Leisch Method for Weaving Analysis

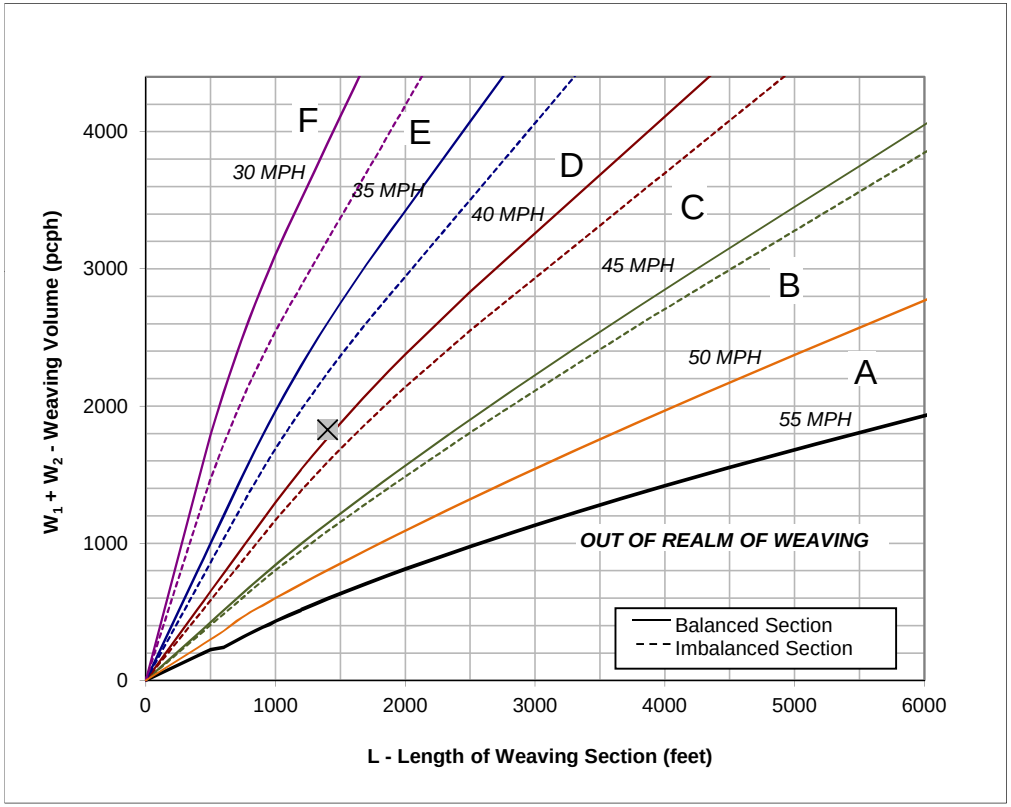
Data Input

Number of Entering Mainline Lanes	N_b	4
Number of Lanes in Weaving Section	N	5
Length of Weaving Section (feet)	L	1,400

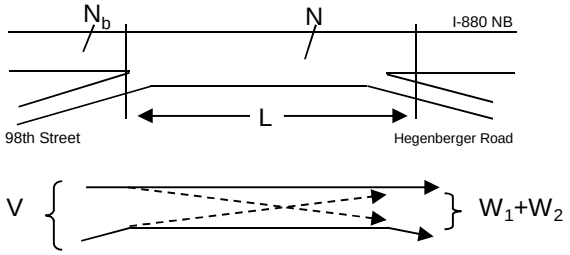
	Total Weaving Section (V)	On-ramp to Mainline (W_1)	Mainline to Off-ramp (W_2)
Volume (vph)*	7,800	760	1,050
Truck Percentage	4%	2%	2%
PCE for Trucks	1.5	1.5	1.5
Volume (pcph)	7,956	768	1,061

Project Information

Project	Coliseum City SP/EIR
Scenario	2035 PP - AM Peak
Freeway	I-880 NB
On-ramp	98th Street
Off-ramp	Hegenberger Road



Figure



Capacity Analysis

1. Is the weaving section balanced (Y / N)? **N**
   [If optional exit lane, then "Y". Otherwise "N".]
2. In the Weaving Speed Chart to the left, which two speed curves is the black "x" between?
   40 MPH and **45 MPH**
   If below the 55 MPH curve, out of the realm of weaving.
   If left of the 30 MPH curve, LOS is F.
3. Interpolated Weaving Speed (S_w, mph) **37.6**
4. Weaving Intensity Factor (k) **2.74**
5. Service Volume (SV, pcph)
   $SV = (1/N)*[V + (k - 1)*\min(W_1, W_2)]$ **1,858**
6. Level of Service (LOS) **E**

The LOS in the chart above refers to the capacity of weaving traffic only; through and ramp to ramp traffic is not included.

* Note: **Do not adjust by a Peak Hour Factor (PHF).** The methodology incorporates the PHF in the Service Volume tables.

Leisch Method for Weaving Analysis

Data Input

Number of Entering Mainline Lanes	N_b	4
Number of Lanes in Weaving Section	N	5
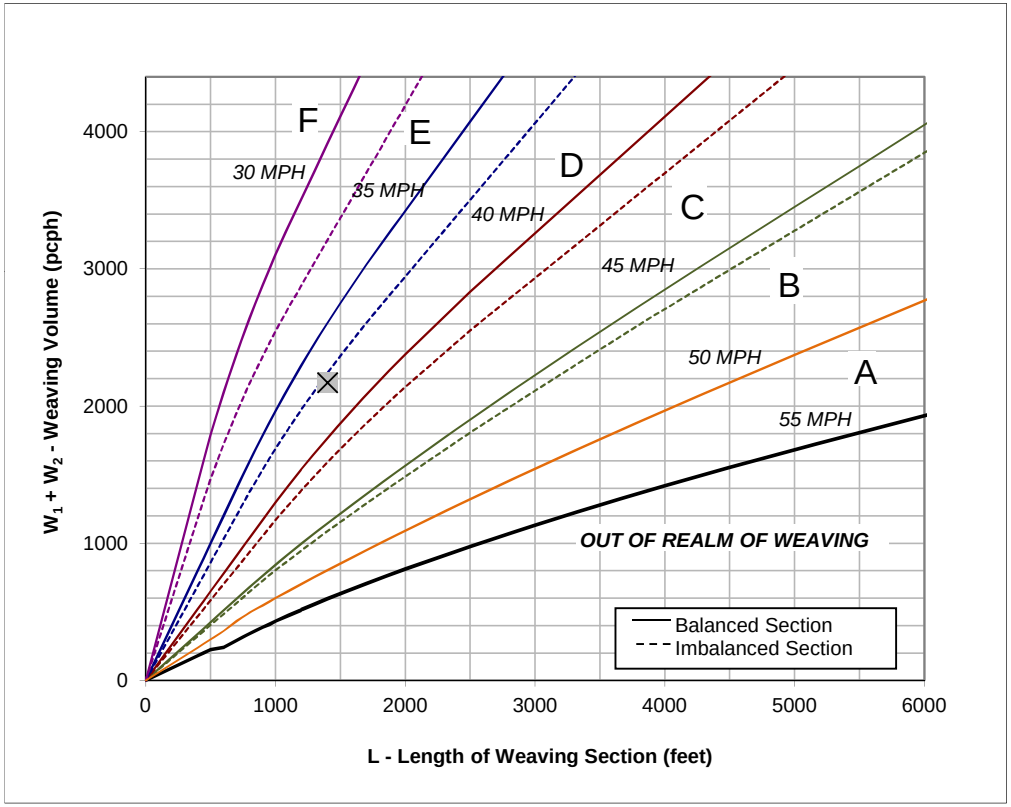
Length of Weaving Section (feet)	L	1,400

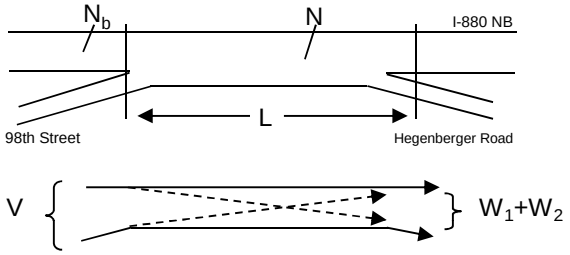
Project Information

Project	Coliseum City SP/EIR
Scenario	2035 PP - PM Peak
Freeway	I-880 NB
On-ramp	98th Street
Off-ramp	Hegenberger Road

Total Weaving Section (V)		On-ramp to Mainline (W_1)		Mainline to Off-ramp (W_2)	
Volume (vph)*	7,470	Volume (vph)*	1,130	Volume (vph)*	1,020
Truck Percentage	3%	Truck Percentage	2%	Truck Percentage	2%
PCE for Trucks	1.5	PCE for Trucks	1.5	PCE for Trucks	1.5
Volume (pcph)	7,582	Volume (pcph)	1,141	Volume (pcph)	1,030



Figure



Capacity Analysis

1. Is the weaving section balanced (Y / N)? **N**
   [If optional exit lane, then "Y". Otherwise "N".]
2. In the Weaving Speed Chart to the left, which two speed curves is the black "x" between?
   40 MPH and **45 MPH**
   If below the 55 MPH curve, out of the realm of weaving.
   If left of the 30 MPH curve, LOS is F.
3. Interpolated Weaving Speed (S_w, mph) **34.2**
4. Weaving Intensity Factor (k) **2.93**
5. Service Volume (SV, pcph)
   $SV = (1/N)*[V + (k - 1)*\min(W_1, W_2)]$ **1,914**
6. Level of Service (LOS) **F**

The LOS in the chart above refers to the capacity of weaving traffic only; through and ramp to ramp traffic is not included.

* Note: **Do not adjust by a Peak Hour Factor (PHF).** The methodology incorporates the PHF in the Service Volume tables.

Leisch Method for Weaving Analysis

Data Input

Number of Entering Mainline Lanes	N_b	4
Number of Lanes in Weaving Section	N	5
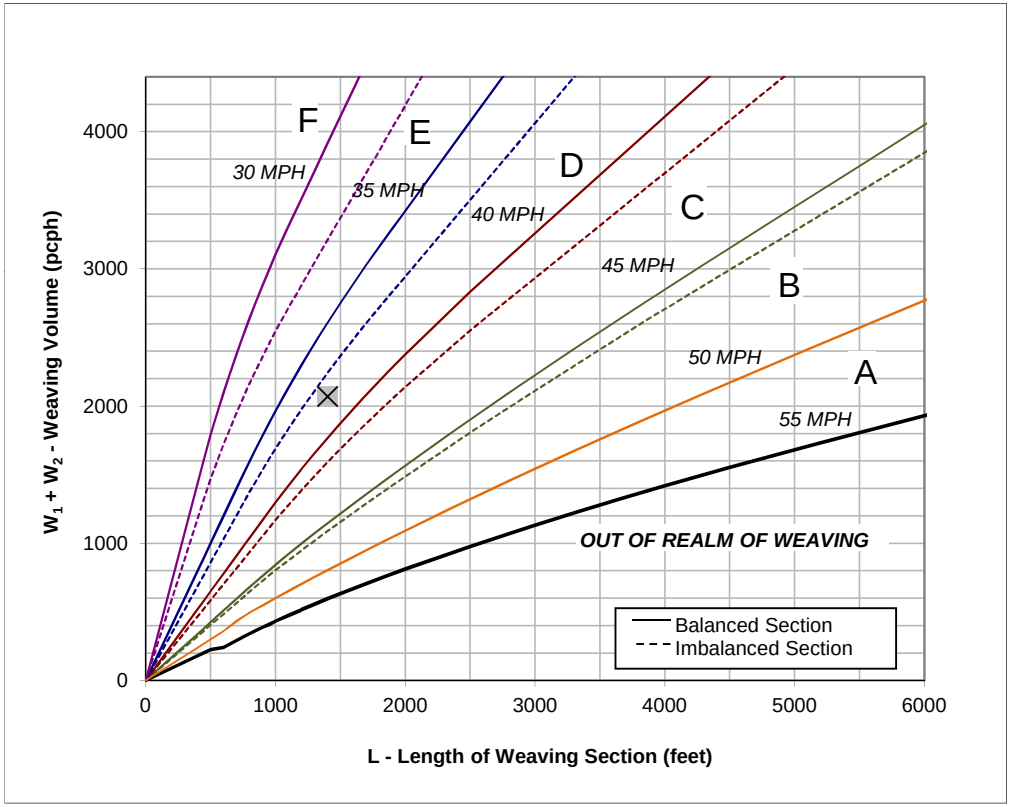
Length of Weaving Section (feet)	L	1,400

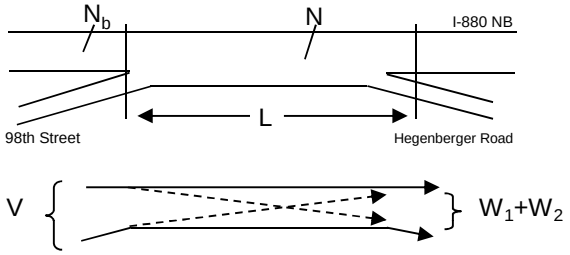
	Total Weaving Section (V)	On-ramp to Mainline (W_1)	Mainline to Off-ramp (W_2)
Volume (vph)*	8,070	790	1,260
Truck Percentage	4%	2%	2%
PCE for Trucks	1.5	1.5	1.5
Volume (pcph)	8,231	798	1,273

Project Information

Project	Coliseum City SP/EIR
Scenario	2035 BO - AM Peak
Freeway	I-880 NB
On-ramp	98th Street
Off-ramp	Hegenberger Road



Figure



Capacity Analysis

1. Is the weaving section balanced (Y / N)? **N**
   [If optional exit lane, then "Y". Otherwise "N".]
2. In the Weaving Speed Chart to the left, which two speed curves is the black "x" between?
   40 MPH and **45 MPH**
   If below the 55 MPH curve, out of the realm of weaving.
   If left of the 30 MPH curve, LOS is F.
3. Interpolated Weaving Speed (S_w, mph) **35.2**
4. Weaving Intensity Factor (k) **2.88**
5. Service Volume (SV, pcph)
   $SV = (1/N)*[V + (k - 1)*\min(W_1, W_2)]$ **1,947**
6. Level of Service (LOS) **F**

The LOS in the chart above refers to the capacity of weaving traffic only; through and ramp to ramp traffic is not included.

* Note: **Do not adjust by a Peak Hour Factor (PHF).** The methodology incorporates the PHF in the Service Volume tables.

Appendix I
MXD Methodology Memorandum

FEHR PEERS

FEHR PEERS

MEMORANDUM

Date: July 15, 2013

To: Scott Gregory, Lamphier Gregory
sgregory@lamphier-gregory.com

From: Rob Rees and Sam Tabibnia, Fehr & Peers

**Subject: Coliseum City Specific Plan and EIR –
Weekday Transportation Impact Analysis Assumptions**

WC12-2923

Fehr & Peers is conducting a transportation impact analysis for the proposed Coliseum City Specific Plan in Oakland. The entire proposed Specific Plan land uses will be briefly discussed below. A portion of the overall Specific Plan will be analyzed in a project level EIR (hereafter the 'Project'). This memorandum concerns the weekday transportation impact analysis assumptions. A separate memo will address weekend analysis.

This memorandum provides a brief description of the proposed Project land uses, describes assumptions used in trip generation methodologies, presents the estimated weekday trip generation for the Project, proposes transportation facilities to be analyzed for the EIR, and describes the transportation impact analysis approach.

PROJECT DESCRIPTION

The Coliseum City Specific Plan would consist of a mix of land uses including residential, retail, entertainment, research and development, office, and hotel within the 815 acre Specific Plan Area in Oakland. The Specific Plan would replace some existing uses in the plan area. **Table 1** presents the net buildout development program for Coliseum City.

The buildout development plan would also include a 72,000 seat football stadium, a 39,000 seat baseball ballpark, and a 20,000 seat arena.

The project team subsequently has identified a portion of the overall Specific Plan to be analyzed in a project level EIR. The project level EIR will analyze Sub-Area A as shown in Table 1.

TABLE 1
COLISEUM CITY NET BUILDOUT DEVELOPMENT ASSUMPTIONS

Land Use	Units	Sub-Area A (east of I-880)	Sub-Area B through E (west of I-880)	Total
Residential	DU	4,000	1,750	5,750
Retail	KSF	408	120	528
Office	KSF	-83	167	84
R&D	KSF	1,500	2,818	4,318
Industrial	KSF	-248	2,636	2,389
Hotel	Rooms	875	0	875
Total Non-Residential Development		1,578	5,741	7,319

TRIP GENERATION

The existing uses would be removed from Sub-Area A and replaced with the proposed Project including about 4,000 residential units, 400,000 square feet of retail and entertainment uses, over 1.50 million square feet of office and research and development, and 875 hotel rooms. This development site provides a variety of automobile and transit travel mode opportunities. Due to the unique nature of the Project site design, pedestrian and bicycle travel modes may be more attractive than a typical development in the surrounding area. If vehicle trip reduction in mixed-use dense urban developments such as this is understated, the result can be excessive traffic impacts and related mitigation that can discourage development of otherwise desirable projects or transportation that is not sized to the urban setting of the development. The trip generation presented in subsequent sections accounts for the mix of uses, urban setting, and travel mode alternatives provided in the Project area.

Trip Generation Methodology

Current accepted methodologies, such as the Institute of Transportation Engineers (ITE) Tr*ip Generation* methodology, are primarily based on data collected at suburban, single-use, freestanding sites. These defining characteristics limit their applicability to mixed-use or multi-use development projects, such as the proposed Sub-Area A of Coliseum City, which is in an urban setting with frequent and nearby local and regional transit service. The land use mix, design features, and setting of the proposed Coliseum City Specific Plan would include characteristics that influence travel behavior differently from typical single-use suburban

developments. Thus, traditional data and methodologies, such as ITE, would not accurately estimate the project vehicle trip generation.

In response to the limitations in the ITE methodology, and to provide a straightforward and empirically validated method of estimating vehicle trip generation at mixed-use developments, the US Environmental Protection Agency (EPA) sponsored a national study of the trip generation characteristics of multi-use sites. Travel survey data was gathered from 239 mixed-use developments (MXDs) in six major metropolitan regions, and correlated with the characteristics of the sites and their surroundings. The findings indicate that the amount of external traffic generated is affected by a wide variety of factors including the mix of employment and residents, the overall size and density of the development, the internal connectivity for walking or driving among land uses, the availability of transit service, and the surrounding trip destinations within the immediate area outside the Project site.

These characteristics were related statistically to trip behavior observed at the study development sites using statistical techniques. These statistical relationships produced equations, known as the EPA MXD model, that allows predicting external vehicle trip reduction as a function of the MXD characteristics. Applying the external vehicle trip reduction percentage to "raw trips", as predicted by ITE, produces an estimate for the number of vehicle trips traveling in or out of the site.

The MXD model has been approved for use by the EPA[1]. It has also been peer-reviewed in the ASCE Journal of Urban Planning and Development[2], peer-reviewed in a 2012 TRB paper evaluating various smart growth trip generation methodologies[3], recommended by SANDAG for use on mixed-use smart growth developments[4], promoted in an American Planning Association (APA) Planning Advisory Service (PAS)[5] which recommended it for evaluating traffic generation of mixed-use and other forms of smart growth, including in-fill and transit oriented development, It has also been used successfully in multiple certified EIRs in California. **Attachment A** presents

certified EIRs that have used the MXD model or its predecessors and a comparison of the accuracy of MXD versus other methods for sample mixed-use developments across the country.

To supplement the results of the MXD model, Fehr & Peers utilized the Alameda County Transportation Commission (Alameda CTC) Countywide Travel Demand Model to estimate BART trips by the Coliseum City project.

Coliseum City Non-Event Trip Generation

Fehr & Peers collected input values for the MXD model for use in application on the Coliseum City trip generation. The MXD model uses internal project information such as land use mix, project area, intersection density, and transit stop placement as well as local and regional demographic data such as average household size and vehicle ownership, employment within one mile of the site, and employment within a 30 minute transit trip.

Table 2 summarizes the estimated trip generation for Coliseum City Sub-Area A using the MXD and Alameda CTC Model methodologies for weekday non-event. **Attachment B** summarizes the estimated trip generation for Coliseum City at full buildout.

As shown in Table 2, Coliseum City Sub-Area A is estimated to generate about 34,000 net daily trips, 2,100 net AM peak hour trips, and 2,800 net PM peak hour trips for a weekday non-event.

Overall, the Project is estimated to generate 40 to 48 percent fewer trips than estimated by the unadjusted ITE methodology.

Comparisons with Mode Share Data

American Community Survey (ACS) data and 2000 Bay Area Transportation Survey (BATS) data were used to check the reasonability of the MXD model results presented above.

Considering the specific setting, available transportation infrastructure, and mix of uses of the Project, a number of locations around the Bay Area were compared to the proposed Project. These locations represent a cross section of dense mixed-use urban areas with varying available travel modes. They include the Project area, downtown Oakland, downtown Berkeley, downtown San Francisco, Mission Bay (San Francisco), and downtown Walnut Creek.

Source: American Community Survey (2010 5-year estimates).

The 2000 Bay Area Travel Survey (BATS) provides mode share tables by proximity to rail stations. **Table 4** presents the mode share data for Alameda County and Bay Area residents. The Project is within ½ mile of two rail stations. Based on the BATS data, about 48 percent of trips by Alameda County residents and 55 percent of trips by Bay Area residents within ½ mile of a rail station is by non-auto modes. The data shows that the Project estimate of mode share is conservative relative to locations in a similar environment.

Validation of MXD+ model

Since the conclusion of the EPA sponsored study, Fehr & Peers has been actively enhancing the MXD model to improve sensitivity to various site characteristics, improve peak hour performance, and continue to validate the model against MXDs where data is available.

A set of 27 independent MXD sites across the country that were not included in the initial model development have been tested to validate the model. These sites represent locations where it is expected that traditional data and methodologies, such as ITE, would not accurately estimate the Project vehicle trip generation. **Table A1** presents the performance of the MXD model against ITE and ITE internalization procedures.

TABLE A1
MXD+ MODEL
VALIDATION STATISTICS COMPARISON

Validation Statistic	ITE raw	ITE with internalization	MXD+ model
Daily			
Average Model Error[1]	28%	16%	**2%**
% RMSE[2]	40%	27%	**17%**
R-Squared[3]	0.77	0.89	**0.96**
AM Peak Hour			
Average Model Error	54%	49%	**12%**
% RMSE	54%	53%	**21%**
R-Squared	0.81	0.81	**0.97**
PM Peak Hour			
Average Model Error	49%	35%	**4%**
% RMSE	64%	49%	**15%**
R-Squared	0.40	0.65	**0.97**

1. Average model error measures the difference between the estimated trip generation and the counted trip generation of the 28 survey sites.
2. RMSE stands for percent root mean squared error is a demand assessment of performance of transportation models in that it does not apply average that would allow over-estimates and under-estimates to cancel one another out and it penalizes proportionally more for large errors. A % RMSE of less than 40% is generally considered acceptable in transportation modeling.
3. R-squared is a statistical measure that indicates, in this case, the degree to which each method explains the variation in trip generation among the 27 survey sites. A R-Squared value closer to 1.0 indicates that the method fully explains the variation in trip generation amongst the survey sites and would be suitable to be used for that set of site types.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Water Supply Assessment

EAST BAY
MUNICIPAL UTILITY DISTRICT

January 28, 2014

Devan Reiff, AICP, Planner III
City of Oakland
Planning, Building and Neighborhood Preservation Department
250 Frank Ogawa Plaza, Suite 3315
Oakland, CA 94612

Re: Water Supply Assessment – Oakland Coliseum Area Specific Plan

Dear Mr. Reiff:

This letter responds to the City of Oakland's (City) request on November 7, 2013, for water agency consultation concerning the Oakland Coliseum Area Specific Plan (Enclosure 1) located in Oakland, which is within the East Bay Municipal Utility District's (EBMUD) Ultimate Service Boundary. EBMUD appreciates the opportunity to provide this response.

Pursuant to Sections 10910-10915 (SB-610) of the California Water Code, the project meets the threshold requirement for an assessment of water supply availability based on the amount of water this project would require, a mixed-use project that would demand an amount of water equivalent to or greater than the amount of water required by a 500 dwelling unit project.

Please note that this assessment addresses the issue of water supply only and is not a guarantee of service, and future water service is subject to rates and regulations in effect at the time.

Project Demand

The water demand for the Oakland Coliseum Area Specific Plan area is accounted for in EBMUD's water demand projections as published in EBMUD's 2010 Urban Water Management Plan (UWMP/Enclosure 2). EBMUD's water demand projections account for anticipated future water demands within EBMUD's service boundaries and for variations in demand-attributed changes in development patterns. The proposed project site currently consists of mixed-use office, light industrial, business, hotel, retail, restaurant, and sport event venue space, including the existing Oakland Coliseum and Arena and the Oakland Airport Edgewater Business Park. Current average annual water use is about 700,000 gallons per day (gpd). The increase in the projected average annual water demand for the project at build out is approximately 3,000,000 gpd.

EBMUD's demand projections indicate both densification and land use changes in a few existing land use classifications, including commercial and residential land use areas, thus increasing EBMUD's overall demand. EBMUD's 2010 UWMP projects water demands over time, accounting for estimated variations in demand usage less conservation and recycled supply

sources as noted in Table 4-1, Water Demand Projections for Each Water Use Sector, of the 2010 UWMP. EBMUD's water demand projections are based on the 2040 Demand Study (Demand Study), which was completed in 2009. For planning purposes, the demands are estimated in five year increments, but it is recognized that actual incremental amounts may occur stepwise in shorter time increments. An increase in usage by one customer in a particular customer class does not require a strict gallon-for-gallon increase in conservation by other customers in that class as, in actuality, EBMUD-wide, the amount of potable demand, conservation and recycled water use will vary somewhat. Future versions of the UWMP, which is updated every five years, will include an updated assessment of customer demand and water supply.

Project Area

The Oakland Coliseum Area Specific Plan Project consists of approximately 800 acres bounded by 66th Avenue on the north, San Leandro Street on the east, Hegenberger Road on the south, and San Leandro Bay and Oakland International Airport on the west. As described in the City's WSA request, the Oakland Coliseum Area Specific Plan will provide for up to three new sport venues, significant transportation and transit enhancements, and development of new retail, housing and employment space; this will include approximately 5,750 new housing units and 7,900,000 square feet of new non-residential space within the Area Specific Plan.

EBMUD Water Demand Projections

Since the 1970s, water demand within EBMUD's service area has ranged from 200 to 220 million gallons per day (mgd) in non-drought years. The 2040 water demand forecast of 312 mgd for EBMUD's service area can be reduced to 230 mgd with the successful implementation of water recycling and conservation programs, as outlined in the 2010 UWMP. Although current demand is lower than estimated in the Demand Study, as a result of the recent multi-year drought and the downturn in the economy, the Demand Study still reflects a reasonable expectation for growth over the long term for demand in year 2040. The Oakland Coliseum Area Specific Plan will not change EBMUD's 2040 demand projection.

EBMUD Water Supply and Water Rights

EBMUD has water rights permits and licenses that allow for delivery of up to a maximum of 325 mgd from the Mokelumne River, subject to the availability of Mokelumne River runoff and the senior water rights of other users. EBMUD's position in the hierarchy of Mokelumne River water users is determined by a variety of agreements between Mokelumne River water right holders, and the terms of the appropriative water rights permits and licenses, which have been issued by the State, pre-1914 rights, and riparian rights.

Conditions that could, depending on hydrology, restrict EBMUD's ability to receive its full entitlement include:

- Upstream water use by prior right holders.
- Downstream water use by riparian and senior appropriators and other downstream obligations, including protection of public trust resources.
- Variability in rainfall and runoff.

During prolonged droughts, the Mokelumne River supply cannot meet EBMUD's projected customer demands. To address this, EBMUD has completed construction of the Freeport Regional Water Facility and the Bayside Groundwater Facility, which are discussed below in the Supplemental Water Supply and Demand Management section of this assessment. EBMUD has obtained and continues to seek supplemental supplies.

EBMUD UWMP

The 2010 UWMP, adopted on June 28, 2011, by EBMUD's Board of Directors by Resolution No. 33832-11, is a long-range planning document used to assess current and projected water usage, water supply planning and conservation and recycling efforts. A summary of EBMUD's demand and supply projections, in 5-year increments for a 25-year planning horizon is provided in Table 4-3, EBMUD Demand and Supply Projections of the 2010 UWMP (Enclosure 3).

EBMUD's evaluation of water supply availability accounts for the diversions of both upstream and downstream water right holders and fishery releases on the Mokelumne River. Fishery releases are based on the requirements of a 1998 Joint Settlement Agreement (JSA) between EBMUD, United States (U.S.) Fish and Wildlife Service, and the California Department of Fish and Game. The JSA requires EBMUD to make minimum flow releases from its reservoirs to the lower Mokelumne River to protect and enhance the fishery resources and ecosystem of the river. As this water is released downriver, it is, therefore, not available for use by EBMUD's customers.

The available supply shown in the attached table (Enclosure 3) was derived from EBMUD's hydrologic model with the following assumptions:

- EBMUD Drought Planning Sequence is used for 1976, 1977 and 1978;
- Total system storage is depleted by the end of the third year of the drought;
- EBMUD will implement its Drought Management Program when necessary;
- The diversions by Amador and Calaveras Counties upstream of Pardee Reservoir will increase over time, eventually reaching the full extent of their senior rights;
- Releases are made to meet the requirements of senior downstream water right holders and fishery releases are made according to the JSA;
- Dry-year supply of Central Valley Project (CVP) water, through the Freeport Regional Water Facility, is available; and
- Bayside Groundwater Project, Phase 1, is available.

As discussed under the Drought Management Program section in Chapter 3 of the 2010 UWMP, EBMUD's system storage generally allows it to continue serving its customers during dry-year events. EBMUD imposes rationing based on the projected storage available at the end of September. By imposing rationing in the first dry year of potential drought periods, EBMUD attempts to minimize rationing in subsequent years if a drought persists while continuing to meet its current and subsequent-year fishery flow release requirements and obligations to downstream agencies. Table 3-2, Long-Term Drought Management Program Guidelines, in the 2010 UWMP summarizes the Drought Management Program guidelines for consumer water reduction goals based on projected system storage.

In Table 4-3, EBMUD Demand and Supply Projections (Enclosure 3), "Single Dry Water Year" (or Year 1 of "Multiple Dry Water Years") is determined to be a year that EBMUD would implement Drought Management Program elements at the "moderate" stage with the goal of achieving a reduction between 0 to 10 percent in customer demand. Year 2 of "Multiple Dry Years" is determined to be a year that EBMUD would implement Drought Management Program elements at the "severe" stage with the goal of achieving between 10 to 15 percent reduction in customer demand. Year 3 of "Multiple Dry Years" is a year in which EBMUD would implement Drought Management Program elements at the "critical" stage. Despite water savings from EBMUD's aggressive conservation and recycling programs and rationing of up to 15 percent, additional supplemental supplies beyond those provided through the Freeport Regional Water Facility and the Bayside Groundwater Facility will be needed during Years 2 and 3 of a three-year drought. Therefore, supplemental supplies are needed in a multiple-year drought period while continuing to meet the requirements of senior downstream water right holders and the provisions of the 1998 JSA.

Supplemental Water Supply and Demand Management

The goals of meeting projected water needs and increased water reliability rely on supplemental supplies, improving reliability of existing water supply facilities, water conservation and recycled water programs.

By 2011, EBMUD completed construction of the Freeport Regional Water Facility and the Bayside Groundwater Facility to augment its water supply during drought periods. However, additional supplemental supplies beyond those provided through these facilities will still be needed, as noted above. Chapter 2 of the 2010 UWMP describes potential supplemental water supply projects that could be implemented to meet projected long-term water demands during multi-year drought periods.

The Freeport Regional Water Facility became operational in February 2011. EBMUD's ability to take delivery of water through the Freeport facility is based on its Long Term Renewal Contract (LTRC) with the U.S. Bureau of Reclamation. The LTRC provides for up to 133,000 acre-feet in a single dry-year, not to exceed a total of 165,000 acre-feet in three consecutive dry years. Under

the LTRC, the CVP supply is available to EBMUD only in dry years when EBMUD's total stored water supply is forecast to be below 500,000 total acre feet on September 30 of each year.

Construction of the Bayside Groundwater Project, Phase 1, was completed in 2010. A permit from the Department of Public Health, which is pending, is required before the groundwater can be extracted and treated for municipal use. The project is designed to yield 2 mgd over a 6-month period, resulting in an average annual production capacity of 1 mgd per year.

Chapter 2 of the 2010 UWMP also lists other potential supplemental water projects, including northern California water transfers, Bayside Groundwater Project Expansion, Los Vaqueros Expansion and others that could be implemented as necessary to meet the projected long-term water supplemental need during multi-year drought periods. The 2010 UWMP identifies a broad mix of projects, with inherent scalability and the ability to adjust implementation schedules for a particular component, so that EBMUD will be able to continue to pursue the additional supplemental supplies that are projected to be necessary, while also minimizing the risks associated with future uncertainties such as project implementation challenges and global climate change. The Environmental Impact Report that EBMUD certified for the Water Supply Management Program 2040 examined the impacts of pursuing these supplemental supply projects at a program level. Separate project-level environmental documentation will be prepared, as appropriate, for specific components as they are developed in further detail and implemented in accordance with EBMUD's water supply needs.

In addition to pursuing supplemental water supply sources, EBMUD also maximizes resources through continuous improvements in the delivery and transmission of available water supplies, and investments in ensuring the safety of its existing water supply facilities. These programs, along with emergency interties and planned water recycling and conservation efforts, would ensure a reliable water supply to meet projected demands for current and future EBMUD customers within the current service area.

Individual developments within the project area may present opportunities to incorporate water conservation measures. EBMUD requests that the City include in its conditions of approval a requirement that the project sponsors comply with the California Model Water Efficient Landscape Ordinance (Division 2, Title 23, California Code of Regulations, Chapter 2.7, Sections 490 through 495). EBMUD staff would appreciate the opportunity to meet with the project sponsor to discuss water conservation programs and best management practices applicable to the integrated projects. A key objective of this discussion will be to explore timely opportunities to expand water conservation via early consideration of EBMUD's conservation programs and best management practices applicable to the project.

The Area Specific Plan is located within EBMUD's San Leandro Recycled Water Project serving Alameda's Golf Courses and other sites. The size and nature of the proposed development will present several opportunities for the use of recycled water for landscape irrigation, commercial and industrial process uses, toilet and urinal flushing in sports arenas and

other applications. As part of the long term water supply planning, EBMUD will investigate expanding the existing recycled water infrastructure or constructing a localized satellite facility that treats onsite wastewater to provide recycled water to the project. The existing San Leandro Recycled Water Project could potentially expand in the future should the treatment level be upgraded to a tertiary level and if additional distribution pipelines are extended towards the project's area. EBMUD recommends that the City and their developers maintain continued coordination and consultation with EBMUD as they plan and implement the various projects as identified within the Area Specific Plan regarding the feasibility of providing recycled water for appropriate non-potable uses.

The project sponsor should contact David J. Rehnstrom, Senior Civil Engineer, at (510) 287 1365 for further information.

Sincerely,

William R. Kirkpatrick
Manager of Water Distribution Planning Division

Re: Request for Water Supply Assessment for the Proposed Oakland Coliseum Area Specific Plan

Dear Mr. Rehnstrom:

Pursuant to Section 10910 and 10912 of the California Water Code implemented by Senate Bill 610, the City of Oakland is submitting this request to EBMUD for a Water Supply Assessment (WSA). The assessment is required in order to determine whether adequate water supply is available to meet the projected water demand of the proposed Oakland Coliseum Area Specific Plan. A Notice of Preparation (NOP) for an Environment Impact Report (EIR) was sent to you on April 19, 2013.

The proposed Oakland Coliseum Specific Plan would provide for up to three new sport venues (totaling approximately 130,000 seats), approximately 5,750 net new housing units and 7,900,000 square feet of net new non-residential space within the Planning Area. This development would result in an estimated +/-10,400 new residents and roughly 20,000 new jobs. Although development facilitated by the Specific Plan would occur incrementally over many years, the EIR conservatively assumes that all of this projected growth would occur by 2035. The attached Notice of Preparation contains more detailed existing land use information, build-out projections by land use type, and associated population and employment estimates. To aid in the assessment, proposed water demand for the Plan Area has been estimated. An electronic file of the proposed demands will be provided for your use.

The City respectfully requests that EBMUD prepare a Water Supply Assessment for the project. The City acknowledges that this request for a Water Supply Assessment is a required part of the environmental documentation for the project. We appreciate your prompt response to this request.

Please contact me at (510) 238-3550 or at dreiff@oaklandnet.com, or the City's planning and environmental consultant, Scott Gregory at Lamphier-Gregory at (510) 535-6690, if you require additional information in regard to this request. Thank you for your cooperation in this matter.

Sincerely,

Devan Reiff, AICP
Planner III

Notes:

1 Land Use designations and quantities are based on the upper limit values provided in the "Updated COL Area Development Progaram Summary 10-02-13" workbook. Irrigation quantities based on landscaping shown in the conceptual plan.

2 "Seat Days" represent units of single event attendance at the specified sports venue. Attendance quantities (projected attendance and number of days during the year) are based on "Stadium Revenue Buildup Scenario 7" provided by the City of Oakland, August 29, 2013.

3 Demand Factors are based on industry standards, comparable studies provided by EBMUD, and information contained in the 49er Stadium DEIR.

4 Irrigation quantities assumes: 30' landscaped buffers around open space and creek restoration areas, park areas as shown on the master plan, 4% of impervious areas for stormwater treatment, and required landscape for parking and roadways. Water demand assumes 21 gal/SF/year based on "Guidelines for Estimating Unmetered Landscaping Water Use" by FEMP, July 2010, and industry standards for Oakland area.

5 Parking water demands are included in the irrigation section and are associated with SF of parking, not number of spaces.

EAST BAY MUNICIPAL UTILITY DISTRICT DEMAND AND SUPPLY PROJECTIONS
(Reference: Table 4-3, UWMP 2010 – EBMUD)

	2010	2015	2020	2025	2030	2035[1]	2040
PROJECTED DEMAND (MGD)							
CUSTOMER DEMAND [2]	251	266	280	291	304	308	312
ADJUSTED FOR CUMULATIVE CONSERVATION [3]	(26)	(32)	(43)	(49)	(56)	(59)	(62)
ADJUSTED FOR RECYCLED WATER [4]	(9)	(11)	(16)	(18)	(19)	(20)	(20)
PLANNING LEVEL OF DEMAND	216	223	221	224	229	229	230
PROJECTED AVAILABLE SUPPLY AND NEED FOR SUPPLEMENTAL SUPPLY (MGD)[5]							
NORMAL YEAR	>216	>223	>221	>224	>229	>229	>230
SUPPLEMENTAL SUPPLY NEED	0	0	0	0	0	0	0
SINGLE DRY YEAR (MULTIPLE DRY YEARS – YEAR 1)							
AVAILABLE SUPPLY	211	217	215	218	223	222	222
CUSTOMER RATIONING [6]	2%	3%	3%	3%	3%	3%	4%
SUPPLEMENTAL SUPPLY NEED [7]	5	6	6	7	7	8	8
MULTIPLE DRY YEARS – YEAR 2							
AVAILABLE SUPPLY	183	189	188	190	194	194	195
CUSTOMER RATIONING [6]	15%	15%	15%	15%	15%	15%	15%
SUPPLEMENTAL SUPPLY NEED [7]	21	21	21	21	22	22	22
MULTIPLE DRY YEARS – YEAR 3							
AVAILABLE SUPPLY	183	189	188	190	183	164	144
CUSTOMER RATIONING [6]	15%	15%	15%	15%	15%	15%	15%
SUPPLEMENTAL SUPPLY NEED [7]	21	21	21	21	33	53	73
THREE-YEAR DROUGHT							
TOTAL SUPPLEMENTAL SUPPLY NEED (TAF)[7]	53	54	54	55	69	93	115

[1] Projected demand for 2035 is interpolated.

[2] Customer demand values are based on the demand projections from the "2040 Demand Study," Feb 2009. These projected water demands are based on land use in EBMUD's ultimate service area and is unadjusted for conservation and non-potable water. The values are also unadjusted for the current suppressed demand due to the 2007-2010 rationing period and the economic downturn.

[3] Existing conservation saving from the "1994 Water Conservation Master Plan" and planned conservation program savings based on the "2011 Water Conservation Master Plan".

[4] Existing recycled water achieved per the "1993 Water Supply Management Program" and planned recycled water program savings as outlined in Chapter 5 of the UWMP 2010.

[5] Projected available supply data includes dry year supply deliveries from the Freeport Regional Water Project (FRWP) and Bayside Groundwater Project, Phase 1. Delivery rules for the FRWP follow the rules as developed in the Freeport EIR, 2003.

[6] Rationing reduction goals are determined according to projected system storage levels in the Long-Term Drought Management Program guidelines per Table 3-2 in Chapter 3 of the UWMP 2010.

[7] The supplemental supply need is based on EBMUDSIM modeling studies. It is the amount of water needed based on EBMUD's updated demand projections, the provisions of the 1998 Joint Settlement Agreement and the rationing policy stated in Table 3-2, Chapter 3 of the UWMP 2010. The actual need will be dependent on antecedent conditions and the severity of actual drought conditions. Supplemental supply stored during the initial year of the drought could be later released, diminishing supplemental supply needs. During the drought that continued into 2010, the combined effects of water rationing and an economic downturn suppressed demand below the planning level of demand to maintain a sufficient water supply and deferred the need for supplemental water. However, if the drought had continued into its second year, most likely supplemental supplies would have been obtained from the Freeport Regional Water Facility as anticipated in the Interim Drought Management Program Guidelines discussed in Appendix G-2.
