg}/\text{m}^3$  would simply be  $1 \times 10^3$  and the conversion from g/s to ppb is simply the grams/ $\text{m}^3$  to ppb conversion factor for the pollutant. The syntax and type of the DEPUNIT keyword are summarized below:

<b>Syntax:</b>	SO DEPUNIT Emifac Emilbl Deplbl
<b>Type:</b>	Optional, Non-repeatable

where the parameter Emifac is the factor to convert emission rate input units to the desired output units, Emilbl is the label for the emission input units (up to 40 characters), and Deplbl is the output unit label (up to 40 characters) for deposition calculations. The default conversion is g/s to  $\text{g}/\text{m}^2$  and the value is 3600. To convert to units such as  $\text{ng}/\text{m}^2$ , the conversion would be  $3.6 \times 10^{12}$  ( $3600 * 1 \times 10^9$ ) where  $1 \times 10^9$  is the conversion from g to nanograms.

### 3.3.6 Source input parameters for NO<sub>2</sub> conversion options

It should be noted that not all NO<sub>2</sub> conversion options have been implemented for all source types in AERMOD. Table 3-2 summarizes which NO<sub>2</sub> conversion options have been implemented for each of the AERMOD source types and which options have not.

#### 3.3.6.1 Specifying in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios by source for PVMRM, OLM, TTRM/TTRM2, and GRSM

As noted above, the PVMRM, OLM, TTRM/TTRM2, and GRSM options for modeling NO<sub>2</sub> conversion require in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios to be specified for each source, i.e., AERMOD no longer assumes a default in-stack ratio of 0.10 for the OLM option. The user can specify in-stack NO<sub>2</sub>/NO<sub>x</sub> ratios through the optional NO2RATIO keyword on the SO pathway. The syntax of the NO2RATIO keyword is as follows:

<b>Syntax:</b>	SO NO2RATIO SrcID or SrcRange NO2Ratio
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the SrcID or SrcRange identify the source or sources for which the inputs apply, and where the NO2Ratio parameter specifies the in-stack ratio. In this way, the user can specify a single in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio for a group of stacks. For example, the following input:

SO NO2RATIO STACK1-STACK10 0.15
---------------------------------

will apply the in-stack ratio of 0.15 to sources with IDs falling within the range STACK1 to STACK10. Any value specified on the SO NO2RATIO card will override the default ratio, if any, specified on the CO NO2STACK card. Users should note that while SO NO2RATIO is an optional keyword, the PVMRM and OLM options require the user to specify an in-stack NO<sub>2</sub>/NO<sub>x</sub> ratio for each source, using either the CO NO2STACK (Section 3.2.5.4) or SO NO2RATIO cards, or both.

### 3.3.6.2 Specifying combined plumes for OLM

The OLM option for modeling NO<sub>2</sub> conversion includes an option for specifying which sources are to be modeled as combined plumes, i.e., where the NO<sub>x</sub> within the plumes competes for the available ambient ozone. Sources which are not specified for modeling as combined plumes will be modeled as individual plumes, i.e., where all of the ambient ozone is available for conversion of NO to NO<sub>2</sub>. The selection of individual or combined plume option for OLM is specified through the OLMGROUP keyword on the SO pathway. The syntax of the OLMGROUP card is as follows:

<b>Syntax:</b>	SO OLMGROUP OLMGrpID SrcID's and/or SrcRange's or SO OLMGROUP <u>ALL</u>
<b>Type:</b>	Optional, Repeatable (except for OLMGROUP ALL)
<b>Order:</b>	Must follow the LOCATION card for each source input; OLMGROUP ALL must follow the LOCATION card for all sources

where OLMGrpID identifies a group to be treated as a combined plume with OLM, and the SrcID's and/or SrcRange's identify the sources to be included in the OLM group. As with the SO SRCGROUP card, individual source IDs and source ranges may be used on the same record, and if more than one input card is needed to define the sources for a particular OLM group, then additional records may be input by repeating the pathway, keyword and OLM group ID. A user can also specify an OLMGrpID of ALL, which means that OLM will be applied on a combined plume basis to all sources. However, unlike the SO SRCGROUP card, the results will not be output for a specific OLM group unless the same group of sources is also identified on a SRCGROUP card. Another constraint for the OLMGROUP keyword is that a source cannot be included in more than one OLM group.

**Note: The secondary keyword, ALL, is used in different source grouping contexts (e.g., BLPGROUP, SRCGROUP, OLMGROUP). Refer to the appropriate section of this user's guide to see**

**the usage of the secondary keyword, ALL, for the group of sources to be identified. For SRCGROUP see Section 3.3.15. For BLPGROUP, see Section 3.3.2.11.**

If a source is not selected for an OLMGROUP card, then OLM will be applied to that source as an individual plume. Other than the similarity in syntax, there is no connection in the model between the groups defined on the OLMGROUP card and groups defined on the SRCGROUP card. The OLMGROUP card relates to how the results are processed within the model for the OLM option, and the SRCGROUP card simply controls how source impacts are grouped in the model outputs.

If the user identifies one or more groups of sources to apply OLM on a combined plume basis using the OLMGROUP card, the model will still need to calculate the concentration for individual plumes within the OLM group in order for the model to sum the results for the sources listed on the SRCGROUP card(s). The individual source concentrations are calculated by applying the ratio of the combined concentration for the OLM group with and without OLM to each source within the OLM group.

### 3.3.6.3 Specifying ambient NO<sub>2</sub>/NO<sub>x</sub> ratios for the ARM2 option

The ARM2 option in AERMOD is based on applying an ambient ratio of NO<sub>2</sub>/NO<sub>x</sub> to a modeled NO<sub>x</sub> concentration to estimate ambient NO<sub>2</sub> concentrations. The ARM2 option applies an ambient ratio to the 1-hr modeled NO<sub>x</sub> concentrations based on a formula derived empirically from ambient monitored ratios of NO<sub>2</sub>/NO<sub>x</sub>. The default upper and lower limits on the ambient ratio applied to the modeled NO<sub>x</sub> concentration are 0.9 and 0.5, respectively. These limits can be modified using the optional ARMRATIO on the CO pathway as follows:

<b>Syntax:</b>	CO ARMRATIO ARM2_Min ARM2_Max
<b>Type:</b>	Optional, Non-Repeatable

When the regulatory DFAULT keyword is included on the MODELOPT line, the allowed range for the ARM2 ratio represented by ARM2\_Min and ARM2\_Max is 0.5 to 0.9, respectively. When the DFAULT keyword is not included, the allowed range is extended to a lower limit greater than 0 to an upper limit of 1.0.

### 3.3.7 Modeling NO<sub>2</sub> increment credits with PVMRM

Due to the ozone limiting effects of the PVMRM option, the predicted concentrations of NO<sub>2</sub> are not linearly proportional to the emission rate. Therefore, the approach of modeling NO<sub>2</sub> increment consumption with PSD credits through the use of a negative emission rate for credit sources cannot be used with the PVMRM option. However, the ALPHA PSDCREDIT option allows modeling PSD increment credits for NO<sub>2</sub> when the PVMRM option is specified. The PSDCREDIT option is currently implemented as an ALPHA option and requires that the PVMRM and ALPHA options be specified on the CO MODELOPT card (see Section 3.2.2). **As an ALPHA option, PSDCREDIT requires additional testing and evaluation before it should be considered for use in a regulatory application.** The PSDCREDIT option utilizes a the PSDGROUP keyword, described below, to identify which sources consume or expand increment. This option is not valid if the OLM, TTRM/TTRM2, or GRSM option is specified, and no comparable option is available for modeling increment credits with the any of those options. The user should check with the appropriate reviewing authority for further guidance on modeling increment credits for NO<sub>2</sub>.

A general discussion of concepts related to modeling increment consumption is provided below, followed by a description of inputs required to use the ALPHA PSDCREDIT option for PVMRM.

#### 3.3.7.1 Increment consuming and baseline sources

Increment is the maximum allowable increase in concentration of a pollutant above a baseline concentration for an area defined under the Prevention of Significant Deterioration (PSD) regulations. The PSD baseline area can be an entire State or a subregion of a State such as a county or group of counties. Increment consumption is the additional air quality impact above a baseline concentration.

The baseline concentration is the ambient concentration of the pollutant that existed in the area at the time of the submittal of the first complete permit application by any source in that area subject to PSD regulations. A baseline source is any source that existed prior to that first application and the baseline date is the date of the PSD application. This baseline date is referred to as the minor source baseline date in PSD regulations. By definition, baseline sources do not consume increment. However, any baseline source that retires from service after the baseline date expands the increment available to new sources. Therefore, a PSD modeling analysis performed for a new source may need to account for this increment expansion. Such an analysis may therefore involve identification of three groups of sources: 1) increment-consuming sources; 2) retired (increment-expanding) baseline sources; and 3) existing, non-retired, baseline sources.

### 3.3.7.2 Calculating increment consumption under the PSDCREDIT option

Calculating increment consumption under the PSDCREDIT option in AERMOD is not a simple arithmetic exercise involving the three groups of sources defined above. Since the amount of ozone available in the atmosphere limits the conversion of NO to NO<sub>2</sub>, interactions of plumes from the existing and retired baseline sources with those from the increment consuming sources must be considered as part of the calculation of net increment consumption. Without the PSDCREDIT option, properly accounting for the potential interaction of plumes among the different source categories would require post-processing of results from multiple model runs. Internal “post”-processing algorithms have been incorporated in AERMOD under the PSDCREDIT option to account for the apportioning of the three groups of sources to properly calculate increment consumption from a single model run.

Define the following three source groupings for the discussion that follows:

- A** = increment-consuming sources;
- B** = non-retired baseline sources; and
- C** = retired baseline, increment-expanding sources.

The calculation of the amount of increment consumption by the **A** sources cannot simply be estimated by modeling the **A** sources alone because of the possible interaction of those plumes with the plumes from **B** sources. The PVMRM algorithm is designed to account for such plume interactions and calculate the total NO to NO<sub>2</sub> conversion in the combined plumes based on the amount of ozone available. Therefore, the total increment consumption by the **A** sources is given by the difference between (1) the total future impact of increment consuming sources and non-retired baseline sources (**A+B**) and (2) the total current impact (**B**), which can be expressed as  $(\mathbf{A+B}) - (\mathbf{B})$ . Here (**A+B**) represents the value that would be compared against the National Ambient Air Quality Standard (NAAQS) for NO<sub>2</sub> during PSD review of the **A** sources.

In a case where some of the baseline sources have been retired from service (**C** sources), the PSD regulations allow the consideration of increment expansion when assessing compliance with the PSD increment. However, the amount of increment expansion cannot be estimated by simply modeling the **C** sources alone because of the possible interaction of those plumes with the plumes from **B** sources. Therefore, the total increment expansion, i.e., PSD credit, is calculated as the difference between (1) the total impact prior to the retirement of **C** sources, i.e., (**B+C**), and (2) the total impact from existing (non-retired) baseline sources (**B**), which can be expressed as  $(\mathbf{B+C}) - (\mathbf{B})$ .

Finally, the net increment consumption is given by the difference between total increment consumption and the total increment expansion, or

$$[(\mathbf{A}+\mathbf{B}) - (\mathbf{B})] - [(\mathbf{B}+\mathbf{C}) - (\mathbf{B})] \quad \text{(Equation 1)}$$

Note that in the absence of any increment expansion, the net increment consumption is equal to the total increment consumption  $[(\mathbf{A}+\mathbf{B}) - (\mathbf{B})]$ , as described above.

These expressions of net increment consumption and expansion cannot be interpreted as algebraic equations. Instead, the terms within parentheses represent the results of separate model runs that account for the combined effects of NO<sub>x</sub> conversion chemistry on specific groups of sources. The expression shown in Equation 1 above represents four model simulations:  $(\mathbf{A}+\mathbf{B})$ ,  $(\mathbf{B})$ ,  $(\mathbf{B}+\mathbf{C})$ , and  $(\mathbf{B})$  again. In this case, the two  $(\mathbf{B})$  terms do cancel each other, and we are left with:

$$[(\mathbf{A}+\mathbf{B})] - [(\mathbf{B}+\mathbf{C})] \quad \text{(Equation 2)}$$

The expression presented in Equation 2 summarizes how the net increment consumption calculation is performed under the PSDCREDIT option. Under this option, AERMOD first models the **A** and **B** groups together, then models the **B** and **C** groups together, and finally computes the difference to obtain the desired result, i.e., the value to compare to the PSD increment standard. For AERMOD to perform the special processing associated with this option, the user must define which sources belong to each of the groupings defined above. The next section describes how this is accomplished.

### 3.3.7.3 Specifying source groups under the PSDCREDIT option

The PSDCREDIT option introduces limitations on grouping sources to calculate increment consumption as described in the previous section. A new keyword, PSDGROUP, is used to group the sources to correctly calculate the increment consumption. The syntax, type, and order are similar to the regular SRCGROUP keyword and are summarized below:

<b>Syntax:</b>	SO PSDGROUP Grpid Srcid's and/or Srcrng's
<b>Type:</b>	Mandatory for PSDCREDIT option, Repeatable
<b>Order:</b>	Must follow the last keyword in the SO pathway before FINISHED

If the PSDCREDIT model option is specified, the PSDGROUP keyword must be used. The SRCGROUP keyword cannot be used with the PSDCREDIT option since results from other groupings beyond these three do not have any meaning when the PSDCREDIT option is invoked, and sources are allocated to the calculation of increment consumption. Special source groups for outputting model results are defined within AERMOD for the PSDCREDIT option, as described in the next section.

Only the following special PSD group ID's can be used. Failure to use these group ID's will result in a fatal error message during setup processing by AERMOD. The group ID's are:

- INCRCONS – increment-consuming sources (group **A** above); these can be new sources or modifications to existing sources;
- NONRBASE – existing, non-retired baseline sources (group **B** above); and
- RETRBASE – retired (increment-expanding or PSD credit) baseline sources (group **C** above).

It is important to note that the source emission inputs for sources included in the RETRBASE PSD group must be entered as positive numbers, unlike other types of PSD credit modeling where negative emissions are input to simulate the impact of the credit sources on the increment calculation. The increment-expanding contribution from RETRBASE sources is accounted for within the AERMOD model under the PSDCREDIT option.

The group ID's can appear in any order, but these are the only three that can be specified. If there are no retired baseline sources (i.e., no baseline sources are retired), the keyword RETRBASE can be omitted. Likewise, if there are no non-retired baseline sources (i.e., all baseline sources have been retired), the NONRBASE keyword can be omitted. The special group ID 'ALL' that can be used with the SRCGROUP keyword **cannot** be used with the PSDGROUP keyword. As with the SRCGROUP keyword for non-PSDCREDIT applications, the group IDs are repeatable, and they must be the last keyword before FINISHED on the SO pathway when the PSDCREDIT option is specified.

Source ranges, which are described in more detail in Section 3.3.9, are input as two source IDs separated by a dash, e.g., STACK1-STACK10. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to define the sources for a particular group, then additional cards may be input, repeating the pathway, keyword and group ID. A source can appear in only one of these source groups and must be assigned to one of the groups.

The requirements for specifying sources and source groups under the PSDCREDIT option are summarized below:

- The SRCGROUP keyword cannot be used with the PSDCREDIT option;
- Special PSD group ID's must be used with the PSDGROUP keyword;
- The group ID ALL is not allowed when the PSDCREDIT option is specified;
- A source must appear in one, and only one, of the PSDGROUPs; and
- Emission rates for increment-expanding (RETRBASE) sources must be entered as positive values.

#### 3.3.7.4 Model outputs under the PSDCREDIT option

Unlike the regular SRCGROUP keyword, the PSDGROUP keyword does not define how the source impacts are grouped for model output. As described in the previous sections, the PSDGROUP keyword defines the different categories of sources needed, in order to properly account for NO<sub>x</sub> conversion chemistry under the PVMRM option.

The model outputs under the PSDCREDIT option in AERMOD are based on demonstrating compliance with the air quality standards, i.e., the NAAQS and PSD increment for NO<sub>2</sub>. As a result, AERMOD uses hardcoded "SRCGROUP" names of 'NAAQS' and 'PSDINC' to label these two types of outputs. The results output under the 'NAAQS' source group label are based on the calculation of (A+B) as described above in Section 3.3.7.2. The results reported under the 'PSDINC' source group label are based on the expression presented above in Equation 2.

#### 3.3.8 Background concentrations

Beginning with version 11059, users can specify uniform or temporally varying background concentrations using the BACKGRND keyword on the SO pathway and beginning with version 13350 users can vary background concentrations by wind sector. Background concentrations can be included with any source group to estimate cumulative ambient impacts. Background concentrations can be specified using a range of options, similar to those available with the EMISFACT keyword for source emissions, or on an hourly basis from a separate data file.

### 3.3.8.1 Defining background concentration sectors

For applications where multiple ambient monitors outside of the modeling domain are available and representative of background concentrations within the modeling domain depending on the wind direction, the user may define sector-varying background concentrations. The sectors are defined based on the SO BGSECTOR keyword, as follows:

<b>Syntax:</b>	SO BGSECTOR StartSect1 StartSect2 . . . StartSectN, where $N \leq 6$
<b>Type:</b>	Optional, Non-Repeatable

3.3.8.2 For applications that include sector-varying background concentration the minimum sector width allowed is 30 degrees and warning messages will be issued for sector widths less than 60 degrees. Sector-varying background concentrations will be selected based on the flow vector, i.e., the downwind direction, based on the wind direction specified in the surface meteorological data file. During periods of specific wind directions, the associated user input sector-varying background concentrations will be applied to the entire modeling domain (i.e., all receptors). Specifying the background concentration

For applications that do not include sector-varying background concentrations, the syntax of the BACKGRND keyword is as follows:

<b>Syntax:</b>	SO BACKGRND BGflag BGvalue(i), $i=1,n$ and/or SO BACKGRND <u>HOURLY</u> BGfilnam (BGformat)
<b>Type:</b>	Optional, Repeatable

where the BGflag parameter is the variable background concentration flag, BGvalue is the array of background concentration values associated with BGflag, HOURLY indicates use of an hourly background file, BGfilnam is the filename for the hourly background data, and BGformat is the optional Fortran format of the hourly background file ('free' format is used by default). The BGfilnam can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (") at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces.

For applications that include sector-varying background concentrations, the syntax of the BACKGRND keyword is as follows:

<b>Syntax:</b>	SO BACKGRND SECTx BGflag BGvalue(i), $i=1$ , and $x \leq 6$ and/or SO BACKGRND SECTx <u>HOURLY</u> BGfilnam (BGformat), where $x \leq 6$
----------------	---

<b>Type:</b> Optional, Repeatable
-----------------------------------

where the SECTx parameter identifies the applicable sector as defined on the SO BGSECTOR keyword. Implement as SECT1 or SECT2 ...or SECTx where  $x \leq 6$ , and x is an integer and corresponds to the Nth sector defined by BGSECTOR. The other parameters are as defined above.

The HOURLY background file must include the year, month, day, and hour, followed by the background concentration, in that order (unless specified differently through the BGformat parameter). The year can be specified as either a 2-digit or 4-digit year. If an optional Fortran format is specified using the BGformat parameter, the year, month, day, and hour variables must be read as integers using the Fortran I format, and the background concentration must be read as a real variable, using the Fortran F, E, or D format, e.g., (4I2,F8.3). Note that background values that do not include decimal places can be read as Fx.0, where x is the length of the data field. The BGformat parameter must include the open and close parentheses as shown in the example and may also include embedded spaces if double quotes (“”) are used to delimit the field. A warning message will be generated if the specified format does not meet these requirements, and AERMOD may also issue a fatal error message when reading the file in cases where real variables are read with an integer format, or vice versa.

If the optional BGformat parameter is missing, then the model will read the background data using a Fortran ‘free’ format, i.e., assuming commas or spaces separate the data fields, and that the fields are in the order given above. The date sequence in the background data file must also match the date sequence in the hourly meteorological data files.

Note that the HOURLY option and an option to specify values based on the BGflag parameter can both be specified in the same model run. This allows the user to specify background concentrations on a temporally varying basis, such as SEASHR, that can be used to substitute for missing values in an hourly background file. **NOTE: AERMOD will issue a fatal error message and abort processing if missing data are encountered in an HOURLY background file unless the user provides other temporally varying background concentrations (e.g., SEASHR, etc.) to substitute for missing data.** Background concentration units can be specified using the BACKUNIT keyword, described below. If the BACKUNIT keyword is omitted, default units of PPB are assumed for background NO<sub>2</sub> and SO<sub>2</sub>, PPM for CO, and UG/M3 for all other pollutants. Background concentrations specified in units of PPB or PPM are converted to UG/M3 based on reference temperature (25 C) and pressure (1013.25 mb).

To include background concentrations with a particular source group, the reserved “source ID” of BACKGROUND (or BACKGRND) can be included on the SRCGROUP keyword, including source group ALL. **NOTE: AERMOD will NOT automatically include background concentrations in source group ALL, but the user can specify that background be included in results for group ALL by including the BACKGROUND (or BACKGRND) keyword after ‘ALL’ on the SRCGROUP keyword.** Users can also include the NOBACKGROUND (or NOBACKGRND) keyword after ‘ALL’ on the SRCGROUP keyword to explicitly indicate that BACKGROUND is NOT included with group ‘ALL.’ The contribution of background concentrations can also be tracked separately by including a source group with BACKGROUND as the only “source ID.” **NOTE: The source of background concentrations and the method used to incorporate background concentrations in a cumulative impact assessment involves several considerations and should be documented and justified on a case-by-case basis.**

Background concentrations specified with the BACKGRND keyword are combined with source impacts on a temporally paired basis to estimate cumulative ambient impacts. However, since modeled concentrations are not calculated for hours with calm or missing meteorological data, background concentrations are also omitted for those hours. This may result in the background contribution being lower than expected for short-term averages of 3-hours up to 24-hours for periods when the denominator used to calculate the multi-hour average is adjusted in accordance with EPA’s calms policy (see Section 8.4.6.2 of the Guideline, EPA, 2017b), which is implemented within the AERMOD model. Section 8.4.6.2 of the Guideline states:

“Model predicted concentrations for 3-, 8-, and 24-hour averages should be calculated by dividing the sum of the hourly concentrations for the period by the number of valid or non-missing hours. If the total number of valid hours is less than 18 for 24-hour averages, less than 6 for 8-hour averages, or less than 3 for 3- hour averages, the total concentration should be divided by 18 for the 24-hour average, 6 for the 8-hour average, and 3 for the 3-hour average. For annual averages, the sum of all valid hourly concentrations is divided by the number of non-calm hours during the year.”

For example, if 12 hours out of a 24-hour period are calm or missing, the calms policy dictates that the 24-hour average concentration would be based on the sum of the 12 non-calm/non-missing hours divided by 18. The contribution from background concentrations would also be based on the sum of background values for the 12 non-calm/non-missing hours, divided by 18. If background was specified as uniform during that 24-hour period, then the contribution from background would appear to be 33.3% lower than expected (i.e., 12/18).

The BGflag parameter must be specified as one of the following secondary keywords (the number in parentheses indicates the number of values required for each option):

- ANNUAL - annual background value (n=1),
- SEASON - background values vary seasonally (n=4),
- MONTH - background values vary monthly (n=12),
- HROFDY - background values vary by hour-of-day (n=24),
- WSPEED - background values vary by wind speed (n=6),
- SEASHR - background values vary by season and hour-of-day (n=96),
- HRDOW - background values vary by hour-of-day, and day-of-week [M-F, Sat, Sun] (n=72),
- HRDOW7 - background values vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=168),
- SHRDOW - background values vary by season, hour-of-day, and day-of-week [M-F, Sat, Sun] (n=288),
- SHRDOW7 - background values vary by season, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=672),
- MHRDOW - background values vary by month, hour-of-day, and day-of-week [M-F, Sat, Sun] (n=864), and
- MHRDOW7 - background values vary by month, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=2,016).

The seasons are defined in the following order: Winter (Dec., Jan., Feb.), Spring (Mar., Apr., May), Summer (Jun., Jul., Aug.), and Fall (Sep., Oct., Nov.).<sup>4</sup> The wind speed categories used with the WSPEED option may be defined using the ME WINDCATS keyword. If the WINDCATS keyword is not used, the default wind speed categories are defined by the upper bound of the first five categories as follows (the sixth category is assumed to have no upper bound): 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The BACKGRND keyword may be repeated as many times as necessary to input all of the background values and repeat values may be used for the numerical inputs, e.g., 12\*25.6 can be used to specify a value of 25.6 for 12 adjacent “cells” within the array of values.

---

4 Note that the seasons are based on northern hemisphere seasons. For applications in the southern hemisphere using the seasonal factors (SEASHR, SHRDOW, and SHRDOW7), background concentrations that would be associated with the southern hemisphere winter, for example, should be assigned to the summer seasonal background concentrations input to AERMOD. Similarly, spring southern hemisphere concentrations should be assigned to the fall season background concentrations input to AERMOD.

### 3.3.8.3 Specifying background concentration units

Background concentration units can be specified on the optional BACKUNIT keyword on the SO pathway. The syntax of the BACKUNIT keyword is as follows:

<b>Syntax:</b>	SO BACKUNIT BGUnits
<b>Type:</b>	Optional, Non-repeatable

where the BGUnits parameter specifies the units as parts-per-billion (PPB), parts-per-million (PPM), or micrograms/cubic-meter (UG/M3). Units specified on the BACKUNIT keyword are applied to HOURLY and temporally varying background values if both are included in the same model run. If the BACKUNIT keyword is omitted, default units of PPB are assumed for background NO<sub>2</sub> and SO<sub>2</sub>, PPM for CO, and UG/M3 for all other pollutants. Background

concentrations specified in units of PPB or PPM are converted to UG/M3 based on reference temperature (25 C) and pressure (1013.25 mb). NOTE: When using the BACKUNIT keyword, PPB and PPM may only be used with the NO<sub>2</sub>, SO<sub>2</sub>, and CO POLLUTID. AERMOD will issue a fatal error if PPB and PPM are used with any other pollutant types. Use micrograms/cubic-meter (UG/M3) when specifying any other pollutant type.

### 3.3.9 Specifying building downwash information

As noted above, the AERMOD model include algorithms to model the effects of buildings downwash on emissions from nearby or adjacent point sources. The building downwash algorithms do not apply to volume or area sources. For a technical description of the building downwash algorithms in AERMOD, the user is referred to Schulman, et. al. (2000). The AERMOD model uses direction-specific information for all building downwash cases.

There are five keywords that are used to specify building downwash information: BUILDHGT, BUILDWID, BUILDLN, XBADJ, YBADJ. The syntax, type and order for the BUILDHGT keyword, used to input direction specific building heights, are summarized below:

<b>Syntax:</b>	SO BUILDHGT Srcid (or Srcrng) Dsbh(i),i=1,36 (16 for LT)
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source. The user also has the option of specifying a range of sources (the Srcrng parameter) for which the building heights apply, instead of identifying a single source. This is accomplished by two source ID character strings separated by a dash, e.g., STACK1-STACK10. Since the model reads the source range as a single input field there must not be any spaces between the source IDs. The model then places the building heights that follow (the Dsbh(i) parameter) into the appropriate arrays for all Srcid's that fall within that range, including STACK1 and STACK10.

When comparing a source ID to the range limits for a Srcrng parameter, the model separates the source IDs into three parts: an initial alphabetical part, a numerical part, and then the remainder of the string. Each part is then compared to the corresponding parts of the source range, and all three parts must satisfy the respective ranges for the source ID to be included. If there is no numeric part, then the ID consists of only one alphabetical part. If the ID begins with a numeric character, then the initial alphabetical part defaults to a single blank. If there is no trailing alphabetical part, then the third part also defaults to a single blank part. If the trailing part consists of more than one alphabetical or numeric field, it is all lumped into one-character field. For example, the source ID 'STACK2' consists of the parts 'STACK' plus '2' plus a single trailing blank, ' '. By comparing the separate parts of the source IDs, it can be seen that STACK2 falls between the range 'STACK1-STACK10.' For a three-part example, it can also be seen that VENT1B falls within the range of VENT1A-VENT1C. However, VENT2 does not fall within the range of VENT1A to VENT3B, since the third part of VENT2 is a single blank, which does not fall within the range of A to C. This is because a blank character will precede a normal alphabetical character. Normally, the source ranges will work as one would intuitively expect for simple source names. Most importantly, for names that are made up entirely of numeric characters, the source ranges will be based simply on the relative numerical values. The user is strongly encouraged to check the summary of model inputs to ensure that the source ranges were interpreted as expected and to avoid using complex source names in ranges, such as AA1B2C-AB3A3C. Since the order of keywords within the SO pathway is quite flexible, it is also important to note that the building heights will only be applied to those sources that have been defined previously in the input file.

Following the Srcid or the Srcrng parameter, the user inputs 36 direction-specific building heights (Dsbh parameter) in meters, beginning with the 10-degree flow vector (wind blowing toward 10 degrees

from north), and incrementing by 10 degrees in a clockwise direction. Some examples of building height inputs are presented below:

```
SO BUILDHGT STACK1 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34.
SO BUILDHGT STACK1 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34.
SO BUILDHGT STACK1 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34. 34.

SO BUILDHGT STACK1 36*34.0

SO BUILDHGT STACK1-STACK10 33*34.0 3*0.0

SO BUILDHGT STACK1 35.43 36.45 36.37 35.18 32.92 29.66 25.50 20.56
SO BUILDHGT STACK1 15.00 20.56 25.50 29.66 32.92 35.18 36.37 36.45
SO BUILDHGT STACK1 35.43 33.33 35.43 36.45 0.00 35.18 32.92 29.66
SO BUILDHGT STACK1 25.50 20.56 15.00 20.56 25.50 29.66 32.92 35.18
SO BUILDHGT STACK1 36.37 36.45 35.43 33.33
```

The first example illustrates the use of repeat cards if more than one card is needed to input all of the values. The values are processed in the order in which they appear in the input file and are identified as being repeat cards by repeating the Srcid parameter. The first and second examples produce identical results within the model. The second one illustrates the use of a repeat value that can simplify numerical input in some cases. The field "36\*34.0" is interpreted by the model as "repeat the value 34.0 a total of 36 times." This is also used in the third example where the building height is constant for directions of 10 degrees through 330 degrees, and then is set to 0.0 (e.g., the stack may be outside the region of downwash influence) for directions 340 through 360. The third example also uses a source range rather than a single source ID. The last example illustrates building heights which vary by direction and shows that the number of values on each card need not be the same. For improved readability of the input file, the user may want to put the numerical inputs into "columns," but there are no special rules regarding the spacing of the parameters on this keyword.

The BUILDWID keyword is used to input direction-specific building widths for downwash analyses. The syntax for this keyword, which is very similar to the BUILDHGT keyword, is summarized below, along with the type and order information:

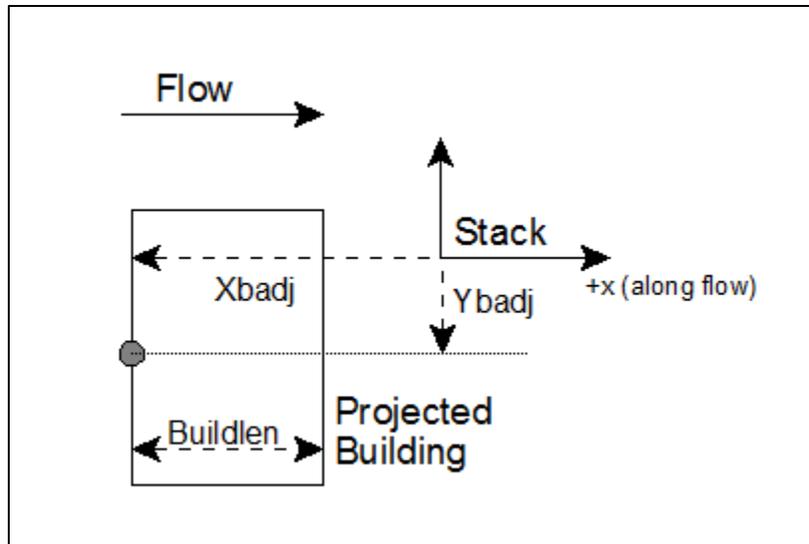

<b>Syntax:</b>	SO BUILDWID Srcid (or Srcrng) Dsbw(i),i=1,36	(16 for LT)
<b>Type:</b>	Optional, Repeatable	
<b>Order:</b>	Must follow the LOCATION card for each source input	

For a description of the Srcid and Srcrng parameters, and for a discussion and examples of the numeric input options, refer to the BUILDHGT keyword above. The Dsbw(i) parameter contains the 36 direction-specific building widths. The directions proceed in a clockwise direction, beginning with the 10-degree flow vector.

The BUILDLEN keyword is used to input direction-specific along-flow building lengths for downwash analyses. Figure 3-3 shows the relationship of the projected building to this dimension. The syntax for this keyword, which is very similar to the BUILDHGT keyword, is summarized below, along with the type and order information:

<b>Syntax:</b>	SO BUILDLEN Srcid (or Srcrng) Dsbl(i),i=1,36
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

For a description of the Srcid and Srcrng parameters, and for a discussion and examples of the numeric input options, refer to the BUILDHGT keyword above. The Dsbl(i) parameter contains the 36 direction-specific building lengths. The directions proceed in a clockwise direction, beginning with the 10-degree flow vector. Figure 3-3 shows the relationship of the projected building to these distances.

**Figure 3-5. Schematic Diagram Identifying New Building Data for Prime Downwash**

The XBADJ and YBADJ keywords are used to input direction-specific along-flow and across-flow distances from the stack to the center of the upwind face of the projected building, respectively. Figure 3-2 shows the relationship of the projected building to these distances. The syntax for these keywords, which is very similar to the BUILDHGT keyword, are summarized below, along with the type and order information:

<b>Syntax:</b>	SO XBADJ Srcid (or Srcrng) Xbadj(i),i=1,36
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

<b>Syntax:</b>	SO YBADJ Srcid (or Srcrng) Ybadj(i),i=1,36
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

For a description of the Srcid and Srcrng parameters, refer to the BUILDHGT keyword above. The Xbadj(i) parameter contains the 36 direction-specific along-flow distances from the stack to the center of the upwind face and the Ybadj(i) parameter contains the 36 direction-specific across-flow distances from the stack to the center of the upwind face. The directions proceed in a clockwise direction, beginning with the 10-degree flow vector.

### 3.3.10 Specifying urban sources

As discussed in Section 3.2.8, the AERMOD model allows the user to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions. The user specifies the parameters for one or more urban areas on the CO URBANOPT card (see Section 3.2.8), and identifies which sources are to be modeled with urban effects and the urban area that will apply to each source affected using the SO URBANSRC card. If a source is not included on the URBANSRC card, it will be modeled without the urban effects. The syntax, type and order for the URBANSRC keyword are summarized below:

	<b><u>For Multiple Urban Areas:</u></b> SO URBANSRC UrbanID SrcID's and/or SrcRng's
<b>Syntax:</b>	<b><u>For Single Urban Areas:</u></b> SO URBANSRC SrcID's and/or SrcRng's or SO URBANSRC ALL (to specify all sources as URBAN)
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the UrbanID parameter is the alphanumeric urban ID (up to eight characters) defined by the user on the CO URBANOPT keyword when multiple urban areas are defined, and the SrcID's and SrcRng's are the individual source IDs and/or source ID ranges that are to be modeled with urban effects. Source ranges are described in more detail in Section 3.3.9. As with the URBANOPT keyword, the syntax of the URBANSRC keyword for applications with single urban areas has not changed from the previous version of AERMOD, so that existing input files will not require modification. However, beginning with version 12060, users can specify that all sources are to be treated as urban sources by specifying 'ALL' on the SO URBANSRC keyword for applications with a single urban area. Since the URBANSRC ALL option is identified during the pre-SETUP phase, there are no restrictions on the order of the URBANSRC ALL keyword within the SO pathway.

### 3.3.11 Specifying variable emission factors (EMISFACT)

The AERMOD model provides the option of specifying variable emission rate factors for individual sources or for groups of sources. The syntax, type and order of the EMISFACT keyword are summarized below:

<b>Syntax:</b>	SO EMISFACT SrcID or SrcRange Qflag Qfact(i), i=1,n
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the SrcID parameter is the same source ID that was entered on the LOCATION card for a particular source. The user also has the option of using the SrcRange parameter for specifying a range of sources for which the emission rate factors apply, instead of identifying a single source. This is accomplished by two source ID character strings separated by a dash, e.g., STACK1-STACK10. The use of the SrcRange parameter is explained in more detail in the description of the BUILDHGT keyword (see Section 3.3.9).

The parameter Qflag is the variable emission rate flag, and must be specified as one of the following secondary keywords (the number in parentheses indicates the number of values required for each option):

- SEASON - emission rates vary seasonally (n=4),
- MONTH - emission rates vary monthly (n=12),
- HROFDY - emission rates vary by hour-of-day (n=24),
- WSPEED - emission rates vary by wind speed (n=6),
- SEASHR - emission rates vary by season and hour-of-day (n=96),
- HRDOW - emission rates vary by hour-of-day, and day-of-week [M-F, Sat, Sun] (n=72),
- HRDOW7 - emission rates vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=168),
- SHRDOW - emission rates vary by season, hour-of-day, and day-of-week [M-F, Sat, Sun] (n=288),
- SHRDOW7 - emission rates vary by season, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=672),
- MHRDOW - emission rates vary by month, hour-of-day, and day-of-week [M-F, Sat, Sun] (n=864), and
- MHRDOW7 - emission rates vary by month, hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun] (n=2,016).

The Qfact array is the array of factors, where the number of factors is shown above for each Qflag option. The seasons are defined in the following order: Winter (Dec., Jan., Feb.), Spring (Mar., Apr., May), Summer (Jun., Jul., Aug.), and Fall (Sep., Oct., Nov.).<sup>5</sup> The wind speed categories used with the WSPEED

---

<sup>5</sup> Note that the seasons are based on northern hemisphere seasons. For applications in the southern hemisphere using the seasonal factors (SEASHR, SHRDOW, and SHRDOW7), emission factors that would be associated with the

option may be defined using the ME WINDCATS keyword. If the WINDCATS keyword is not used, the default wind speed categories are defined by the upper bound of the first five categories as follows (the sixth category is assumed to have no upper bound): 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The EMISFACT card may be repeated as many times as necessary to input all of the factors and repeat values may be used for the numerical inputs. Examples for the more recent HRDOW and MHRDOW options are presented below, with column headers to indicate the order in which values are to be input:

---

southern hemisphere winter, for example, should be assigned to the summer seasonal emission factors input to AERMOD. Similarly, spring southern hemisphere emission factors should be assigned to the fall season emission factors input to AERMOD.

```

```

### 3.3.12 Specifying an hourly emission rate file (HOUREMIS)

The source (SO) pathway includes an option for inputting hourly emission rates for the AERMOD model, controlled by the HOUREMIS keyword. AERMOD currently allows for a single hourly emission file to be used with each model run. The syntax, type and order for this keyword are summarized below:

<b>Syntax:</b>	SO HOUREMIS Emifil Srcid's (and/or Srcrng's)
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Emifil parameter specifies the filename for the hourly emission file, and Srcid or Srcrng identify the source or sources for which hourly emission rates are included. The Emifil filename can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (“”) at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces. Source ranges, which are described in more detail in Section 3.3.9, are input as two source IDs separated by a dash, e.g., STACK1-STACK10. The user may include more than one HOUREMIS card in a control file, if needed to specify additional sources, but there can be only one hourly emissions file, and therefore the filename must be the same on all HOUREMIS cards.

The format of each record of the hourly emissions file includes a pathway and keyword (SO HOUREMIS), followed by the Year, Month, Day, Hour, Source ID, and emission rate (in the appropriate units). For POINT/POINTHOR/POINTCAP sources, an hourly stack gas exit temperature (K) and stack gas exit velocity (m/s) are also required. Beginning with version 09292, the release heights and initial dispersion coefficients can also be varied on an hourly basis for AREA, AREAPOLY, AREACIRC, LINE, and VOLUME sources using the HOUREMIS option.

As discussed in Sections 3.2.12, 3.3.2.2, 3.3.2.4, and 3.3.18, the ALPHA option ARCFTOPT was added to AERMOD beginning in version 23132 to account for plume rise associated with aircraft emissions due to momentum and buoyancy when modeling aircraft as AREA (including AREAPOLY, AREACIRC, and LINE) and/or VOLUME source types. To characterize an aircraft source requires additional source parameters beyond those required for non-aircraft AREA and VOLUME source types. The additional aircraft source parameters **must be specified in an hourly emission rate file**. In addition to the required hourly emission rate for AREA and VOLUME source types, the following aircraft parameters must be included for each hour and aircraft source in the hourly emission rate file, appended to each record, in the following order:

- MFUEL: Fuel burn rate (g/s)
- THRUST: Aircraft thrust (newtons)

- VAA: Aircraft speed (m/s)
- AFR: Air-fuel ratio
- BYPR: Bypass ratio (> 0 for turbofan and -999 for shaft-based engines)
- RPWR: Rated power (kW) (-99999 for turbofan and > 0 for shaft-based)
- SRCANGLE: Landing/takeoff angle with the ground (degrees) (airborne sources)

The parameters listed above must be included each hour in the hourly emission rate file for all AREA and VOLUME sources identified as an aircraft source with the ARCFTSRC keyword. These parameters must not be included for any AREA or VOLUME source that is not identified as an aircraft source. If AERMOD determines there are too many or too few parameters a fatal error message will be issued, and processing will not complete.

Beginning with version 19191, release heights and initial dispersion can be varied for RLINE and RLINEXT sources. The user selects this enhanced option by including the additional source parameters in the hourly emissions file. AERMOD determines whether hourly release heights and initial dispersion coefficients are being used based on the first HOUREMIS record for each source, and these additional parameters must be included on all HOUREMIS records unless the emissions are missing, which is indicated by leaving the emission rate and all fields beyond the source ID blank.

**When hourly emissions are specified for a buoyant line source, each of the individual lines (BUOYLINE sources) that comprise the buoyant line source must be represented in the hourly emissions file for every hour, and the buoyancy ( $\text{m}^4/\text{s}^3$ ) of each line must be specified after the hourly emission rate.** The buoyancy of each line can vary within an hour and from hour to hour. AERMOD computes an average buoyancy of the buoyant line source for each hour using the buoyancy values specified for each individual line that comprises the buoyant line source.

The hourly emissions file is processed using the same routines used to process the control file, therefore each of the parameters must be separated by at least one space, but otherwise the format is flexible. It is also not necessary to include the SO HOUREMIS on each line, as long as the parameters (Year, Month, etc.) do not begin before column 13. The data in the hourly emission file must also include the exact same dates as are included in the meteorological input files, and the source IDs must correspond to the source IDs defined on the SO LOCATION cards and be in the same order as defined in the 'aermod.inp' file.

The model will check for a date mismatch between the hourly emissions file and the meteorological data files. However, it is not necessary to process the entire hourly emissions file on each model run, i.e., the correct emissions data will be read if the ME DAYRANGE or the ME STARTEND cards (see Section 3.5.4) are used, as long as all the dates (including those that are processed and those that are skipped) match the meteorological data files.

An example of several lines from an hourly emissions file for two point sources is provided below:

SO	HOUREMIS	88	8	16	1	STACK1	52.5	382.60	12.27
SO	HOUREMIS	88	8	16	1	STACK2	44.3	432.33	22.17
SO	HOUREMIS	88	8	16	2	STACK1	22.3	377.88	9.27
SO	HOUREMIS	88	8	16	2	STACK2	42.2	437.68	19.67
SO	HOUREMIS	88	8	16	3	STACK1	51.5	373.72	11.87
SO	HOUREMIS	88	8	16	3	STACK2	41.3	437.28	18.77
SO	HOUREMIS	88	8	16	4	STACK1	36.0	374.83	9.63
SO	HOUREMIS	88	8	16	4	STACK2	43.7	437.68	18.23

The use of hourly varying release heights and initial dispersion coefficients for VOLUME and AREA sources is illustrated in the following example:

SO	HOUREMIS	88	3	1	1	VOL1	500.0	2.0	2.0	2.0
SO	HOUREMIS	88	3	1	1	AREA1	5.000	2.0	2.0	
SO	HOUREMIS	88	3	1	2	VOL1	500.0	2.0	2.0	3.0
SO	HOUREMIS	88	3	1	2	AREA1	5.000	2.0	3.0	
SO	HOUREMIS	88	3	1	3	VOL1	500.0	2.0	2.0	4.0
SO	HOUREMIS	88	3	1	3	AREA1	5.000	2.0	4.0	

For POINT/POINTHOR/POINTCAP sources, the model will use the stack release height and stack inside diameter defined on the SO SRCPARAM card, but will use the emission rate, exit temperature and exit velocity from the hourly emission file. As noted above regarding VOLUME and AREA sources, if the emission rate, exit temperature and exit velocity are not included for a particular hour, i.e., any or all of those fields are blank, the model will interpret emissions data for that hour as missing and will set the parameters to zero. Since the emission rate will be zero, there will be no calculations made for that hour and that source.

### 3.3.13 Adjusting the emission rate units for output

The default emission rate units for the AERMOD model are grams per second (g/s) for POINT/POINTHOR/POINTCAP, VOLUME, and BUOYLINE sources, grams per second per meter (g/s/m) for RLINEXT sources, and grams per second per square meter (g/s/m<sup>2</sup>) for AREA, LINE, OPENPIT, and RLINE sources. By default, the model converts these input units to output units of micrograms per cubic meter (µg/m<sup>3</sup>) for concentration calculations. This is accomplished by applying a default emission rate unit factor of 1.0E06 for concentration.

The EMISUNIT keyword on the SO pathway allows the user to specify a different unit conversion factor, and to specify the appropriate label for the output units for either concentration calculations. The syntax and type of the EMISUNIT keyword are summarized below:

<b>Syntax:</b>	SO EMISUNIT Emifac Emilbl Conlbl
<b>Type:</b>	Optional, Non-repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the parameter Emifac is the emission rate unit factor, Emilbl is the label for the emission units (up to 40 characters), and Conlbl is the output unit label (up to 40 characters) for concentration calculations. For example, to produce output concentrations in milligrams per cubic meter, assuming input units of grams per sec, the following card could be input:

```
SO EMISUNIT 1.0E3 GRAMS/SEC MILLIGRAMS/M**3
```

since there are 1.0E3 milligrams per gram. The emission rate unit factor applies to all sources for a given run. Since the model uses one or more spaces to separate different fields on the input control file commands, it is important that there not be any spaces within the label fields on this card. Thus, instead of entering 'GRAMS PER SECOND' for the emission label, a label of 'GRAMS/SECOND', or 'GRAMS-PER-SECOND' or an equivalent variation should be used.

For the RLINE or RLINEXT source types, an additional keyword was introduced in version 19191 to allow alternate units of grams per link per hour. These alternate units can be used if the keyword RLEMCONV (RLine EMISSION CONVersion) is used on the SO card. This keyword has no additional inputs, but when present, emissions for all RLINE and RLINEXT sources are assumed to be in grams per

link per hour. The model converts such units internally to its native units for each source and the computation proceeds as normal. The syntax and type of the RLEMCONV keyword are summarized below:

<b>Syntax:</b>	SO RLEMCONV
<b>Type:</b>	Optional, Non-repeatable
<b>Order:</b>	Can be present anywhere on the SO card

### 3.3.14 Including source data from an external file

The user has the option of including source data from an external file by using the INCLUDED keyword on the source (SO) pathway. A SO INCLUDED card may be placed anywhere within the source pathway, after the STARTING card and before the FINISHED card (i.e., the SO STARTING and SO FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the control file. The syntax and type of the INCLUDED keyword are summarized below:

<b>Syntax:</b>	SO INCLUDED Incfil
<b>Type:</b>	Optional, Repeatable

where the Incfil parameter is a character field of up to 200 characters that identifies the filename for the included file. The contents of the included file must be valid control file commands for the source pathway. If an error is generated during processing of the included file, the error message will report the line number of the included file (see APPENDIX B). If more than one INCLUDED file is specified for the source pathway, the user will first need to determine which file the error occurred in. If the starting column of the main control input file is shifted from column 1 (see Section 2.4.8), then the control file commands in the included file must be offset by the same amount.

### 3.3.15 Using source groups

The AERMOD model allows the user to group contributions from particular sources together. Several source groups may be setup in a single run, and they may, for example, be used to model impacts from the source being permitted, the group of increment consuming PSD sources, and the group of all sources for comparison to a NAAQS in a single run. There is always at least one source group in a run, which may consist of all sources, so the SRCGROUP keyword has been made mandatory in the AERMOD

model unless the PSDGROUP is specified, which is mandatory when using the PSDCREDIT keyword with the PVMRM NO to NO<sub>2</sub> conversion option (See Section 3.3.7). The SRCGROUP keyword cannot be used when the PSDGROUP keyword is used. The syntax, type and order of the SRCGROUP keyword are summarized below:

<b>Syntax:</b>	SO SRCGROUP Grpid Srcid's and/or Srcrng's
<b>Type:</b>	Mandatory (conditional), Repeatable
<b>Order:</b>	Must be the last keyword in the SO pathway before FINISHED

where the Grpid parameter is an alphanumeric string of up to eight characters that identifies the group name. The Srcid's and Srcrng's are the individual source IDs and/or source ranges that make up the group of sources. Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.3.9), are input as two source IDs separated by a dash, e.g., STACK1-STACK10. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to define the sources for a particular group, then additional cards may be input, repeating the pathway, keyword and group ID.

A special group ID has been reserved for use in specifying the group of all sources. When Grpid = ALL, the model will automatically setup a source group called ALL that includes all sources modeled for that particular run. If desired, the user can setup a group of all sources with a different group ID by explicitly specifying all sources on the input card(s).

**Note: The secondary keyword, ALL, is used in different source grouping contexts (e.g., BLPGROUP, SRCGROUP, OLMGROUP). Refer to the appropriate section of this user's guide to see the usage of the secondary keyword, ALL, for the group of sources to be identified. For BLPGROUP see Section 3.3.2.11. For OLMGROUP, see Section 3.3.6.2.**

The number of source groups is allocated dynamically at the time AERMOD is run. This value, in concert with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

As discussed in Sections 1.2.9 and 3.2.14, it is sometimes important for a user to know the contribution of a particular source to the total result for a group. These source contribution analyses are

facilitated for short-term averages by the use the EVENT processing capabilities in the AERMOD model. EVENT processing uses the same source groups that are identified by AERMOD (when the input file is generated using the CO EVENTFIL option), but the model is structured in a way that it retains individual source results for particular events. Refer to the sections noted above for a more complete description of EVENT processing and its uses.

With respect to buoyant line sources, note that the SRCGROUP keyword treats the individual lines (BUOYLINE) that comprise a buoyant line source as if they are individual sources. A SRCGROUP can consist of all or a subset of the individual lines by specifying the source IDs from the LOCATION keyword for those lines that should make up the SRCGROUP.

**Note that when modeling with Tier 2 or Tier 3 NO<sub>2</sub> conversion and using source groups, the conversion mechanism will be based on the total NO<sub>x</sub> at each receptor for all sources rather than the NO<sub>x</sub> concentration just for each source group.**

### 3.3.16 Specifying platform downwash information (POINT, POINTHOR, POINTCAP sources ONLY)

The Offshore and Coastal Dispersion (OCD) Model is the EPA's preferred model for estimating near field air pollutant impacts from overwater emission sources, for both deep water and shoreline applications. The original platform downwash algorithms were developed by Petersen (1984) and adapted when implemented into OCD by Hanna and Dicristofaro (1988). The platform downwash algorithms from OCD were integrated into AERMOD for POINT/POINTHOR/POINTCAP source types ONLY.

The SRCPARAM input for stack height is used with inputs via a new PLATFORM keyword to simulate a platform's influence on the dispersion from a POINT or POINTHOR or POINTCAP source. When the PLATFORM keyword is included in the AERMOD control file, platform downwash will be applied to the source identified by the source ID. The syntax, type, and order for the PLATFORM keyword are summarized below:

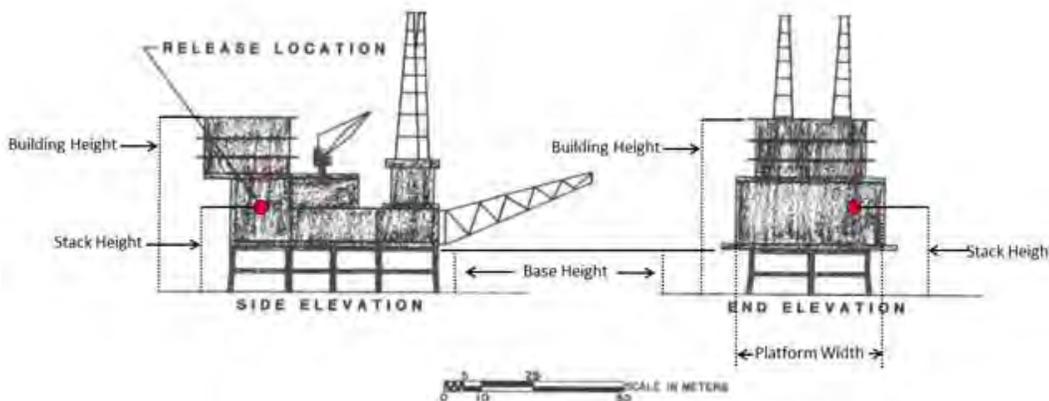

<b>Syntax:</b>	SO PLATFORM Srcid Zelp Hb Wb
<b>Type:</b>	Optional, Repeatable
<b>Order:</b>	Must follow the LOCATION card for each source input

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular POINT/POINTHOR/POINTCAP source, and the other parameters are as follows:

Zelp - Base height (in meters) defined as the height of the bottom of the platform above the sea surface. NOTE: This input is consistent with the input for OCD, but this input is not currently used in the AERMOD implementation of platform downwash specific algorithms, because the full height of the source as defined for the POINT/POINTHOR/POINTCAP source is used, no adjustment is made for the height of the platform.

Hb - Total height (in meters), above the sea surface, of the tallest solid or “influential” building (i.e., the sum of the height of the base of the platform above the sea surface and the height of the building above the base of the platform)

Wb - The **lesser of the two distances (in meters)** from outer edges of the leftmost and rightmost buildings on top of the platform that can influence downwash when comparing the side and end views of the platform as shown in Figure 3-7. The platform downwash influence is not adjusted for platform dimension normal to the wind, the influence will be identical for all wind directions.

**Figure 3-6. New platform parameter figure with correct parameter definitions. Adapted from Petersen (1984)**

All parameters are required for a POINT or POINTHOR or POINTCAP source located on a platform. POINT or POINTHOR or POINTCAP sources located on a platform are NOT subject to the PRIME building downwash options. An ERROR message will occur if the same source ID is used with the building downwash keywords.

3.3.17 Specifying highly buoyant point sources for HBP option (POINT, POINTHOR, POINTCAP sources ONLY)

Beginning with version 23132, HBP, specified with the MODELOPT keyword in the CO pathway (see Section 3.2.2), was added as an ALPHA option for highly buoyant plumes that penetrate the top of the convective mixed layer (Weil, 2020; Warren et. al., 2022). The HBP option is only applicable to POINT, POINTHOR, and POINTCAP source types. When the HBP option is specified with the MODELOPT keyword, the sources to which the HBP option should be applied must be identified using the HBPSRCID keyword on the SO pathway.

<b>Syntax:</b>	SO HBPSRCID	Srcid's	and/or	Srcrng's
		or		
	SO HBPSRCID	ALL		
<b>Type:</b>	Mandatory (conditional), Repeatable			

where the Srcid's and Srcrng's are the individual source IDs and/or source ranges that make up the group of sources. Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.3.9), are input as two source IDs separated by a dash, e.g., STACK1-STACK10. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to define the sources for a particular group, then additional cards may be input, repeating the pathway (SO), keyword (HBPSRCID), and source IDs and/or ranges. The secondary keyword ALL can be entered in the place of specific source IDs or ranges to apply the HBP option to all POINT, POINTHOR, and POINTCAP source types. Any source types other than POINT, POINTHOR, and POINTCAP that are included in the model simulation and specified with the HBPSRCID keyword, either by source ID or by specifying ALL, will be ignored. In that case, AERMOD will generate an informational message to indicate the non-POINT source type that was ignored.

3.3.18 Specifying aircraft sources (AREA and VOLUME sources ONLY)

As discussed in Section 3.2.12, the ALPHA option ARCFTOPT was added to AERMOD version 23132 to account for plume rise from aircraft emissions when aircraft are modeled as either VOLUME or AREA source types. Because additional parameters are required to characterize an aircraft source, all aircraft sources must be identified in the AERMOD control file using the ARCFTSRC primary keyword in the SO pathway, followed by a list of source IDs or ranges of source IDs. The syntax for the ARCFTSRC keyword is shown here

<b>Syntax:</b>	SO ARCFTSRC Srcid's and/or Srcrng's or SO ARCFTSRC ALL
<b>Type:</b>	Mandatory (conditional), Repeatable

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source. The user also has the option of specifying a range of sources (the Srcrng parameter) instead of identifying a single source or a list of single sources.

Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.3.9), are input as two source IDs separated by a dash, e.g., STACK1-STACK10. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to identify all aircraft sources, then additional cards may be input, repeating the pathway, keyword, and group ID. The secondary keyword ALL can be entered in the place of specific source IDs or ranges to apply the AIRCFTOPT option to all AREA and VOLUME source types. Source types other than AREA and VOLUME sources that are included in the model simulation and specified with the ARCFTSRC keyword, either by source ID or by specifying ALL, will be ignored. The ARCFTSRC keyword is mandatory when the AIRCFTOPT keyword is included in the CO pathway as described in Section 3.2.12. Failure to identify aircraft sources in the SO pathway with the ARCFTSRC keyword will generate a fatal error and processing will stop.

### 3.4 Receptor pathway inputs and options

The REceptor pathway contains keywords that define the receptor information for a particular model run. The RE pathway contains keywords that allow the user to define Cartesian grid receptor networks and/or polar grid receptor networks, with either uniform or non-uniform grid spacing, as well as discrete receptor locations referenced to a Cartesian or a polar system. The number of receptors and receptor networks are allocated dynamically at the time AERMOD is run. This value, in combination with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

All of the receptor options in AERMOD allow the user to input terrain elevations and hill height scales for each receptor, both of which are needed when applying AERMOD in an elevated terrain situation. To facilitate the generation of hill height scales for AERMOD, a terrain preprocessor, called AERMAP, has been developed (EPA, 2004c). The AERMAP terrain preprocessor, which can process U.S. Geological Survey (USGS) Digital Elevation Model (DEM) data and data from the National Elevation Dataset (NED), may also be used to generate the terrain elevations for the receptor locations. The AERMAP program

generates an output file that contains the receptor pathway data for AERMOD in the format described below. This file may be cut and pasted into the AERMOD control file or included as an external file using the RE INCLUDED card (see Section 3.4.4).

The default units for receptor elevations for the AERMOD model are in meters; however, the user may specify receptor elevations to be in units of feet by adding the RE ELEVUNIT FEET card immediately after the RE STARTING card. Since the AERMAP terrain preprocessor outputs elevations in meters and includes the RE ELEVUNIT METERS card as the first record, the AERMAP data must be placed at the beginning of the receptor pathway.

### 3.4.1 Defining networks of gridded receptors

Two types of receptor networks are allowed by the AERMOD model. A Cartesian grid network, defined through the GRIDCART keyword, includes an array of points identified by their x (east-west) and y (north-south) coordinates. A polar network, defined by the GRIDPOLR keyword, is an array of points identified by direction and distance from a user-defined origin. Each of these keywords has a series of secondary keywords associated with it that are used to define the network, including any receptor elevations for elevated terrain and flagpole receptor heights. The GRIDCART and GRIDPOLR keywords can be thought of as "sub-pathways," since their secondary keywords include a STArt and an ENd card to define the start and end of inputs for a particular network.

#### 3.4.1.1 Cartesian grid receptor networks

Cartesian grid receptor networks are defined by use of the GRIDCART keyword. The GRIDCART keyword may be thought of as a "sub-pathway," in that there are a series of secondary keywords that are used to define the start and the end of the inputs for a particular network, and to select the options for defining the receptor locations that make up the network. The syntax and type of the GRIDCART keyword are summarized below:

<b>Syntax:</b>	RE GRIDCART Netid <u>STA</u>
	<u>XYINC</u> Xinit Xnum Xdelta Yinit Ynum Ydelta
	<u>XPNTS</u> Gridx1 Gridx2 Gridx3 .... Gridxn, and
	or <u>YPNTS</u> Gridy1 Gridy2 Gridy3 .... Gridyn
	<u>ELEV</u> Row Zelev1 Zelev2 Zelev3 ... Zelevn
	<u>HILL</u> Row Zhill1 Zhill2 Zhill3 ... Zhilln
	<u>FLAG</u> Row Zflag1 Zflag2 Zflag3 ... Zflagn
	<u>END</u>
<b>Type:</b>	Optional, Repeatable

where the parameters are defined as follows:

<u>Netid</u>	Receptor network identification code (up to eight alphanumeric characters)
<u>STA</u>	Indicates the <u>STA</u> rt of GRIDCART inputs for a particular network, repeated for each new Netid
<u>XYINC</u>	Keyword identifying uniform grid network generated from x and y increments
Xinit	Starting x-axis grid location in meters
Xnum	Number of x-axis receptors
Xdelta	Spacing in meters between x-axis receptors
Yinit	Starting y-axis grid location in meters
Ynum	Number of y-axis receptors
Ydelta	Spacing in meters between y-axis receptors
<u>XPNTS</u>	Keyword identifying grid network defined by a series of discrete x and y coordinates (used with <u>YPNTS</u> )
Gridx1	Value of first x-coordinate for Cartesian grid (m)
Gridxn	Value of 'nth' x-coordinate for Cartesian grid (m)
<u>YPNTS</u>	Keyword identifying grid network defined by a series of discrete x and y coordinates (used with <u>XPNTS</u> )
Gridy1	Value of first y-coordinate for Cartesian grid (m)
Gridyn	Value of 'nth' y-coordinate for Cartesian grid (m)
<u>ELEV</u>	Keyword to specify that receptor elevations follow (optional)
Row	Indicates which row (y-coordinate fixed) is being input (Row=1 means first, i.e., southmost row) An
Zelev	Array of receptor terrain elevations (m) for a particular Row (default units of meters may be changed to feet by use of RE ELEVUNIT keyword), number of entries per row equals the number of x-coordinates for that network

<u>HILL</u>	Keyword to specify that hill height scales follow (optional)
Row	Indicates which row (y-coordinate fixed) is being input (Row=1 means first, i.e., southmost row) An
Zelev	Array of hill height scales (m) for a particular Row (default units of meters may be changed to feet by use of RE ELEVUNIT keyword), number of entries per row equals the number of x-coordinates for that network
<u>FLAG</u>	Keyword to specify that flagpole receptor heights follow (optional)
Row	Indicates which row (y-coordinate fixed) is being input (Row=1 means first, i.e., southmost row)
Zflag	An array of receptor heights (m) above local terrain elevation for a particular Row (flagpole receptors), number of entries per row equals the number of x-coordinates for that network
<u>END</u>	Indicates the <u>END</u> of GRIDCART inputs for a particular network, repeated for each new Netid

The ELEV, HILL, and FLAG keywords are optional inputs, and are only needed if elevated terrain or flagpole receptor heights are to be used. If elevated terrain is being used, then both the ELEV and HILL inputs are needed for each receptor. If the ELEV and HILL keywords are used and the model is being run with the flat terrain option (see Section 3.2.2), then the elevated terrain height inputs will be ignored by the model, and a non-fatal warning message will be generated. If the elevated terrain option is selected, and no elevated terrain heights are entered, the elevations will default to 0.0 meters, and warning messages will also be generated. The model handles flagpole receptor height inputs in a similar manner.

The order of cards within the GRIDCART subpathway is not important, as long as all inputs for a particular network are contiguous and start with the STA secondary keyword and end with the END secondary keyword. It is not even required that all ELEV cards be contiguous, although the input file will be more readable if a logical order is followed. The network ID is also not required to appear on each control file command (except for the STA card). The model will assume the previous ID if none is entered, similar to the use of continuation cards for pathway and keywords. Thus, the following two examples produce the same 8 X 4 Cartesian grid network:

```

RE GRIDCART CAR1 STA
RE GRIDCART CAR1 XPNTS -500. -400. -200. -100. 100. 200. 400. 500.
RE GRIDCART CAR1 YPNTS -500. -250. 250. 500.
RE GRIDCART CAR1 ELEV 1 10. 10. 10. 10. 10. 10. 10. 10.
RE GRIDCART CAR1 ELEV 2 20. 20. 20. 20. 20. 20. 20. 20.
RE GRIDCART CAR1 ELEV 3 30. 30. 30. 30. 30. 30. 30. 30.
RE GRIDCART CAR1 ELEV 4 40. 40. 40. 40. 40. 40. 40. 40.
RE GRIDCART CAR1 HILL 1 50. 50. 50. 50. 50. 50. 50. 50.
RE GRIDCART CAR1 HILL 2 60. 60. 60. 60. 60. 60. 60. 60.
RE GRIDCART CAR1 HILL 3 70. 70. 70. 70. 70. 70. 70. 70.
RE GRIDCART CAR1 HILL 4 80. 80. 80. 80. 80. 80. 80. 80.
RE GRIDCART CAR1 FLAG 1 10. 10. 10. 10. 10. 10. 10. 10.
RE GRIDCART CAR1 FLAG 2 20. 20. 20. 20. 20. 20. 20. 20.
RE GRIDCART CAR1 FLAG 3 30. 30. 30. 30. 30. 30. 30. 30.
RE GRIDCART CAR1 FLAG 4 40. 40. 40. 40. 40. 40. 40. 40.
RE GRIDCART CAR1 END

RE GRIDCART CAR1 STA
      XPNTS -500. -400. -200. -100. 100. 200. 400. 500.
      YPNTS -500. -250. 250. 500.
      ELEV 1 8*10.
      HILL 1 8*50.
      FLAG 1 8*10.
      ELEV 2 8*20.
      HILL 2 8*60.
      FLAG 2 8*20.
      ELEV 3 8*30.
      HILL 3 8*70.
      FLAG 3 8*30.
      ELEV 4 8*40.
      HILL 4 8*80.
      FLAG 4 8*40.
RE GRIDCART CAR1 END

```

The Row parameter on the ELEV, HILL, and FLAG inputs may be entered as either the row number, i.e., 1, 2, etc., or as the actual y-coordinate value, e.g., -500., -250., etc. in the example above. The model

sorts the inputs using Row as the index, so the result is the same. The above example could therefore be entered as follows, with the same result:

```
RE GRIDCART CAR1 STA
      XPNTS  -500.  -400.  -200.  -100.  100.  200.  400.  500.
      YPNTS  -500.  -250.  250.  500.
      ELEV   -500.  8*10.
      FLAG   -500.  8*10.
      ELEV   -250.  8*20.
      FLAG   -250.  8*20.
      ELEV    250.  8*30.
      FLAG    250.  8*30.
      ELEV    500.  8*40.
      FLAG    500.  8*40.
RE GRIDCART CAR1 END
```

Of course, one must use either the row number or y-coordinate value consistently within each network to have the desired result.

The following simple example illustrates the use of the XYINC secondary keyword to generate a uniformly spaced Cartesian grid network. The resulting grid is 11 x 11, with a uniform spacing of 1 kilometer (1000. meters), and is centered on the origin (0., 0.). No elevated terrain heights or flagpole receptor heights are included in this example.

```
RE GRIDCART CG1 STA
      XYINC  -5000.  11  1000.  -5000.  11  1000.
RE GRIDCART CG1 END
```

### 3.4.1.2 Polar grid receptor networks

Polar receptor networks are defined by use of the GRIDPOLR keyword. The GRIDPOLR keyword may also be thought of as a "sub-pathway," in that there are a series of secondary keywords that are used to define the start and the end of the inputs for a particular network, and to select the options for defining the receptor locations that make up the network. The syntax and type of the GRIDPOLR keyword are summarized below:

<b>Syntax:</b>	RE GRIDPOLR Netid <u>STA</u> <u>ORIG</u> Xinit Yinit, or <u>ORIG</u> Srcid <u>DIST</u> Ring1 Ring2 Ring3 ... Ringn <u>DDIR</u> Dir1 Dir2 Dir3 ... Dirn, or <u>GDIR</u> Dirnum Dirini Dirinc <u>ELEV</u> Dir Zelev1 Zelev2 Zelev3 ... Zelevn <u>HILL</u> Dir Zhill1 Zhill2 Zhill3 ... Zhilln <u>FLAG</u> Dir Zflag1 Zflag2 Zflag3 ... Zflagn <u>END</u>
<b>Type:</b>	Optional, Repeatable

where the parameters are defined as follows:

Netid	Receptor network identification code (up to eight alphanumeric characters)
<u>STA</u>	Indicates <u>STA</u> rt of GRIDPOLR inputs for a particular network, repeat for each new Netid
<u>ORIG</u> Xinit Yinit Srcid	Keyword to specify the origin of the polar network (optional) x-coordinate for origin of polar network y-coordinate for origin of polar network Source ID of source used as origin of polar network
<u>DIST</u> Ring1 Ringn	Keyword to specify distances for the polar network Distance to the first ring of polar coordinates Distance to the 'nth' ring of polar coordinates
<u>DDIR</u> Dir1 Dirn	Keyword to specify discrete direction radials for the polar network First direction radial in degrees (1 to 360) The 'nth' direction radial in degrees (1 to 360)
<u>GDIR</u> Dirnum Dirini Dirinc	Keyword to specify generated direction radials for the polar network Number of directions used to define the polar system Starting direction of the polar system Increment (in degrees) for defining directions
<u>ELEV</u> Dir Zelev	Keyword to specify that receptor elevations follow (optional) Indicates which direction is being input An array of receptor terrain elevations for a particular direction radial (default units of meters may be changed to feet by use of RE ELEVUNIT keyword), number of entries per radial equals the number of distances for that network

<u>HILL</u> Dir Zelev	Keyword to specify that hill height scales follow (optional) Indicates which direction is being input An array of receptor hill height scales for a particular direction radial (default units of meters may be changed to feet by use of RE ELEVUNIT keyword), number of entries per radial equals the number of distances for that network
<u>FLAG</u> Dir Zflag	Keyword to specify that flagpole receptor heights follow (optional) Indicates which direction is being input An array of receptor heights above local terrain elevation for a particular direction (flagpole receptors)
<u>END</u>	Indicates <u>END</u> of GRIDPOLR subpathway, repeat for each new Netid

The ORIG secondary keyword is optional for the GRIDPOLR inputs. If omitted, the model assumes a default origin of (0.,0.) in x,y coordinates. The ELEV, HILL, and FLAG keywords are also optional inputs, and are only needed if elevated terrain or flagpole receptor heights are to be used. If elevated terrain is being used, then both the ELEV and HILL inputs are needed for each receptor. If the ELEV and HILL keywords are used and the model is being run with the flat terrain option (see Section 3.2.2), then the elevated terrain height inputs will be ignored by the model, and a non-fatal warning message will be generated. If the elevated terrain option is selected, and no elevated terrain heights are entered, the elevations will default to 0.0 meters, and warning messages will also be generated. The model handles flagpole receptor height inputs in a similar manner.

As with the GRIDCART keyword described above, the order of cards within the GRIDPOLR subpathway is not important, as long as all inputs for a particular network are contiguous and start with the STA secondary keyword and end with the END secondary keyword. It is not even required that all ELEV cards be contiguous, although the input file will be more readable if a logical order is followed. The network ID is also not required to appear on each control file command (except for the STA card). The model will assume the previous ID if none is entered, similar to the use of continuation cards for pathway and keywords.

The following example of the GRIDPOLR keyword generates a receptor network consisting of 180 receptor points on five concentric distance rings centered on an assumed default origin of (0.,0.). The receptor locations are placed along 36 direction radials, beginning with 10. degrees and incrementing by 10. degrees in a clockwise fashion.

```

RE GRIDPOLR POL1 STA
          DIST 100. 300. 500. 1000. 2000.
          GDIR 36 10. 10.
RE GRIDPOLR POL1 END

```

Another example is provided illustrating the use of a non-zero origin, discrete direction radials and the specification of elevated terrain and flagpole receptor heights:

```

RE GRIDPOLR POL1 STA
          ORIG 500. 500.
          DIST 100. 300. 500. 1000. 2000.
          DDIR 90. 180. 270. 360.
          ELEV 90. 5. 10. 15. 20. 25.
          ELEV 180. 5. 10. 15. 20. 25.
          ELEV 270. 5. 10. 15. 20. 25.
          ELEV 360. 5. 10. 15. 20. 25.
          HILL 90. 50. 60. 75. 80. 95.
          HILL 180. 50. 60. 75. 80. 95.
          HILL 270. 50. 60. 75. 80. 95.
          HILL 360. 50. 60. 75. 80. 95.
          FLAG 90. 5. 10. 15. 20. 25.
          FLAG 180. 5. 10. 15. 20. 25.
          FLAG 270. 5. 10. 15. 20. 25.
          FLAG 360. 5. 10. 15. 20. 25.
RE GRIDPOLR POL1 END

```

The user has the option of specifying the radial number (e.g., 1, 2, 3, etc.) on the ELEV, HILL, and FLAG inputs, or the actual direction associated with each radial.

For purposes of model calculations, all receptor locations, including those specified as polar, are stored in the model arrays as x, y and z coordinates and flagpole heights. For the purposes of reporting the results by receptor in the main print file, the tables are labeled with the polar inputs, i.e., directions and distances.

### 3.4.2 Using multiple receptor networks

For some modeling applications, the user may need a fairly coarsely spaced network covering a large area to identify the area of significant impacts for a plant, and a denser network covering a smaller area to identify the maximum impacts. To accommodate this modeling need, the AERMOD model allows the user to specify multiple receptor networks in a single model run. The user can define either Cartesian grid networks or polar networks, or both. With the use of the ORIG option in the GRIDPOLR keyword, the user can easily place a receptor network centered on the facility being permitted, and also place a network centered on another background source known to be a significant contributor to high concentrations. Alternatively, the polar network may be centered on a receptor location of special concern, such as a nearby Class I area.

As noted in the introduction to this section (3.4), the model dynamically allocates array storage based on the number of receptors and receptor networks when the AERMOD model is run, up to the maximum amount of memory available on the computer.

### 3.4.3 Specifying discrete receptor locations

In addition to the receptor networks defined by the GRIDCART and GRIDPOLR keywords described above, the user may also specify discrete receptor points for modeling impacts at specific locations of interest. This may be used to model critical receptors, such as the locations of schools or houses, nearby Class I areas, or locations identified as having high concentrations by previous modeling analyses. The discrete receptors may be input as either Cartesian x,y points (DISCCART keyword) or as polar distance and direction coordinates (DISCPOLR keyword). Both types of receptors may be identified in a single run. In addition, for discrete polar receptor points the user specifies the source whose location is used as the origin for the receptor.

#### 3.4.3.1 Discrete Cartesian receptors.

Discrete Cartesian receptors are defined by use of the DISCCART keyword. The syntax and type of this keyword are summarized below:

<b>Syntax:</b>	RE DISCCART Xcoord Ycoord (Zelev Zhill) (Zflag)
<b>Type:</b>	Optional, Repeatable

where the Xcoord and Ycoord parameters are the x-coordinate and y-coordinate (m), respectively, for the receptor location. The Zelev parameter is an optional terrain elevation (m) and Zhill is a corresponding hill height scale for the receptor for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms and are referenced to the same reference elevation (e.g., mean sea level) used for source elevations. The Zflag parameter is the optional receptor height above ground (m) for modeling flagpole receptors. All of the parameters are in units of meters, except for Zelev and Zhill, which default to meters but may be specified in feet by use of the RE ELEVUNIT keyword.

If neither the elevated terrain option (Section 3.2.2) nor the flagpole receptor height option (Section 3.2.11) are used, then the optional parameters are ignored if present. In other words, the FLAGPOLE keyword is required on the CO pathway if Zflag values are to be used and, the ELEV option must be specified with the MODELOPT keyword on the CO pathway if Zelev and Zhill values are to be used. If only the elevated terrain height option is used (no flagpoles), then the third parameter (the field after the Ycoord) is read as the Zelev parameter. If only the flagpole receptor height option is used (no elevated terrain), then the third parameter is read as the Zflag parameter. If both options are used, then the parameters are read in the order indicated for the syntax above. If the optional parameters are left blank, then default values will be used. The default value for Zelev is 0.0, and the default value for Zflag is defined by the CO FLAGPOLE card (see Section 3.2.11). Note: If both the elevated terrain and flagpole receptor height options are used, then the third parameter will always be used as Zelev, and it is not possible to use a default value for Zelev while entering a specific value for the Zflag parameter.

#### 3.4.3.2 Discrete polar receptors

Discrete polar receptors are defined by use of the DISCPOLR keyword. The syntax and type of this keyword are summarized below:

<b>Syntax:</b>	RE DISCPOLR Srcid Dist Direct (Zelev Zhill) (Zflag)
<b>Type:</b>	Optional, Repeatable

where the Srcid is the alphanumeric source identification for one of the sources defined on the SO pathway which will be used to define the origin for the polar receptor location. The Dist and Direct parameters are the

distance in meters and direction in degrees for the discrete receptor location. Degrees are measured clockwise from north. The Zelev parameter is an optional terrain elevation for the receptor and Zhill is the corresponding hilltop elevation (m) for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms and are referenced to the same reference elevation (e.g., mean sea level) used for source elevations. The units of Zelev and Zhill are in meters, unless specified as feet by the RE ELEVUNIT keyword. The Zflag parameter is the optional receptor height above ground (meters) for modeling flagpole receptors.

If neither the elevated terrain option (Section 3.2.2) nor the flagpole receptor height option (Section 3.2.11) are used, then the optional parameters are ignored if present. If only the elevated terrain height option is used (no flagpoles), then the third parameter (the field after the Ycoord) is read as the Zelev parameter. If only the flagpole receptor height option is used (no elevated terrain), then the third parameter is read as the Zflag parameter. If both options are used, then the parameters are read in the order indicated for the syntax above. If the optional parameters are left blank, then default values will be used. The default value for Zelev is 0.0, and the default value for Zflag is defined by the CO FLAGPOLE card (see Section 3.2.11). Note: If both the elevated terrain and flagpole receptor height options are used, then fourth parameter will always be used as Zelev, and it is not possible to use a default value for Zelev while entering a specific value for the Zflag parameter.

### 3.4.3.3 Discrete Cartesian receptors for evalfile output

The EVALCART keyword is used to define discrete Cartesian receptor locations, similar to the DISCCART keyword, but it also allows for grouping of receptors, e.g., along arcs. It is designed to be used with the EVALFILE option, described later for the output pathway, which outputs arc maxima values to a separate file for evaluation purposes. The EVALCART keyword can be used without the use of the EVALFILE option, in which case the receptor groupings are ignored. The syntax and type for the modified EVALCART keyword are summarized below:

<b>Syntax:</b>	RE EVALCART Xcoord Ycoord Zelev Zhill Zflag Arcid (Name)
<b>Type:</b>	Optional, Repeatable

where the Xcoord and Ycoord parameters are the x-coordinate and y-coordinate (m), respectively, for the receptor location. The Zelev parameter is the terrain elevation (m) for the receptor and Zhill is the corresponding hilltop elevation (m) for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms and are referenced to the same

reference elevation (e.g., mean sea level) used for source elevations. The elevation (Zelev) and hill heights (Zhill) inputs are set to zero, by default, if ELEV is NOT specified as a MODELOPT on the CO card. The Zflag parameter is the receptor height above ground (m) for modeling flagpole receptors and must be specified for use with the receptor flagpole option. The flagpole height (Zflag) inputs are set to zero, by default, if CO FLAGPOLE is NOT specified on the CO card. All of the parameters are in units of meters, except for Zelev and Zhill, which default to meters but may be specified in feet by use of the RE ELEVUNIT keyword. The Arcid parameter is the receptor grouping identification, which may be up to eight characters long, and may be used to group receptors by arc. The Name parameter is an optional name field that may be included to further identify a particular receptor location. The Name parameter is ignored by the model. Unlike the DISCCART keyword, all of the parameters (except for the Name) must be present on each card with the EVALCART keyword. The elevation, hill height, and flagpole height are set to zero, by default, if the appropriate options are not specified the CO card.

#### 3.4.4 Including receptor data from an external file

The user has the option of including receptor data from an external file by using the INCLUDED keyword on the receptor pathway. A RE INCLUDED card may be placed anywhere within the source pathway, after the STARTING card and before the FINISHED card (i.e., the RE STARTING and RE FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the control file. The syntax and type of the INCLUDED keyword are summarized below:

<b>Syntax:</b>	RE INCLUDED Incfil
<b>Type:</b>	Optional, Repeatable

where the Incfil parameter is a character field of up to 200 characters that identifies the filename for the included file. The contents of the included file must be valid control file commands for the receptor pathway. If an error is generated during processing of the included file, the error message will report the line number of the included file (see APPENDIX B). If more than one INCLUDED file is specified for the receptor pathway, the user will first need to determine which file the error occurred in. If the starting column of the main control input file is shifted from column 1 (see Section 2.4.8), then the control file commands in the included file must be offset by the same amount. The INCLUDED option allows the user to include receptor data that have been generated by the AERMOD Terrain Preprocessor, AERMAP, in the control file without having to cut and paste the AERMAP output file. Since AERMAP generates terrain elevations in meters and includes the RE ELEVUNIT METERS card as the first record, an AERMAP file must be

INCLUDED at the beginning of the receptor pathway, immediately following the RE STARTING card. If more than one AERMAP output file is INCLUDED on the receptor pathway, the RE ELEVUNIT METERS card must be deleted from all but the first one.

### 3.5 Meteorology pathway inputs and options

The Meteorology pathway contains keywords that define the input meteorological data for a particular model run.

#### 3.5.1 Specifying the input data files and formats

The AERMOD model uses hourly meteorological data from separate surface and profile data files as one of the basic model inputs. These input meteorological data filenames for AERMOD are identified by the SURFFILE and PROFFILE keywords on the ME pathway. The syntax and type of these keywords are summarized below:

<b>Syntax:</b>	ME SURFFILE Sfcfil (Format) ME PROFFILE Profil (Format)
<b>Type:</b>	Optional, Repeatable

where the Srcfil and Profil parameters are character fields of up to 200 characters that identify the filenames for the input meteorological data files. For running the model on an IBM-compatible PC, the filename parameters may include the complete DOS pathname for the file or will assume the current directory if only the filename is given. The optional Format parameter specifies the format of the meteorological data files. The default formats for the surface and profile data files corresponds with the format of the files generated by the AERMET meteorological preprocessor program. The user also has the option of specifying the Fortran read format for each of these files. The contents of the meteorological data files are described below, and the file formats are documented in APPENDIX C.

The surface meteorological data file consists of a header record containing information on the meteorological station locations, and one record for each hour of data. These data are delimited by at least one space between each element, i.e., the data may be read as free format. The contents of the surface file are as follows:

- Year
- Month (1 – 12)

- Day of Month (1 – 31)
- Julian Day (Day of Year) (1 – 366)
- Hour of Day (1 – 24)
- Heat Flux (W/m<sup>2</sup>)
- Surface Friction Velocity,  $u^*$  (m/s)
- Convective Velocity Scale,  $w^*$  (m/s)
- Lapse Rate above Mixing Height (K/m)
- Convective Mixing Height (m)
- Mechanical Mixing Height (m)
- Monin-Obukhov Length,  $L$  (m)
- Surface Roughness Length,  $z_0$  (m)
- Bowen Ratio
- Albedo
- Reference Wind Speed (m/s)
- Reference Wind Direction (degrees)
- Reference Height for Wind (m)
- Ambient Temperature (K)
- Reference Height for Temperature (m)
- Precipitation Code (0-45)
- Precipitation Amount (mm)
- Relative Humidity (%)
- Surface Pressure (mb)
- Cloud Cover (tenths)
- Wind Speed Adjustment and Data Source Flag

The sensible heat flux, Bowen ratio and albedo are not used by the AERMOD model but are passed through by AERMET for information purposes only.

The profile meteorological data file consists of one or more records for each hour of data. As with the surface data file, the data are delimited by at least one space between each element and may be read as Fortran free format. The contents of the profile meteorological data file are as follows:

- Year
- Month (1 – 12)
- Day (1 – 31)
- Hour (1 – 24)
- Measurement height (m)
- Top flag = 1, if this is the last (highest) level for this hour,  
0, otherwise
- Wind direction for the current level (degrees)
- Wind speed for the current level (m/s)
- Temperature at the current level (°C)
- Standard deviation of the wind direction,  $\sigma_2$  (degrees)
- Standard deviation of the vertical wind speed,  $\sigma_w$  (m/s)

The data in this file include the on-site meteorological data that are processed by AERMET. Since AERMET was designed to be able to perform dispersion parameter calculations with NWS data only, i.e., no on-site data, the profile data may consist of a one-level “profile” based on the NWS winds and temperature.

### 3.5.2 Specifying station information

Three keywords are used to specify information about the meteorological stations, SURFDATA for the surface meteorological station, UAIRDATA for the upper air station, and the optional SITEDATA for any on-site meteorological data that may be used. The syntax and type of these keywords are summarized below:

<b>Syntax:</b>	ME SURFDATA	Stanum	Year	(Name)	(Xcoord)	(Ycoord)
<b>Syntax:</b>	ME UAIRDATA	Stanum	Year	(Name)	(Xcoord)	(Ycoord)
<b>Syntax:</b>	ME SITEDATA	Stanum	Year	(Name)	(Xcoord)	(Ycoord)
<b>Type:</b>	Mandatory, Non-repeatable for SURFDATA and UAIRDATA Optional, Non-repeatable for SITEDATA					

where Stanum is the station number, e.g., the 5-digit WBAN number for NWS stations; Year is the year of data being processed (either 2 or 4 digits); Name is an optional character field (up to 40 characters with no blanks) specifying the name of the station; and Xcoord and Ycoord are optional parameters for specifying the x and y coordinates for the location of the stations. **Note: The Year should indicate the first year of data that are present in the meteorological data, regardless if only a subset of complete temporal period will be modeled by AERMOD using the STARTEND keyword (Section 3.5.4).** The station locations are not utilized in the model. Therefore, no units are specified for Xcoord and Ycoord, although meters are suggested for consistency with the source and receptor coordinates. The AERMOD model compares the station numbers that are input using these keywords with the numbers in the header record of the surface meteorological data file, and issues non-fatal warning messages if there are any mismatches.

### 3.5.3 Specifying the base elevation for potential temperature profile

The AERMOD model generates a gridded vertical profile of potential temperatures for use in the plume rise calculations. Since potential temperature is dependent on the elevation above mean sea level (MSL), the user must define the base elevation for the profile with the PROFBASE keyword. The syntax and type for the PROFBASE keyword are summarized below:

<b>Syntax:</b>	ME PROFBASE BaseElev (Units)
<b>Type:</b>	Mandatory, Non-repeatable

where the BaseElev parameter specifies the base elevation above MSL for the potential temperature profile, and the optional Units parameter specifies the units of BaseElev. Valid inputs of Units are the secondary keywords METERS or FEET. The default units for BaseElev are in meters if Units is left blank. The base elevation should correspond with the base elevation of the primary meteorological tower.

#### 3.5.4 Specifying a data period to process

There are two keywords that allow the user to specify particular days or ranges of days to process from the sequential meteorological file input for the AERMOD model. The STARTEND keyword controls which period within the meteorological data file is read by the model, while the DAYRANGE keyword controls which days or ranges of days (of those that are read) for the model to process. When the STARTEND keyword is omitted from the control file, the default for the model is to read the entire meteorological data file and to process all days within that period.

The syntax and type for the STARTEND keyword are summarized below:

<b>Syntax:</b>	ME STARTEND Strtyr Strtmn Strtdy (Strthr) Endyr Endmn Enddy (Endhr)
<b>Type:</b>	Optional, Non-repeatable

where the Strtyr Strtmn Strtdy parameters specify the year, month and day of the first record to be read (e.g., 87 01 31 for January 31, 1987), and the parameters Endyr Endmn Enddy specify the year, month and day of the last record to be read. The Strthr and Endhr are optional parameters that may be used to specify the start and end hours for the data period to be read. If either Strthr or Endhr is to be specified, then both must be specified. Any records in the data file that occur before the start date are ignored, as are any records in the data file that occur after the end date. In fact, once the end date has been reached, the model does not read any more data from the meteorological file. If Strthr and Endhr are not specified, then processing begins with hour 1 of the start date, and ends with hour 24 of the end date, unless specific days are selected by the DAYRANGE card described below.

Any PERIOD averages calculated by the model will apply only to the period of data actually processed. Therefore, if someone wanted to calculate a six-month average, they could select PERIOD averages on the CO AVERTIME card, and then specify the period as follows:

```
ME STARTEND 87 01 01 87 06 30
```

for the period January 1, 1987 through June 30, 1987.

The syntax and type for the DAYRANGE keyword are summarized below:

<b>Syntax:</b>	ME DAYRANGE Range1 Range2 Range3 ... RangeN
<b>Type:</b>	Optional, Repeatable

where the Range parameters specify particular days or ranges of days to process. The days may be specified as individual days (e.g., 1 2 3 4 5) or as a range of days (e.g., 1-5). The user also has the option of specifying Julian day numbers, from 1 to 365 (366 for leap years), or specifying month and day (e.g., 1/31 for January 31). Any combination of these may also be used. For example, the following card will tell the model to process the days from January 1 (Julian day 1) through January 31 (1/31):

```
ME DAYRANGE 1-1/31
```

The DAYRANGE keyword is also repeatable, so that as many cards as needed may be included in the ME pathway.

As with the STARTEND keyword, any PERIOD averages calculated by the model will apply only to the period of data actually processed. If the STARTEND keyword is also used, then only those days selected on the DAYRANGE cards that fall within the period from the start date to the end date will be processed. Thus, if the ME pathway included the following two cards:

```
ME STARTEND 87 02 01 87 12 31
ME DAYRANGE 1-31
```

then no data would be processed, since the days 1 through 31 are outside the period 2/1 to 12/31.

### 3.5.5 Correcting wind direction alignment problems

The WDRotate keyword allows the user to correct the input meteorological data for wind direction alignment problems. All input wind directions or flow vectors are rotated by a user-specified

amount. Since the model results at particular receptor locations are often quite sensitive to the transport wind direction, this optional keyword should be used only with extreme caution and with clear justification.

The syntax and type of this keyword are summarized below:

<b>Syntax:</b>	ME WDROTATE Rotang
<b>Type:</b>	Optional, Non-repeatable

where the Rotang parameter specifies the angle in degrees to rotate the input wind direction measurements. The value of Rotang is subtracted from the wind direction measurements. It may be used to correct for known (and documented) calibration errors, or to adjust for the alignment of a valley if the meteorological station is located in a valley with a different alignment than the source location.

### 3.5.6 Specifying wind speed categories

Variable emission rate factors may be input to the model that vary by wind speed category. The model uses six wind speed categories, and these are defined by the upper bound wind speed for the first five categories (the sixth category is assumed to have no upper bound). The default values for the wind speed categories are as follows: 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The syntax and type of the WINDCATS keyword, which may be used to specify different category boundaries, are summarized below:

<b>Syntax:</b>	ME WINDCATS Ws1 Ws2 Ws3 Ws4 Ws5
<b>Type:</b>	Optional, Non-repeatable

where the Ws1 through Ws5 parameters are the upper bound wind speeds of the first through fifth categories in meters per second. The upper bound values are inclusive, i.e., a wind speed equal to the value of Ws1 will be placed in the first wind speed category.

### 3.5.7 Specifying SCIM parameters

The SCIM parameters on the SCIMBYHR card specify the starting hour and sampling interval for the regular sample and an optional file name. The syntax and type of the SCIMBYHR keyword are summarized below:

<b>Syntax:</b>	ME SCIMBYHR NRegStart NRegInt NwetStart NwetInt (SfcFilnam PflFilnam)
<b>Type:</b>	Optional, Non-repeatable

where the NRegStart and NRegInt parameters specify the first hour to be sampled and the sampling interval, respectively, when performing the regular sampling. The NWetStart and NWetInt parameters are used to specify the first wet hour (i.e., with non-zero precipitation) and the wet sampling interval for wet sampling. However, since the AERMOD model currently does not include wet deposition algorithms, the wet sampling option is not operational, and the user should enter a value of zero (0) for both NWetStart and NWetInt. Optionally, the user can create output files containing the surface and profile meteorological data for the sampled hours by specifying the SfcFilnam and PflFilnam parameters. These output files are in the same format used in the summary of the first 24 hours of data included in the main output file.

In order to use the SCIM option, the user must specify the non-DEFAULT SCIM option on the CO MODELOPT card. Although the ME SCIMBYHR is an optional card, it is required when using the SCIM option. NRegStart is required to have a value from 1 through 24, i.e., the first sampled hour must be on the first day in the meteorological data file. There are no restrictions for NRegInt; however, NRegInt would generally be greater than one. For example, NRegInt could be based on the formula  $(24n+1)$ , where "n" is the number of days to skip between samples, in order to ensure a regular diurnal cycle to the sampled hours (e.g., 25 or 49).

### 3.5.8 Specify the number of years to process

The NUMYEARS keyword on the ME pathway allows the user to specify the number of years of data being processed for purposes of allocating array storage for the MAXDCONT option (see Section 3.7.2.8), with a default value of five (5) years being assumed if the optional NUMYEARS keyword is omitted. The syntax of the optional NUMYEARS keyword is summarized below:

<b>Syntax:</b>	ME NUMYEARS NumYrs
<b>Type:</b>	Optional, Non-repeatable

where NumYrs specifies the number of (full) years of meteorological data being processed.

### 3.5.9 Specify turbulence treatment options

Beginning with version 21112, the user can prompt AERMOD to set non-missing values for turbulence ( $\sigma_\theta$  or  $\sigma_w$ ) from the profile file to missing for certain conditions. These options were included to facilitate the use of meteorological data with turbulence under certain conditions. For example, these options allow for the user to use an urban meteorological site with turbulence data with the URBAN option in AERMOD without rerunning AERMET to ignore the site-specific turbulence as discussed Section 3.3 of the AERMOD Implementation Guide (EPA, 2024b). The syntax of the turbulence options is summarized below:

<b>Syntax:</b>	ME TurbOpt
<b>Type:</b>	Optional, Non-repeatable

Where TurbOpt is defined as:

- NOTURB: set  $\sigma_\theta$  and  $\sigma_w$  to missing for all hours
- NOTURBST: set  $\sigma_\theta$  and  $\sigma_w$  for stable hours only
- NOTURBCO: set  $\sigma_\theta$  and  $\sigma_w$  for convective hours only
- NOSA: set  $\sigma_\theta$  to missing for all hours
- NOSW: set  $\sigma_w$  to missing for all hours
- NOSAST: set  $\sigma_\theta$  to missing for stable hours only
- NOSWST: set  $\sigma_w$  to missing for stable hours only
- NOSACO: set  $\sigma_\theta$  to missing for convective hours only
- NOSWCO set  $\sigma_w$  to missing for convective hours only

Where stable (convective) hours are defined as hours where the Monin-Obukhov length is positive (negative). The options NOTURB and NOTURBST can be used with the DFAULT keyword on the MODELOPT pathway. The remaining options cannot be used with the DFAULT keyword and if they are used with the DFAULT keyword, AERMOD will warn the user that the option can not be used with the DFAULT keyword and the option will not set the appropriate turbulence parameters to missing, i.e., AERMOD will ignore the turbulence option. For the options that only reset turbulence under stable conditions only or convective conditions only, AERMOD will report the day and hour and turbulence parameter that is being reset to the file specified with the ERRORFIL keyword.

### 3.6 Event pathway inputs and options

EVENT processing is specifically designed to facilitate analysis of source contributions to specific events for short-term averages (less than or equal to 24 hours). These events may be design concentrations generated by the AERMOD model, occurrences of violations of an air quality standard, or user-specified events. These events are input to the AERMOD model through the EVent pathway. Each event is defined by an averaging period and specific data period, a source group, and a receptor location. Since the locations are only of interest in combination with particular averaging and data periods, the REceptor pathway is not used with EVENT processing.

There are two keywords that are used to define the events on the EV pathway. The EVENTPER keyword defines the averaging period, data period and source group, while the EVENTLOC keyword defines the receptor location for the event. Each event is also given an alphanumeric name that links the two input cards for that event.

The syntax and type of the EVENTPER and EVENTLOC keywords are summarized below:

<b>Syntax:</b>	EV EVENTPER Evname Aveper Grpid Date
<b>Syntax:</b>	EV EVENTLOC Evname <u>XR=</u> Xr <u>YR=</u> Yr (Zelev) (Zflag) Or Evname <u>RNG=</u> Rng <u>DIR=</u> Dir (Zelev) (Zflag)
<b>Type:</b>	Mandatory, Repeatable

where the parameters are as follows:

- Evname - event name (an alphanumeric string of up to 8 characters),
- Aveper - averaging period for the event (e.g., 1, 3, 8, 24 hr)
- Grpid - source group ID for the event (must be defined on SO pathway),
- Date - date for the event, input as an eight-digit integer for the ending hour of the data period (YYMMDDHH), e.g., 84030324 defines a data period ending at hour 24 on March 3, 1984. The length of the period corresponds to Aveper.
- XR= - X-coordinate (m) for the event location, referenced to a Cartesian coordinate system
- YR= - Y-coordinate (m) for the event location, referenced to a Cartesian coordinate system
- RNG= - distance range (m) for the event location, referenced to a polar coordinate system with an origin of (0., 0.)

- DIR= - radial direction (deg.) for the event location, referenced to a polar coordinate system with an origin of (0., 0.)
- Zelev - optional terrain elevation for the event location (m)
- Zflag - optional receptor height above ground (flagpole receptor) for the event location (m)

Each event is defined by the two input cards EVENTPER and EVENTLOC, and these inputs are linked by the event name, which must be unique among the events being processed in a given run. There is no particular requirement for the order of cards on the EV pathway. Note that the location for the event may be specified by either Cartesian coordinates or by polar coordinates, however, the polar coordinates must be relative to an origin of (0,0).

### 3.6.1 Using events generated by the AERMOD model

The AERMOD model has an option (CO EVENTFIL described in Section 3.2.14) to generate an input file for the AERMOD EVENT processing. When this option is used, the AERMOD model copies relevant inputs from the AERMOD control input file to the Event processing input file and generates the inputs for the EV pathway from the results of the modeling run. These events are the design concentrations identified by the OU RECTABLE keyword (see Section 2.1.1.1), such as the highest and high-second-high 24-hour averages, etc., and any threshold violations identified by the OU MAXIFILE keyword (see Section 2.1.1.2). The inputs generated by the AERMOD model correspond to the syntax described above for the EVENTPER and EVENTLOC keywords. The locations for events generated by the AERMOD model are always provided as Cartesian coordinates.

To easily identify the events generated by the AERMOD model, and to provide a mechanism for the AERMOD model to manage the events generated from the model run, a naming convention is used for the EVNAME parameter. The following examples illustrate the event names used by the AERMOD model:

- H1H01001 - High-first-high 1-hour average for source group number 1
- H2H24003 - High-second-high 24-hour average for source group number 3
- TH030010 - Threshold violation number 10 for 3-hour averages
- TH240019 - Threshold violation number 19 for 24-hour averages

The high value design concentrations are listed first in the EVENT processing input file, followed by the threshold violations (grouped by averaging period). To make it easier for the user to review the EVENT processing input file generated by the AERMOD model, and determine which events are of most concern, the actual concentration value associated with the event is included as the last field on the EVENTPER card. This field is ignored by the AERMOD model and is included only for informational purposes. The user should be aware that the same event may appear in the AERMOD model input file as both a design value and as a threshold violation, depending on the options selected and the actual results. Since the model processes the events by date sequence and outputs the results for each event as it is processed, the order of events in the output file will generally not follow the order of events in the input file, unless all of the events were generated by the MAXIFILE option.

### 3.6.2 Specifying discrete events

The user can specify discrete events by entering the EVENTPER and EVENTLOC cards as described above. The averaging period and source group selected for the event must be among those specified on the CO AVERTIME and SO SRCGROUP cards. If the EVENT processing input file was generated by the AERMOD model, the user may include additional events for those averaging periods and source groups used in the original AERMOD model run. They may also add averaging periods or define new source groups in the Event processing input file in order to define additional events.

### 3.6.3 Including event data from an external file

The user has the option of including event data from an external file by using the INCLUDED keyword on the source (EV) pathway. An EV INCLUDED card may be placed anywhere within the event pathway, after the STARTING card and before the FINISHED card (i.e., the EV STARTING and EV FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the control file. The syntax and type of the INCLUDED keyword are summarized below:

<b>Syntax:</b>	EV INCLUDED Incfil
<b>Type:</b>	Optional, Repeatable

where the Incfil parameter is a character field of up to 40 characters that identifies the filename for the included file. The contents of the included file must be valid control file commands for the event pathway. If an error is generated during processing of the included file, the error message will report the line number

of the included file (see APPENDIX B). If more than one INCLUDED file is specified for the event pathway, the user will first need to determine which file the error occurred in. If the starting column of the main control input file is shifted from column 1 (see Section 2.4.8), then the control file commands in the included file must be offset by the same amount.

### 3.7 Output pathway inputs and options

The **OU**tput pathway contains keywords that define the output options for the model runs. Beginning with version 11059, a number of enhancements have been incorporated in AERMOD to more fully support the form of more recent 1-hour NO<sub>2</sub> and SO<sub>2</sub> standards, as well as the 24-hour PM<sub>2.5</sub> standard. The form of these NAAQS is similar in that they are based on a ranked percentile value averaged over the number of years processed.

The options on the **OU**tput pathway have been divided into five categories: 1) options that control different types of tabular output in the main output files of the model; 2) output files for specialized purposes that that can be generated for any pollutant and averaging period; 3) options that are specific to more recent 24-hour PM<sub>2.5</sub>, 1-hour NO<sub>2</sub>, and/or 1-hour SO<sub>2</sub> standards; 4) options related to EVENT processing; and 5) miscellaneous options. The user may select any combination of output option for a particular application.

#### 3.7.1 Selecting options for tabular printed outputs

The three tabular printed output options are controlled by the following keywords:

- RECTABLE: Controls output option for high value summary tables by receptor;
- MAXTABLE: Controls output option for overall maximum value summary tables; and
- DAYTABLE: Controls output option for tables of concurrent values summarized by receptor for each day processed.

The keywords are described in more detail in the order listed above.

The syntax and type for the RECTABLE keyword are summarized below:

<b>Syntax:</b>	OU RECTABLE Aveper <u>FIRST</u> <u>SECOND</u> ... <u>SIXTH</u> ... <u>TENTH</u> and/or <u>1ST</u> <u>2ND</u> ... <u>6TH</u> ... <u>10TH</u> and/or <u>1</u> <u>2</u> ... <u>6</u> ... <u>10</u> ... <u>N</u> ... <u>999</u>
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the short-term averaging period (e.g., 1, 3, 8 or 24 hr or MONTH) for which the receptor table is selected, and the secondary keywords, FIRST, SECOND, etc., indicate which high values are to be summarized by receptor for that averaging period. The RECTABLE card may be repeated for each averaging period. For cases where the user wants the same RECTABLE options for all short-term averaging periods being modeled, the input may be simplified by entering the secondary keyword ALLAVE for the Aveper parameter.

In order to support the implementation of recent guidance regarding modeling to demonstrate compliance with these NAAQS, the RECTABLE keyword had been modified to allow user-specified ranks of short-term averages (for all pollutants) up to the 999th highest value. The previous version of AERMOD was limited to the 10th-highest value and also restricted the rank for the 24-hour PM<sub>2.5</sub> NAAQS to the 8th highest value (corresponding to the 98th percentile of daily values during a year).

The following example will select summaries of the highest, second highest and third highest values by receptor for all averaging periods:

```
OU RECTABLE ALLAVE FIRST SECOND THIRD
```

The model will also recognize a range of high values on the RECTABLE input card, and therefore the following card will have the effect:

```
OU RECTABLE ALLAVE FIRST-THIRD
```

The output file will include tables for only the high values selected. Tables for all source groups for a particular averaging period are grouped together, and the averaging periods are output in the order that they appear the CO AVERTIME card. For each averaging period and source group combination, the tables of high values for the receptor networks (if any) are printed first, followed by any discrete Cartesian receptors, and any discrete polar receptors.

If the CO EVENTFIL keyword has been used to generate an input file for EVENT processing, then the design values identified by the RECTABLE options, e.g., the high-second-high 24-hour average, are included in the events that are defined in the EVENT processing input file.

If the PLOTFILE (3.7.2.3) and/or MAXDCONT (0) keywords are used, the RECTABLE keyword is required and must be specified prior to these keywords in the OU pathway. The rank or high value (e.g., FIRST, SECOND, etc.) specified for each PLOTFILE must also be included on the RECTABLE keyword. There will need to be a RECTABLE entry that includes each of the high values and averaging periods for which a PLOTFILE is generated, or a single RECTABLE entry with the ALLAVE keyword and each high value specified can be used. However, because the RECTABLE only relates to short-term averaging periods, a RECTABLE entry is not required for a PLOTFILE that is generated for either an ANNUAL or a PERIOD average. When the MAXDCONT keyword is used, the UpperRank and LowerRank values of the MAXDCONT file must be within the range of ranks specified on the RECTABLE keyword. The MAXDCONT THRESH value analysis is limited to the range of ranks specified on the RECTABLE keyword (but not the individual ranks that are specified). Read more about the requirements of the of RECTABLE as it relates to the PLOTFILE and MAXDCONT keywords in Sections 3.7.2.3 and 0, respectively.

The syntax and type for the MAXTABLE keyword are summarized below:

<b>Syntax:</b>	OU MAXTABLE Aveper Maxnum
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the short-term averaging period (e.g., 1, 3, 8 or 24 hr or MONTH) for which the receptor table is selected, and the Maxnum parameter specifies the number of overall maximum values to be summarized for each averaging period. The MAXTABLE card may be repeated for each averaging period. As with the RECTABLE keyword, for cases where the user wants the same MAXTABLE options for all short-term averaging periods being modeled, the input may be simplified by entering the secondary keyword ALLAVE for the Aveper parameter. The following example will select the maximum 50 table for all averaging periods:

```
OU MAXTABLE ALLAVE 50
```

A separate maximum overall value table is produced for each source group. The maximum value tables follow the RECTABLE outputs in the main print file. All source group tables for a particular averaging period are grouped together, and the averaging periods are output in the order that they appear on the CO AVERTIME card.

The syntax and type for the DAYTABLE keyword are summarized below:

<b>Syntax:</b>	OU DAYTABLE Avper1 Avper2 Avper3 . . .
<b>Type:</b>	Optional, Non-repeatable

where the Avper*n* parameters are the short-term averaging periods (e.g., 1, 3, 8 or 24 hr or MONTH) for which the daily tables are selected. The DAYTABLE card is non-repeatable, but as with the RECTABLE and MAXTABLE keywords, for cases where the user wants daily tables for all short-term averaging periods being modeled, the input may be simplified by entering the secondary keyword ALLAVE for the first parameter. The following example will select the daily tables for all averaging periods:

```
OU DAYTABLE ALLAVE
```

For each averaging period for which the DAYTABLE option is selected, the model will print the concurrent averages for all receptors for each day of data processed. The receptor networks (if any) are printed first, followed by any discrete Cartesian receptors, and any discrete polar receptors. Results for each source group are output. For example, if 1, 3, and 24-hour averages are calculated, and the OU DAYTABLE ALLAVE option is used, then for the first day of data processed, there will be 24 sets of tables of hourly averages (one for each hour in the day), eight sets of 3-hour averages (one for each 3-hour period in the day), and one set of 24-hour averages. The averages are printed as they are calculated by the model, but for hours where more than one averaging period is calculated (e.g., hour 24 is the end of an hourly average, a 3-hour average, and a 24-hour average), the order in which the averages are output will follow the order used on the CO AVERTIME card. Note: This option can produce very large output files, especially when used with a full year of data and very short period averages, such 1-hour and 3-hour. It should therefore be used with CAUTION.

### 3.7.2 Selecting options for special purpose output files

The AERMOD model provides options for seven types of output files for specialized purposes. These options are controlled by the following keywords that create the output file described:

- MAXIFILE - Occurrences of violations of user-specified threshold value;
- POSTFILE - Concurrent (raw) results at each receptor suitable for post-processing;
- PLOTFILE - Design values that can be imported into graphics software for plotting contours;
- TOXXFILE - Unformatted files of raw results above a threshold value with a special structure for use with the TOXX model component of TOXST;
- RANKFILE - Output values by rank for use in Q-Q (quantile) plots;
- EVALFILE - Output values, including arc-maximum normalized concentrations, suitable for model evaluation studies;
- SEASONHR - Output values by season and hour-of-day;
- MAXDCONT - Ranked values for individual source groups to determine source contributions for 24-hour PM<sub>2.5</sub>, 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> standards;
- MAXDAILY - Daily maximum 1-hour concentrations for a specified source group, for each day in the data period processed, useful for analyzing the 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS; and
- MAXDYBY-R - Summary of daily maximum 1-hour concentrations by year for each rank specified on the RECTABLE keyword.

The keywords are described in more detail in the order listed above.

### 3.7.2.1 MAXIFILE

The syntax and type for the MAXIFILE keyword are summarized below:

<b>Syntax:</b>	OU MAXIFILE Aveper Grpid Thresh Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the short-term averaging period (e.g., 3, 8, 24 for 3, 8 and 24-hour averages, or MONTH for monthly averages) and Grpid is the source group ID for which the MAXIFILE option is selected. The Thresh parameter is the user-specified threshold value, and Filnam is the name of the file where the MAXIFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are

reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940.

Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. By specifying the same filename and unit for more than one MAXIFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 2.1.2).

The MAXIFILE card may be repeated for each combination of averaging period and source group, and a different filename should be used for each file. The resulting maximum value file will include several header records identifying the averaging period, source group and the threshold value for that file, and a listing of every occurrence where the result for that averaging period/source group equals or exceeds the threshold value. Each of these records includes the averaging period, source group ID, date for the threshold violation (ending hour of the averaging period), the x, y, z and flagpole receptor height for the receptor location where the violation occurred, and the concentration value.

Each of the threshold violations, except for monthly averages, identify events that may be modeled for source contribution information with EVENT processing by selecting the CO EVENTFIL option (see Sections 3.2.14 and 2.1). Each of the threshold violations is included as an event on the EV pathway and is given a name of the form THxxyyyy, where xx is the averaging period, and yyyy is the violation number for that averaging period. For example, an event name of TH240019 identifies the 19th threshold violation for 24-hour averages. Monthly average threshold violations are included in the file specified on the MAXIFILE card but are not included in the EVENT processing input file since the AERMOD model currently handles only averaging periods of up to 24 hours.

The following examples illustrate the use of the MAXIFILE option:

OU MAXIFILE	24	ALL	364.0	MAX24ALL.OUT	
OU MAXIFILE	24	PSD	91.0	MAXPSD.OUT	50
OU MAXIFILE	3	PSD	365.0	MAXPSD.OUT	50
OU MAXIFILE	3	PLANT	25.0	C:\OUTPUT\MAXI3HR.FIL	
OU MAXIFILE	MONTH	ALL	10.0	MAXMONTH.OUT	

where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. The FILNAM parameter may be up to 200 characters in length. It should also be noted that only one MAXIFILE card may be used for each averaging period/source group combination.

Note: The MAXIFILE option may produce very large files for runs involving a large number of receptors if a significant percentage of the results exceed the threshold value.

### 3.7.2.2 POSTFILE

The syntax and type for the POSTFILE keyword are summarized below:

<b>Syntax:</b>	OU POSTFILE Aveper Grpid Format Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the averaging period (e.g., 3, 8, 24 for 3, 8 and 24-hour averages, MONTH for monthly averages, PERIOD for period averages, or ANNUAL for annual averages) and Grpid is the source group ID for which the POSTFILE option is selected. The Format parameter specifies the format of the POSTFILE output and may either be the secondary keyword UNFORM for unformatted concentration files, or the secondary keyword PLOT to obtain formatted files of receptor locations (x- and y-coordinates) and concentrations suitable for plotting contours of concurrent values. The Filnam parameter is the name of the file where the POSTFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT, 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. By specifying the same filename and unit for more than one POSTFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 2.1.2).

The POSTFILE card may be repeated for each combination of averaging period and source group, and a different filename should be used for each file. If UNFORM is specified for the Format parameter, then the resulting unformatted file includes a constant-length record for each of the selected averaging periods calculated during the model run. The first variable of each record is an integer variable (4 bytes) containing the ending date (YYMMDDHH) for the averages on that record. The second variable for each record is an integer variable (4 bytes) for the number of hours in the averaging period. The third variable for each record is a character variable of length eight containing the source group ID. The remaining variables of each record contain the calculated average concentration values for all receptors, in the order in which they were defined in the input runstream.

The following examples illustrate the use of the POSTFILE option:

```

OU POSTFILE 24 ALL UNFORM PST24ALL.BIN
OU POSTFILE 24 PSD UNFORM PST24PSD.BIN
OU POSTFILE 3 PLANT UNFORM C:\BINOUT\PST3HR.FIL
OU POSTFILE MONTH ALL PLOT PSTMONTH.PLT
OU POSTFILE PERIOD ALL PLOT PSTANN.PLT

```

where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. The Filnam parameter may be up to 200 characters in length. The use of separate files for each averaging period/source group combination allows the user flexibility to select only those results that are needed for post-processing for a particular run, and also makes the resulting unformatted files manageable. Note: The POSTFILE option can produce very large files and should be used with some caution. For a file of hourly values for a full year (8760 records) and 400 receptors, the resulting file will use about 14 megabytes of disk space. To estimate the size of the file (in bytes), use the following equation:

$$File\ Size\ (bytes) = \frac{\# Hrs/Yr}{\# Hrs/Ave} * (\# Rec + 4) * 4$$

Divide the result by 1000 to estimate the number of kilobytes (KB) and divide by 1.0E6 to estimate the number of megabytes (MB).

### 3.7.2.3 PLOTFILE

The syntax and type for the PLOTFILE keyword are summarized below:

<b>Syntax:</b>	OU PLOTFILE Aveper Grpid Hivalu Filnam (Funit), or OU PLOTFILE <u>PERIOD</u> Grpid Filnam (Funit) OU PLOTFILE <u>ANNUAL</u> Grpid Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the averaging period (e.g., 3, 8, 24 for 3, 8 and 24-hour averages, MONTH for monthly averages, PERIOD for period averages, or ANNUAL for annual averages), Grpid is the source group ID for which the PLOTFILE option is selected, and Hivalu specifies which short-term high values are to be output (FIRST for the first highest at each receptor, SECOND for the second highest at each receptor,

etc.) Note that the Hivalu parameter is not specified for PERIOD or ANNUAL averages, since there is only one period or annual average for each receptor. The Filnam parameter is the name of the file where the PLOTFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. By specifying the same filename and unit for more than one PLOTFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 2.1.2).

**Note: The averaging period and high value for which a PLOTFILE is generated must also be included on the RECTABLE keyword (see Section 3.7.1). The RECTABLE keyword entry must be specified on the OU pathway prior to the PLOTFILE entry. However, a RECTABLE entry is not required for a PLOTFILE generated for the ANNUAL or PERIOD average.**

The PLOTFILE card may be repeated for each combination of averaging period, source group, and high value, and a different filename should be used for each file. The resulting formatted file includes several records with header information identifying the averaging period, source group and high value number of the results, and then a record for each receptor which contains the x and y coordinates for the receptor location, the appropriate high value at that location, and the averaging period, source group and high value number. The data are written to the file in the order of x-coord, y-coord, concentration so that the file can easily be imported into a graphics package designed to generate contour plots. Many such programs will read the PLOTFILES directly without any modification, ignoring the header records, and produce the desired plots.

The following examples illustrate the use of the PLOTFILE option:

OU	PLOTFILE	24	ALL	FIRST	PLT24ALL.FST
OU	PLOTFILE	24	ALL	SECOND	PLT24ALL.SEC
OU	PLOTFILE	24	PSD	2ND	PLTPSD.OUT 75
OU	PLOTFILE	3	PSD	2ND	PLTPSD.OUT 75
OU	PLOTFILE	3	PLANT	1ST	C:\PLOTS\PLT3HR.FIL

OU	PLOTFILE	MONTH	ALL	THIRD	PLTMONTH.OUT
OU	PLOTFILE	PERIOD	ALL		PSTANN.PLT

where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. As illustrated by the second and third examples, the high value parameter may also be input as secondary keywords using the standard abbreviations of 1ST, 2ND, 3RD . . . 10TH. The Filnam parameter may be up to 40 characters in length. The use of separate files for each averaging period, source group, high value combination allows the user flexibility to select only those results that are needed for plotting from a particular run.

### 3.7.2.4 TOXXFILE

The syntax and type for the TOXXFILE keyword are summarized below:

<b>Syntax:</b>	OU TOXXFILE Aveper Cutoff Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the short-term averaging period (e.g., 1, 3, 8, 24 for 1, 3, 8 and 24-hour averages, or MONTH for monthly averages) for which the TOXXFILE option has been selected. The Cutoff (threshold) parameter is the user-specified threshold cutoff value in  $g/m^3$ , and Filnam is the name of the file where the TOXXFILE results are to be written. It is important to note that the units of the Cutoff parameter are  $g/m^3$ , regardless of the input and output units selected with the SO EMISUNIT card. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 2.1.2). While the TOXXFILE option may be specified for any of the short-term averaging periods that are identified on the CO AVERTIME card for a particular run, a non-fatal warning message will be generated if other than 1-hour averages are specified. This is because the TOXST model currently supports only 1-hour averages.

The TOXXFILE card may be repeated for each averaging period, but a different filename should be used for each file since the structure of the output file generated by the TOXXFILE option does not allow for a clear way to distinguish between results for different averaging periods. The resulting output file for the AERMOD model is an unformatted file with several header records identifying the title, averaging period, receptor information, and the threshold value for that file, followed by records listing every occurrence where the result for any source group for that averaging period equals or exceeds the threshold value. When one of the source groups exceeds the threshold value, the results for all source groups for that averaging period and receptor location are output. Each concentration that is output through the TOXXFILE option is paired with an integer ID variable that identifies the averaging period (hour number of the year), the source group number, and the receptor number corresponding to that value. The concentration values and corresponding ID variables are stored in buffer arrays, and the arrays are then written to the unformatted output file when full. The size of the arrays is controlled by the NPAIR PARAMETER defined in MODULE MAIN1 and is initially set at 100. At the end of the modeling run, any values remaining in the buffer arrays are written to the file, padded to the right with zeroes. The structure of the output file generated by the TOXXFILE option is described in more detail in Section 2.1.2 and in APPENDIX C. When using the TOXXFILE option, the user will normally place a single source in each source group. The user should refer to the user's guide for TOXST for further instructions on the application of the TOXXFILE option of the AERMOD model.

The following examples illustrate the use of the TOXXFILE option:

```
OU TOXXFILE 1 1.0E-5 TOXX1HR.BIN
OU TOXXFILE 24 2.5E-3 TOXX24HR.BIN 50
```

The Filnam parameter may be up to 200 characters in length. It should be noted that only one TOXXFILE card may be used for each averaging period. Note: The TOXXFILE option may produce very large files for runs involving a large number of receptors if a significant percentage of the results exceed the threshold value.

### 3.7.2.5 RANKFILE

The RANKFILE keyword outputs values by rank for use in Q-Q (quantile) plots. The MAXTABLE option must be specified first in order to use the RANKFILE option for a particular averaging period. However, the RANKFILE output differs from the results in the MAXTABLE output in that duplicate date/hour occurrences are removed. The syntax and type for the RANKFILE keyword are summarized below:

<b>Syntax:</b>	OU RANKFILE Aveper Hinum Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Aveper parameter is the averaging period (e.g., 3, 8, 24 for 3, 8, and 24-hour averages, or MONTH for monthly averages), and Hinum is the number of high values to be ranked. The RANKFILE keyword cannot be used with PERIOD averages. As noted above, the MAXTABLE option must be specified first for the particular Aveper, and the Hinum parameter on the RANKFILE card must be less than or equal to the Maxnum parameter on the corresponding MAXTABLE card. Since duplicate dates are removed from the RANKFILE output, the output file may contain less than the number of requested high values. The NMAX parameter, which controls the maximum number of values that can be stored, has been set initially to 400. The Filnam parameter is the name of the file (up to 200 characters) where the RANKFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT, 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. By specifying the same filename and unit for more than one RANKFILE card, results for different averaging periods may be combined into a single file. If the Funit parameter is omitted, the model will dynamically allocate a unique file unit for this file according to the following formula:

$$\text{IRKUNT} = 100 + \text{IAVE}$$

where IRKUNT is the Fortran unit number and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card).

### 3.7.2.6 EVALFILE

The EVALFILE option is specifically designed for use in generating residuals for model evaluation studies. The EVALFILE output consists of the arc-maximum normalized concentration values for each hour of meteorology and for each source specified. The arc groupings of the receptors must be specified using the RE EVALCART keyword described above. The syntax and type for the EVALFILE keyword are summarized below:

<b>Syntax:</b>	OU EVALFILE Srcid Filnam (Funit)
<b>Type:</b>	Optional, Repeatable

where the Srcid parameter is the source ID for which EVALFILE results are requested, the Filnam parameter is the name of the file (up to 200 characters) where the EVALFILE results are to be written, and the optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. Please note, when specifying the FUNIT, 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. By specifying the same filename and unit for more than one EVALFILE card, results for different sources may be combined into a single file. If the Funit parameter is omitted, the model will dynamically allocate a unique file unit for this file according to the following formula:

$$IELUNT = 400 + ISRC*5$$

where IELUNT is the Fortran unit number and ISRC is the source number (the order of the source as specified on the SO pathway).

For each hour of meteorological data processed and for each receptor grouping (e.g., arc), the EVALFILE option outputs five records containing the source ID, date, arc ID, arc-maximum normalized concentration (P/Q), emission rate, and other plume dispersion and meteorological variables associated with the arc-maximum. Since the EVALFILE option looks at receptor groupings, it must be used in conjunction with the EVALCART keyword described above for the RE pathway, and a fatal error is generated if no receptor groups are identified.

### 3.7.2.7 SEASONHR

The SEASONHR option is used to output a file containing the average results by season and hour-of-day. To select this option, the user must include the SEASONHR keyword on the OU pathway. The syntax, type, and order for the SEASONHR keyword are summarized below:

<b>Syntax:</b>	OU SEASONHR GroupID Filenam (FUnit)
<b>Type:</b>	Optional, Repeatable

where the GroupID parameter specifies the source group to be output, FileName specifies the name of the output file, and the optional FileUnit parameter specifies an optional file unit. Please note, when specifying the FUNIT, 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. If FileUnit is left blank, then the model will dynamically assign a file unit based on the formula  $302+IGRP*10$ , where IGRP is the group index number. A sample from a SEASONHR output file is shown below:

```

* MODELING OPTIONS USED:
*   CONC           WDEP   RURAL   FLAT       TOXICS
*   FILE OF SEASON/HOUR VALUES FOR SOURCE GROUP: ALL
*   FOR A TOTAL OF   216 RECEPTORS.
*   FORMAT: (4(1X,F13.5),1X,F8.2,2X,A8,2X,I4,2X,I4,2X,I4,2X,A8)
*
*   X             Y             AVERAGE CONC   ZELEV   GRP   NHRS  SEAS  HOUR  NET ID
*   -----
      8.68241      49.24039      0.00000      0.00   ALL    87    1    1   POL1
      17.36482     98.48077      0.00000      0.00   ALL    87    1    1   POL1
      86.82409    492.40387      0.18098      0.00   ALL    87    1    1   POL1
      173.64818   984.80774      2.52520      0.00   ALL    87    1    1   POL1
      868.24091  4924.03857      2.07470      0.00   ALL    87    1    1   POL1
     1736.48181  9848.07715      0.93252      0.00   ALL    87    1    1   POL1

```

The NHRS column in the output file contains the number of non-calm and non-missing hours used to calculate the season-by-hour-of-day averages. The SEAS column is the season index, and is 1 for winter, 2 for spring, 3 for summer and 4 for fall. The records loop through hour-of-day first, and then through the seasons.

### 3.7.2.8 MAXDCONT

Beginning with version 11059, three output options have been incorporated on the OU pathway to support the 1-hour NO<sub>2</sub> and SO<sub>2</sub> standards, especially the analyses that may be required to determine a source's (or group of sources) contributions to modeled violations of the NAAQS for comparison to the Significant Impact Level (SIL). The form of the standards, based on averages of ranked values across years, complicates this analysis, especially for the 1-hour NO<sub>2</sub> and SO<sub>2</sub> standards which are based on ranked values from the distribution of daily maximum 1-hour averages. One of the options (MAXDCONT) can also be used for the 24-hour PM<sub>2.5</sub> NAAQS.

The MAXDCONT option, applicable to 24-hour PM<sub>2.5</sub>, 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> standards, can be used to determine the contribution of each user-defined source group to the high ranked values for a target source group, paired in time and space. This is accomplished as an internal post-processing routine after the main model run is completed. The user can specify the range of ranks to analyze, or can specify an upper bound rank, e.g., 8th-highest for 1-hour NO<sub>2</sub> (note that "upper bound" rank implies a higher concentration, while "lower bound" rank implies a lower concentration), and a threshold value, such as the NAAQS, for the target source group. The model will process each rank within the range specified but will stop after the first rank (in descending order of concentration) that is below the threshold.

The syntax, type and order of the optional MAXDCONT keyword are summarized below:

<b>Syntax:</b>	OU MAXDCONT GrpID UpperRank LowerRank FileName (FileUnit) or OU MAXDCONT GrpID UpperRank <u>THRESH</u> ThreshValue FileName (FileUnit)
<b>Type:</b>	Optional, Repeatable

where GrpID is the target or reference source group toward which contributions are being determined, UpperRank and LowerRank are the upper bound and lower bound ranks (where upper bound rank implies higher concentrations and lower bound rank implies lower concentrations), THRESH indicates that the lower bound rank is determined based on a lower concentration threshold, ThreshValue is the user-specified concentration threshold for GrpID impacts which serves as a lower bound on the range of ranks analyzed, FileName is the output file name, and (FileUnit) is the optional file unit. The filename can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (") at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces. Please note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units

range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one. When the THRESH option is selected AERMOD will skip the contribution analysis for any receptor where the target GrpID impact is less than the threshold and will stop processing completely after the first rank where the target GrpID values are below the threshold for all receptors. **NOTE: It is important note that the range of ranks that can be analyzed under the MAXDCONT option is limited to the range of ranks (not the individual ranks) specified on the OU RECTABLE keyword, even when the THRESH option is used in lieu of specifying a LowerRank value. AERMOD will issue a fatal error if the THRESH option is used and the range of ranks is less than or equal to 8 for the 1-hr SO<sub>2</sub> NAAQS, or less than or equal to 12 for the 1-hr NO<sub>2</sub> and 24-hr PM<sub>2.5</sub> NAAQS. Non-fatal warning messages will be generated if the THRESH option is used and the range of ranks is less than or equal to 24 for the 1-hr SO<sub>2</sub> NAAQS, or less than or equal to 28 for the 1-hr NO<sub>2</sub> and 24-hr PM<sub>2.5</sub> NAAQS. The RECTABLE keyword entry must be specified on the OU pathway prior to the MAXDCONT entry.**

When the MAXDCONT option is specified, AERMOD stores all meteorological variables in memory for each hour during the initial stage of processing in order to optimize the model runtime during the post-processing stage. Any temporally varying emissions and background concentrations, including background ozone concentrations for the OLM and PVMRM options, are also stored in memory for each hour. While optimizing runtime for the post-processing, this approach may also significantly increase the memory storage requirements of the model. In addition, since the MAXDCONT option extracts meteorological variables and other temporally-varying data stored in memory to optimize runtime, the MAXDCONT option cannot be used with the model “re-start” option using the INITFILE and SAVEFILE keywords (Section 3.2.15) on the CO pathway, or with the MULTYEAR option (Section 3.2.7) on the CO pathway.

### 3.7.2.9 MAXDAILY

The MAXDAILY option, introduced with version 11059, is applicable to 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> NAAQS and generates a file of daily maximum 1-hour concentrations for a specified source group, for each day in the data period processed. The MAXDAILY file provides an interim output that may be useful for analyzing the 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS. The syntax, type and order of the optional MAXDAILY keyword are summarized below:

<b>Syntax:</b>	OU MAXDAILY GrpID FileName (FileUnit)
<b>Type:</b>	Optional, Non-repeatable

where GrpID is the source group selected for daily maximum 1-hour values, FileName is the name of the MAXDAILY output file, and FileUnit is the optional file unit. The filename can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (“”) at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces. Please note, when specifying the FUNIT, 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one.

### 3.7.2.10 MAXDYBYR

Another option applicable to 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> NAAQS introduced with version 11059, the MXDYBYR keyword, generates a summary of daily maximum 1-hour concentrations by year for each rank specified on the RECTABLE keyword. The ranks included in the MXDYBYR file are the ranks used in the MAXDCONT postprocessing option. The syntax, type and order of the optional MXDYBYR keyword are summarized below:

<b>Syntax:</b>	OU MXDYBYR GrpID FileName (FileUnit)
<b>Type:</b>	Optional, Non-repeatable

where GrpID is the source group selected for daily maximum 1-hour values summarized by year, FileName is the name of the MXDYBYR output file, and FileUnit is the optional file unit. The filename can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (“”) at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces. Please

note, when specifying the FUNIT 1 to 32 are reserved for input/output files, internally computed file units range 100 to 730, and the following are reserved for debug files: 731, 931, 932, 933, 937, 938, 939, 941, 8837, 8932, 9937, 9938, 9939, 9940. Therefore, to ensure there will be no file conflicts, it is recommended that user-specified units begin at a large integer value such as 10,000 and increment by one.

### 3.7.3 EVENT processing options

EVENT processing in the AERMOD model is designed specifically to perform source contribution analyses for short-term average (less than or equal to 24-hour) events. The events may either be generated by the AERMOD model, or they may be user-specified events, or both. Because of this rather narrow focus of applications, the output options are limited to a single keyword. The EVENTOUT keyword controls the level of detail in the source contribution output from the EVENT model. The syntax and type of the EVENTOUT keyword are summarized below:

<b>Syntax:</b>	OU EVENTOUT <u>SOCONT</u> <u>DETAIL</u>
<b>Type:</b>	Mandatory, Non-repeatable

where the SOCONT secondary keyword specifies the option to produce only the source contribution information in the output file, and the DETAIL secondary keyword specifies the option to produce more detailed summaries in the output file. The SOCONT option provides the average concentration (or total deposition) value (i.e., the contribution) from each source for the period corresponding to the event for the source group. The basic source contribution information is also provided with the DETAIL option. In addition, the DETAIL option provides the hourly average concentration (or total deposition) values for each source for every hour in the averaging period, and a summary of the hourly meteorological data for the event period. In general, the DETAIL option produces a larger output file than the SOCONT file, especially if there are a large number of sources. There is no default setting for the EVENTOUT options.

### 3.7.4 Miscellaneous output options

The optional SUMMFILE keyword can be used to generate a separate formatted output file containing the summary of high ranked values included at the end of the standard 'aermod.out' file. The optional FILEFORM keyword can be used to specify the use of exponential notation, rather than fixed format as currently used, for results that are output to separate result files. The optional NOHEADER keyword can be used to suppress file headers in formatted output file options. These new options are described below.

The syntax, type, and order of the optional SUMMFILE keyword are summarized below:

<b>Syntax:</b>	OU SUMMFILE SummFileName
<b>Type:</b>	Optional, Non-repeatable

where the SummFileName is the name of the external file containing the summary of high ranked values. The SUMMFILE filename can be up to 200 characters in length based on the default parameters in AERMOD. Double quotes (“”) at the beginning and end of the filename can also be used as field delimiters to allow filenames with embedded spaces. In addition to the summary of high ranked values, the SUMMFILE also includes the “MODEL SETUP OPTIONS SUMMARY” page from the main ‘aermod.out’ file.

The syntax, type, and order of the optional FILEFORM keyword are summarized below:

<b>Syntax:</b>	OU FILEFORM <u>EXP</u> or <u>FIX</u>
<b>Type:</b>	Optional, Non-repeatable

where the EXP parameter specifies that output results files will use exponential-formatted values, and the FIX parameter specifies that the output results files will use fixed-formatted values. The default option is to use fixed-formatted results, so use of FILEFORM = ‘FIX’ is extraneous. Note that AERMOD only examines the first three characters of the input field, so that the full terms of ‘EXPONENTIAL’ or ‘FIXED’ can also be used. The format specified on this optional keyword is applicable to PLOTFILES, plot formatted POSTFILES, MAXIFILES, RANKFILES, and SEASONHR files, but will not affect the format of results in the standard ‘aermod.out’ file or the optional SUMMFILE. The FILEFORM optional may be useful to preserve precision in applications with relatively small impacts, especially for the purpose of post-processing hourly concentrations using the POSTFILE option. The option may also be useful for applications with relatively large impacts that may overflow the Fortran format specifier of F13.5 used for fixed-formatted outputs. AERMOD will issue a warning message if values that exceed the range allowed for fixed format are detected unless the FILEFORM EXP option has been selected.

The syntax, type, and order of the optional NOHEADER keyword are summarized below:

<b>Syntax:</b>	OU NOHEADER FileType1 FileType2 FileType3 ... FileTypeN or OU NOHEADER <u>ALL</u>
<b>Type:</b>	Optional, Non-repeatable

where FileTypeN identifies the keywords for formatted output files for which the file headers will be suppressed, which may include the includes the following file types: POSTFILE, PLOTFILE, MAXIFILE, RANKFILE, SEASONHR, MAXDAILY, MXDYBYR, and MAXDCONT. The keyword ALL may be used to specify that header records will be suppressed for ALL applicable output file types.

## APPENDIX A. Functional keyword/parameter reference

This appendix provides a functional reference for the primary keywords and related secondary keywords and parameters used by the input control files for the AERMOD model. The keywords are organized by functional pathway. Except where noted, there is not a required order that the primary keywords within a pathway must be specified. Similarly, there is not a required order in which secondary keywords that follow a primary keyword must be specified, unless noted. However, AERMET assumes that user-entered values for parameters following a primary keyword are specified in the order listed in the tables below. The pathways used by the model are as follows, in the order in which they appear in the control file and in the tables that follow:

- CO** - for specifying overall job **C**ontrol options;
- SO** - for specifying **S**ource information;
- RE** - for specifying **R**eceptor information;
- ME** - for specifying **M**eteorology information and options;
- EV** - for specifying **E**vent information and options;
- OU** - for specifying **O**utput options.

The pathways and keywords are presented in the same order as in the Detailed Keyword Reference in Section 3.0, and in the Quick Reference at the end of the manual.

Two types of tables are provided for each pathway. The first table lists all of the keywords for that pathway, identifies each keyword as to its type (either mandatory or optional and either repeatable or non-repeatable), and provides a brief description of the function of the keyword. The second type of table, which takes up more than one page for most pathways, presents the parameters for each keyword, in the order in which they should appear in the control file where order is important, and describes each parameter in detail.

The following convention is used for identifying the different types of input parameters. Parameters corresponding to secondary keywords which should be input "as is" are listed on the tables with all capital letters and are underlined, although none of the inputs to AERMOD are treated as case sensitive. Other parameter names are given with an initial capital letter and are not input "as is." In all cases, the parameter names are intended to be descriptive of the input variable being represented, and they often correspond to the Fortran variable names used in the AERMOD code. Parentheses around a parameter indicate that the parameter is optional for that keyword. The default that is taken when an optional parameter is left blank is explained in the discussion for that parameter.

**Table A-1. Description of Control Pathway Keywords**

<b>CO Keywords</b>	<b>Type</b>	<b>Keyword Description</b>
STARTING	M – N	Identifies the start of CONTROL pathway inputs
TITLEONE	M – N	First line of title for output
TITLETWO	O – N	Optional second line of title for output
MODELOPT	M – N	Job control and dispersion options
AVERTIME	M – N	Averaging time(s) to process
URBANOPT	O – R	Specifies parameters for urban dispersion option
POLLUTID	M – N	Identifies type of pollutant being modeled
HALFLIFE <sup>1</sup>	O – N	Optional half life used for exponential decay
DCAYCOEF <sup>1</sup>	O – N	Optional decay coefficient
GASDEPDF	O – N	Option to override default parameters for gas dry deposition
GASDEPVD	O – N	Option to specify deposition velocity for gas dry deposition
GDLANUSE	O – N	Specify land use categories by sector for gas dry deposition
GDSEASON	O – N	Specify seasonal definitions for gas dry deposition
LOW_WIND	O – N	ALPHA option for low wind conditions that allows user to specify values for minimum sigma-v, minimum wind speed, and maximum meander factor
AWMADWNW	O – N	Specifies downwash options developed by AWMA
ORD_DWNW	O – N	Specifies downwash options developed by ORD
NO2EQUIL	O – N	Option to override default NO <sub>2</sub> /NO <sub>x</sub> equilibrium ratio for PVMRM, OLM, or TTRM/TTRM2
NO2STACK	O – N	Option to specify default in-stack NO <sub>2</sub> /NO <sub>x</sub> equilibrium ratio for PVRM, OLM, TTRM/TTRM2, and GRSM options; may be overridden by NO2RATIO option on SO pathway
NOX_FILE	O – N	Specifies hourly NO <sub>x</sub> file for the GSRM option
NOX_UNIT	O – N	Option to specify units for temporally varying NO <sub>x</sub> concentrations for the NOX_VALS keyword used with the GSRM option for estimating NO <sub>2</sub>
NOXVALUE	O – N	Specifies background value of NO <sub>x</sub> for the GSRM option for estimating NO <sub>2</sub>
NOXSECTR	O – N	Option to specify wind sectors for use in varying background NO <sub>x</sub> concentrations by wind direction for use with the GSRM option for estimating NO <sub>2</sub> ; can be used with the NOX_FILE, NOXVALUE, and NOX_VALS options
NOX_VALS	O – R	Option to specify temporally varying NO <sub>x</sub> concentrations for use with the GSRM option for estimating NO <sub>2</sub>
ARMRATIO	O – N	Option to override default minimum and maximum (equilibrium) ratios for the ARM2 option
O3SECTOR	O – N	Specifies optional wind sectors for use in varying background ozone (O <sub>3</sub> ) concentrations by wind direction for use with OLM, PVMRM, TTRM/TTRM2,

		and GRSM options; can be used with the OZONEFIL, OZONEVAL, and O3VALUES options
OZONEFIL	O – N	Specifies filename for hourly ozone file for use with OLM, PVMRM, TTRM/TTRM2, and GRSM options
OZONEVAL	O – R	Specifies background value of ozone for use with OLM, PVMRM, TTRM/TTRM2, and GRSM options
O3VALUES	O – R	Option to specify temporally varying ozone concentrations for use with OLM, PVMRM, TTRM/TTRM2, and GRSM options for estimating NO <sub>2</sub>
OZONUNIT	O – N	Option to specify units for temporally varying ozone concentrations for the O3VALUES keyword
FLAGPOLE	O – N	Specifies whether to accept receptor heights above local terrain (m) for use with flagpole receptors, and allows for default flagpole height to be specified
ARCFTOPT	O – N	Option to apply aircraft plume rise to AREA and VOLUME source types identified as aircraft using the ARCFTSRC keyword in the SO pathway
RUNORNOT	M – N	Identifies whether to run model or process setup information only
EVENTFIL <sup>2</sup>	O – N	Specifies whether to generate an input file for EVENT model
SAVEFILE <sup>3</sup>	O – N	Option to store intermediate results for restart of model after user or system interrupt
INITFILE <sup>3</sup>	O – N	Option to initialize model from intermediate results generated by SAVEFILE option
MULTYEAR <sup>3</sup>	O – N	Option to process multiple years of meteorological data (one year per run) and accumulate high short-term values across years
DEBUGOPT	O – N	Option to generate detailed result and meteorology files for debugging purposes
ERRORFIL	O – N	Option to generate detailed error listing file
FINISHED	M – N	Identifies the end of CONTROL pathway inputs

Type: M – Mandatory, O – Optional, N – Non-Repeatable, R – Repeatable

- 1) Either HALFLIFE or DCAYCOEF may be specified. If both cards appear a warning message will be issued and the first value entered will be used in calculations. The DFAULT option assumes a half-life of 4 hours for SO<sub>2</sub> modeled in urban mode.
- 2) The EVENTFIL keyword controls whether to generate an input file for EVENT processing. The primary difference between AERMOD “regular” processing and EVENT processing by AERMOD is in the treatment of source group contributions. The AERMOD model treats the source groups independently, whereas EVENT processing determines individual source contributions to particular events, such as the design concentrations determined from AERMOD, or user specified events. By specifying the EVENTFIL keyword, an input control file will be generated that can be used directly for EVENT processing. The events included in the generated EVENT processing input file are defined by the RECTABLE and MAXIFILE keywords on the OU pathway and are placed in the EVENT pathway.
- 3) The SAVEFILE and INITFILE keywords work together to implement the model's re-start capabilities. Since the MULTYEAR option utilizes the re-start features in a special way to

accumulate high short-term values from year to year, it cannot be used together with the SAVEFILE or INITFILE keyword in the same model run.

**Table A-2. Description of Control Pathway Keywords and Parameters**

Keyword	Parameters	
TITLEONE	Title1	
where:	Title1	First line of title for output, character string of up to 68 characters (additional characters can be included on the TITLEONE keyword, but only the first 68 characters are printed in the output files).
TITLETWO	Title2	
where:	Title2	Optional second line of title for output, character string of up to 68 characters (any additional characters are not printed).
MODELOPT	<u>DFAULT</u> <u>ALPHA</u> <u>BETA</u> <u>CONC</u> <u>AREADPLT</u> <u>FLAT</u> <u>NOSTD</u> <u>NOCHKD</u> <u>NOWARN</u> <u>SCREEN</u> <u>SCIM</u> <u>NOMINO3</u> <u>RLINEFDH</u> <u>ELEV</u> <u>WARNCHKD</u> <u>NOURTRAN</u> <u>VECTORWS</u> <u>PSDCREDIT</u> <u>FASTALL</u> <u>FASTAREA</u> <u>GSRM</u> <u>TTRM</u> <u>TTRM2</u> <u>PVMRM</u> <u>OLM</u> <u>ARM2</u> <u>DEPOS</u> <u>DDEP</u> <u>WDEP</u> <u>DRYDPLT</u> <u>WETDPLT</u> <u>NODRYDPLT</u> <u>NOWETDPLT</u> <u>AREAMNDR</u> <u>HBP</u>	
where:	<u>DFAULT</u>  <u>ALPHA</u>  <u>BETA</u>  <u>CONC</u> <u>DEPOS</u> <u>DDEP</u> <u>WDEP</u> <u>AREADPLT</u>  <u>FLAT</u>	<p>Specifies that the regulatory default options will be used; note that specification of the DFAULT option will override some non-DFAULT options that may be specified in the input file, while other non-DFAULT options will cause fatal errors when DFAULT is specified (see below for details).</p> <p>Non-regulatory option flag that allows the input control file to include research/experimental options for review and evaluation by the user community; (e.g., LOW_WIND, PSDCREDIT, ORD_DWNW, AWMADWNW, PLATFORM, METHOD 2 particle deposition, gas deposition, RLINEFDH, and RLINEXT with options for modeling barriers and depressed roadways) and cannot be used with DFAULT keyword.</p> <p>Non-regulatory option flag that allows the input control file to include options that have been vetted through the scientific community and are waiting to be promulgated as regulatory options. Prior to promulgation, BETA options require alternative model approval for use in regulatory applications and cannot be used with DFAULT keyword.</p> <p>Specifies that concentration values will be calculated.</p> <p>Specifies that total deposition flux values will be calculated.</p> <p>Specifies that dry deposition flux values will be calculated.</p> <p>Specifies that wet deposition flux values will be calculated.</p> <p>Specifies use of non-regulatory method for optimized plume depletion due to dry removal mechanisms for area sources (cannot be used when the DFAULT keyword is specified).</p> <p>Specifies that the non-regulatory option of assuming flat terrain will be used; Note that FLAT and ELEV may be specified in the same model run to allow specifying the non-regulatory FLAT terrain option on a source-by-source basis; FLAT sources are identified by specifying the keyword <u>FLAT</u> in place of the source elevation field on the SO LOCATION</p>

Keyword	Parameters	
	<u>ELEV</u>  <u>NOSTD</u>  <u>NOCHKD</u>  <u>WARNCHKD</u>  <u>NOWARN</u>  <u>SCREEN</u>  <u>SCIM</u>  <u>PVMRM</u>  <u>OLM</u>  <u>ARM2</u>  <u>TTRM</u>	<p>keyword (cannot be used simultaneously with the DFAULT keyword)..</p> <p>Specifies that the default option of assuming elevated terrain will be used; Note that FLAT and ELEV may be specified in the same model run to allow specifying the non-regulatory FLAT terrain option on a source-by-source basis (the ELEV option is set as a regulatory option with the DFAULT keyword).</p> <p>Specifies that the non-regulatory option of no stack-tip downwash will be used (cannot be used with the DFAULT keyword).</p> <p>Specifies that the non-regulatory option of suspending date checking will be used for non-sequential meteorological data files (cannot be used with the DFAULT keyword).</p> <p>Specifies that the option of issuing warning messages rather than fatal errors will be used for non-sequential meteorological data files.</p> <p>Specifies that the option of suppressing the detailed listing of warning messages in the main output file will be used (the number of warning messages is still reported, and warning messages are still included in the error file controlled by the CO ERRORFIL keyword).</p> <p>Non-regulatory option for running AERMOD in a screening mode for AERSCREEN will be used (cannot be used when the DFAULT keyword is specified).</p> <p>Sampled Chronological Input Model – non-regulatory option used only with the ANNUAL average option to reduce runtime by sampling meteorology at a user-specified regular interval; SCIM sampling parameters must be specified on the ME pathway (cannot be used with the DFAULT keyword).</p> <p>Specifies that the Plume Volume Molar Ratio Method (PVMRM) for NO<sub>2</sub> conversion will be used (regulatory option, can be used simultaneously with DFAULT); cannot be used with OLM, ARM2, or GRSM; cannot be used with TTRM without TTRM2.</p> <p>Specifies that the Ozone Limiting Method (OLM) for NO<sub>2</sub> conversion will be used (regulatory option, can be used simultaneously with DFAULT keyword); cannot be used with PVMRM, ARM2, or GRSM; cannot be used with TTRM without TTRM2.</p> <p>Specifies that the Ambient Ratio Method - 2 (ARM2) for NO<sub>2</sub> conversion will be used (regulatory option, can be used with DFAULT keyword); cannot be used with PVMRM, OLM, or GRSM; cannot be used with TTRM without TTRM2.</p> <p>Specifies that the non-regulatory Travel Time Reaction Method (TTRM) will be used for NO<sub>2</sub> conversion (non-regulatory alpha option, requires the ALPHA keyword and cannot be used with the DFAULT keyword); cannot be used with PVMRM, OLM, ARM2 without TTRM2; cannot be used with</p>

Keyword	Parameters	
	<u>TTRM2</u>  <u>GRSM</u>  <u>PSDCREDIT</u>  <u>FASTALL</u>  <u>FASTAREA</u>  <u>DRYDPLT</u>  <u>NODRYDPLT</u>  <u>WETDPLT</u>  <u>NOWETDPLT</u>	<p>GRSM; cannot be used with TTRM2 without PVMRM, OLM, or ARM2.</p> <p>Specifies that the non-regulatory Travel Time Reaction Method (TTRM) will be paired with OLM, PVMRM, or ARM2 for NO<sub>2</sub> conversion (non-regulatory alpha option, requires the ALPHA keyword and cannot be used with the DFAULT keyword); cannot be used with TTRM alone or GRSM; must be paired with one of PVMRM, OLM, or ARM2</p> <p>Specifies that the Generic Reaction Set Method (GRSM) will be used for NO<sub>2</sub> conversion; cannot be used with PVMRM, OLM, TTRM, TTRM2, or ARM2.</p> <p>Specifies that the non-regulatory ALPHA option will be used to calculate the increment consumption with PSD credits using the PVMRM option (cannot be used with the DFAULT keyword).</p> <p>Non-regulatory option to optimize model runtime through use of an alternative implementation of horizontal meander for POINT and VOLUME sources; also optimizes model runtime for AREA/AREAPOLY/AREACIRC/LINE, OPENPIT, RLINE, and RLINEXT sources (formerly associated with TOXICS option, now controlled by the FASTAREA and FASTALL option, cannot be used with the DFAULT keyword).</p> <p>Non-regulatory option to optimize model runtime through hybrid approach for AREA/ AREAPOLY/AREACIRC and OPENPIT sources (formerly associated with TOXICS option, cannot be used with the DFAULT keyword).</p> <p>Option to incorporate dry depletion (removal) processes associated with dry deposition algorithms; this requires specification of dry deposition source parameters and additional meteorological variables; dry depletion will be used by default if dry deposition algorithms are invoked; cannot be used with NODRYDPLT.</p> <p>Option to disable dry depletion (removal) processes associated with dry deposition algorithms; cannot be used with DRYDPLT.</p> <p>Option to incorporate wet depletion (removal) processes associated with wet deposition algorithms; this requires specification of wet deposition source parameters and additional meteorological variables; wet depletion will be used by default if wet deposition algorithms are invoked; cannot be used with NOWETDPLT.</p> <p>Option to disable wet depletion (removal) processes associated with wet deposition algorithms; cannot be used with WETDPLT.</p> <p>Non-regulatory option to ignore the transition from nighttime urban boundary layer to daytime convective boundary layer</p>

Keyword	Parameters	
	<u>NOURBTRAN</u>  <u>VECTORWS</u>  <u>NOMINO3</u>  <u>RLINEFDH</u>  <u>AREAMNDR</u>  <u>HBP</u>	<p>(i.e., to revert to the urban option as implemented prior to version 11059) (cannot be used with the DFAULT keyword).</p> <p>Option to specify that input wind speeds are vector mean (or resultant) wind speeds, rather than scalar means. Under the VECTORWS option, the adjustments to wind speeds based on Equation 112 of the AERMOD Model Formulation document (EPA, 2024a) will be applied (can be used with the DFAULT keyword).</p> <p>Option to remove the minimum ozone used for Tier 2 &amp; 3 NO<sub>2</sub> options. Without this option, AERMOD will use a minimum value of 40 ppb of ozone for nighttime stable conditions, regardless of the value in an hourly input file (can be used with the DFAULT keyword).</p> <p>Option to have wind profile calculations without a displacement height for RLINE and RLINEXT source types. This makes the wind profile closer to other AERMOD source types, which do not use a displacement height in wind profile (requires the ALPHA keyword and cannot be used with the DFAULT keyword).</p> <p>Option to apply plume meander to AREA, AREAPOLY, AREACIRC, and LINE source types. Note that AREAMNDR and FASTAREA or FASTALL can be specified in the same model run, but in that case, meander will not be applied to those source types listed.</p> <p>Option for highly buoyant plumes (HBP) when plume penetrates the top of the convective mixed layer. Limited to point source types (POINT, POINTHOR, POINTCAP). Compares convective mixing height for the current hour and next hour to determine how much of the penetrated plume has been captured by the CBL by the end of the current hour (requires the ALPHA keyword and cannot be used with the DFAULT keyword).</p>
AVERTIME	Time1 Time2 ... TimeN <u>MONTH</u> <u>PERIOD</u> or <u>ANNUAL</u>	
where:	TimeN <u>MONTH</u> <u>PERIOD</u>  <u>ANNUAL</u>	<i>N</i> th optional averaging time ( <u>1</u> , <u>2</u> , <u>3</u> , <u>4</u> , <u>6</u> , <u>8</u> , <u>12</u> , or <u>24</u> -hr) Option to calculate <u>MONTH</u> ly averages. Option to calculate averages for the entire data <u>PERIOD</u> ; for the <u>MULTYEAR</u> option, the summary of highest <u>PERIOD</u> averages is based on the highest <u>PERIOD</u> average across the individual years processed with <u>MULTYEAR</u> . Option to calculate <u>ANNUAL</u> averages (assumes complete years); for multi-year meteorological data files, with and without the <u>MULTYEAR</u> option, the multi-year average of the <u>ANNUAL</u> values is reported.
URBANOPT	For multiple urban areas:	

Keyword	Parameters	
where:	Haflif	Half-life used for exponential decay (s).
DCAYCOEF	Decay	
where:	Decay	Decay coefficient for exponential decay ( $s^{-1}$ ) = 0.693/HAFLIF
GASDEPDF	React F_Seas2 F_Seas5 (Refpoll)  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the GASDEPDF keyword.</b>	
where:	React F_Seas2 F_Seas5 (Refpoll)	Value for pollutant reactivity factor ( $f_0$ ). Fraction (F) of maximum green LAI for seasonal category 2. Fraction (F) of maximum green LAI for seasonal category 5. Optional name of reference pollutant.
GASDEPVD	Uservd  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the GASDEPVD keyword.</b>	
where:	Uservd	User-specified dry deposition velocity (m/s) for gaseous pollutants.
GDLANUSE	Sec1 Sec2 ... Sec36  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the GDLANUSE keyword.</b>	
where:	Sec1  Sec2 . . . Sec36	Land use category for winds blowing toward sector 1 (10 degrees). Land use category for winds blowing toward sector 2 (20 degrees).  Land use category for winds blowing toward sector 36 (360 degrees).
GDSEASON	Jan Feb ... Dec  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the GDSEASON keyword.</b>	
where:	Jan  . . . . Dec	Seasonal category for January: 1 = Midsummer/Lush vegetation; 2 = Autumn/Unharvested cropland; 3 = Late autumn after harvest or Winter with no snow; 4 = Winter with continuous snow cover; or 5 = Transitional spring/partial green coverage/short annuals)  Seasonal category for December.
LOW_WIND	SVmin (WSmin) or	

Keyword	Parameters	
	SVmin WSmin (FRANmax) or SVmin WSmin FRANmax (SWmin) or SVmin WSmin FRANmax SWmin (BigT) or SVmin WSmin FRANmax SWmin BigT (FRANmin) or SVmin WSmin FRANmax SWmin BigT FRANmin (PBAL)  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the LOW_WIND keyword</b>	
where:	SVmin WSmin FRANmax SWmin BigT  FRANmin  <u>PBAL</u>	Minimum value of sigma-v, within a range of 0.01 to 1.0 m/s. Minimum value of wind speed, within a range of 0.01 to 1.0 m/s. Maximum value for meander factor, within a range of 0.0 to 1.0. Minimum value of sigma-w, within a range of 0.0 to 3.0 m/s. Time period (BigT) used to calculate the time scale TRAN, within a range of 0.5 to 48.0 hours. Minimum value for meander factor, within a range of 0.0 to 1.0 but must be less than or equal to FRANmax. Alternate momentum balance approach to determine plume meander which overrides the default energy balance approach.
AWMADWNW	<u>AWMAUEFF</u> and/or <u>AWMAENTRAIN</u> and/or (( <u>AWMAUTURB</u> or <u>AWMAUTURBHX</u> ) w/wo <u>STREAMLINE(D)</u> )  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the AWMADWNW keyword.</b>	
where:	<u>AWMAUEFF</u>  <u>AWMAENTRAIN</u>  <u>AWMAUTURB</u>  <u>AWMAUTURBHX</u>  <u>STREAMLINE</u>	Redefines the height at which the wind speed is taken from the profile wind speed used in the calculation of concentrations from the primary plume. Changes beta (B) entrainment coefficient for PRIME downwash from default value of 0.60 to 0.35. Uses alternative formulations for turbulence enhancement and velocity deficit calculations. Uses distance-based plume rise at the downwind distance X for calculations. Reduces dispersion in the wake of streamlined structures such as storage tanks and cooling towers.
ORD_DWNW	<u>ORDUEFF</u> and/or <u>ORDTURB</u> and/or <u>ORDCAV</u>  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the ORD_DWNW keyword.</b>	
where:	<u>ORDUEFF</u>  <u>ORDTURB</u>  <u>ORDCAV</u>	Redefines the height at which the wind speed is taken from the profile wind speed used in the calculation of concentrations from the primary plume. Redefines the maximum value of the ambient turbulence intensity in the wake, reduced from 0.07 to 0.06.

Keyword	Parameters	
		Redefines the initial vertical dispersion, $\sigma_z$ , of the re-emitted plume at the cavity boundary to equal the $\sigma_z$ of the cavity plume.
NO2EQUIL	NO2Equil	
where:	NO2Equil	Equilibrium ratio of NO <sub>2</sub> /NO <sub>x</sub> for the PVMRM, OLM, and TTRM options; between 0.1 and 1.0, inclusive (default is 0.9).
NO2STACK	NO2Ratio	
where:	NO2Ratio	Default in-stack ratio of NO <sub>2</sub> /NO <sub>x</sub> for PVMRM, OLM, TTRM, and GSRM options, which may be overridden by the NO2RATIO keyword on SO pathway.  <u>NOTE:</u> Beginning with version 11059, AERMOD no longer assumes a default in-stack ratio of 0.1 for the OLM option.
ARMRATIO	ARM2_Min    ARM2_Max	For ARM2 Option
where:	ARM2_Min ARM2_Max	Minimum ARM2 ambient ratio, with a default value of 0.50. Maximum ARM2 ambient ratio, with a default value of 0.90.
O3SECTOR	StartSect1 StartSect2 . . . StartSectN, where N is ≤ 6	
where:	StartSect1 StartSect2 . . StartSectN	Starting direction for the first sector. Starting direction for the second sector. . . Starting direction for the last sector.  <u>NOTE:</u> The minimum sector width allowed is 30 degrees, and warning messages will be issued for sector widths less than 60 degrees. Sector-varying O <sub>3</sub> concentrations will be selected based on the flow vector, i.e., the downwind direction based on the wind direction specified in the surface meteorological data file.
OZONEFIL	O3FileName (O3Units) (O3Format) (without O3SECTORs) or SECTx O3FileName (O3Units) (O3Format) (with O3SECTORs)	
where:	SECTx  O3FileName  (O3Units) (O3Format)	Applicable sector ( $x = 1$ to 6) defined on the CO O3SECTOR keyword, if specified. Filename for hourly ozone data file (YR, MN, DY, HR, O3Value). Units of ozone data (PPM, PPB, or UG/M3); default is UG/M3. Fortran format statement to read ozone file; default is FREE-format, i.e., comma or space-delimited data fields (Yr Mn Dy Hr O3Value). The O3Format parameter must include open and close parentheses, the date variables must be read as integers (Fortran I format), and the O3Value must be read as real (Fortran F, E, or D format), e.g., '(412,F8.3)'. The year

Keyword	Parameters	
NOXSECTR	StartSect1 StartSect2 . . . StartSectN, where N is ≤ 6	
where:	StartSect1 StartSect2 . . StartSectN	Starting direction for the first sector. Starting direction for the second sector. . . Starting direction for the last sector.  <u>NOTE:</u> The minimum sector width allowed is 30 degrees, and warning messages will be issued for sector widths less than 60 degrees. Sector-varying NOX concentrations will be selected based on the flow vector, i.e., the downwind direction based on the wind direction specified in the surface meteorological data file.
NOX_FILE	NOXFileName (NOXUnits) (NOXFormat) (without NOXSECTRs) or SECTx NOXFileName (NOXUnits) (NOXFormat) (with NOXSECTRs)	
where:	SECTx  NOXFileName  (NOXUnits) (NOXFormat)	Applicable sector (x = 1 to 6) defined on the CO O3SECTOR keyword, if specified. Filename for hourly NOX data file (YR, MN, DY, HR, NOXValue). Units of NOX data (PPM, PPB, or UG/M3); default is UG/M3. Fortran format statement to read NOX file; default is FREE-format, i.e., comma or space-delimited data fields (Yr Mn Dy Hr NOXValue). The NOXFormat parameter must include open and close parentheses, the date variables must be read as integers (Fortran I format), and the NOXValue must be read as real (Fortran F, E, or D format), e.g., '(412,F8.3)'. The year may be specified as a 2-digit or 4-digit year, and the data period in the NOX_FILE must match the data period in the meteorological data files.
NOXVALUE	NOXValue (NOXUnits) (without NOXSECTRs) or SECTx NOXValue (NOXUnits) (with NOXSECTRs)	
where:	SECTx  NOXValue  (NOXUnits)	Applicable sector (x = 1 to 6) defined on the CO NOXSECTR keyword, if specified. Background ozone concentration; also used to substitute for missing data in OZONEFIL. Units of ozone value (PPM, PPB, or UG/M3); default is UG/M3.
NOX_VALS	NOXFlag NOXvalues(i), i=1, n (without NOXSECTRs) or SECTx NOXFlag NOXvalues(i), i=1, n (with NOXSECTRs)	
where:	SECTx  NOXFlag	Applicable sector (x = 1 to 6) defined on the CO O3SECTOR keyword, if specified. Background ozone values flag:

Keyword	Parameters	
	NOXvalues	<p><u>ANNUAL</u> for annual; <u>SEASON</u> for seasonal; <u>MONTH</u> for monthly; <u>HROFDY</u> for hour-of-day; <u>WSPEED</u> for wind speed category; <u>SEASHR</u> for season-by-hour; <u>HRDOW</u> for emission rates vary by hour-of-day, and day-of-week [M-F, Sat, Sun]; <u>HRDOW7</u> for emission rates vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun]; <u>SHRDOW</u> for season by hour-of-day by day-of-week (M-F,Sat,Sun); <u>SHRDOW7</u> for season by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun); <u>MHRDOW</u> for month by hour-of-day by day-of-week (M-F,Sat,Sun); <u>MHRDOW7</u> for month by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun).</p> <p>Array of background concentrations, for: <u>ANNUAL</u>, <math>n=1</math>; <u>SEASON</u>, <math>n=4</math>; <u>MONTH</u>, <math>n=12</math>; <u>HROFDY</u>, <math>n=24</math>; <u>WSPEED</u>, <math>n=6</math>; <u>SEASHR</u>, <math>n=96</math>; <u>HRDOW</u>, <math>n=72</math>; <u>HRDOW7</u>, <math>n=168</math>; <u>SHRDOW</u>, <math>n=288</math>; <u>SHRDOW7</u>, <math>n=672</math>; <u>MHRDOW</u>, <math>n=864</math>; <u>MHRDOW7</u>, <math>n=2016</math>.</p> <p><u>NOTE</u>: Background NOX values input through the NOXVALUES keyword are assumed to be in units of PPB, unless modified by the NOX_UNIT keyword.</p>
NOX_UNIT	NOXUnits	
where:	NOXUnits	NOX concentration units for NOX_VALS, specified as <u>PPB</u> for parts-per-billion, <u>PPM</u> for parts-per-million, or <u>UG/M3</u> for micrograms/cubic-meter.
FLAGPOLE	(Flagdf)	
where:	(Flagdf)	Default value for height of (flagpole) receptors above local ground, a default value of 0.0 m is used if this optional parameter is omitted.
ARCFTOPT	(AirportID)	
where:	(AirportID)	Optional alphanumeric character string to identify the airport where aircraft sources are located.
RUNORNOT	<u>RUN</u> or <u>NOT</u>	
where:	<u>RUN</u> <u>NOT</u>	Indicates to run full model calculations. Indicates to process setup data and report errors, but to <u>not</u> run full model calculations.
EVENTFIL	(Evfile) (Evopt)	
where:	(Evfile)  (Evopt)	Identifies the filename to be used to generate a file for input to EVENT model (Default=EVENTFIL.INP). Optional parameter to specify the level of output detail selected for the EVENT model: either <u>SOCONT</u> or <u>DETAIL</u> (default is <u>DETAIL</u> if this parameter is omitted).

<b>Keyword</b>	<b>Parameters</b>	
SAVEFILE	(Savfil) (Dayinc) (Savfl2)	
where:	(Savfil)  (Dayinc) (Savfl2)	Specifies name of disk file to be used for storing intermediate results (default = SAVE.FIL); file is overwritten after each dump.  Number of days between dumps (optional: default is 1).  Optional second disk filename to be used on alternate dumps - eliminates risk of system crash during the dump. If blank, file is overwritten each time.
INITFILE	(Inifil)	
where:	(Inifil)	Specifies name of disk file of intermediate results to be used for initializing run (default = SAVE.FIL).
MULTYEAR	<u>(H6H)</u> Savfil (Inifil)	
where:	<u>(H6H)</u>  Savfil  (Inifil)	Optional field formerly used to specify that High-Sixth-High is being calculated for use in PM10 processing; no longer required.  Specifies name of file to be used for storing results at the end of the year.  Optional name of file used for initializing the results arrays from previous year(s). The Inifil parameter is not used for the first year in the multi-year run.
DEBUGOPT	<u>MODEL</u> (Dbgfil) and/or <u>METEOR</u> (Dbmfil) and/or <u>PRIME</u> (Prmfil) and/or <u>AWMADW</u> (AwmaDwfil) and/or <u>PLATFORM</u> (PlatfmDbgFil) and/or <u>DEPOS</u> (Dbgfil) and/or <u>[AREA</u> (AreaDbFil) or <u>LINE</u> (LineDbFil)] and/or <u>RLINE</u> (RlineDbgFil) and/or <u>BLPDEBUG</u> (BLPDdbFil) and/or <u>URBANDB</u> (UrbanDbFil) and/or <u>[PVMRM</u> (Dbpvfil) (and <u>TTRM2</u> ) or <u>OLM</u> (OLMfil) (and <u>TTRM2</u> ) or <u>ARM2</u> (ARM2fil) (and <u>TTRM2</u> ) or <u>TTRM</u> (TTRMfil) or <u>GSRM</u> (GSRMfil)] and/or <u>SWPOINT</u> (SWfil) and/or <u>HBPDBG</u> (HBPfil) and/or	

Keyword	Parameters	
	<u>AIRCRAFT</u> (DbARCFTfil)	
where:	<u>MODEL</u> (Dbgfil)  <u>METEOR</u> (Dbmfil)  <u>PRIME</u> (Prmfil)  <u>AWMADW</u> (AwmaDwfil)  <u>PLATFORM</u> (PlatfmDbgfil)  <u>DEPOS</u>  <u>AREA</u> or <u>LINE</u> (AreaDbfil)  <u>RLINE</u> (RLineDbgFil)  <u>BLPDBUG</u> (BLPDbFil)  <u>URBANDB</u> (UrbanDbFil)	<p>Specifies that <u>MODEL</u> debugging output will be generated. Optional filename for the model calculation debug file (a default filename of 'MODEL.DBG' will be used if omitted).</p> <p>Specifies that <u>METEOR</u>ological profile data file will be generated. Optional filename for the meteorological profile data file (a default filename of 'METEOR.DBG' will be used if omitted).</p> <p>Specifies that <u>PRIME</u> debugging output will be generated. Optional filename for PRIME debug file (a default filename of 'PRIME.DBG' will be used if omitted).</p> <p>Specifies the debug out will be generated for <u>AWMA</u> Downwash options. Optional filename for AWMADW debug file (a default filename of 'AWMADW.DBG' will be used if omitted).</p> <p>Specifies the debug out will be generated for PLATFORM Downwash options. Optional filename for PLATFORM downwash debug file. (a default filename of 'PLATFORM.DBG' will be used if omitted).</p> <p>Specifies that <u>DEPOS</u>ition debugging output will be generated, using default filenames of 'GDEP.DAT' for gas deposition and 'PDEP.DAT' for particle deposition.</p> <p>Specifies that <u>AREA</u> or <u>LINE</u> debugging output will be generated, including debugging outputs for OPENPIT sources, if included in the modeling. Optional filename for AREA debug file (a default filename of 'AREA.DBG' will be used if omitted).</p> <p>Specifies that RLINE debugging output will be generated. Optional filename for RLINE debug file (a default filename of 'RLINE.DBG' will be used if omitted).</p> <p>Debug information for the BUOYLINE source. Optional filename for BLPDBUG debug file (a default filename of 'BLPDBUG.DBG' will be used if omitted).</p> <p>Debug information from the URBANDB option. This will produce 3 output files, one for the surface meteorology and two for the profile meteorology. Optional filename for URBANDB debug files This will produce three output files, one for the surface meteorology, two for the profile meteorology. If the filename is specified by the user, then the filename will be used for the surface meteorology debug file. The same name will be assigned for the two profile debug files with a "1" and "2" appended to the filename, respectively. Default filenames: URBDDBUG.DBG, URBDDBUG1.DBG, and URBDDBUG2.DBG.</p>

Keyword	Parameters
	<p><u>PVMRM</u> (Dbpvfil) Specifies that <u>PVMRM</u> debugging output will be generated Optional filename for PVMRM debug file (a default filename of 'PVMRM.DBG' will be used if omitted).</p> <p><u>OLM</u> (OLMfil) Specifies that <u>OLM</u> debugging output will be generated Optional filename for OLM debug file (a default filename of 'OLM.DBG' will be used if omitted).</p> <p><u>ARM2</u> (ARM2fil) Specifies that <u>ARM2</u> debugging output will be generated Optional filename for ARM2 debug file (a default filename of 'ARM2.DBG' will be used if omitted).</p> <p><u>TTRM</u> (TTRMfil) Specifies that <u>TTRM</u> debugging output will be generated Optional filename for TTRM debug file (a default filename of 'TTRM.DBG' will be used if omitted).</p> <p><u>TTRM2</u> Specifies that TTRM2 debugging output will be generated. TTRM2 can only be used with ARM2, PVMRM, or OLM and only if specified with the MODELOPT keyword along with one of those options. A user-defined debug filename cannot be specified for the TTRM2 debug option.</p> <p><u>GRSM</u> (GRSMfil) Specifies that <u>GRSM</u> debugging output will be generated. Optional filename for GRSM debug file (a default filename of 'GRSM.DBG' will be used if omitted).</p> <p><u>SWPOINT</u> (SWfil) Specifies debugging output for the SWPOINT (sidewash) source type will be generated. Optional filename for SWPOINT debug file (a default filename of SWPOINT.DBG will be used if omitted).</p> <p><u>Note:</u> The user can specify any of the applicable debug options for a particular model run, and the options can be specified in any order. However, the optional filenames must be specified immediately after the keyword option associated with the filename. Also note that debugging information that was written to the main 'aermod.out' file for the <u>MODEL</u> debug option prior to version 13350 is now written to the applicable debug file (either <u>MODEL</u> or <u>PRIME</u>) and beginning with version 14134 debug information for AREA/LINE/OPENPIT sources is written to the <u>AREA</u> debug file.</p> <p><u>HBPDBG</u> (HBPfil) Specifies debugging output for the HBP (highly buoyant plume) sources will be generated. Optional filename for HBP debug file (a default filename of HBP_DEBUG.DBG will be used if omitted).</p> <p><u>AIRCRAFT</u> (DbARCFTfil) Specifies debugging output for AREA and VOLUME aircraft sources. Optional filename for the AIRCRAFT debug file (a default filename of AIRCRAFT.DBG will be used if omitted).</p>

ERRORFIL	(Errfil)	
where:	(Errfil)	Specifies name of detailed error listing file (default = ERRORS.LST).

**Table A-3. Description of Source Pathway Keywords**

<b>SO Keywords</b>	<b>Type</b>	<b>Keyword Description</b>
STARTING	M – N	Identifies the start of SOURCE pathway inputs
ELEVUNIT	O – N	Defines input units for source elevations (defaults to meters), must be first keyword after SO STARTING if used.
LOCATION	M – R	Identifies coordinates for particular source
RLEMCONV	O - N	Optional emission units conversion that changes the input units for the RLINE and RLINEXT sources to grams/hour/link
SRCPARAM	M – R	Identifies source parameters for a particular source
BUILDHGT	O – R	Building height values for each wind sector
BUILDLEN	O – R	Building projected length values for each wind sector
BUILDWID	O – R	Building projected width values for each wind sector
XBADJ	O – R	Along-flow distances from the stack to the center of the upwind face of the projected building
YBADJ	O – R	Across-flow distances from the stack to the center of the upwind face of the projected building
AREAVERT	M – R	Specifies location of vertices for an AREAPOLY source type (mandatory if AREAPOLY source is used)
RBARRIER	O - R	Specifies RLINEXT barrier source configuration  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the RBARRIER keyword.</b>
RDEPRESS	O - R	Specifies RLINEXT depressed roadway source configuration  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the RDEPRESS keyword.</b>
BLPINPUT	M - R	Buoyant line group parameters representative of the buoyant line group
URBANSRC	O – R	Identifies which sources to model with urban effects
EMISFACT	O – R	Optional input for variable emission rate factors
EMISUNIT	O – N	Optional unit conversion factors for emissions, concentrations
CONCUNIT	O – N	Optional conversion factors for emissions and concentrations
DEPOUNIT	O – N	Optional conversion factors for emissions and depositions
PARTDIAM	O – R	Input variables for optional input of particle size (microns)
MASSFRAX	O – R	Optional input of mass fraction for each particle size category
PARTDENS	O – R	Optional input of particle density (g/cm <sup>3</sup> ) for each size category
METHOD_2	O – R	Optional input of parameters for METHOD_2 particle deposition

SO Keywords	Type	Keyword Description
		<b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the METHOD_2 keyword.</b>
GASDEPOS	O – R	Optional input of gas deposition parameters  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the GASDEPOS keyword.</b>
NO2RATIO	O – R	Option to specify in-stack NO2/NOx equilibrium ratio for OLM and PVMRM options by source
HOUREMIS	O – R	Option for specifying hourly emission rates in a separate file
BGSECTOR	O – N	Specifies optional wind sectors for use in varying background concentrations by wind direction for the pollutant being modeled, as specified on the BACKGRND keyword
BACKGRND	O – R	Option to specify temporally varying background concentrations
BACKUNIT	O – N	Option to specify units for background concentrations
INCLUDED	O – R	Option to include data from a separate file in the runstream
OLMGROUP	O – R	Specifies sources to combine for OLM option to account for merging plumes
BLPGROUP <sup>2</sup>	M - R	Associates individual buoyant lines with a buoyant line source group
PSDGROUP <sup>1</sup>	O – R	Specifies source groups for PSDCREDIT option with PVMRM
HBPSRCID	M – R	Identification of HBP (highly buoyant plume) sources. Mandatory when HBP option is used
ARCFTSRC	M - R	Identification of aircraft sources. Mandatory when the ARCFTOPT option is used
SRCGROUP <sup>1</sup>	M – R	Identification of source groups
PLATFORM	O – R	Optional input for POINT and POINTHOR sources on a platform.  <b>The ALPHA option must be specified as a MODELOPT on the CO pathway to use the PLATFORM keyword.</b>
FINISHED	M – N	Identifies the end of SOURCE pathway inputs

- 1) The PSDGROUP or SRCGROUP keywords must be the last keyword within the SO pathway before the FINISHED keyword. The SRCGROUP keyword is mandatory, unless the PSDCREDIT option is used, which requires the PSDGROUP option instead.
- 2) The BLPGROUP keyword(s) must be after the BLPINPUT keyword(s)

**Table A-4. Description of Source Pathway Keywords and Parameters**

<b>Keyword</b>	<b>Parameters</b>	
ELEVUNIT	<u>METERS</u> or <u>FEET</u>	
where:	<u>METERS</u>	Specifies input units for source base elevations of meters (default if ELEVUNIT is omitted).
	<u>FEET</u>	Specifies input units for source elevations of feet. <u>Note:</u> This keyword applies to source base elevations only.
LOCATION	SrcID Srcryp Xs Ys (Zs)  or ( <u>FLAT</u> )	[for all Srcryps except <u>LINE</u> , <u>BUOYLINE</u> , <u>RLINE</u> , and <u>RLINEXT</u> ]  [for 'FLAT & ELEV' option]
	SrcID Srcryp Xs1 Ys1 Xs2 Ys2 (Zs)  or ( <u>FLAT</u> )	[for <u>LINE</u> , <u>RLINE</u> , or <u>BUOYLINE</u> Srcryp]  [for 'FLAT & ELEV' option]
	SrcID Srcryp Xs1 Ys1 Zs1 Xs2 Ys2 Zs2 (Zs)  or ( <u>FLAT</u> )	[for <u>RLINEXT</u> Srcryp]  [for ' <u>FLAT</u> & <u>ELEV</u> ' option]
where:	SrcID Srcryp Xs Ys Xs1, Xs2 Ys1, Ys2 Zs1, Zs2 (Zs) ( <u>FLAT</u> )	Source identification code (unique alphanumeric string of up to 12 characters). Source type: <u>POINT</u> , <u>POINTCAP</u> , <u>POINTHOR</u> , <u>VOLUME</u> , <u>AREA</u> , <u>AREAPOLY</u> , <u>AREACIRC</u> , <u>OPENPIT</u> , <u>LINE</u> , <u>BUOYLINE</u> , <u>RLINE</u> , or <u>RLINEXT</u> . x-coord of source location, corner for <u>AREA</u> , <u>AREAPOLY</u> , and <u>OPENPIT</u> , center for <u>AREACIRC</u> (m). y-coord of source location, corner for <u>AREA</u> , <u>AREAPOLY</u> , and <u>OPENPIT</u> , center for <u>AREACIRC</u> (m). x-coords of midpoint for start and end of <u>LINE</u> , <u>RLINE</u> , <u>RLINEXT</u> , or <u>BUOYLINE</u> source (m). y-coords of midpoint for start and end of <u>LINE</u> , <u>RLINE</u> , <u>RLINEXT</u> , or <u>BUOYLINE</u> source (m). z-coords of midpoint for start and end of <u>RLINEXT</u> source (m). Optional z-coord of source location (elevation above mean sea level, defaults to 0.0 if omitted). Optional keyword to indicate non-DEFAULT option to specify source to model with FLAT terrain.
SRCPARAM	SrcID Ptemis Stkhgt Stktmp Stkvel Stkdia  Vlemis Relhgt Syinit Szinit Aremis Relhgt Xinit (Yinit) (Angle) (Szinit) Aremis Relhgt Nverts (Szinit) Aremis Relhgt Radius (Nverts) (Szinit)	( <u>POINT</u> , <u>POINTCAP</u> , <u>POINTHOR</u> source) ( <u>VOLUME</u> source) ( <u>AREA</u> source) ( <u>AREAPOLY</u> source) ( <u>AREACIRC</u> source)

Keyword	Parameters	
	Lnemis Relhgt Width (Szinit)	( <u>LINE</u> or <u>RLINE</u> source)
	Opemis Relhgt Xinit Yinit Pitvol (Angle)	( <u>OPENPIT</u> source)
	Blemis Relhgt	( <u>BUOYLINE</u> source)
	Rlemis DCL Width Szinit	( <u>RLINEXT</u> source)
where:	SrcID	Source identification code.
	Emis	Source emission rate: in g/s for Ptemis, Vlemis, and Blemis; g/(s-m <sup>2</sup> ) for Aremis, Lnemis, and Opemis; g/m/s for Rlemis.
	Hgt	Source physical release height above ground (center of height for <u>VOLUME</u> , height above base of pit for <u>OPENPIT</u> ).
	Stktmp	Stack gas exit temperature (K).
	Stkvel	Stack gas exit velocity (m/s).
	Stkdia	Stack inside diameter (m).
	Syinit	Initial lateral dimension of <u>VOLUME</u> source (m).
	Szinit	Initial vertical dimension of <u>VOLUME</u> , <u>AREA</u> , <u>LINE</u> , <u>RLINE</u> , or <u>RLINEXT</u> source (m).
	Xinit	Length of side of <u>AREA</u> source in X-direction (m).
	Yinit	Length of side of <u>AREA</u> source in Y-direction (m) (optional parameter, assumed to be equal to Xinit if omitted).
	Angle	Orientation angle (deg) of <u>AREA</u> or <u>OPENPIT</u> source relative to N measured positive clockwise, rotated around the source location, (Xs,Ys) (optional parameter, assumed to be 0.0 if omitted).
	Nverts	Number of vertices used for <u>AREAPOLY</u> or <u>AREACIRC</u> source (optional for <u>AREACIRC</u> sources).
	Radius	Radius of circular area for <u>AREACIRC</u> source (m).
	Width	Width of <u>LINE</u> , <u>RLINE</u> , or <u>RLINEXT</u> source (m).
	Pitvol	Volume of <u>OPENPIT</u> source (m <sup>3</sup> ).
	Blemis	Buoyant line emission rate in g/(s) for the individual line of <u>BUOYLINE</u> source.
	DCL	Distance from roadway centerline for <u>RLINEXT</u> source (m).
BUILDHGT	SrcID (or SrcRange) Dsbh(i), i=1, 36	
where:	SrcID	Source identification code.
	SrcRange	Range of sources (inclusive) for which building dimensions apply, entered as two alphanumeric strings separated by a '-'. Dsbh
	Dsbh	Array of direction-specific building heights (m) beginning with 10-degree flow vector and incrementing by 10 degrees clockwise.
BUILDLEN	SrcID (or SrcRange) Dsbl(i), i=1, 36	
where:	SrcID	Source identification code.
	SrcRange	Range of sources (inclusive) for which building dimensions apply.
	Dsbl	Array of direction-specific building lengths (m) beginning with 10 degree flow vector and incrementing by 10 degrees clockwise.
BUILDWID	SrcID (or SrcRange) Dsbw(i), i=1, 36	
where:	SrcID	Source identification code.
	SrcRange	Range of sources (inclusive) for which building dimensions apply.

Keyword	Parameters	
	Dsbw	Array of direction-specific building widths (m) beginning with 10 degree flow vector and incrementing by 10 degrees clockwise.
XBADJ	SrcID (or SrcRange) Xbadj(i), i=1, 36	
where:	SrcID SrcRange Xbadj(i)	Source identification code. Range of sources (inclusive) for which XBADJ distances apply. Array of direction-specific along-wind distances beginning with 10 degree flow vector and incrementing by 10 degrees clockwise.
YBADJ	SrcID (or SrcRange) Ybadj(i), i=1, 36	
where:	SrcID SrcRange Ybadj(i)	Source identification code. Range of sources (inclusive) for which YBADJ distances apply. Array of direction-specific across-wind distances beginning with 10 degree flow vector and incrementing by 10 degrees clockwise.
AREAVERT	SrcID Xv(1) Yv(1) Xv(2) Yv(2) ... Xv(i) Yv(i)	
where:	SrcID Xv(1)  Yv(1)  Xv(i) Yv(i)	Source identification code. X-coordinate of the first vertex of an AREAPOLY source (must be the same as the value of Xs for that source defined on the SO LOCATION card). Y-coordinate of the first vertex of an AREAPOLY source (must be the same as the value of Ys for that source defined on the SO LOCATION card). X-coordinate for the i <sup>th</sup> vertex of an AREAPOLY source. Y-coordinate for the i <sup>th</sup> vertex of an AREAPOLY source.
RBARRIER	SrcID Htwall DCLwall (Htwall2 DCLwall2)	
where:	SrcID Htwall DCLwall Htwall2 DCLwall2	Source identification code. Height of the wall (or barrier 1) near roadway (m). Distance from the roadway centerline to the wall (m). Height of the second wall (or barrier 2) near roadway (m). Distance from the roadway centerline to the second wall (m).
RDEPRESS	SrcID Htwall DCLwall Depth Wtop Wbottom	
where:	SrcID Depth Wtop Wbottom	Source identification code. Depth of the depression containing the roadway (m). Width of the top of the depression containing the roadway (m). Width of the bottom of the depression containing the roadway (m).
BLPINPUT	(BLPGrpID) Blavglen Blavgbhgt Blavgbwid Blavglwid Blavgbsep Blavgfprm	
where:	BLPGrpID Blavglen Blavgbhgt Blavgbwid Blavglwid Blavgbsep Blavgfprm	Buoyant line group ID following parameters apply to Average buoyant line length (m) Average building height (m) Average building width (m) Average buoyant line width (m) Average building separation (m) Average buoyancy parameter (m <sup>4</sup> /s <sup>3</sup> )

Keyword	Parameters	
URBANSRC	<p><u>For multiple urban areas:</u> UrbanID SrcID's and/or SrcRng's</p> <p><u>For single urban areas:</u> SrcID's and/or SrcRng's</p> <p>User may also specify 'ALL' for SrcID's to assign all sources as urban.</p>	
where:	UrbanID SrcID SrcRange	<p>Specifies the alphanumeric urban ID (up to eight characters).</p> <p>Specifies which source(s) will be modeled with urban effects.</p> <p>Specifies a range of sources that will be modeled with urban effects.</p>
EMISFACT	SrcID (or SrcRange) Qflag Qfact(i), i=1,n	
where:	SrcID SrcRange Qflag  Qfact	<p>Source identification code.</p> <p>Range of sources (inclusive) for which emission rate factors apply.</p> <p>Variable emission rate flag:  <u>SEASON</u> for seasonal; <u>MONTH</u> for monthly; <u>HROFDY</u> for hour-of-day; <u>WSPEED</u> for wind speed category; <u>SEASHR</u> for season-by-hour; <u>HRDOW</u> for emission rates vary by hour-of-day, and day-of-week [M-F, Sat, Sun]; <u>HRDOW7</u> for emission rates vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun]; <u>SHRDOW</u> for season by hour-of-day by day-of-week (M-F,Sat,Sun); <u>SHRDOW7</u> for season by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun); <u>MHRDOW</u> for month by hour-of-day by day-of-week (M-F,Sat,Sun); <u>MHRDOW7</u> for month by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun).</p> <p>Array of scalar emission rate factors, for:  <u>SEASON</u>, n=4; <u>MONTH</u>, n=12; <u>HROFDY</u>, n=24;  <u>WSPEED</u>, n=6; <u>SEASHR</u>, n=96; <u>HRDOW</u>, n=72;  <u>HRDOW7</u>, n=168; <u>SHRDOW</u>, n=288; <u>SHRDOW7</u>, n=672;  <u>MHRDOW</u>, n=864; <u>MHRDOW7</u>, n=2016</p>
EMISUNIT	Emifac Emilbl Outlbl	
where:	Emifac  Emilbl Outlbl	<p>Emission rate factor used to adjust units of output (default value is 1.0E06 for CONC for grams to micrograms; default value is 3600 for grams/sec to grams/m<sup>2</sup>/hr for deposition).</p> <p>Label to use for emission units (default is grams/sec).</p> <p>Label to use for output units; applies to first output type if more than one output type is generated (default is micrograms/m<sup>**3</sup> for concentration and grams/m<sup>**2</sup> for deposition).</p>
RLEMCONV	<p><i>No parameters or secondary keywords</i></p> <p>Changes the expected emission units for the RLINE (Lemis) and RLEINXT (Rlemis)emissions to grams/hour/link.</p>	
CONCUNIT	Emifac Emilbl Conlbl	
where:	Emifac	Emission rate factor used to adjust units of output (default value is 1.0E06 for concentration for grams to micrograms).

Keyword	Parameters	
	Emilbl Conlbl	Label to use for emission units (default is grams/sec). Label to use for concentrations (default is micrograms/m <sup>3</sup> ).
DEPOUNIT	Emifac Emilbl Deplbl	
where:	Emifac Emilbl Deplbl	Emission rate factor used to adjust units of output for deposition (default value is 3600 for grams/sec to grams/m <sup>2</sup> /hr). Label to use for emission units (default is grams/sec). Label to use for deposition (default is grams/m <sup>2</sup> ).
PARTDIAM	SrcID (or SrcRange) Pdiam(i), i=1,Npd	
where:	SrcID SrcRange Pdiam	Source identification code. Range of sources (inclusive) for which size categories apply. Array of particle diameters (microns).
MASSFRAX	SrcID (or SrcRange) Phi(i), i=1,Npd	
where:	SrcID SrcRange Phi	Source identification code. Range of sources (inclusive) for which mass fractions apply. Array of mass fractions for each particle size category.
PARTDENS	SrcID (or SrcRange) Pdens(i), i=1,Npd	
where:	SrcID SrcRange Pdens	Source identification code. Range of sources (inclusive) for which particle densities apply. Array of particle densities (g/cm <sup>3</sup> ) for each size category.
METHOD_2	SrcID (or SrcRange) FineMassFraction Dmm	
where:	SrcID FineMassFraction Dmm	Source identification code. Fraction (between 0 and 1) of particle mass emitted in fine mode, less than 2.5 microns. Representative mass mean particle diameter in microns.
GASDEPOS	SrcID (or SrcRange) Da Dw rcl Henry	
where:	SrcID Da Dw rcl Henry	Source identification code. Diffusivity in air for the pollutant being modeled (cm <sup>2</sup> /s). Diffusivity in water for the pollutant being modeled (cm <sup>2</sup> /s). Cuticular resistance to uptake by lipids for individual leaves (s/cm). Henry's Law constant (Pa m <sup>3</sup> /mol).
NO2RATIO	SrcID (or SrcRange) NO2Ratio	
where:	SrcID SrcRange NO2Ratio	Source identification code. Source ID range for specified ratio. In-stack ratio of NO <sub>2</sub> /NO <sub>x</sub> .
HOUREMIS	Emifil SrcID's SrcRange's	
where:	Emifil SrcID's SrcRange's	Specifies name of the hourly emission rate file. Discrete source IDs that are included in the hourly emission file. Source ID ranges that are included in the hourly emission file.
BGSECTOR	StartSect1 StartSect2 . . . StartSectN, where N is ≤ 6	

Keyword	Parameters	
where:	StartSect1 StartSect2 . . StartSectN	Starting direction for the first sector. Starting direction for the second sector. . . Starting direction for the last sector.  <u>NOTE:</u> The minimum sector width allowed is 30 degrees, and warning messages will be issued for sector widths less than 60 degrees. Sector-varying background concentrations will be selected based on the flow vector, i.e., the downwind direction, based on the wind direction specified in the surface meteorological data file.
BACKGRNd	BGflag BGvalue(i), i=1, n (without BGSECTORs) and/or <u>HOURLY</u> BGfilnam (BGformat)  or  SECT <sub>x</sub> BGflag BGvalue(i), i=1, n (with BGSECTORs) and/or SECT <sub>x</sub> <u>HOURLY</u> BGfilnam (BGformat)	
where:	SECT <sub>x</sub>  BGflag  BGvalue  <u>HOURLY</u>	Applicable sector ( $x = 1$ to 6) defined on the SO BGSECTOR keyword, if specified.  Variable background concentration flag: <u>ANNUAL</u> for annual; <u>SEASON</u> for seasonal; <u>MONTH</u> for monthly; <u>HROFDY</u> for hour-of-day; <u>WSPEED</u> for wind speed category; <u>SEASHR</u> for season-by-hour; <u>HRDOW</u> for emission rates vary by hour-of-day, and day-of-week [M-F, Sat, Sun]; <u>HRDOW7</u> for emission rates vary by hour-of-day, and the seven days of the week [M, Tu, W, Th, F, Sat, Sun]; <u>SHRDOW</u> for season by hour-of-day by day-of-week (M-F,Sat,Sun); <u>SHRDOW7</u> for season by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun); <u>MHRDOW</u> for month by hour-of-day by day-of-week (M-F,Sat,Sun); <u>MHRDOW7</u> for month by hour-of-day by day-of-week (M,Tu,W,Th,F,Sat,Sun).  Array of background concentrations; for: <u>ANNUAL</u> , $n=1$ ; <u>SEASON</u> , $n=4$ ; <u>MONTH</u> , $n=12$ ; <u>HROFDY</u> , $n=24$ ; <u>WSPEED</u> , $n=6$ ; <u>SEASHR</u> , $n=96$ ; <u>HRDOW</u> , $n=72$ ; <u>HRDOW7</u> , $n=168$ ; <u>SHRDOW</u> , $n=288$ ; <u>SHRDOW7</u> , $n=672$ ; <u>MHRDOW</u> , $n=864$ ; <u>MHRDOW7</u> , $n=2016$  Flag indicating that hourly background concentrations are specified in a separate data file; data period must match the meteorological data period being processed; no missing values are allowed in the hourly file, unless temporally varying background concentrations are also specified through the BGflag parameter, which are used to substitute for missing hourly values.

Keyword	Parameters	
	BGfilnam (BGformat)	<p>Filename for hourly background concentrations. Optional Fortran format of hourly background concentration file; the default format is FREE format, i.e., comma or space-delimited data fields (Yr Mn Dy Hr BGvalue). The BGformat parameter must include open and close parentheses, the date variables must be read as integers (Fortran I format), and the BGvalue must be read as real (Fortran F, E, or D format), e.g., '(4I2,F8.3)'. The year may be specified as a 2-digit or 4-digit year, and the data period in the HOURLY background file must match the data period in the meteorological data files. The BGformat parameter cannot include any blank spaces, unless the field is enclosed by double quotes.</p> <p><u>NOTE:</u> Background concentrations specified on the BACKGRND keyword are currently assumed to be in units of PPB for NO<sub>2</sub> and SO<sub>2</sub>, PPM for CO, and UG/M3 for all other pollutants, unless otherwise specified on the SO BACKUNIT keyword.</p> <p>Background concentrations can be included with any source group, including group 'ALL', by including a "SrcID" of 'BACKGROUND' on the SRCGROUP keyword. <b>Note that background concentrations are automatically included with group ALL by default; however, background concentrations can be excluded from group ALL by including NOBACKGROUND (or NOBACKGRND) on the SRCGROUP ALL keyword.</b></p>
BACKUNIT	BGunits	
where:	BGunits	<p>Background concentration units, specified as <u>PPB</u> for parts-per-billion, <u>PPM</u> for parts-per-million, or <u>UG/M3</u> for micrograms/cubic-meter. Background concentrations input in units of PPB or PPM are converted to micrograms/cubic-meter based on reference temperature (25 C) and pressure (1013.25 mb).</p> <p><u>Note:</u> Units of PPB and PPM can only be used with the NO<sub>2</sub>, SO<sub>2</sub>, and CO POLLUTID.</p>
INCLUDED	Incfil	
where:	SrcIncFile	<p>Filename for the included source file, up to 200 characters in length; double quotes (") may be used as delimiters for the filename to allow for embedded spaces; and quotes don't count toward the limit of 200.</p>
OLMGROUP	OLMGrpID SrcID's SrcRange's or <u>ALL</u>	
where:	OLMGrpID  SrcID's	<p>Group ID (Grpid = ALL specifies group including all sources). Discrete source IDs to be included in group. Source ID ranges to be included in group.</p>

Keyword	Parameters	
	SrcRange's	<u>Note:</u> Card may be repeated with same Grpid if more space is needed to specify sources.
BLPGROUP	BLPGrpID SrcID's SrcRange's	
where:	BLPGrpID SrcID's SrcRange's	Buoyant line group ID. Discrete BUOYLINE source IDs to be included in group. BUOYLINE source ID ranges to be included in group.
PSDGROUP	PSDGrpID SrcID's SrcRange's	
where:	PSDGrpID  SrcID's SrcRange's	PSD GrpID for PSDCREDIT option, must be one of the following: INCRCONS – increment-consuming sources, NONRBASE – non-retired baseline sources, or RETRBASE – retired (increment-expanding) baseline sources. Discrete source IDs to be included in group. Source ID ranges to be included in group.  <u>Note:</u> Card may be repeated with same PSDGrpID if more space is needed to specify sources
HBPSRCID	SrcID's and/or SrcRange's or ALL	
where:	SrcID's  SrcRange's  ALL	Discrete source IDs to be included. Source ID ranges to be included.  <u>Note:</u> Card may be repeated if more space is needed to specify sources.  Includes all sources modeled that are source type POINT, POINTHOR, and POINTCAP.
ARCFTSRC	SrcID's and/or SrcRange's or ALL	
where:	SrcID's  SrcRange's  ALL	Discrete source IDs to be included. Source ID ranges to be included.  <u>Note:</u> Card may be repeated if more space is needed to specify sources.  Applies aircraft plume rise option (ARCFTOPT) to all AREA and VOLUME source types modeled.
SRCGROUP	SrcGrpID SrcID's SrcRange's	
where:	SrcGrpID SrcID's	Group ID (Grpid = ALL specifies group including all sources). Discrete source IDs to be included in group; a "SrcID" of 'BACKGROUND' (or 'BACKGRND') can be used to include background concentrations, based on the BACKGRND keyword. Also note that background concentrations are automatically included with group ALL; however, background concentrations can be

Keyword	Parameters	
	SrcRange's	<p>excluded from group ALL by specifying 'NOBACKGROUND' on the SRCGROUP ALL keyword.</p> <p>Source ID ranges to be included in group.</p> <p><u>Note:</u> Card may be repeated with same Grpid if more space is needed to specify sources.</p>
BLPINPUT	Blavgblen Blavgbhgt Blavgbwid Blavglwid Blavgbsep Blavgfprm	
where:	Blavgblen Blavgbhgt Blavgbwid Blavglwid Blavgbsep Blavgfprm	<p>Average building length (m).</p> <p>Average building height (m).</p> <p>Average building width (m).</p> <p>Average line source width (m) (of the individual lines).</p> <p>Average building separation (m) (between the individual lines).</p> <p>Average buoyancy parameter (m<sup>4</sup>/s<sup>3</sup>).</p>

**Table A-5. Description of Receptor Pathway Keywords**

RE Keywords	Type	Keyword Description
STARTING	M – N	Identifies the start of RECEPTOR pathway inputs
ELEVUNIT	O – N	Defines input units for receptor elevations (defaults to meters), must be first keyword after RE STARTING if used.
GRIDCART	O <sup>1</sup> – R	Defines a Cartesian grid receptor network
GRIDPOLR	O <sup>1</sup> – R	Defines a polar receptor network
DISCCART	O <sup>1</sup> – R	Defines the discretely placed receptor locations referenced to a Cartesian system
DISCPOLR	O <sup>1</sup> – R	Defines the discretely placed receptor locations referenced to a polar system
EVALCART	O <sup>1</sup> – R	Defines discrete Cartesian receptor locations for use with EVALFILE output option
INCLUDED	O – R	Identifies an external file containing receptor locations to be included in the inputs
FINISHED	M - N	Identifies the end of RECEPTOR pathway inputs

- 1) At least one of the following must be present: GRIDCART, GRIDPOLR, DISCCART, DISCPOLR, or EVALCART, unless the INCLUDED keyword is used to include receptor inputs from an external file. Multiple receptor networks can be specified in a single run, including both Cartesian and polar.

**Table A-6. Description of Receptor Pathway Keywords and Parameters**

Keyword	Parameters	
ELEVUNIT	<u>METERS</u> or <u>FEET</u>	
where:	<u>METERS</u> <u>FEET</u>	Specifies input units for receptor elevations of meters. Specifies input units for receptor elevations of feet. Note: This keyword applies to receptor elevations only.
GRIDCART	Netid <u>STA</u> <u>XYINC</u> Xinit Xnum Xdelta Yinit Ynum Ydelta or <u>XPNTS</u> Gridx1 Gridx2 Gridx3 .... GridxN, and <u>YPNTS</u> Gridy1 Gridy2 Gridy3 .... GridyN <u>ELEV</u> Row Zelev1 Zelev2 Zelev3 ... ZelevN <u>HILL</u> Row Zhill1 Zhill2 Zhill3 ... ZhillN <u>FLAG</u> Row Zflag1 Zflag2 Zflag3 ... ZflagN <u>END</u>	
where:	Netid <u>STA</u> <u>XYINC</u> Xinit Xnum Xdelta Yinit Ynum Ydelta <u>XPNTS</u>  Gridx1 GridxN <u>YPNTS</u>  Gridy1 GridyN <u>ELEV</u> Row Zelev <u>HILL</u> Row Zhill <u>FLAG</u> Row Zflag  <u>END</u>	Receptor network identification code (up to eight alphanumeric characters). Indicates <u>START</u> of GRIDCART subpathway, repeat for each new Netid. Keyword identifying grid network generated from x and y increments. Starting local x-axis grid location in meters. Number of x-axis receptors. Spacing in meters between x-axis receptors. Starting local y-axis grid location in meters. Number of y-axis receptors. Spacing in meters between y-axis receptors. Keyword identifying grid network defined by series of x and y coordinates. Value of first x-coordinate for Cartesian grid. Value of 'nth' x-coordinate for Cartesian grid. Keyword identifying grid network defined by series of x and y coordinates. Value of first y-coordinate for Cartesian grid. Value of 'nth' y-coordinate for Cartesian grid. Keyword to specify that receptor elevations follow. Indicates which row (y-coordinate fixed) is being input. An array of receptor terrain elevations for a particular Row. Keyword to specify that hill height scales follow. Indicates which row (y-coordinate fixed) is being input. An array of hill height scales for a particular Row. Keyword to specify that flagpole receptor heights follow. Indicates which row (y-coordinate fixed) is being input. An array of receptor heights above local terrain elevation for a particular Row (flagpole receptors). Indicates <u>END</u> of GRIDCART subpathway, repeat for each new Netid.
GRIDPOLR	Netid <u>STA</u> <u>ORIG</u> Xinit Yinit, or <u>ORIG</u> Srcid	

Keyword	Parameters	
	<p><u>DIST</u> Ring1 Ring2 Ring3 ... RingN  <u>DDIR</u> Dir1 Dir2 Dir3 ... DirN,  or <u>GDIR</u> Dirnum Dirini Dirinc  <u>ELEV</u> Dir Zelev1 Zelev2 Zelev3 ... ZelevN  <u>HILL</u> Dir Zhill1 Zhill2 Zhill3 ... ZhillN  <u>FLAG</u> Dir Zflag1 Zflag2 Zflag3 ... ZflagN  <u>END</u></p>	
where:	Netid  <u>STA</u> <u>ORIG</u>  Xinit Yinit Srcid <u>DIST</u> Ring1 RingN <u>DDIR</u> Dir1 DirN <u>GDIR</u> Dirnum Dirini Dirinc <u>ELEV</u> Dir Zelev <u>HILL</u> Row Zhill  <u>FLAG</u> Dir Zflag  <u>END</u>	Receptor network identification code (up to eight alphanumeric characters). Indicates <u>STA</u> rt of GRIDPOLR subpathway, repeat for each new Netid Optional keyword to specify the origin of the polar network (assumed to be at x=0, y=0 if omitted). local x-coordinate for origin of polar network (m). local y-coordinate for origin of polar network (m). Source ID of source used as origin of polar network. Keyword to specify distances for the polar network. Distance to the first ring of polar coordinates (m). Distance to the 'nth' ring of polar coordinates (m). Keyword to specify discrete direction radials for the polar network. First direction radial in degrees (1 to 360). The 'nth' direction radial in degrees (1 to 360). Keyword to specify generated direction radials for the polar network. Number of directions used to define the polar system. Starting direction of the polar system. Increment (in degrees) for defining directions. Keyword to specify that receptor elevations follow. Indicates which direction is being input. An array of receptor terrain elevations for a particular direction radial. Keyword to specify that hill height scales follow. Indicates which row (y-coordinate fixed) is being input. An array of hill height scales for a particular Row Keyword to specify that flagpole receptor heights follow. Keyword to specify that flagpole receptor heights follow. Indicates which direction or direction number is being input. An array of receptor heights above local terrain elevation for a particular direction (flagpole receptors). Indicates <u>END</u> of GRIDPOLR subpathway, repeat for each new Netid.
DISCCART	Xcoord Ycoord (Zelev Zhill) (Zflag)	
where:	Xcoord Ycoord (Zelev)  (Zhill) (Zflag)	local x-coordinate for discrete receptor location (m). local y-coordinate for discrete receptor location (m). Elevation above sea level for discrete receptor location (optional), used only for <u>ELEV</u> terrain. Hill height scale (optional), used only for <u>ELEV</u> terrain. Receptor height (flagpole) above local terrain (optional), used only with <u>FLAGPOLE</u> keyword.
DISCPOLR	Srcid Dist Direct (Zelev Zhill) (Zflag)	

Keyword	Parameters	
where:	Srcid Dist Direct (Zelev) (Zhill) (Zflag)	Specifies source identification for which discrete polar receptor locations apply (used to define the origin for the discrete polar receptor). Downwind distance to receptor location (m). Direction to receptor location, in degrees clockwise from North. Elevation above sea level for receptor location (optional), used only for <u>ELEV</u> terrain. Hill height scale (optional). Receptor height (flagpole) above local terrain (optional), used only with <u>FLAGPOLE</u> keyword.
EVALCART	Xcoord Ycoord Zelev Zhill Zflag Arcid (Name)	
where:	Xcoord Ycoord Zelev  Zhill Zflag  Arcid (Name)	Local x-coordinate for discrete receptor location (m). Local y-coordinate for discrete receptor location (m). Elevation above sea level for discrete receptor location, used only for <u>ELEV</u> terrain. Hill height scale (m), used only for <u>ELEV</u> terrain. Receptor height (flagpole) above local terrain, used only with <u>FLAGPOLE</u> keyword. Receptor arc ID used to group receptors along an arc or other grouping (up to eight characters). Optional name for receptor (up to eight characters).
INCLUDED	RecIncFile	
where:	RecIncFile	Identifies the filename for the included receptor file, up to 200 characters in length; double quotes (“) may be used as delimiters for the filename to allow for embedded spaces; quotes don’t count toward the limit of 200.

**Table A-7. Description of Meteorology Pathway Keywords**

<b>ME Keywords</b>	<b>Type</b>	<b>Keyword Description</b>
STARTING	M – N	Identifies the start of METEOROLOGY pathway inputs
SURFFILE	M – N	Describes input meteorological surface data file
PROFFILE	M – N	Describes input meteorological profile data file
SURFDATA	M – N	Describes surface meteorological station
UAIRDATA	M – N	Describes upper air meteorological station
SITEDATA	O – N	Describes on-site meteorological station
PROFBASE	M – N	Specifies the base elevation for the potential temperature profile
STARTEND	O – N	Specifies start and end dates to be read from input meteorological data file (default is to read entire file)
DAYRANGE	O – R	Specifies days or ranges of days to process (default is to process all data)
NOSA	O – N	Specifies to set $\sigma_{\theta}$ to missing for all hours in profile data file
NOSACO	O – N	Specifies to set $\sigma_{\theta}$ to missing for convective hours only in profile data file
NOSAST	O – N	Specifies to set $\sigma_{\theta}$ to missing for stable hours only in profile data file
NOSW	O – N	Specifies to set $\sigma_w$ to missing for all hours in profile data file
NOSWCO	O – N	Specifies to set $\sigma_w$ to missing for convective hours only in profile data file
NOSWST	O – N	Specifies to set $\sigma_w$ to missing for stable hours only in profile data file
NOTURB	O – N	Specifies to set $\sigma_{\theta}$ and $\sigma_w$ to missing for all hours in profile data file
NOTURBCO	O – N	Specifies to set $\sigma_{\theta}$ and $\sigma_w$ to missing for convective hours only in profile data file
NOTURBST	O – N	Specifies to set $\sigma_{\theta}$ and $\sigma_w$ to missing for stable hours only in profile data file
SCIMBYHR	O – N	Specifies the parameters for the SCIM (Sampled Chronological Input Model) option (see CO MODELOPT)
WDROTATE	O – N	May be used to correct for alignment problems of wind direction measurements, or to convert wind direction from to flow vector
WINDCATS	O – N	Input upper bounds of wind speed categories, five values input - sixth category is assumed to have no upper bound (used for WSPEED option on the EMISFACT keyword)
FINISHED	M – N	Identifies the end of METEOROLOGY pathway inputs

**Table A-8. Description of Meteorology Pathway Keywords and Parameters**

<b>Keyword</b>	<b>Parameters</b>	
SURFFILE	Sfcfil	
where:	Sfcfil	Specify filename for surface meteorological input file <u>Note:</u> FREE format is used for all SURFFILE reads beginning with version 09292.
PROFFILE	Profil	
where:	Profil	Specify filename for profile meteorological input file <u>Note:</u> FREE format is used for all PROFFILE reads beginning with version 09292.
SURFDATA	Stanum Year (Name) (Xcoord Ycoord)	
where:	Stanum Year (Name) (Xcoord) (Ycoord)	Station number, e.g., 5-digit WBAN number for NWS station. Year of data being processed (four digits). Station name (optional). x-coordinate of station location (m) (optional). y-coordinate of station location (m) (optional).
UAIRDATA	Stanum Year (Name) (Xcoord Ycoord)	
where:	Stanum Year (Name) (Xcoord) (Ycoord)	Station number, e.g., 5-digit WBAN number for NWS station. Year of data being processed (four digits). Station name (optional). x-coordinate of station location (m) (optional). y-coordinate of station location (m) (optional).
SITEDATA	Stanum Year (Name) (Xcoord Ycoord)	
where:	Stanum Year (Name) (Xcoord) (Ycoord)	Station number for on-site meteorological data station. Year of data being processed (four digits). Station name (optional). x-coordinate of station location (m) (optional). y-coordinate of station location (m) (optional).
PROFBASE	BaseElev (Units)	
where:	BaseElev (Units)	Base elevation (above MSL) for the potential temperature profile. Units of BaseElev: <u>METERS</u> or <u>FEET</u> (default is <u>METERS</u> ).
STARTEND	Strtyr Strtmn Strtdy (Strthr) Endyr Endmn Enddy (Endhr)	
where:	Strtyr Strtmn Strtdy (Strthr) Endyr Endmn Enddy (Endhr)	Year of first record to be read. Month of first record to be read. Day of first record to be read. Hour of first record to be read (optional). Year of last record to be read. Month of last record to be read. Day of last record to be read. Hour of last record to be read (optional).

Keyword	Parameters	
		<u>Note:</u> File read begins with hour 1 of the start date and ends with hour 24 of the end date if Stahr and Endhr are omitted.
DAYRANGE	Range1 Range2 Range3 ... RangeN	
where:	Range1  RangeN	First range of days to process, either as individual day (XXX) or as range (XXX-YYY); days may be input as Julian dates (XXX) or as month and day (XX/YY). The 'N-th' range of days to process.
NUMYEARS	NumYrs	
where:	NumYrs	Specifies the number of years of meteorological data being processed for purposes of allocating array storage for the OU MAXDCONT option. A default value of 5 years is assumed if the optional NUMYEARS keyword is omitted.
NOSA or NOSACO or NOSAST or NOSW or NOSWCO or NOSWST or NOTURB or NOTURBCO or NOTURBST	<i>No parameters or secondary keywords</i>	
SCIMBYHR	NRegStart NRegInt (SfcFilnam PflFilnam)	
where:	NRegStart  NRegInt (SfcFilnam)  (PflFilnam)	Specifies the first hour to be sampled with the SCIM option; required to have a value from 1 to 24. Specifies the sampling interval, in hours. Optional output file name to list the surface meteorological data for the sampled hours. Optional output file name to list the profile meteorological data for the sampled hours.
WDROTATE	Rotang	
where:	Rotang	Specifies angle (in degrees) to rotate wind direction measurements to correct for alignment problems; value of Rotang is subtracted from WD measurements, i.e., rotation is counterclockwise.
WINDCATS	Ws1 Ws2 Ws3 Ws4 Ws5	

<b>Keyword</b>	<b>Parameters</b>	
where:	Ws1 Ws2 Ws3 Ws4 Ws5	Upper bound of first wind speed category (m/s). Upper bound of second wind speed category (m/s). Upper bound of third wind speed category (m/s). Upper bound of fourth wind speed category (m/s). Upper bound of fifth wind speed category (m/s). (sixth category is assumed to have no upper bound).

**Table A-9. Description of Event Pathways and Keywords**

<b>EV Keywords</b>	<b>Type</b>	<b>Keyword Description</b>
STARTING	M – N	Identifies the start of EVENT pathway inputs
EVENTPER	M – R	Describes data and averaging period for an event
EVENTLOC	M – R	Describes receptor location for an event
INCLUDED	O – R	Identifies an external file containing EVENT data to be included in the inputs
FINISHED	M – N	Identifies the end of EVENT pathway inputs

**Table A-10. Description of Event Pathway Keywords and Parameters**

<b>Keyword</b>	<b>Parameters</b>	
EVENTPER	Evname Aveper Grpid Date Conc	
where:	Name Grpid Aveper Date Conc	Specify name of event to be processed (e.g., H002H24ALL), (up to ten alphanumeric characters). Specify source group ID for event. Specify averaging period for event. Specify data period for event (ending YYMMDDHH for averaging period). Specifies the concentration value generated during the initial non-EVENT processing.
EVENTLOC	Evname <u>XR=</u> Xr <u>YR=</u> Yr (Zelev Zhill) (Zflag) or <u>RNG=</u> Rng <u>DIR=</u> Dir (Zelev Zhill) (Zflag)	
where:	Evname <u>XR=</u> <u>YR=</u> <u>RNG=</u> <u>DIR=</u> (Zelev) (Zhill) (Zflag)	Specify name of event to be processed (e.g., H002H24ALL), (up to ten alphanumeric characters). X-coordinate for event (discrete Cartesian receptor). Y-coordinate for event (discrete Cartesian receptor). Distance range for event (discrete polar receptor). Radial direction for event (discrete polar receptor). Terrain elevation for event (optional). Hill height scale (optional). Receptor height above ground for event (optional).
INCLUDED	EventIncFile	
where:	EventIncFile	Identifies the filename for the included EVENT file, up to 200 characters in length; double quotes (“) may be used as delimiters for the filename to allow for embedded spaces; and quotes don’t count toward the limit of 200.

Note: EVENT locations can be input as either discrete Cartesian receptors (XR=, YR=) or as discrete polar receptors (RNG=, DIR=). Events that are specified in the file generated by the AERMOD model (CO EVENTFIL card) are always given as discrete Cartesian coordinates. Discrete polar receptors are assumed to be relative to an origin of (0,0).

**Table A-11. Description of Output Pathway Keywords**

<b>OU Keywords</b>	<b>Type</b>	<b>Keyword Description</b>
STARTING	M – N	Identifies the start of OUTPUT pathway inputs
RECTABLE	O – R	Option to specify value(s) by receptor for output
MAXTABLE	O – R	Option to summarize the overall maximum values
DAYTABLE	O – N	Option to print summaries for each averaging period for each day processed.
MAXIFILE	O – R	Option to list events exceeding a threshold value to file (if CO EVENTFIL option is used, these events are included in the input file generated for the EVENT model).
POSTFILE <sup>1</sup>	O – R	Option to write results to a mass storage file for postprocessing.
PLOTFILE <sup>1</sup>	O – R	Option to write certain results to a storage file suitable for input to plotting routines
TOXXFILE	O – R	Option to write results to a storage file suitable for input to the TOXX model component of TOXST or the RISK
RANKFILE	O – R	Option to output file of ranked values for Q-Q plots (must be used with the MAXTABLE keyword)
EVALFILE	O – R	Option to output file of normalized arc maxima from EVALCART receptors for model evaluation studies
SEASONHR	O – R	Option to output results by season and hour-of-day
MAXDAILY	O – R	Option to output file of daily maximum 1-hour values for each day processed; only applicable for 1-hour NO <sub>2</sub> and 1-hour SO <sub>2</sub> NAAQS
MXDYBYR	O – R	Option to output file of daily maximum 1-hour values by year, for each year processed; only applicable for 1-hour NO <sub>2</sub> and 1-hour SO <sub>2</sub> NAAQS
MAXDCONT	O – R	Option to output contributions of each source group to ranked values averaged across years for a reference source group, paired in time and space; only applicable for 24-hour PM <sub>2.5</sub> 1-hour NO <sub>2</sub> , and 1-hour SO <sub>2</sub> NAAQS
SUMMFILE	O – N	Option to output summary of high ranked values to separate file
FILEFORM	O – N	Specify fixed or exponential format for output results files
NOHEADER	O – N	Option to suppress file headers for output file options, e.g., POSTFILE, PLOTFILE, MAXDCONT, etc.
EVENTOUT	M – N	Specifies the level of output information provided for EVENT Processing [EVENT Only]
FINISHED	M – N	Identifies the end of OUTPUT pathway inputs

- 1) POSTFILE is used to output concurrent concentration values for particular source groups and averaging times across the receptor network suitable for postprocessing. PLOTFILE is used to output specific design values, such as second high concentrations, across the receptor network, suitable for plotting concentration contours.

**Table A-12. Description of Output Pathway Keywords and Parameters**

Keyword	Parameters	
RECTABLE	Aveper <u>FIRST</u> <u>SECOND</u> ... <u>SIXTH</u> ... <u>TENTH</u> and/or Aveper <u>1ST</u> <u>2ND</u> ... <u>6TH</u> ... <u>10TH</u> and/or Aveper <u>1</u> <u>2</u> ... <u>6</u> ... <u>10</u> ... <u>N</u> ... <u>999</u>	
where:	Aveper  <u>FIRST</u> <u>SECOND</u> <u>SIXTH</u> <u>1ST</u> <u>2ND</u> <u>6TH</u> <u>N</u>	Averaging period to summarize with high values (keyword <u>ALLAVE</u> specifies all short-term averaging periods). Select summaries of <u>FIRST</u> highest values by receptor. Select summaries of <u>SECOND</u> highest values by receptor. Select summaries of <u>SIXTH</u> highest values by receptor. Select summaries of <u>1ST</u> highest values by receptor. Select summaries of <u>2ND</u> highest values by receptor. Select summaries of <u>6TH</u> highest values by receptor. Select summaries of <u>N</u> -th highest values by receptor (up to <u>999</u> -th highest values).  <u>Note:</u> If two parameters are input separated by a dash (e.g. <u>FIRST-THIRD</u> or <u>4-12</u> ), then summaries of all high ranked values within that range (inclusive) are provided.  If the CO EVENTFIL keyword is exercised, then the events generated by the RECTABLE keyword are included in the input file for EVENT model.  The range of ranks specified on the RECTABLE keyword (but not the individual ranks specified) also determines the range of ranks that may be considered with the MAXDCONT option.
MAXTABLE	Aveper Maxnum	
where:	Aveper  Maxnum	Averaging period to summarize with overall maximum values (keyword <u>ALLAVE</u> specifies all averaging periods). Specifies number of overall maximum values to summarize .
DAYTABLE	Avper1 Avper2 Avper3 ...	
where:	Avper1	Averaging period, e.g., <u>24</u> for 24-hr averages, to summarize with values by receptor for each day of data processed (keyword <u>ALLAVE</u> for first parameter specifies all averaging periods).
MAXIFILE	Aveper GrpID Thresh Filnam (Funit)	
where:	Aveper  GrpID Thresh Filnam Funit	Specifies averaging period for list of values equal to or exceeding a threshold value. Specifies source group to be output to file. Threshold value (e.g., NAAQS) for list of exceedances. Name of disk file to store maximum values. Optional parameter to specify the file unit.

Keyword	Parameters	
		<u>Note:</u> If the CO EVENTFIL keyword is exercised, then the events generated by the MAXIFILE keyword are included in the input file for EVENT processing.
POSTFILE	Aveper GrpID Format Filnam (Funit)	
where:	Aveper GrpID Format Filnam Funit	Specifies averaging period to be output to file, e.g., <u>24</u> for 24-hr averages, <u>PERIOD</u> for period averages. Specifies source group to be output to file. Specifies format of file, either <u>UNFORM</u> for unformatted files or <u>PLOT</u> for formatted files for plotting. Specifies filename for output file. Optional parameter to specify the file unit.
PLOTFILE	Aveper GrpID Hivalu Filnam (Funit) (Short-Term values) Aveper GrpID Filnam (Funit) (PERIOD or ANNUAL averages)	
where:	Aveper GrpID Hivalu Filnam Funit	Specifies averaging period to be output to file, e.g., <u>24</u> for 24-hr averages, <u>PERIOD</u> for period averages, etc. Specifies source group to be output to file. Specifies rank to be included in high value summary (e.g., <u>FIRST</u> , <u>SECOND</u> , <u>1ST</u> , <u>2ND</u> , etc.) to be output to file (the rank must be included on the RECTABLE card). Specifies filename for output file. Optional parameter to specify the file unit.
TOXXFILE	Aveper Cutoff Filnam (Funit)	
where:	Aveper Cutoff Filnam Funit	Specifies averaging period to be output to file, e.g., <u>1</u> for 1-hr averages. Specifies cutoff (threshold) value in g/m <sup>3</sup> for outputting results for AERMOD model. Specifies filename for output file. Optional parameter to specify the file unit.
RANKFILE	Aveper Hinum Filnam (Funit)	
where:	Aveper Hinum Filnam Funit	Specifies averaging period to be output to file, e.g., <u>24</u> for 24-hr averages. Specifies the number of high values to be ranked. Specifies filename for output file. Optional parameter to specify the file unit.
EVALFILE	SrcID Filnam (Funit)	
where:	SrcID Filnam Funit	Specifies the source ID to be output to file. Specifies filename for output file. Optional parameter to specify the file unit.
SEASONHR	GrpID FileName (FileUnit)	
where:	GrpID FileName	Specifies the source group ID to be output to file. Specifies filename for output file.

Keyword	Parameters	
	(FileUnit)	Optional parameter to specify file unit.
MAXDAILY	GrpID FileName (FileUnit)	
where:	GrpID FileName (FileUnit)	Specifies the source group ID to be output to file. Specifies filename for output file. Optional parameter to specify file unit.
MXDYBYR	GrpID FileName (FileUnit)	
where:	GrpID FileName (FileUnit)	Specifies the source group ID to be output to file. Specifies filename for output file. Optional parameter to specify file unit.
MAXDCONT	GrpID UpperRank LowerRank FileName (FileUnit) or GrpID UpperRank <u>THRESH</u> ThreshValue FileName (FileUnit)	
where:	GrpID UpperRank LowerRank  <u>THRESH</u> ThreshValue  FileName (FileUnit)	Specifies the source group ID to be output to file. Upper bound of ranks to evaluate for contributions. Lower bound of ranks to evaluate for contributions (note that lower rank refers to lower concentrations and higher rank refers to higher concentrations). <u>NOTE:</u> The UpperRank and LowerRank values must be within the range of ranks specified on the RECTABLE keyword. AERMOD will analyze each rank within the range, regardless of whether the rank is specified explicitly on the RECTABLE keyword. Indicates that a threshold concentration (ThreshValue) will be specified as a limit on the lower bound rank to process. Lower threshold value for evaluating contributions; processing will stop after the first ranked value that is below ThreshValue <u>NOTE:</u> The ThreshValue analysis will be limited to the range of ranks specified on the RECTABLE keyword (but not the individual ranks that are specified). A warning message is generated if the ThreshValue is not reached within the range of ranks analyzed. Specifies filename for output file. Optional parameter to specify file unit.  <u>Note:</u> The range of ranks specified on the RECTABLE keyword (but not the individual ranks specified) also determines the range of ranks that may be considered with the MAXDCONT option, even with the <u>THRESH</u> option.
SUMMFILE	SummFileName	
where:	SummFileName	Specifies filename of output summary file
FILEFORM	<u>EXP</u> or <u>FIX</u>	

Keyword	Parameters	
where:	<u>EXP</u>  <u>FIX</u>	Specifies that the output results files will use EXPonential-formatted values.  Specifies that the output results files will use FIXed-formatted values (fixed-formatted values will be used if FILEFORM is omitted).
NOHEADER	FileType1 FileType2 FileType3 . . . FileTypeN or <u>ALL</u>	
where:	FileTypeN  <u>ALL</u>	Specifies the output file type(s) for which header records will be suppressed; includes the following file types: POSTFILE, PLOTFILE, MAXIFILE, RANKFILE, SEASONHR, MAXDAILY, MXDYBYR, and MAXDCONT.  Specifies that header records will be suppressed for <u>ALL</u> applicable output file types.
EVENTOUT	<u>SOCONT</u> or <u>DETAIL</u> [EVENT Only]	
where:	<u>SOCONT</u> <u>DETAIL</u>	Provide source contribution information only in the event output. Include hourly concentrations for each source and hourly meteorological data in the event output

## APPENDIX B. Explanation of error message codes

### B.1 Introduction

Prior to AERMOD beginning the intensive processing to calculate predicted values specified by the user (e.g., concentrations, deposition), AERMOD runs a series of checks on the input control file to identify issues that would prevent AERMOD from completing successfully. Some of these checks include the control file structure and syntax, proper use or use of undefined keywords or parameters, missing required keywords, and conflicting options. Also, a great deal of effort has been made to eliminate the possibility of run time errors, such as "divide by zero" and to identify questionable input data.

Error messages are reported to the user in two ways. A summary of messages is provided in the main output result file. The user can also request a detailed message file.

Message Summary: Whether the user selects a detailed message file or not, the AERMOD model outputs a summary of messages within the output result file. This message table gives the number of messages of each type, together with a detailed list of all the fatal errors and warning messages. During setup processing, if no errors or warnings are generated, then the model simply reports to the user that "SETUP Finishes Successfully."

Detailed Message File: The AERMOD model provides the option of saving a detailed list of all messages generated by the model in a separate output file. The user can select this option by specifying the keyword "ERRORFIL" followed by a filename inside the CONTROL pathway. For example, the following statements will save all the error messages to an ASCII text file named "errormsg.out":

```
CO STARTING
   ERRORFIL errormsg.out
CO FINISHED
```

## B.2 Output message summary

There are two message summaries provided in the standard output file of the AERMOD model. The first one is located after the echo of input control file options and before the input data summary. This summary will take one of two forms, depending on whether any fatal error or non-fatal warning messages were generated and depending on whether the option to RUN or NOT to run was selected on the CO RUNORNOT card. If there are no errors or warnings generated during the setup processing, and the RUN option was selected, then the model simply reports that "SETUP Finishes Successfully." If any fatal errors or warning messages were generated during the setup processing or if the option NOT to run was selected, then a more detailed summary is provided. This summary provides a message count for each type of message and a detailed listing of each fatal error and warning message generated. The second message summary table is located at the very end of the standard output result file, and it sums up the messages generated by the complete model run - both setup processing and run-time processing. An example of a setup processing message summary is shown in Figure B-1.

```
*** Message Summary For The AERMOD Model Setup ***

----- Summary of Total Messages -----
A Total of 0 Fatal Error Message(s)
A Total of 0 Warning Message(s)
A Total of 0 Information Message(s)

***** FATAL ERROR MESSAGES *****
          *** NONE ***

***** WARNING MESSAGES *****
          *** NONE ***

*****
*** SETUP Finishes Successfully ***
*****
```

**Figure B-1. Example of an AERMOD Message Summary**

### B.3 Description of the message layout

Three types of messages can be produced by the model during the processing of input control file commands and during model calculations. These are described briefly below:

- Errors that will halt any further processing, except to identify additional error conditions (type E);
- Warnings that do not halt processing but indicate possible errors or suspect conditions (type W); and
- Informational messages that may be of interest to the user but have no direct bearing on the validity of the results (type I).

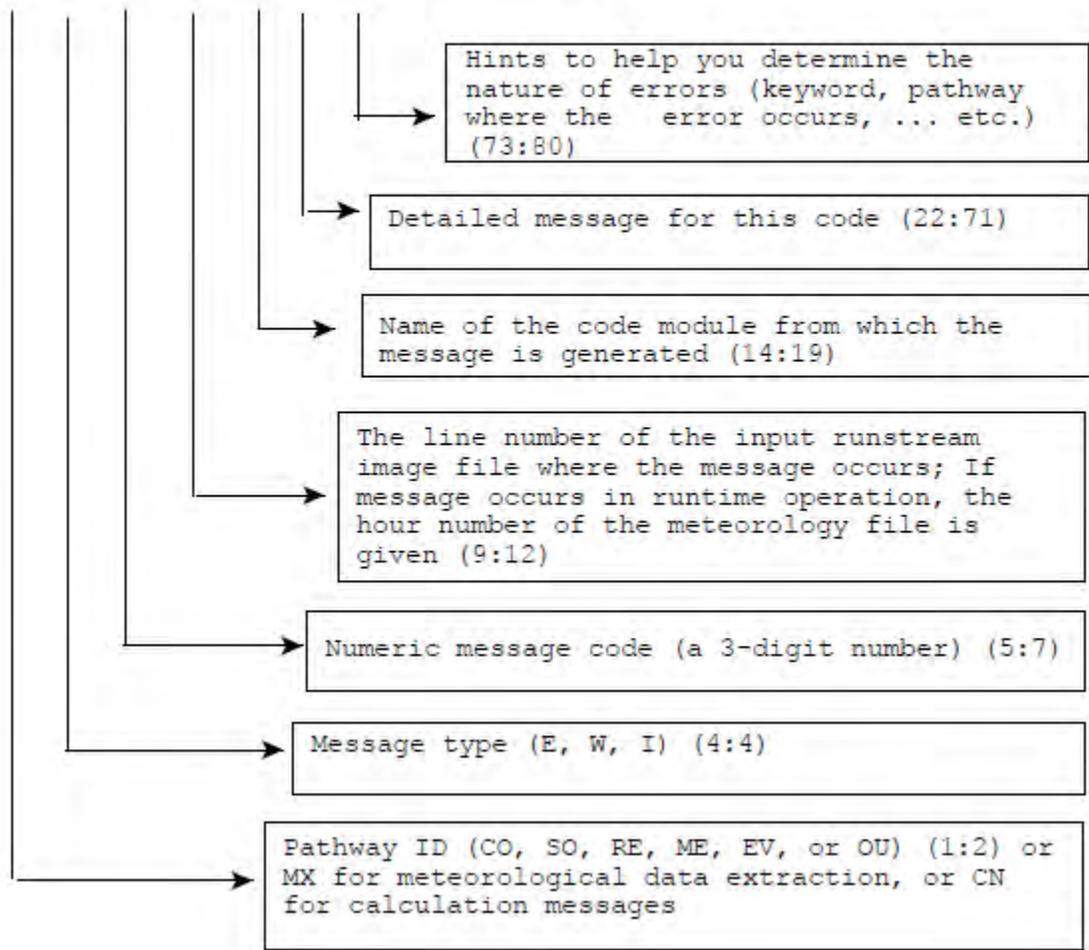

The messages have a consistent structure which contains the pathway ID, indicating which pathway the messages are generated from; the message type followed by a three-digit message number; the line number of the input control file command file for setup messages (or the meteorology hour number for runtime messages); the name of the module (e.g., the subroutine name) from which the message is generated; a detailed message corresponding to the message code; and an 8-character simple hint to help the user spot the possible source of the problem.

The following is an example of a detailed message generated from the CO pathway:

```
CO E1008 EXPATH: Invalid Pathway Specified. The Troubled Pathway is FF
```

The message syntax is explained in more detail below (values in parentheses give the column numbers within the message line for each element):

```
PW Txxx LLLL mmmmmmm: MESSAGE Hints
```

If an error occurs during processing of an included file (either SO INCLUDED or RE INCLUDED), the line number will represent the line number of the included file. The line number of the control file is saved before processing the included data, and then restored when processing returns to the main control file. The three message types are identified with the letters E (for errors), W (for warnings), and I (for informational messages).

## APPENDIX C. Description of file formats

### C.1 AERMET meteorological data

Two files are produced for input to the AERMOD dispersion model by the AERMET meteorological preprocessor. The surface OUTPUT contains observed and calculated surface variables, one record per hour. The PROFILE file contains the observations made at each level of an on-site tower, or the one level observations taken from NWS data, one record per level per hour. The contents and format of each of these files is described below:

#### SURFACE OUTPUT

##### Header record:

READ( ) *latitude, longitude, UA identifier, SF identifier, OS identifier, Version date, AERMET flags*

FORMAT (2(2X,A8), 8X,' UA\_ID: ',A8,' SF\_ID: ',A8,' OS\_ID: ',A8, T85,'VERSION:', A6 )

where	<i>latitude</i>	=	latitude specified in Stage 1 for primary surface station
	<i>longitude</i>	=	longitude specified in Stage 1 for primary surface station
	<i>UA identifier</i>	=	station identifier for upper air data; usually the WBAN number used to extract the data from an archive data set
	<i>SF identifier</i>	=	station identifier for hourly surface observations; usually the WBAN number used in extracting the data
	<i>OS identifier</i>	=	site-specific identifier
	<i>Version date</i>	=	AERMET version date; this date also appears in the banner on each page of the summary reports
	<i>AERMET flags</i>	=	One or more of the following flags may be included in the header record after the version date, based on either the source of the data or option(s) used in AERMET to process the data for input to AERMOD: CCVR_Sub, TEMP_Sub, THRESH_1MIN <i>speed</i> , Adjust_u*, MMIF <i>version</i> , BULKRN, and COARE, where <i>speed</i> is the threshold wind speed and <i>version</i> is the MMIF version used. Refer to the AERMET User's Guide (EPA, 2024e) for information on each of these flags.

Note 1: The '*cc\_ID*:' fields in the FORMAT statement above where *cc* can be UA for upper air, SF for surface, and OS for onsite or site-specific, include two spaces before the 2-character pathway ID and one space after the colon.

Note 2: The FORMAT statement above will read the header record through the version date. One or more flags may follow the version date to identify either the data source or option(s) used to preprocess the data with AERMET for input to AERMOD. The FORMAT statement will need to be revised with additional terms to read beyond the version date to retrieve the flags from the header record.

### Data records:

READ( )            *year, month, day, j\_day, hour, H, u\* , w\* , VPTG, Zic, Zim, L, z<sub>o</sub> , B<sub>o</sub> , r, W<sub>s</sub> , W<sub>d</sub> , z<sub>ref</sub>, temp, z<sub>temp</sub>, ipcode, pamt, rh, pres, ccvr, WSADJ*

FORMAT            (3(I2,1X), I3,1X, I2,1X, F6.1,1X, 3(F6.3,1X), 2(F5.0,1X), F8.1,1X, F7.4,1X, 2(F6.2,1X), F7.2,1X, F5.0, 3(1X,F6.1), 1X,I5, 1X,F6.2, 2(1X, F6.0), 1X, I5, 1X, A7)

where            *j\_day*            =            Julian day  
*H*                =            sensible heat flux (W/m<sup>2</sup>)  
*u\**              =            surface friction velocity (m/s)  
*w\**              =            convective velocity scale (m/s)  
*VPTG*          =            vertical potential temperature gradient above *Zic* (K/m)  
*Zic*             =            height of convectively-generated boundary layer (m)  
*Zim*            =            height of mechanically-generated boundary layer (m)  
*L*               =            Monin-Obukhov length (m)  
*z<sub>o</sub>*             =            surface roughness length (m)  
*B<sub>o</sub>*             =            Bowen ratio  
*r*                =            Albedo  
*W<sub>s</sub>*             =            reference wind speed (m/s)  
*W<sub>d</sub>*             =            reference wind direction (degrees)  
*z<sub>ref</sub>*            =            reference height for wind (m)  
*temp*          =            reference temperature (K)  
*z<sub>temp</sub>*         =            reference height for temperature (m)  
*ipcode*        =            precipitation type code (0=none, 11=liquid, 22=frozen, 99=missing)  
*pamt*          =            precipitation amount (mm/hr)  
*rh*             =            relative humidity (percent)  
*pres*          =            station pressure (mb)  
*ccvr*          =            cloud cover (tenths)  
*WSADJ* =        wind speed adjustment and data source flag

When site-specific data are included in the data base, the definition of the reference height wind speed and direction are subject to the following restrictions:

- the wind speed,  $W_s$ , must be greater than or equal to the site-specific data threshold wind speed;
- the measurement height must be at or above  $7 \cdot z_0$ , where  $z_0$  is the surface roughness length;
- the height must be less than or equal to 100 meters;

If AERMET is run only with NWS data, i.e., no site-specific data are in the data base, then the restrictions above do not apply and the reference winds are taken to be the NWS winds independent of the height at which the winds were measured.

Ambient air temperature is subject to a similar, but less restrictive, selection process:

- the measurement height must be above  $z_0$ ; and
- the height must be less than or equal to 100 meters.

The sensible heat flux, Bowen ratio and albedo are not used by AERMOD, but are passed through by AERMET for information purposes only.

### PROFILE OUTPUT

READ( ) *year, month, day, hour, height, top, WDnn, WSnn, TTnn, SAnn, SWnn*

FORMAT (4(I2,1X), F7.1,1X, I1,1X, F7.1,1X, F8.2,1X, F8.2,1X, F8.2,1X, F8.2)

where, height = measurement height (m)  
top = 1, if this is the last (highest) level for this *hour*, or 0 otherwise  
WDnn = wind direction at the current level (degrees)  
WSnn = wind speed at the current level (m/s)  
TTnn = temperature at the current level (°C)  
SAnn =  $\sigma_\theta$  (degrees)  
SWnn =  $\sigma_w$  (m/s)

### **C.2 Threshold violation files (MAXIFILE option)**

The OU MAXIFILE card for the AERMOD model allows the user the option to generate a file or files of threshold violations for specific source group and averaging period combinations. The file consists of several header records, each identified with an asterisk (\*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, and the threshold value. Any value equal to or exceeding the threshold value will be included in the file. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the averaging period, the source group ID, the date (YYMMDDHH) for the end of averaging period, the X and Y coordinates of the receptor location,

receptor terrain elevation, hill height scale, flagpole receptor height, and the concentration value that violated the threshold. The following example from a threshold file identifies the contents of the MAXIFILE:

```

* AERMOD ( 15181): A Simple Example Problem for the AERMOD-PRIME Model                                06/09/16
* AERMET ( 15181):                                                                                                      17:03:34
* MODELING OPTIONS USED:  NonDEFAULT CONC          FLAT          RURAL

```

### C.3 Postprocessor files (POSTFILE option)

The OU POSTFILE card for the AERMOD model allows the user the option of creating output files of concurrent concentration values suitable for postprocessing. The model offers two options for the type of file generated - one is an unformatted file, and the other is a formatted file of X, Y, CONC values suitable for inputting to plotting programs.

The unformatted POSTFILE option generates a separate unformatted data record of concurrent values for each averaging period and source group specified. The averaging period and source group combinations may be written to separate files or combined into a single file. Each record begins with the date variable for the end of the averaging period (an integer variable of the form YYMMDDHH), the averaging period (e.g., an integer value of 3 for 3-hour averages), and the source group ID (eight characters). Following these three header variables, the record includes the concentration values for each receptor location, in the order in which the receptors are defined on the RE pathway. The results are output to the unformatted file or files as they are calculated by the model.

The formatted plot file option for the POSTFILE keyword includes several lines of header information, each identified with an asterisk (\*) in column one. The header information includes the model

name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, and the number of receptors included. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for that location, receptor terrain elevation, hill height scale, flagpole receptor height, the averaging period, the source group ID, the date variable for the end of the averaging period (in the form of YYMMDDHH) for short-term averages or the number of hours in the period for PERIOD averages, and the receptor network ID. The following example from a formatted postprocessor file for PERIOD averages identifies the contents of the POSTFILE:

```
* AERMOD ( 15181): A Simple Example Problem For the AERMOD-PRIME Model          06/09/16
* AERMET ( 15181):                                                              16:58:19

#### C.4 High value results for plotting (PLOTFILE option)

The OU PLOTFILE card for the AERMOD model allows the user the option of creating output files of highest concentration values suitable for importing into graphics software to generate contour plots. The

formatted plot files generated by the PLOTFILE include several lines of header information, each identified with an asterisk (\*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, the high value (e.g., 2ND highest) included for plotting, and the number of receptors included. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for that location, receptor terrain elevation, hill height scale, flagpole receptor height, averaging period, the source group ID, the high value included for short-term averages or the number of hours in the period for PERIOD averages, and the receptor network ID. For short-term averages, the PLOTFILE also includes the date variable for the end of the averaging period (in the form of YYMMDDHH). The PERIOD average PLOTFILE uses the same format for the data records as the PERIOD average formatted POSTFILE shown in the previous section. The following example from a plot file for high second highest 24-hour averages identifies the contents of the PLOTFILE:

```

* AERMOD ( 15181): A Simple Example Problem for the AERMOD-PRIME Model          06/09/16
* AERMET ( 15181):                                                              17:07:58
* MODELING OPTIONS USED:  NonDEFAULT CONC      FLAT      RURAL
*
*      PLOT FILE OF  HIGH  2ND HIGH 24-HR VALUES FOR SOURCE GROUP: ALL
*
*      FOR A TOTAL OF  144 RECEPTORS.
*
*      FORMAT: (3(1X,F13.5),3(1X,F8.2),3X,A5,2X,A8,2X,A5,5X,A8,2X,I8)
*
*      X          Y          AVERAGE CONC      ZELEV      ZHILL      ZFLAG      AVE      GRP      RANK      NET ID      DATE(CONC)
*
*      _____  _____  _____  _____  _____  _____  _____  _____  _____  _____  _____
*
*      30.38843    172.34136    0.34726    0.00    0.00    0.00    24-HR  ALL      2ND    POL1    88030324
*
*      60.77686    344.68271    0.75187    0.00    0.00    0.00    24-HR  ALL      2ND    POL1    88030124
*
*      86.82409    492.40388    1.18649    0.00    0.00    0.00    24-HR  ALL      2ND    POL1    88030124
*
*      173.64818   984.80775    1.19837    0.00    0.00    0.00    24-HR  ALL      2ND    POL1    88030124

```

The PLOTFILE output also includes a flag (\*\*\*) identifying the receptor with the highest concentration. For short-term averages, the flag precedes the date field. For period averages, the flag precedes the field with the number of hours in the period.

### C.5 TOXX model input files (TOXXFILE option)

The OU TOXXFILE card for the AERMOD model allows the user the option to generate an unformatted file or files of threshold violations for a specific averaging period for use with the TOXX model component of TOXST. The file consists of three header records, including the first line of the title information for the run, the number of source groups, receptors and averaging periods, information on the type of receptor network, and the threshold cutoff value. Following the header records are pairs of records identifying the specific averaging period, source group and receptor location and corresponding concentration value for the values exceeding the user- specified threshold. If any source group exceeds the threshold for a given averaging period and receptor location, then the concentrations for all source groups are output for that period and receptor. The structure of the unformatted file for the AERMOD model TOXXFILE option is described below:

Record	#	Description
	1	Title (80 characters)
	2	IYEAR, NUMGRP, NUMREC, NUMPER, ITAB, NXTOX, NYTOX, IDUM1, IDUM2, IDUM3
	3	CUTOFF, RDUM1, ..., RDUM9
where:		TITLE = First line of title (80 characters)
		IYEAR = Year of simulation
		NUMGRP = No. of source groups
		NUMREC = Total no. of receptors
		NUMPER = No. of averaging periods (e.g., number of hours in the year)
		ITAB = 1 for polar grid; 2 for Cartesian grid; 0 for discrete receptors or mixed grids
		NXTOX = No. of x-coordinates (or distances) in receptor network
		NYTOX = No. of y-coordinates (or directions) in receptor network
		IDUM1 = dummy integer variable, arbitrarily set equal to zero
		IDUM2 = dummy integer variable, arbitrarily set equal to zero
		IDUM3 = dummy integer variable, arbitrarily set equal to zero
		CUTOFF = User-specified threshold for outputting results (g/m <sup>3</sup> )
		RDUM1 = Dummy real variables (nine), arbitrarily set equal to zero
		.
		.
		.
		RDUM9 = Dummy real variables (nine), arbitrarily set equal to zero

Following the header records, the file consists of pairs of records including an ID variable identifying the data period, source group number and receptor number, and the corresponding concentration values. The

number of values included in each record is controlled by the NPAIR PARAMETER, which is initially set at 100 in MODULE MAIN1. The identification variable is determined as follows:

$$\text{IDCONC} = \text{IPER} * 100000 + \text{IGRP} * 1000 + \text{IREC}$$

where: IPER = the hour number for the year corresponding to the concentration value  
IGRP = the source group number (the order in which the group was defined on the SO pathway)  
IREC = the receptor number (the order in which the receptor was defined on the RE pathway)

### **C.6 Maximum values by rank (RANKFILE option)**

The OU RANKFILE card for the AERMOD model allows the user the option of creating output files of the maximum concentration values by rank, suitable for generating Q-Q or quantile plots. The data contained in the RANKFILE output is based on the MAXTABLE arrays, except that only one occurrence per data period is included. The formatted data files generated by the RANKFILE include several lines of header information, each identified with an asterisk (\*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period included in the file, and the number of ranked values included. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the rank, concentration value, X and Y coordinates of the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, and the source group ID. Each RANKFILE includes results for all of the source groups for a particular averaging period. Since the RANKFILE only include one occurrence per data period, the file may not include the number of ranked values requested, especially for evaluation data bases of limited duration. The following example identifies the contents of the RANKFILE:

```

* AERMOD ( 15181): A Simple Example Problem for the AERMOD-PRIME Model                                06/09/16
* AERMET ( 15181):                                                                                                      17:11:08
* MODELING OPTIONS USED:  NonDEFAULT CONC          FLAT          RURAL

### C.7 Arc-maximum values for evaluation (EVALFIL option)

The OU EVALFILE card for the AERMOD model allows the user the option of creating output files of the arc-maximum concentration values for individual sources suitable for use in model evaluation studies. The data contained in the EVALFILE output is based on the maximum value along arcs of receptors, identified using the RE EVALCART card. Receptors may be grouped on arcs based on their distance from the source, or other logical grouping. The formatted EVALFILE output includes five records of information for each selected source and each hour of meteorological data. The information provided is as follows:

1. Source ID (12 characters)
2. Date (YYMMDDHH)
3. Arc ID (eight characters)
4. Arc maximum P/Q
5. Emission rate for arc maximum (including unit conversions)
6. Crosswind integrated concentration based on true centerline concentration
7. Normalized non-dimensional crosswind integrated concentration
8. Downwind distance corresponding to arc maximum (m)
9. Effective wind speed corresponding to arc maximum (m/s)
10. Effective  $F_v$  corresponding to arc maximum (m/s)
11. Effective  $F_w$  corresponding to arc maximum (m/s)
12.  $F_y$  corresponding to arc maximum (m)
13. Effective plume height corresponding to arc maximum (m)
14. Monin-Obukhov length for current hour (m)

15. Mixing height for current hour (m)
16. Surface friction velocity for current hour (m/s)
17. Convective velocity scale for current hour if unstable (m/s) or  $F_z$  for current hour if stable
18. Buoyancy flux for current hour ( $m^4/s^3$ )
19. Momentum flux for current hour ( $m^4/s^2$ )
20. Bowen ratio for current hour
21. Plume penetration factor for current hour
22. Centerline P/Q for direct plume
23. Centerline P/Q for indirect plume
24. Centerline P/Q for penetrated plume
25. Nondimensional downwind distance
26. Plume height/mixing height ratio
27. Non-dimensional buoyancy flux
28. Source release height (m)
29. Arc centerline P/Q
30. Developmental option settings place holder (string of 10 zeroes)
31. Flow vector for current hour (degrees)
32. Effective height for stable plume reflections (m)

The following Fortran WRITE and FORMAT statements are used to write the results to the EVALFILE output:

```

      WRITE( IELUNT( ISRC ), 9000 ) SRCID( ISRC ), KURDAT, ARCID( I ),
&                                ARCMAX( I ), QMAX( I ), CWIC, CWICN,
&                                DXMAX( I ), UOUT, SVMAX( I ),
&                                SWMAX( I ), SYOUT, HEMAX( I ),
&                                OBUOUT, ZI, USTAR, PWSTAR, FB, FM,
&                                BOWEN, PPF, CHIDML( I ), CHINML( I ), CHI3ML( I ),
&                                XNDIM, HEOZI, FSTAR, AHS( ISRC ), ARCCL( I ),
&                                AFV, HSBLMX( I )

9000  FORMAT( 1X, A12, 1X, I8.8, 1X, A8, 4( 1X, G12.6 ),
&          9X, 6( 1X, G12.4 ), 9X, 6( 1X, G12.4 ),
&          9X, 6( 1X, G12.4 ), 9X, 4( 1X, G12.4 ), 1X, '0000000000',
&          1X, G12.4, 1X, G12.4 )

```

## C.8 Results by season and hour-of-day (SEASONHR option)

The SEASONHR option is used to output a file containing the average results by season and hour-of-day. The formatted data files generated by the SEASONHR option include several lines of header information, each identified with an asterisk (\*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the source group included in the file, and the number of receptors. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the average concentration value, receptor terrain elevation, hill height scale, flagpole receptor height, source group ID, number of non-calm and non-missing hours used to calculate the season-by-hour-of-day averages (the NHRS column), season index (the SEAS column with 1 for winter, 2 for spring, 3 for summer, and 4 for fall), the hour-of-day for the concentration value, and the receptor network ID. A sample from a SEASONHR output file is shown below:

```

## C.9 Source group contribution for ranked averaged maximum daily values (MAXDCONT)

The OU MAXDCONT card of the AERMOD model allows the user to create output files that provide source contributions for the 24-hour PM<sub>2.5</sub>, 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> standards in which the design value is based on averages of ranked values across multiple years. Ranked concentrations and source contributions are based on a target source group specified by the user. The user can define the ranks to include or a range of ranks and an optional minimum threshold concentration value. The MAXDCONT output file includes several lines of header information, each identified with an asterisk (\*) in column one, including: the model name and version number, the first line of the title information, the list of modeling option keywords, the highest rank specified, the averaging period, target source group, and threshold value if applicable. The header also includes the total number of receptors and source groups and the Fortran format statement used to write the data records. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for the target source group at the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, averaging period, the source group ID, rank, receptor network ID, and the source contribution for each source modeled. The data records are grouped by rank in ascending order. Concentrations are displayed for all receptors for the highest rank, then the next highest rank, etc. The following example is a partial MAXDCONT file with a minimum threshold value of 35 µg/m<sup>3</sup> was specified for ranks 1 through 50. Results for the first two ranks are displayed for four the source groups that were modeled.

```

### **C.10 Daily maximum 1-hour values (MAXDAILY)**

The OU MAXDAILY card of the AERMOD model generates a file of daily maximum 1-hour concentrations for a specified source group, useful for analyzing the 1-hour NO<sub>2</sub> and SO<sub>2</sub> NAAQS. The MAXDAILY file includes several lines of header information, each identified with an asterisk (\*) in column one, including: the model name and version number, the first line of the title information, the list of modeling option keywords, and the source group. The header also includes the total number of receptors and the Fortran format statement used to write the data records. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for the target source group at the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, averaging period, the source group ID, day of the year, hour, date, and receptor network ID. The following example is a sample from a MAXDAILY output file.

```

* AERMOD ( 15181): AERMOD OLM/OLMGROUP ALL Test Case, with BACKGROUND                                07/30/15

### **C.11 Maximum daily 1-hour concentration by year (MAXDYBYR)**

The OU MAXDYBYR card of the AERMOD model generates a file with a summary of daily maximum 1-hour concentrations by year for each rank specified on the RECTABLE keyword for a specified source group. This is another output file type that is applicable to the 1-hour NO<sub>2</sub> and 1-hour SO<sub>2</sub> NAAQS. The ranks included in the MXDYBYR file are the ranks used in the MAXDCONT postprocessing option. The MAXDYBYR file includes several lines of header information, each identified with an asterisk (\*) in column one, including: the model name and version number, the first line of the title information, the list of modeling option keywords, and the source group. The header also includes the total number of receptors and the Fortran format statement used to write the data records. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for the target source group at the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, rank, the source group ID, day of the year, hour, date, and receptor network ID. The data records are grouped by rank in ascending order. Concentrations are displayed for all receptors for the highest rank, then the next highest rank, etc. The following example is a sample from a MAXDAILY output file for which ranks 4, 8 12, and 50 were specified on the MAXDCONT keyword.

**APPENDIX D. Overview of AERMOD revisions in version 24142**

Model Change Bulletin (MCB) 18  
 AERMOD version 24142 (May 21, 2024)

Changes are listed by type and with each change are the affected pollutants and source types:

**Bug Fixes**

Item	Modification	Pollutants	Source Types
1	Corrected a bug in subroutine PLUME_CONCENTRATION that was causing mixing height to be potentially reset each time the subroutine was called.	ALL	RLINE, RLINEXT
2	Corrected 2-digit year conversion for year 2000 when meteorological data crosses from 1999 to 2000.	ALL	ALL
3	Corrected bug in which EMISUNIT keyword was not working with the BUOYLINE source type. EMISUNIT keyword was ignored.	ALL	BUOYLINE
4	GRSM PLUMESIZES and DoGRSMChem code modified to prevent not-a-number (NaNs) concentration values for ground releases from volume, area, and openpit source types.	NO2	ALL

**Enhancements**

Item	Modification	Pollutants	Source Types
1	Updated the warning message for 24-hour average to state the date and time information when less than 18 hours of data are used in the average.	ALL	ALL
2	Add warning messages for 3- and 8-hour averages. Warning issued if less than 6 hours used to compute 8-hour average or less than 3 hours used to compute 3-hour average.	ALL	ALL

**Formulation updates – Regulatory**

<b>Item</b>	<b>Modification</b>	<b>Pollutants</b>	<b>Source Types</b>
1	Remove BETA flag restriction for RLINE source type. RLINE promulgated as a regulatory option in 2024 update to the <i>Guideline</i> (40 CFR Part51, Appendix W).	ALL	RLINE
2	Remove BETA flag restriction for GRSM NO2 conversion option. GRSM promulgated as a regulatory option in 2024 update to the <i>Guideline</i> (40 CFR Part51, Appendix W).	ALL	ALL
3	Remove BETA flag restriction for COARE processing of overwater meteorology in AERMET. COARE in AERMET promulgated as a regulatory option in 2024 update to the <i>Guideline</i> (40 CFR Part51, Appendix W).	ALL	ALL

**Formulation updates – BETA**

None

**Formulation updates – ALPHA**

None

## APPENDIX E. Glossary

AERMAP -- AMS/EPA Regulatory Model (AERMOD) Terrain Preprocessor. AERMET -- AMS/EPA Regulatory Model (AERMOD) Meteorological Preprocessor. AERMOD -- AMS/EPA Regulatory Model.

ASCII -- American Standard Code for Information Interchange, a standard set of codes used by computers and communication devices. Sometimes used to refer to files containing only such standard codes, without any application-specific codes such as might be present in a document file from a word processor program.

Card -- A single input record within the input control file.

CO -- **C**ontrol, the 2-character pathway ID for input control file commands used to specify overall job control options.

CO Pathway -- Collective term for the group of input control file commands used to specify the overall job control options, including titles, dispersion options, terrain options, etc.

Directory -- A logical subdivision of a disk used to organize files stored on a disk.

Dispersion Model -- A group of related mathematical algorithms used to estimate (model) the dispersion of pollutants in the atmosphere due to transport by the mean (average) wind and small scale turbulence.

DOS -- Disk Operating System. Software that manages applications software and provides an interface between applications and the system hardware components, such as the disk drive, terminal, and keyboard.

Echo of inputs -- By default, the AERMOD model will echo the input control file commands, character by character, into the main printed output file. This serves as a record of the inputs as originally entered by the user, without any rounding of the numerical values. The echoing can be suppressed with the NO ECHO option.

EOF -- End-of-File.

EPA -- U. S. Environmental Protection Agency.

Error message -- A message written by the model to the error/message file whenever an error is encountered that will inhibit data processing.

Error/Message File -- A file used for storage of messages written by the model.

EV -- **E**Vent, the 2-character pathway ID for input control file commands used to specify event inputs for the Short-Term EVENT model.

EV Pathway -- Collective term for the group of input control file commands used to specify the event periods and location for the Short-Term EVENT model.

EVENT Processing -- An option in the AERMOD model specifically designed to provide source contribution (culpability) information for specific events of interest, e.g., design values or threshold violations.

Extended Memory -- Additional memory on 80386 and 80486 PCs that allows programs to address memory beyond the 640 KB limit of DOS. Special software is required to utilize this extra memory.

Fatal Error -- Any error which inhibits further processing of data by the model. Model continues to read input images to check for errors during setup and will continue to read input meteorological data during calculation phase.

Flow Vector -- The direction towards which the wind is blowing. GMT  
-- Greenwich Mean Time, the time at the 0° meridian.

Informational Message -- Any message written to the error/message file that may be of interest to the user, but which have no direct bearing on the validity of the results, and do not affect processing.

Input Image -- User supplied input, read through the default input device, controlling the model options and data input. A single card or record from the input control file. Each input image consists of a pathway ID (may be blank indicating a continuation of the previous pathway), a keyword (may also be blank for continuation of a keyword), and possibly one or more parameter fields.

Input control file -- The basic input file to the AERMOD model controlling the modeling options, source data, receptor locations, meteorological data file specifications, and output options. Consists of a series of input images grouped into functional pathways.

Julian Day -- The number of the day in the year, i.e., Julian Day = 1 for January 1 and 365 (or 366 for leap years) for December 31.

KB -- Kilobyte, 1000 bytes, a unit of storage on a disk

Keyword -- The 8-character codes that follow immediately after the pathway ID in the input run stream data.

LST -- Local Standard Time.

Math Co-processor -- A computer chip used to speed up floating point arithmetic in a personal computer.

MB -- Megabyte, one million bytes, a unit of storage on a disk

ME -- **ME**eteorology, the 2-character pathway ID for input control file commands used to specify meteorological data options

ME Pathway -- Collective term for the group of input control file commands used to specify the input meteorological data file and other meteorological variables, including the period to process from the meteorological file for the AERMOD model.

Meteorological Data File -- Any file containing meteorological data, whether it be mixing heights, surface observations or on-site data.

Missing Value -- Alphanumeric character(s) that represent breaks in the temporal or spatial record of an atmospheric variable.

Mixing Height -- The depth through which atmospheric pollutants are typically mixed by dispersive processes.

NCDC -- National Climatic Data Center, the federal agency responsible for distribution of the National Weather Service upper air, mixing height and surface observation data.

NO ECHO -- Option to suppress echoing of the control file commands to the main printed output file.

NWS -- National Weather Service.

On-site Data -- Data collected from a meteorological measurement program operated in the vicinity of the site to be modeled in the dispersion analysis.

OU -- **OU**tput, the 2-character pathway ID for input control file commands used to specify output options.

OU Pathway -- Collective term for the group of input control file commands used to specify the output options for a particular run.

Overlay -- One or more subprograms that reside on disk and are loaded into memory only when needed.

Pasquill Stability Categories -- A classification of the dispersive capacity of the atmosphere, originally defined using surface wind speed, solar insolation (daytime) and cloudiness (nighttime). They have since been reinterpreted using various other meteorological variables.

Pathway -- One of the six major functional divisions in the input control file for the AERMOD model. These are **C**ontrol, **S**ource, **R**eceptor, **M**eteorology, **E**vent, and **O**utput (see these entries in this section for a description).

PC -- Personal Computer, a wide-ranging class of computers designed for personal use, typically small enough to fit on a desktop.

Quality Assessment -- Judgment of the quality of the data.

Quality Assessment Check -- Determining if the reported value of a variable is reasonable (see also Range Check).

Quality Assessment Message -- Message written to the error/message file when a data value is determined to be suspect.

Quality Assessment Violation -- Occurrences when data values are determined to be suspect (see also Range Check Violation).

RAM -- Random Access Memory on a personal computer.

RAMMET -- Meteorological processor program used for regulatory applications capable of processing twice-daily mixing heights and hourly surface weather observations for use in dispersion models such as AERMOD, CRSTER, MPTER and RAM.

Range Check -- Determining if a variable falls within predefined upper and lower bounds.

Range Check Violation -- Determination that the value of a variable is outside range defined by upper and lower bound values (see also Quality Assessment Violation).

RE -- **RE**ceptor, the 2-character pathway ID for input control file commands used to specify receptor locations.

RE Pathway -- Collective term for the group of input control file commands used to specify the receptor locations for a particular run.

Regulatory Applications -- Dispersion modeling involving regulatory decision-making as described in the Guideline on Air Quality Models, which is published as Appendix W of 40 CFR Part 51 (as revised).

Regulatory Model -- A dispersion model that has been approved for use by the regulatory offices of the EPA, specifically one that is included in Appendix A of the Guideline on Air Quality Models, (as revised), such as the AERMOD model.

R-LINE -- Research LINE-source dispersion model for near surface releases.

Control file -- Collectively, all input images required to process input options and input data for the AERMOD model.

SCRAM -- Support Center for Regulatory Air Models - part of EPA's website on the internet, used by EPA for disseminating air quality dispersion models, modeling guidance, and related information.

Secondary Keyword -- A descriptive alphabetical keyword used as a parameter for one of the main control file keywords to specify a particular option.

SO -- **SO**urce, the 2-character pathway ID for input control file commands used to specify input source parameters and source groups.

SO Pathway -- Collective term for the group of input control file commands used to specify the source input parameters and source group information.

Station Identification -- An integer or character string used to uniquely identify a station or site as provided in the upper air, mixing height, and surface weather data formats available from NCDC. There are no standard station numbers for on-site data or card image/screening data, and the user may include any integer string

Subdirectory -- A directory below the root, or highest level, directory or another subdirectory, used for organization of files on a storage medium such as a PC hard disk.

Surface Weather Observations -- A collection of atmospheric data on the state of the atmosphere as observed from the earth's surface. In the U.S. the National Weather Service collect these data on a regular basis at selected locations.

Surface Roughness Length -- Height at which the wind speed extrapolated from a near-surface wind speed profile becomes zero.

Syntax -- The order, structure and arrangement of the inputs that make of the input control file, specifically, the rules governing the placement of the various input elements including pathway IDs, keywords, and parameters.

Unformatted File -- A file written without the use of a FORTRAN FORMAT statement, sometimes referred to as a binary file.

Upper Air Data (or soundings) -- Meteorological data obtained from balloon- borne instrumentation that provides information on pressure, temperature, humidity, and wind away from the surface of the earth.

Vertical Potential Temperature Gradient -- The change of potential temperature with height, used in modeling the plume rise through a stable layer, and indicates the strength of the stable temperature inversion. A positive value means that potential temperature increases with height above ground and indicates a stable atmosphere.

Warning Message -- A message written by the model to the error/message file whenever a problem arises that may reflect an erroneous condition but does not inhibit further processing.

# IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

## Location

Alameda County, California

## Local office

Sacramento Fish And Wildlife Office

☎ (916) 414-6600

📅 (916) 414-6713

Federal Building  
2800 Cottage Way, Room W-2605  
Sacramento, CA 95825-1846

# Endangered species

**This resource list is for informational purposes only and does not constitute an analysis of project level impacts.**

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species<sup>1</sup> and their critical habitats are managed by the [Ecological Services Program](#) of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries<sup>2</sup>).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact [NOAA Fisheries](#) for [species under their jurisdiction](#).

1. Species listed under the [Endangered Species Act](#) are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the [listing status page](#) for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

## Mammals

NAME	STATUS
Salt Marsh Harvest Mouse <i>Reithrodontomys raviventris</i> Wherever found No critical habitat has been designated for this species. <a href="https://ecos.fws.gov/ecp/species/613">https://ecos.fws.gov/ecp/species/613</a>	Endangered

## Birds

NAME	STATUS
California Least Tern <i>Sternula antillarum browni</i> Wherever found No critical habitat has been designated for this species. <a href="https://ecos.fws.gov/ecp/species/8104">https://ecos.fws.gov/ecp/species/8104</a>	Endangered
California Ridgway's Rail <i>Rallus obsoletus obsoletus</i> Wherever found No critical habitat has been designated for this species. <a href="https://ecos.fws.gov/ecp/species/4240">https://ecos.fws.gov/ecp/species/4240</a>	Endangered
Western Snowy Plover <i>Charadrius nivosus nivosus</i> There is <b>final</b> critical habitat for this species. Your location does not overlap the critical habitat. <a href="https://ecos.fws.gov/ecp/species/8035">https://ecos.fws.gov/ecp/species/8035</a>	Threatened

## Reptiles

NAME	STATUS
Alameda Whipsnake (=striped Racer) <i>Masticophis lateralis euryxanthus</i> Wherever found There is <b>final</b> critical habitat for this species. Your location does not overlap the critical habitat. <a href="https://ecos.fws.gov/ecp/species/5524">https://ecos.fws.gov/ecp/species/5524</a>	Threatened
Northwestern Pond Turtle <i>Actinemys marmorata</i> Wherever found No critical habitat has been designated for this species. <a href="https://ecos.fws.gov/ecp/species/1111">https://ecos.fws.gov/ecp/species/1111</a>	Proposed Threatened

## Amphibians

NAME	STATUS
------	--------

California Red-legged Frog *Rana draytonii*

Threatened

Wherever found

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.

<https://ecos.fws.gov/ecp/species/2891>

Foothill Yellow-legged Frog *Rana boylei*

Threatened

No critical habitat has been designated for this species.

<https://ecos.fws.gov/ecp/species/5133>

## Fishes

NAME

STATUS

Tidewater Goby *Eucyclogobius newberryi*

Endangered

Wherever found

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.

<https://ecos.fws.gov/ecp/species/57>

## Insects

NAME

STATUS

Monarch Butterfly *Danaus plexippus*

Candidate

Wherever found

No critical habitat has been designated for this species.

<https://ecos.fws.gov/ecp/species/9743>

## Crustaceans

NAME

STATUS

Vernal Pool Fairy Shrimp *Branchinecta lynchi*

Threatened

Wherever found

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.

<https://ecos.fws.gov/ecp/species/498>

## Flowering Plants

NAME

STATUS

Pallid Manzanita *Arctostaphylos pallida*

Threatened

Wherever found

No critical habitat has been designated for this species.

<https://ecos.fws.gov/ecp/species/8292>

Presidio Clarkia *Clarkia franciscana*

Endangered

Wherever found

No critical habitat has been designated for this species.

<https://ecos.fws.gov/ecp/species/3890>

Robust Spineflower *Chorizanthe robusta* var. *robusta*

Endangered

Wherever found

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.

<https://ecos.fws.gov/ecp/species/9287>

## Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

## Bald & Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act<sup>1</sup> and the Migratory Bird Treaty Act<sup>2</sup>.

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats<sup>3</sup>, should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "[Supplemental Information on Migratory Birds and Eagles](#)".

Additional information can be found using the following links:

- Eagle Management <https://www.fws.gov/program/eagle-management>
- Measures for avoiding and minimizing impacts to birds  
<https://www.fws.gov/library/collections/avoiding-and-minimizing-incident-take-migratory-birds>
- Nationwide conservation measures for birds  
<https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf>
- Supplemental Information for Migratory Birds and Eagles in IPaC  
<https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action>

There are likely bald eagles present in your project area. For additional information on bald eagles, refer to [Bald Eagle Nesting and Sensitivity to Human Activity](#).

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
<b>Bald Eagle</b> <i>Haliaeetus leucocephalus</i>	Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

<b>Golden Eagle</b> <i>Aquila chrysaetos</i>	Breeds Jan 1 to Aug 31
--	------------------------

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

<https://ecos.fws.gov/ecp/species/1680>

## Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "[Supplemental Information on Migratory Birds and Eagles](#)", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

### Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is  $0.25/0.25 = 1$ ; at week 20 it is  $0.05/0.25 = 0.2$ .

3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

### Breeding Season (■)

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

### Survey Effort (|)

Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

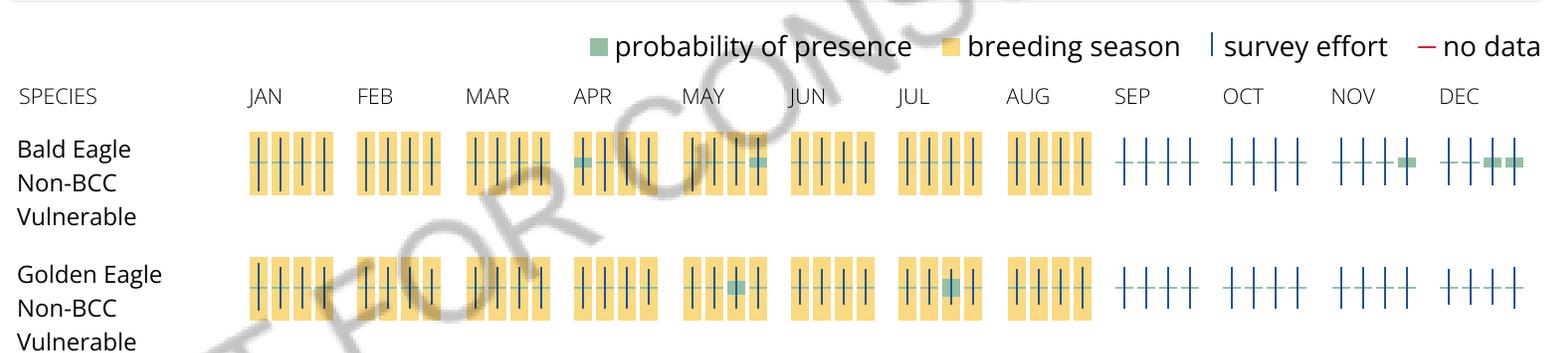

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

### No Data (—)

A week is marked as having no data if there were no survey events for that week.

### Survey Timeframe

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

### What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the [Avian Knowledge Network \(AKN\)](#). The AKN data is based on a growing collection of [survey, banding, and citizen science datasets](#) and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle ([Eagle Act](#) requirements may apply). To see a list of all birds potentially present in your project area, please visit the [Rapid Avian Information Locator \(RAIL\) Tool](#).

### What does IPaC use to generate the probability of presence graphs of bald and golden eagles in my specified location?

The Migratory Bird Resource List is comprised of USFWS [Birds of Conservation Concern \(BCC\)](#) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the [Avian Knowledge Network \(AKN\)](#). The AKN data is based on a growing collection of [survey, banding, and citizen science datasets](#) and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects,

and that have been identified as warranting special attention because they are a BCC species in that area, an eagle ([Eagle Act](#) requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the [Rapid Avian Information Locator \(RAIL\) Tool](#).

### What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the [Eagle Act](#) should such impacts occur. Please contact your local Fish and Wildlife Service Field Office if you have questions.

## Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act<sup>1</sup> and the Bald and Golden Eagle Protection Act<sup>2</sup>.

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats<sup>3</sup> should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "[Supplemental Information on Migratory Birds and Eagles](#)".

1. The [Migratory Birds Treaty Act](#) of 1918.
2. The [Bald and Golden Eagle Protection Act](#) of 1940.

Additional information can be found using the following links:

- Eagle Management <https://www.fws.gov/program/eagle-management>
- Measures for avoiding and minimizing impacts to birds <https://www.fws.gov/library/collections/avoiding-and-minimizing-incident-take-migratory-birds>
- Nationwide conservation measures for birds <https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf>
- Supplemental Information for Migratory Birds and Eagles in IPaC <https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action>

The birds listed below are birds of particular concern either because they occur on the [USFWS Birds of Conservation Concern](#) (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ [below](#). This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the [E-bird data mapping tool](#) (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found [below](#).

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
<b>Allen's Hummingbird</b> <i>Selasphorus sasin</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/9637">https://ecos.fws.gov/ecp/species/9637</a>	Breeds Feb 1 to Jul 15
<b>Bald Eagle</b> <i>Haliaeetus leucocephalus</i> This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
<b>Belding's Savannah Sparrow</b> <i>Passerculus sandwichensis beldingi</i> This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA <a href="https://ecos.fws.gov/ecp/species/8">https://ecos.fws.gov/ecp/species/8</a>	Breeds Apr 1 to Aug 15
<b>Black Oystercatcher</b> <i>Haematopus bachmani</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/9591">https://ecos.fws.gov/ecp/species/9591</a>	Breeds Apr 15 to Oct 31
<b>Black Skimmer</b> <i>Rynchops niger</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/5234">https://ecos.fws.gov/ecp/species/5234</a>	Breeds May 20 to Sep 15
<b>Black Turnstone</b> <i>Arenaria melanocephala</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
<b>Brandt's Cormorant</b> <i>Urile penicillatus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Apr 15 to Sep 15
<b>Bullock's Oriole</b> <i>Icterus bullockii</i> This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Mar 21 to Jul 25
<b>California Gull</b> <i>Larus californicus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 1 to Jul 31

<p><b>California Thrasher</b> <i>Toxostoma redivivum</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.</p>	<p>Breeds Jan 1 to Jul 31</p>
<p><b>Clark's Grebe</b> <i>Aechmophorus clarkii</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.</p>	<p>Breeds Jun 1 to Aug 31</p>
<p><b>Common Yellowthroat</b> <i>Geothlypis trichas sinuosa</i>  This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA  <a href="https://ecos.fws.gov/ecp/species/2084">https://ecos.fws.gov/ecp/species/2084</a></p>	<p>Breeds May 20 to Jul 31</p>
<p><b>Elegant Tern</b> <i>Thalasseus elegans</i>  This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA  <a href="https://ecos.fws.gov/ecp/species/8561">https://ecos.fws.gov/ecp/species/8561</a></p>	<p>Breeds Apr 5 to Aug 5</p>
<p><b>Golden Eagle</b> <i>Aquila chrysaetos</i>  This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.  <a href="https://ecos.fws.gov/ecp/species/1680">https://ecos.fws.gov/ecp/species/1680</a></p>	<p>Breeds Jan 1 to Aug 31</p>
<p><b>Gull-billed Tern</b> <i>Gelochelidon nilotica</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/9501">https://ecos.fws.gov/ecp/species/9501</a></p>	<p>Breeds May 1 to Jul 31</p>
<p><b>Heermann's Gull</b> <i>Larus heermanni</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.</p>	<p>Breeds Mar 15 to Aug 31</p>
<p><b>Lawrence's Goldfinch</b> <i>Spinus lawrencei</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/9464">https://ecos.fws.gov/ecp/species/9464</a></p>	<p>Breeds Mar 20 to Sep 20</p>
<p><b>Marbled Godwit</b> <i>Limosa fedoa</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/9481">https://ecos.fws.gov/ecp/species/9481</a></p>	<p>Breeds elsewhere</p>

<p><b>Northern Harrier</b> <i>Circus hudsonius</i>  This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA  <a href="https://ecos.fws.gov/ecp/species/8350">https://ecos.fws.gov/ecp/species/8350</a></p>	<p>Breeds Apr 1 to Sep 15</p>
<p><b>Nuttall's Woodpecker</b> <i>Dryobates nuttallii</i>  This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA  <a href="https://ecos.fws.gov/ecp/species/9410">https://ecos.fws.gov/ecp/species/9410</a></p>	<p>Breeds Apr 1 to Jul 20</p>
<p><b>Oak Titmouse</b> <i>Baeolophus inornatus</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/9656">https://ecos.fws.gov/ecp/species/9656</a></p>	<p>Breeds Mar 15 to Jul 15</p>
<p><b>Olive-sided Flycatcher</b> <i>Contopus cooperi</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/3914">https://ecos.fws.gov/ecp/species/3914</a></p>	<p>Breeds May 20 to Aug 31</p>
<p><b>Red Knot</b> <i>Calidris canutus roselaari</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/8880">https://ecos.fws.gov/ecp/species/8880</a></p>	<p>Breeds elsewhere</p>
<p><b>Santa Barbara Song Sparrow</b> <i>Melospiza melodia graminea</i>  This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA  <a href="https://ecos.fws.gov/ecp/species/5513">https://ecos.fws.gov/ecp/species/5513</a></p>	<p>Breeds Mar 1 to Sep 5</p>
<p><b>Short-billed Dowitcher</b> <i>Limnodromus griseus</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/9480">https://ecos.fws.gov/ecp/species/9480</a></p>	<p>Breeds elsewhere</p>
<p><b>Tricolored Blackbird</b> <i>Agelaius tricolor</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/3910">https://ecos.fws.gov/ecp/species/3910</a></p>	<p>Breeds Mar 15 to Aug 10</p>
<p><b>Western Grebe</b> <i>aechmophorus occidentalis</i>  This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.  <a href="https://ecos.fws.gov/ecp/species/6743">https://ecos.fws.gov/ecp/species/6743</a></p>	<p>Breeds Jun 1 to Aug 31</p>

**Western Gull** *Larus occidentalis*

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Breeds Apr 21 to Aug 25

**Western Screech-owl** *Megascops kennicottii cardonensis*

This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Breeds Mar 1 to Jun 30

**Willet** *Tringa semipalmata*

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Breeds elsewhere

**Wrentit** *Chamaea fasciata*

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Breeds Mar 15 to Aug 10

**Yellow-billed Magpie** *Pica nuttalli*

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Breeds Apr 1 to Jul 31

<https://ecos.fws.gov/ecp/species/9726>

## Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "[Supplemental Information on Migratory Birds and Eagles](#)", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

### Probability of Presence (■)

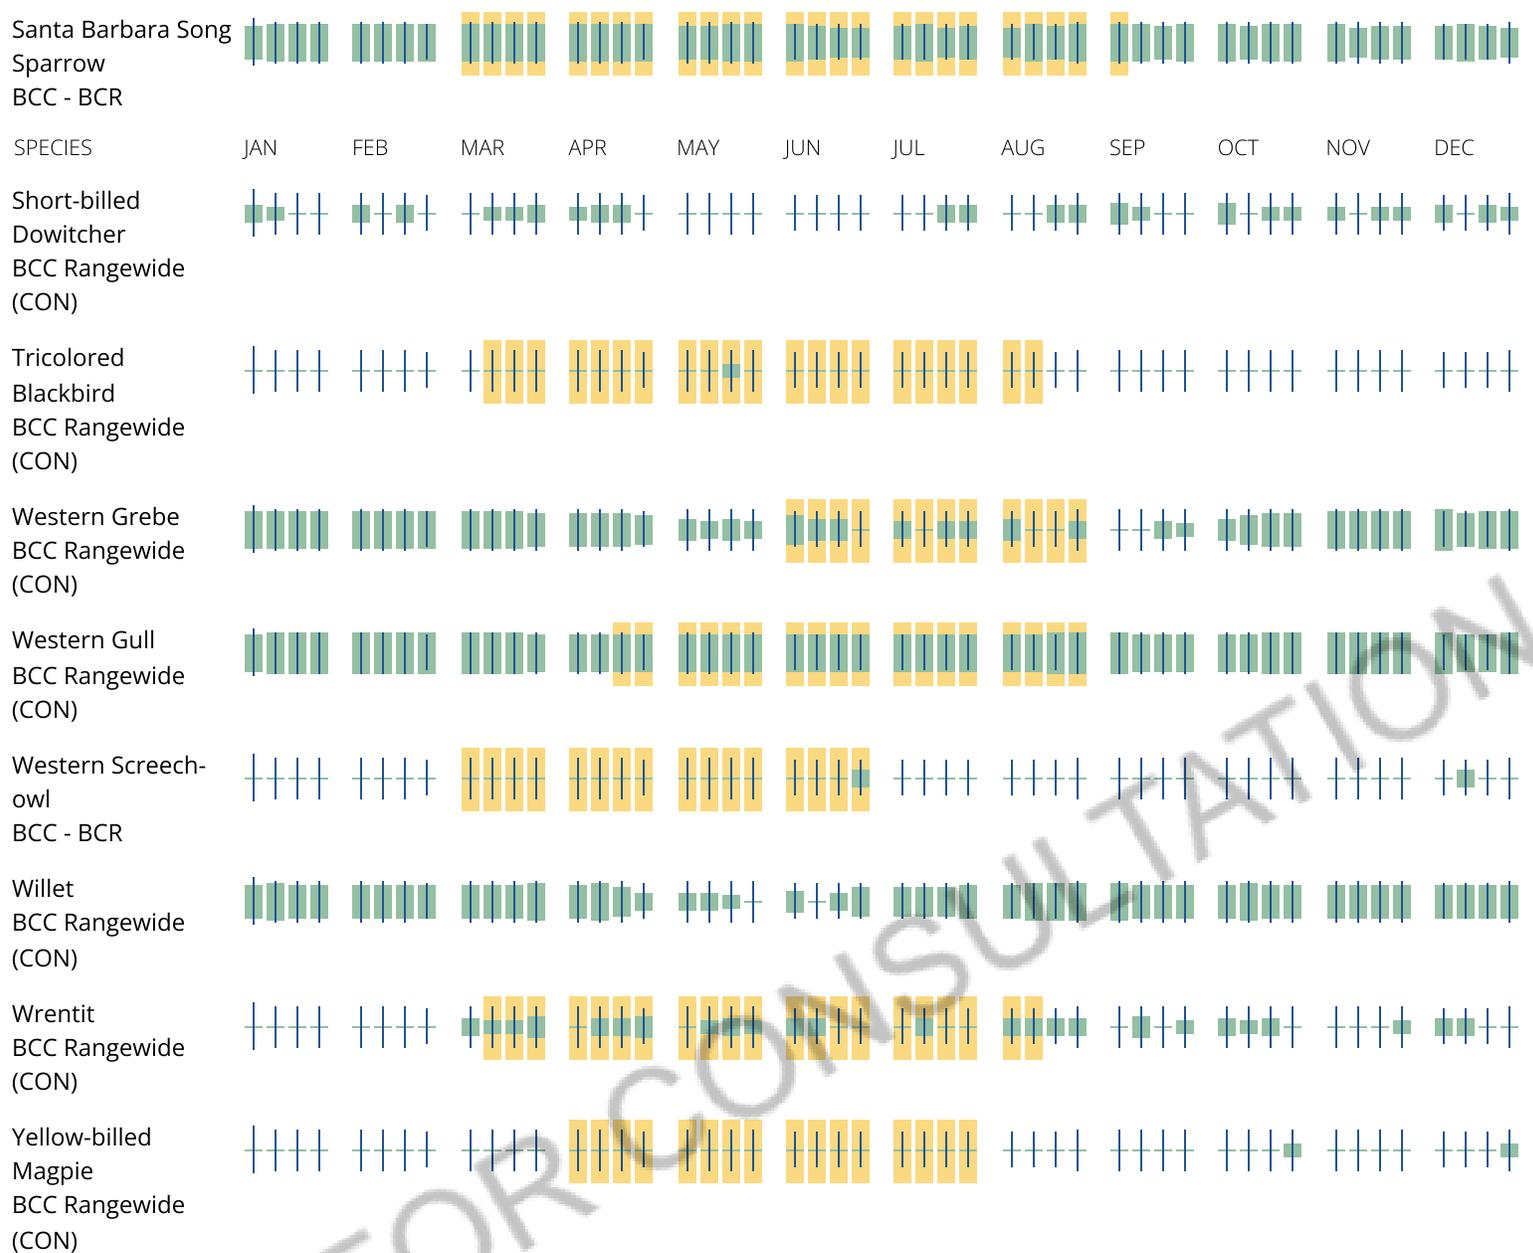

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week

**Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.**

[Nationwide Conservation Measures](#) describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. [Additional measures](#) or [permits](#) may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

**What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?**

The Migratory Bird Resource List is comprised of USFWS [Birds of Conservation Concern \(BCC\)](#) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the [Avian Knowledge Network \(AKN\)](#). The AKN data is based on a growing collection of [survey, banding, and citizen science datasets](#) and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects,

and that have been identified as warranting special attention because they are a BCC species in that area, an eagle ([Eagle Act](#) requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the [Rapid Avian Information Locator \(RAIL\) Tool](#).

### **What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?**

The probability of presence graphs associated with your migratory bird list are based on data provided by the [Avian Knowledge Network \(AKN\)](#). This data is derived from a growing collection of [survey, banding, and citizen science datasets](#).

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go to the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

### **How do I know if a bird is breeding, wintering or migrating in my area?**

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the [RAIL Tool](#) and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

### **What are the levels of concern for migratory birds?**

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are [Birds of Conservation Concern](#) (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the [Eagle Act](#) requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

### **Details about birds that are potentially affected by offshore projects**

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the [Northeast Ocean Data Portal](#). The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review.

Alternately, you may download the bird model results files underlying the portal maps through the [NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf](#) project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the [Diving Bird Study](#) and the [nanotag studies](#) or contact [Caleb Spiegel](#) or [Pam Loring](#).

### What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to [obtain a permit](#) to avoid violating the Eagle Act should such impacts occur.

### Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

## Facilities

### National Wildlife Refuge lands

Any activity proposed on lands managed by the [National Wildlife Refuge](#) system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

### Fish hatcheries

There are no fish hatcheries at this location.

# Wetlands in the National Wetlands Inventory (NWI)

Impacts to [NWI wetlands](#) and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local [U.S. Army Corps of Engineers District](#).

This location did not intersect any wetlands mapped by NWI.

**NOTE:** This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

## Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

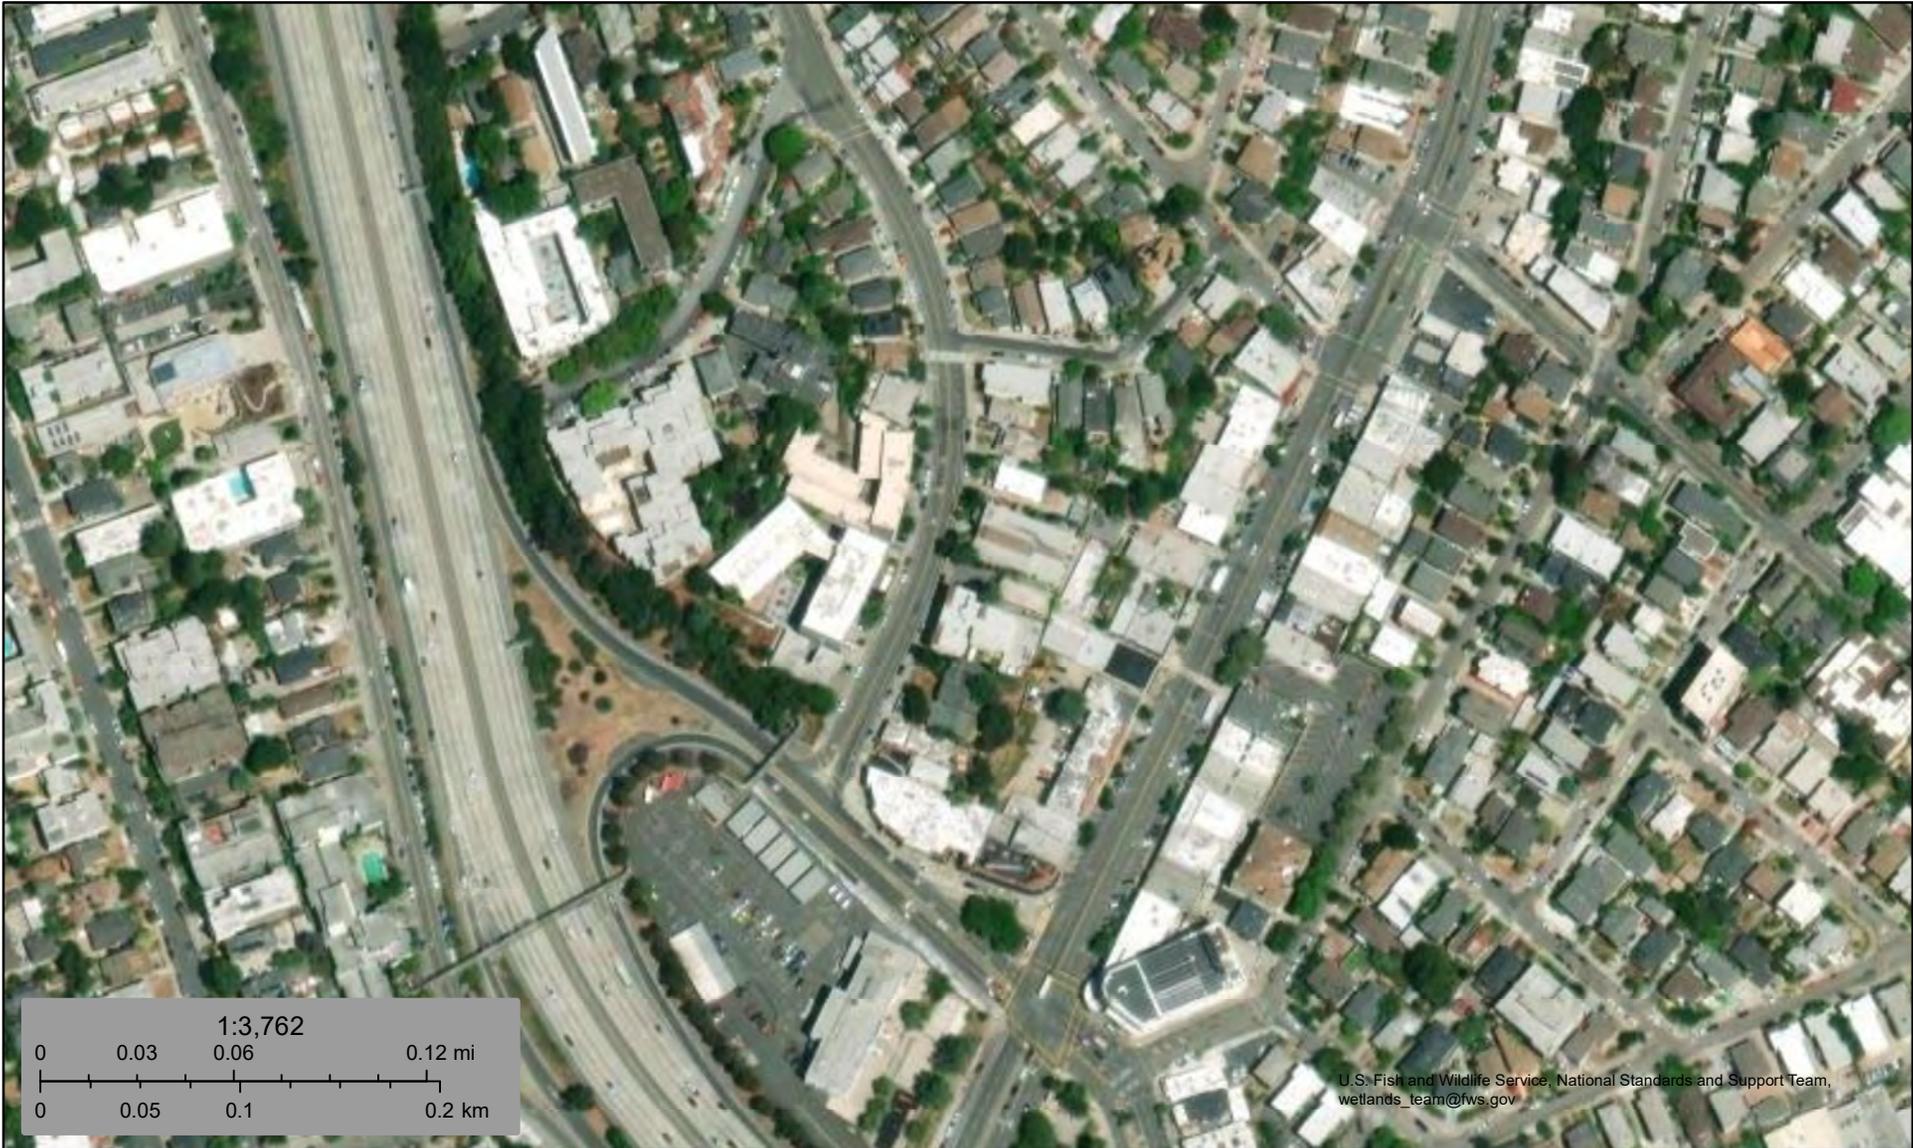

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

## Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tubercid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

## Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

U.S. Fish and Wildlife Service, National Standards and Support Team,
