TARGET PROPERTY: ADDRESS NOT IDENTIFIED IN RESEARCH SOURCE

The following Target Property addresses were researched for this report, and the addresses were not identified in the research source.

Address Researched

800 Madison Street

Address Not Identified in Research Source

2006, 2002, 1993, 1984, 1982, 1979, 1976, 1973, 1965, 1960, 1959, 1956, 1954, 1951, 1946, 1940, 1932, 1928, 1926, 1925, 1920

APPENDIX H
RESUMES OF ENVIRONMENTAL PROFESSIONALS

DRAFT

WENDY KWONG

STAFF SCIENTIST

ENVIRONMENTAL ENGINEERING

Ms. Kwong's experience includes projects involving groundwater monitoring, hazardous soil remediation, site mitigation, soil management, dust mitigation, and vapor mitigation systems throughout the San Francisco Bay Area. She has worked on various environmental projects, which require lengthy commitments. She has completed Phase I Environmental Assessments (ESAs) and Vapor Mitigation System projects, and has completed data analyses on projects related to indoor air, vapor gas sampling, soil sampling, groundwater sampling, and dust monitoring. She manages field investigations, including but not limited to, soil excavation oversight, soil sampling, groundwater sampling, vapor mitigation system installation, and dust monitoring. Wendy assists with proposals and cost estimates for waste characterization and field investigations.

Ms. Kwong is currently working on a variety of projects both in the office and field. She manages and analyzes large amounts of data for projects like Hunters Point Naval Shipyard and Golden State Warriors. She is working on Phase I ESAs, various environmental investigations, and soil management oversight in the field.

SELECTED PROJECTS

- Hunters Point Naval Shipyard, Data Analysis, Feasibility Assessments, San Francisco, CA
- Alameda Point Naval Base, Environmental Investigations, Alameda, CA
- 801 Brannan, Dust Monitoring Plan and Vapor Mitigation System, San Francisco, CA
- 1460 El Camino Real, Indoor Air Monitoring, Menlo Park, CA
- Texas Instruments, Indoor Air Monitoring, South Bay, CA
- 1 Henry Adams Street, Vapor Mitigation System, San Francisco, CA
- Transbay Block 8, Site Mitigation Plan Oversight, San Francisco, CA
- Block 40, Site Mitigation Plan and Vapor Mitigation System, San Francisco, CA
- Golden State Warriors, Dust Monitoring Plan and Asbestos Dust Monitoring Plan, San Francisco, CA
- 2500 El Camino Real (Stanford Affordable), Vapor Mitigation System, Palo Alto, CA
- Oceanwide, Site Mitigation Plan Oversight, San Francisco, CA
- 377 2nd Street, Soil Management Oversight, Oakland, CA
- 1500 San Pablo Avenue, Phase I ESA and Soil Management Plan, Berkeley, CA
- 1395 22nd Street, Dust Monitoring Plan, Asbestos Dust Monitoring Plan, Site Management Plan Oversight, San Francisco, CA
- Parcel O, Phase I Update, Dust Monitoring Plan, San Francisco, CA
- Bascom, Methane Mitigation System Repairs. Campbell, CA
- 1068 Mission Street, Phase I ESA, San Francisco, CA

EDUCATION

B.Sc., Environmental Systems, concentration in Environmental Chemistry
University of California, San Diego

CERTIFICATIONS

40-Hour Hazardous Waste Operations and Emergency Response (HAZWOPER)

First Aid/ CPR Certified

Land Science Technologies Geo -Seal Certified Inspector

CETCO Certified Inspector

SOFTWARE TRAINING

Microsoft Office Suite
Bluebeam Revu

DORINDA SHIPMAN, PG, CHG, ENV SP

PRINCIPAL/VICE PRESIDENT

ENVIRONMENTAL ENGINEERING & PROGRAM MANAGEMENT

Ms. Shipman has 30 years of experience as a senior manager and hydrogeologist. Her previous experience managing US Navy base cleanup work has been augmented by directing environmental work at five large military base Superfund site conversions underway in the Bay Area: Hunters Point Shipyard, the Presidio of San Francisco, Treasure Island, Mare Island, and Alameda Naval Air Station. Her expertise encompasses integrating environmental cleanup and mitigation with design and construction for real estate property transfer and redevelopment. Ms. Shipman is adept at using site and regulatory knowledge to develop a strategy that addresses contamination issues and resolves environmental challenges while balancing land use regulations, property constraints, and client requirements. She leads soil and groundwater investigation and cleanup, soil gas and vapor intrusion risk assessments, water supply assessment, and dewatering evaluations; provides litigation support; and directs groundwater-flow and fate and transport modeling. She works successfully with the California Department of Toxic Substances Control, Regional Water Quality Control Boards, US Environmental Protection Agency Region 9, and numerous county regulators.

EDUCATION

M.S., Geology
(Hydrogeology Option)
Wright State University

B.S., Geology (cum laude)
Ohio University

PROFESSIONAL REGISTRATION

Professional Geologist
(PG) in CA, NY

Certified Hydrogeologist in
CA

Certified Environmental
Manager in NV

Environmental
Sustainability Professional
(ENV SP)

AFFILIATIONS

National Groundwater
Association
Groundwater Resources
Association of California

Recycling (CCLR),
Advisory Board member

SELECTED PROJECTS

Arenas, Stadiums and Event Centers

- Chase Center (Golden State Warriors Arena), Mission Bay (Blocks 29-32), San Francisco, CA
- Avaya Stadium, San Jose Earthquakes, San Jose, CA - 2015 EPA Region 9 Phoenix Award Winner
- Proposed Farmer's Field Stadium Expansion, Los Angeles, CA
- L.A. Live Way Parking Structure, Los Angeles, CA
- Los Angeles Convention Center Expansion, Los Angeles, CA
- Stockton Event Center, Remedial Investigation/Feasibility Study, Remedial Action Plan, Phase II Environmental Site Assessments & Soil and Groundwater Remediation, Stockton, CA - 2008 EPA Region 9 Phoenix Award Winner

Large-Scale Urban Development

- City and County of San Francisco Hunters Point Shipyard Transfer and Redevelopment, San Francisco, CA
- Treasure Island Development Authority, Environmental Review of Navy Remediation, San Francisco, CA
- Mission Bay Redevelopment, San Francisco, CA
 - Chase Center (Golden State Warriors Arena), Mission Bay (Blocks 29-32), San Francisco, CA
 - One Mission Bay, San Francisco, CA
 - University of California – San Francisco (UCSF), Mission Bay Life Science Building Blocks, 41-43 Parcel 1

LANGAN

DORINDA SHIPMAN, PG, CHG, ENV SP

- J. David Gladstone Institutes Blocks, 41-43 Parcel 2
- UCSF Sandler Neurosciences Center, Block 19A
- Multi-family Residential Buildings at Block N1
- Pier 70 Brownfield Investigation and Remedial and Risk Management Planning, Port of San Francisco, CA
- Reuse of National Historical Landmark Building, Presidio National Park, San Francisco, CA
- Presidio of San Francisco on behalf of the Presidio Trust (Federal Agency), As-Needed Environmental and Groundwater Monitoring Services for Base Closure and Redevelopment, CA
- The Presidio Commissary/Post Exchange, San Francisco, CA
- Treasure Island on behalf of the Treasure Island Development Authority, Monitoring Navy Remediation, San Francisco, CA
- Sunnyvale Downtown Redevelopment, Sunnyvale, CA

Public Agency Contracts

- The Presidio Trust, Environmental Cleanup and Groundwater Monitoring, Presidio of San Francisco. CA
- City and County of San Francisco, As-Needed Environmental and Infrastructure Support Services, CA
- City of Huntington Beach, On-Call Peer Review and Environmental Consulting Services of Work Plans, Environmental Site Assessments and Remediation Documents, CA
- City of Lodi, Groundwater and Water Supply Management Services, CA
- City of Lodi, Groundwater Modeling and Data Management, CA
- City of San Pablo, Brownfield Grant Phase I and II Environmental Site Assessments (ESAs) for Hazardous Material and Petroleum Sites, CA
- County of Los Angeles Department of Public Works, Del Valle Fire Training Facility, Castaic, CA
- Pier 70 Brownfield Investigation and Remedial and Risk Management Planning, Port of San Francisco, CA
- San Francisco Municipal Transportation Agency (SFMTA), Groundwater Modeling for Downtown San Francisco Basin, San Francisco, CA

Retail/Commercial Projects

- (*Confidential - TCL Chinese Theatre) Historic Theatre, Phase I and Hazardous Material Environmental Site Assessment, Hollywood, CA
- (*Confidential – Millennium) Commercial Development, Environmental Due Diligence Support, Hollywood, CA
- (*Confidential - Future Fashion Outlets of Los Angeles) Proposed Commercial Shopping Center, Environmental Assessment on Former Landfill, for Los Angeles County, CA
- (*Confidential – 1617/1621 Gower) Commercial Development, Phase I and Limited Phase II Environmental Site Assessment and Waste Oil UST investigation, Los Angeles, CA
- Dollar/Thrifty Rental Car Facility, Inglewood, CA
- Budget Rent-A-Truck, Los Angeles, CA

Residential Projects

- 1548 Maple Street, CLRRRA Site Assessment and Response Plan Redwood City, CA
- Waters Park Drive, Residential Development, Environmental Due Diligence and Phase I and II Environmental Site Assessments, San Mateo, CA
- Residential Development, Environmental Due Diligence and Phase I Environmental Site Assessment, Laguna Niguel, CA
- (*Confidential – Three Forbes) Environmental Services for Residential Development, Laguna Niguel, CA
- (*Confidential - Camden Three Flags) Environmental Due Diligence for Residential Development, Laguna Niguel, CA

Industrial/Warehouse/Landfill Projects

- Aerospace Facility, Phase I Environmental Site Assessment, Tempe, AZ
- Former Industrial Production Services Facility, Environmental Assessment for Potential Redevelopment, La Verne, CA
- Industrial Facility Characterization, Risk Evaluation and Regulatory Compliance, La Verne, CA
- Food Manufacturing and Distribution Facility, Post-UST Removal Engineering Services, Buena Park, CA
- Schlage Manufacturing Facility Closure, Characterization and Cleanup Planning, San Francisco, CA
- Sears Warehouse Facility, Environmental Assessment, Los Angeles, CA
- Texas Instruments Inc., Groundwater Extraction System Optimization, Santa Clara, CA
- Texas Instruments Inc., Remediation, Soil Vapor and Indoor Air Sampling, Santa Clara and Palo Alto, CA
- Texas Instruments Inc., Water Reuse Following Groundwater Extraction and Treatment, Santa Clara, CA
- Texas Instruments Inc., Risk Management Plan for Superfund Property Transfer, Santa Clara, CA
- Texas Instruments Inc. Superfund Operable Unit, Santa Clara, CA
- 915 DeGuigne, Evaluation of Superfund Site for Potential Redevelopment, Sunnyvale, CA
- City Place Santa Clara Landfill Post-Closure Development, Santa Clara, CA

Military Bases

- Environmental Cleanup and Groundwater Monitoring, Presidio of San Francisco, CA
- Aerospace Facility Phase I Environmental Site Assessment, Tempe, AZ
- Remedial Investigation Feasibility Study Martin Marietta/HAZWRAP, Air Force Base, Mississippi
- RCRA Facility Investigation Workplans for the U.S. Navy, Guam
- Landfill and Dip Tank Remedial Investigation/Risk Assessment for US Navy, Guam
- Alameda Naval Air Station Superfund Site, Site A Redevelopment for Alameda Point Partners, Alameda, CA
- Mare Island Shipyard, Superfund Site, Fuel Pipeline, Petroleum and PCB Site Remediation, Vallejo, CA

Oil/Petroleum Projects

- (*Confidential – Asphalt Refinery) Environmental Due Diligence, Oxnard, CA

DORINDA SHIPMAN, PG, CHG, ENV SP

- (*Confidential - Bandini) Oil and Gas Tank Farm, Well, and Pipeline Demolition Support, , CA
- (*Confidential - Elk Hills) Oil and Gas Facility Environmental Investigations, Bakersfield, CA
- Mare Island Shipyard, Remediation of PCB and Petroleum Sites, Vallejo, CA
- Chevron Real Estate Management Company, Site and Risk Assessments, Richmond, CA

Expert Witness/Litigation Support

- Various Confidential Litigation projects - Due diligence support, document review, expert witness services and allocation of responsibility evaluation, California
- Housing Authority of the City of Los Angeles (HACLA) Cost Recovery To Fund Mixed-Use Project, Los Angeles, CA
- Confidential Municipal Well Field Contamination At Groundwater Basin, CA
- Contra Costa County, Landfill Litigation Support, CA
- Manufactured Gas Plant, Litigation Support, Oahu, Hawaii
- Remedial Investigation/Risk Assessment Pearl Harbor Naval Shipyard, Oahu, Hawaii for US Navy
- Pier 70 Redevelopment, San Francisco, CA
- Hunters Point Naval Shipyard, San Francisco, CA
- RCRA Facility Investigations Apra Harbor Naval Complex for US Navy, Guam

Misc Projects

- Delta Wetlands, Groundwater-Level Monitoring and Seepage Study, Central Valley Delta, CA
- Residential Water Supply Groundwater Sampling, Livermore, CA

SELECTED PRESENTATIONS

2016 "The Remediation, Redevelopment, and Revitalization of Treasure Island," Battelle Tenth International Conference on Remediation of Chlorinated and Recalcitrant Compounds (with Chris Glenn)

2014 "Sustainable Engineering - Water Reuse Following Groundwater Extraction and Treatment," 9th International Conference on Remediation of Chlorinated and Recalcitrant Compounds (with Christina Rain, Christopher Glenn, and Joshua Graber)

2011 "Municipal Risk Management of Early Transfer Parcels for Redevelopment and Reuse at Hunters Point Shipyard" Battelle International Symposium on Bioremediation and Sustainable Environmental Technologies (with Amy Brownell and Sigrida Reinis)

PHASE II ENVIRONMENTAL SITE ASSESSMENT
Lake Merritt BART
Oakland, California

1.0 INTRODUCTION

This Phase II Environmental Site Assessment (ESA) was prepared for Strada Investment Group (Strada) for the proposed transit oriented development (TOD) located at the Lake Merritt BART station in Oakland, California (site). The approximately 2.75-acre site consists of two blocks in a mixed-use area of Oakland that includes asphalt parking lots and a commercial office building. Block 1 is the Lake Merritt BART parking lot and is bound by 9th Street to the northeast, Oak Street to the northwest, 8th Street to the southwest, and Fallon Street to the southeast (Figure 1). Block 2 contains a commercial office building and associated parking lot and is diagonally opposite to Block 1 and is bound by 8th Street to the northeast, Madison Street to the northwest, 7th Street to the southwest, and Oak Street to the southeast (Figure 1). The site is identified by the following Assessor's Parcel Numbers (APNs): 1-691-1 and 1-171-2. It is our understanding that current development plans for the site include construction of four multi-story, steel framed residential and commercial buildings.

2.0 PROJECT DESCRIPTION

The proposed development includes the demolition and removal of the existing parking lot and commercial building, and the construction of four multi-story residential and commercial buildings. The Building A for market rate residential in Block 1 will include over 350 residential housing units, as well as common living spaces and other amenities, and two commercial spaces. The Building B developed for senior housing will be a seven-story construction with over 80 residential housing units. There will be a food court market between these two buildings in Block 1. In Block 2, there will be a 19-story office building with below grade parking (Building C) and a seven-story affordable family housing (Building D). We have assumed the excavation depth is between five and seven feet for foundation elements.

3.0 SITE HISTORY

Based on the review of historical records (Draft Phase I ESA¹, ACEH CUPA file, EDR Radius Report Sanborn Fire Insurance Maps and Aerial Photographs) requested from Environmental Data Resources, Inc. (EDR), Langan prepared the following Site History chronology. As early as 1952, a gas station with an address of 43 8th Street was located within the footprint of the Block 1 (Figure 2). In the Block 2, historical fuel oil underground storage tank (UST) was installed in 1982 (Figure 2), and a leak was detected by the BART District and recorded on 27 May 1989 with the State Water Resources Control Board.

A ground penetrating radar (GPR) survey was conducted at both potential and former UST locations on 17 August 2019. Results of the survey identified an anomaly at the historical gas station area on Block 1 extending from west to east at approximately two feet below the ground surface.

Several historical cleaner properties were also identified in close proximity to the site, including one facility at 148 9th Street listed on the EDR Historical Cleaners list and another at 709 Oak Street.

4.0 FIELD INVESTIGATION

Langan performed a Phase II ESA to evaluate the environmental quality of the soil, soil vapor, and groundwater that may be encountered during construction. In addition, soil and groundwater samples were analyzed to assess potential contamination due to the presence of leaking underground storage tanks (LUSTs) and historical dry cleaners. Groundwater and soil vapor samples were analyzed to assess potential vapor intrusion concerns.

4.1 Mobilization Activities

Prior to initiating field activities, Langan obtained BART's permit to enter and provided information from BART to obtain Alameda County Public Works Agency boring permits.

In addition, Underground Service Alert North 811 (USA North) was notified and a private utility locator was employed to confirm the boring locations were free of underground

¹ Draft Phase I Environmental Site Assessment, Lake Merritt BART Development dated 17 May 2019

utilities prior to intrusive activities. Under Soil boring and temporary soil vapor well permits were obtained from Alameda County Public Work Agency (ACPWA),

4.2 Soil Sampling

PeneCore Drilling a C-57 licensed drilling company located in Woodland, California performed the drilling activities. The soil was visually logged by Langan in general accordance with the Unified Soil Classification System (USCS), working under the supervision of a California licensed professional geologist. The locations and depths of the soil borings were selected based on the proposed building footprint to provide roughly equal lateral and vertical coverage (where accessible), to characterize soil that will most likely be graded and excavated during future proposed development as shown on Figure 2.

Soil samples were collected from each boring by a hydraulically driven direct push drill rig advancing a continuous four-foot long Macro-core tooling with an acetate sleeve to the following depths: approximately 10 feet (EB-6, EB-7, and EB-4), 15 feet (EB-3), 20 feet (EB-1 and EB-2), and 30 feet (EB-5 and EB-8). Soil samples from EB-1 and EB-2 were collected at approximately 0.5, 5, 10, 15, and 20 feet bgs and logged continuously until the terminus of the boring. In addition, soil samples from EB-3, EB-4, EB-5, EB-6, EB-7, and EB-8 were collected at approximately 0.5 and 5 feet bgs. Approximately six-inch sample lengths were cut from the liners and ends were covered with Teflon, sealed with plastic end caps, labeled, and stored in an ice-cooled chest for delivery to McCampbell Analytical, Inc. (McCampbell), a California Department of Health Services certified analytical laboratory in Pittsburg, California. All samples were delivered under chain-of-custody procedures. Boring logs from this investigation are presented in Appendix A as Figures A-1 and A-2. The soil encountered was classified in accordance with the soil classification chart on Figure A-3.

4.3 Groundwater Sampling

EB-1, EB-3, EB-5, and EB-8 were advanced to depths of 15 to 30 feet for the collection of grab groundwater samples and four samples (EBGW-1, EBGW-3, EBGW-5, and EBGW-8) were collected. To facilitate the collection of the groundwater sample, temporary groundwater wells with prepacked well screens were driven into the water table which was encountered at approximately 7.5 to 15 feet bgs at EB-3, 10 feet bgs at EB-1, and 20 feet bgs at EB-5 and EB-8. The grab groundwater samples were collected directly into

laboratory-supplied sample containers using a peristaltic pump. Samples were appropriately labeled and stored in an ice-cooled chest until delivery to McCampbell.

4.4 Soil Vapor Sampling

Temporary soil vapor probes were installed at eight boring locations to depths of five feet bgs. One sample was collected from each probe (EBSV-1, EBSV-2, EBSV-3, EBSV-4, EBSV-5, EBSV-6, EBSB-7, and EBSV-8), and a duplicate sample (DUP-1) was collected from a random soil vapor probe. The soil vapor probes were installed and sampling was conducted in general accordance with procedures established by the Department of Toxic Substance Control (DTSC) *Advisory for Active Soil Gas Investigations* dated July 2015. The soil vapor sample was collected by advancing 1.75-inch diameter steel rods equipped with a retractable sampling tip advanced to a depth of approximately five feet bgs using a truck-mounted hydraulically driven direct push drill rig. Disposable 1/4-inch diameter Teflon tubing was connected from the surface to the sampling tip. A sand filter pack was placed around the sampling tip to facilitate soil vapor collection. Hydrated bentonite chips were placed above the filter pack to the ground surface to seal the annular space.

After waiting two hours, three well volumes of soil vapor were purged using a one-liter summa canister connected to the Teflon tubing. Helium was used as a tracer gas around the sampling assembly above the borehole during sampling as a quality assurance/quality control (QA/QC) measure to confirm the sample integrity. The soil vapor sample was collected in a one-liter laboratory supplied summa canister and sealed before delivery to K-Prime Analytical (K-prime) a California Department of Health Services certified analytical laboratory in Santa Rosa, California.

Upon completion of the drilling and sampling, the boreholes were backfilled with neat cement grout under the supervision of the ACPWD grout inspector.

5.0 SUBSURFACE CONDITIONS

Results of Langan's *Preliminary Geotechnical Investigation* (Langan 2020), our March 2020 environmental borings and borings by others indicate the blocks are underlain by up to 5 feet of fill consisting of sand with variable silt and clay content. The fill could be thicker at Block 1 where the cut-and-cover BART tunnel was constructed.

At Block 1, the fill is underlain by about 11 to 17 feet of Merritt sand over the Alameda formation. The Merritt sand consists of thin interbedded layers of medium dense to very dense clayey sand and sand with silt. The Alameda formation consists of very stiff to hard clay with variable sand content. Layers of dense to very dense sand were encountered within the Alameda formation between depths of 23 and 41 feet bgs, with thicknesses between about 1 foot and 12 feet.

At Block 2, the fill is underlain by about 13 to 21 feet of medium dense to very dense Merritt sand over stiff to hard clay of the Alameda formation. Layers of dense to very dense sand, ranging in thickness from between 1 to 10 feet, were encountered within the Alameda formation between depths of 24½ and 70 feet bgs.

Groundwater was found between approximately 7.45 and 20 feet bgs at the time of drilling EB-1, EB-3, EB-5 and EB-8. Groundwater was not present within the top 20 feet drilled at EB-2. We anticipate the groundwater level is affected by local variations in subsurface conditions and seasonal variations in rainfall. The nearest surface water bodies are the San Francisco Bay and Lake Merritt, approximately 0.5 miles south and northeast respectively of the Site. Groundwater flow is anticipated to be to the southeast in the direction of the channel flowing from Lake Merritt to the Oakland Inner Harbor.

6.0 SAMPLE SELECTION AND ANALYTICAL TESTING

The Phase II ESA sampling and analytical testing was chosen to evaluate potential vapor intrusion concerns, and soil profiling scenarios generally accepted by landfills.

6.1 Soil Testing

The soil chemical analytical schedule was chosen to assess potential health risk management protocols needed during construction and development and to satisfy waste profiling scenarios generally accepted by landfills. Certain soil samples were analyzed for some or all of the following.

- Total petroleum hydrocarbons (TPH) as gasoline (TPHg), TPH as diesel (TPHd), and TPH as motor oil (TPHmo) by EPA Method 8015B;
- Volatile organic compounds (VOCs) by EPA Method 8260B;
- Semi-volatile organic compounds (SVOCs) by EPA Method 8270C;

- Organochlorine pesticides (OCPs) by EPA Method 8081A;
- Polychlorinated biphenyls (PCBs) by EPA Method 8082;
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270;
- California Assessment Manual (CAM) 17 metals by EPA Method 6020; and
- Leaking Underground Fuel Tank (LUFT) 5 metals by EPA Method 6020.

Soil samples with metal concentrations metal greater than 10 times the soluble threshold limit concentration (STLC) were also analyzed for soluble metals using the California waste extraction test (WET) method. Any total threshold limit concentration (TTLC) concentration exceeding 20 times the STLC value, or if the STLC value after analysis with the WET method exceeded the State of California hazardous waste criteria the sample was submitted for analysis by the Federal toxicity characteristic leaching potential (TCLP). These analyses were necessary to assess if metal concentrations in soil exceed State and/or Federal hazardous waste criteria.

6.2 Groundwater Testing

Groundwater was sampled and analyzed to evaluate potential vapor intrusion concerns. The grab groundwater sample was analyzed for the following:

- TPHg, TPHd, and TPHmo by EPA Method 8015M;
- VOCs by EPA Method 8260B;
- SVOCs by EPA Method 8270C; and
- Total CAM 17 metals by EPA Method E200.8.6.3 Soil Vapor Testing

Soil vapor samples were collected to evaluate the potential for unacceptable vapor intrusion human health risks and were analyzed for the following:

- VOCs by EPA Method TO-15;
- Carbon dioxide by ASTM D-1946;
- Methane by EPA Method 18;
- Helium by ASTM D-1946; and
- Oxygen by ASTM D-1946.

7.0 LABORATORY TEST RESULTS AND EVALUATION

The laboratory analytical results are discussed below and summarized on Tables 1 through 5. Copies of the certified laboratory analytical reports are presented in Appendix B.

7.1 Soil Analytical Results

Soil analytical results for parameters other than metals are summarized in Table 1. TPHg was detected in one sample (EB-7-0.5) at a concentration of 2.2 milligram per kilogram (mg/kg). TPHd was detected in six samples (EB-1-0.5, EB-2-0.5, EB-5-0.5, EB-6-0.5, EB-7-0.5, and EB-8-0.5) at concentrations ranging from 150 mg/kg to 400 mg/kg. The 400 mg/kg concentration in sample EB-1-0.5 exceeds the soil residential environmental screening level (ESL) (cancer) of 260 mg/kg. TPHmo was detected in eight samples (EB-1-0.5, EB-2-0.5, EB-3-0.5, EB-4-0.5, EB-5-0.5, EB-6-0.5, EB-7-0.5, and EB-8-0.5) at concentrations ranging from 6.4 to 5,700 mg/kg.

Four SVOCs were detected benzo(a)pyrene (B(a)P), bis (2-ethylhexyl) phthalate, di-n-butyl phthalate, and phenol above the laboratory reporting limits but below the residential and commercial soil ESLs at concentrations ranging from 0.0052 mg/kg to 0.043 mg/kg. No other SVOCs were detected above laboratory reporting limits in the samples analyzed.

No VOCs were detected above laboratory reporting limits in any of the soil samples analyzed.

One PCB (Aroclor 1254) was detected in one soil sample, EB-1-0.5, above the laboratory reporting limit as well as the residential and commercial soil ESLs at a concentration of 28 mg/kg. No other PCBs were detected above laboratory reporting limits in any of the samples analyzed.

Three OCPs, dichlorodiphenyltrichloroethane (DDT), dieldrin, and endrin, were detected above the laboratory reporting limit at a concentration of 1.6 mg/kg, 1.4 mg/kg, and 0.23 mg/kg, respectively in one soil sample, EB-1-0.5. The concentration of dieldrin at 1.4 mg/kg exceeded the residential and commercial soil ESLs of 0.037 and 0.16 mg/kg respectively. No other OCPs were detected above laboratory reporting limits in any of the samples analyzed.

The metal analytical results are summarized in Table 2. Total arsenic was detected at or above the laboratory reporting limits in all 15 samples analyzed at concentrations ranging

from 0.94 mg/kg to 4.5 mg/kg (Table 2). Of the 15 detections, 13 of the detections fell within the background metal concentrations of Bay Area soils² of 1.2-31 mg/kg. The other two detections, EB-6-0.5 and EB-8-0.5, exceeded the residential and commercial soil ESLs (cancer) of 0.067 mg/kg and 0.31 mg/kg respectively but fell below the background metal concentrations. Additionally, EB-8-0.5, exceeded the soil construction worker ESL of 0.98 mg/kg.

Arsenic was not detected at concentrations above 50 mg/kg (10 times the STLC) in any of the soil samples analyzed; therefore, analysis to determine soluble arsenic levels was not necessary.

Total barium was detected at or above the laboratory reporting limits in all 15 samples analyzed at concentrations ranging from 24 mg/kg to 150 mg/kg (Table 2). All 15 detections did not exceed soil residential or commercial ESLs. Barium was not detected at concentrations above 1,000 mg/kg (10 times the STLC) in any of the soil samples analyzed; therefore, analysis to determine soluble barium levels was not necessary.

Total chromium was detected at or above the laboratory reporting limits in each of the 22 samples analyzed at concentrations ranging from 18 mg/kg to 85 mg/kg (Table 2). Total chromium was detected in 14 samples (EB-1-5, EB-1-10, EB-1-15, EB-2-0.5, EB-2-5, EB-2-10, EB-2-15, EB-2-20, EB-3-5, EB-4-5, EB-5-5, EB-6-5, EB-7-5, EB-8-5) at a concentration above 50 mg/kg (10 times the STLC) but below 2,500 mg/kg (TTLC). These total chromium concentrations, including those that were greater than 10 times the STLC, were within normal background ranges found in the Bay Area² and did not exceed soil residential or commercial ESLs. These soil samples were subsequently analyzed to determine soluble chromium levels using the WET method. Soluble chromium was detected in sample EB-1-10 at 0.11 mg/L, EB-1-15 at 0.12 mg/L, EB-2-0.5 at 0.14 mg/L, EB-2-5 at 0.20 mg/L, EB-2-10 at 0.16 mg/L, EB-2-15 at 0.12 mg/L, EB-3-5 at 0.14 mg/L, EB-6-5 at 0.11 mg/L, EB-7-5 at 0.15 mg/L, and EB-8-5 at 0.11 mg/L. Soluble chromium was non-detect for samples EB-1-2.0, EB-2-20, EB-4-5, and EB-5-5. All soluble chromium detections were below the Class I non-Resource Conservation and Recovery Act (RCRA) State of California hazardous waste criteria of 5 mg/L (Table 2).

² Environmental Resources Management. *Feasibility Study, Hookston Station, Pleasant Hill, California. Appendix A, Table A-2, "Comparison of Background Concentrations of Metals in Bay Area Soils,"* dated July 2006.

Total cobalt was detected at or above the laboratory reporting limits in 15 samples analyzed at concentrations ranging from 4.4 mg/kg to 19 mg/kg (Table 2). Cobalt detections did not exceed soil residential or commercial ESLs nor were they detected at concentrations above 800 mg/kg (10 times the STLC) in any of the soil samples analyzed; therefore, analysis to determine soluble cobalt levels was not necessary.

Total lead was detected at or above the laboratory reporting limits in each of the 22 samples analyzed at concentrations ranging from 1.9 mg/kg to 11 mg/kg (Table 2). Lead was not detected at concentrations above the soil residential or commercial ESLs. In addition, concentrations were not detected above 50 mg/kg (10 times the STLC) in any of the soil samples analyzed; therefore, analysis of STLC and TCLP lead to determine soluble lead levels was not necessary.

Total zinc was detected at or above the laboratory reporting limits in each of the 22 samples analyzed at concentrations ranging from 22 mg/kg to 95 mg/kg (Table 2). Zinc was not detected at concentrations above the soil residential or commercial ESLs. In addition, concentration were not detected above 2,500 mg/kg (10 times the STLC) in any of the soil samples analyzed; therefore, analysis of STLC and TCLP zinc to determine soluble zinc levels was not necessary.

Antimony, silver, and thallium were not detected above or at the laboratory reporting limit in the samples that it was analyzed for. The remaining metal concentrations were within normal background ranges found in the Bay Area² and did not exceed the soil residential and commercial ESLs.

7.2 Groundwater Analytical Results

The groundwater analytical results for organic compounds are summarized in Table 3. TPHd was detected in three of the three samples (EBGW-1, EBGW-5, EBGW-8) at concentrations of 130 µg/L, 1,100 µg/L, and 830 µg/L respectively. TPHmo was detected in three samples (EBGW-1, EBGW-5, EBGW-8) at concentrations of 730 µg/L, 18,000 µg/L, and 15,000 µg/L respectively. TPHg was not detected in any samples. Tetrachloroethene (PCE) was detected in groundwater samples EBGW-1 and EBGW-3 at concentrations of 7.9 µg/L and 52 µg/L respectively, which exceed the residential and commercial groundwater vapor intrusion (GW-VI) ESL of 0.64 µg/L and 2.80 µg/L respectively. TCE was detected in one groundwater sample EBGW-3 at a concentration of 4.4 µg/L, which exceeds the residential VI ESL of 1.2 µg/L. Acetone and chloroform

were detected in groundwater sample EBGW-8 at concentrations of 18 µg/L and 0.54 µg/L respectively, which do not exceed the residential or commercial GW-VI ESLs. No other VOCs were detected above laboratory reporting limits in any of the samples analyzed. Six SVOCs were detected including anthracene, bis (2-ethylhexyl) phthalate, di-n-butyl phthalate, diethyl phthalate, dimethyl phthalate, and phenol were detected above the laboratory reporting limits at concentrations ranging from 0.022 µg/L to 4.5 µg/L. No other SVOCs were detected above laboratory reporting limits in the samples analyzed.

The metal analytical results are summarized in Table 4. Total arsenic was detected at or above the laboratory reporting limits in three samples analyzed at concentrations ranging from 100 µg/L to 540 µg/L (Table 2).

Total barium was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 3,100 µg/L to 10,000 µg/L (Table 4).

Total chromium was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 420 µg/L to 2,500 µg/L (Table 4).

Total cobalt was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 63 µg/L to 1,900 µg/L (Table 4).

Total copper was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 59 µg/L to 810 µg/L (Table 4).

Total lead was detected at or above the laboratory reporting limits in each of all four samples analyzed at concentrations ranging from 120 µg/L to 720 µg/L (Table 4).

Total mercury was detected at or above the laboratory reporting limits in one sample analyzed (EBGW-8) at a concentration of 3.6 µg/L (Table 4).

Total molybdenum was detected at or above the laboratory reporting limits in two samples (EBGW-1 and EBGW-5) analyzed at concentrations of 180 µg/L and 220 µg/L (Table 4).

Total nickel was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 320 µg/L to 2,900 µg/L (Table 4).

Total selenium was detected at or above the laboratory reporting limits in one sample analyzed (EBGW-8) at a concentration of 100 µg/L (Table 4).

Total vanadium was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 230 µg/L to 2,000 µg/L (Table 4).

Total zinc was detected at or above the laboratory reporting limits in all four samples analyzed at concentrations ranging from 330 µg/L to 1,800 µg/L (Table 4).

Antimony, beryllium, cadmium, silver, and thallium were not detected above or at the laboratory reporting limit in the four samples.

The elevated concentrations of metals are likely a result of high sediment content in the groundwater grab samples. The metal concentrations were detected below wastewater discharge criteria for East Bay Mud³ Municipal Utility District (EBMUD).

7.3 Soil Vapor Analytical Results

Soil vapor analytical results are presented in Table 5. Four VOCs associated with petroleum hydrocarbons were detected above their respective laboratory reporting limits; including, benzene, ethylbenzene, p/m-xylene, and PCE. Benzene was detected in soil vapor samples EBSV-1, EBSV-3, DUP-1, and EBSV-4 at the concentrations of 38.3 micrograms per cubic meter (µg/m³), 17.1 µg/m³, 9.65 µg/m³ and 22.8 µg/m³ respectively, which exceed the residential VI ESL of 3.2 µg/m³. Ethylbenzene was detected in soil vapor samples EBSV-2, EBSV-4, EBSV-5, EBSV-6, EBSV-7, and EBSV-8 at the concentrations of 838 µg/m³, 355 µg/m³, 393 µg/m³, 928 µg/m³, 4,410 µg/m³ and 4,490 µg/m³ respectively, which exceed the residential VI Soil Gas (SG ESL) ESL of 37 µg/m³. Xylenes (m/p) were detected in soil vapor samples EBSV-2, EBSV-6, EBSV-7, and EBSV-8 at the concentrations of 4,620 µg/m³, 4,610 µg/m³, 20,700 µg/m³ and 20,000 µg/m³, which exceed the residential SG ESL of 3,500 µg/m³.

PCE, a VOC associated with historical dry cleaner operations and industrial operations was detected in soil vapor samples EBSV-1, EBSV-2, EBSV-3 and DUP-1 at 18.9 µg/m³,

³ East Bay Municipal Utility District. *Wastewater control ordinance & discharge limits*. <https://www.ebmud.com/wastewater/collection-treatment/wastewater-control-ordinance-discharge-limits#>, 4 January 2020

1,320 $\mu\text{g}/\text{m}^3$, 45.7 $\mu\text{g}/\text{m}^3$, and 88.8 $\mu\text{g}/\text{m}^3$, respectively, which exceed the residential VI ESL of 15 $\mu\text{g}/\text{m}^3$. The remaining VOCs detected in soil vapor were below their respective SG ESLs.

Helium was used as a tracer gas around the sampling assembly and borehole during sampling as a QA/QC measure to confirm the sample integrity. Helium was not detected above the laboratory reporting limit in the eight primary and one duplicate soil vapor samples analyzed. Oxygen was analyzed to assess the possibility of petroleum vapor intrusion bio-attenuation in the shallow soil zone. Oxygen was detected above the laboratory reporting limit in the soil vapor samples analyzed at 10.5 to 21.7 percent by volume (%V). Methane was analyzed to assess potential explosive concerns and vapor intrusion. In soil vapor samples EBSV-5 and EBSV-6 methane was detected below laboratory reporting limits. For the remainder of the soil vapor samples, methane was detected below a concentration of 0.01%V with the exception of EBSV-1 where methane was detected at a concentration of 0.017%V. All methane concentrations were detected below the indoor air methane screening level of 0.5%V.

8.0 INDOOR AIR RISK EVALUATION

The groundwater analytical results for VOCs detected in samples collected from Block 2 (i.e., PCE and TCE) were compared to the groundwater vapor intrusion (GW-VI) ESLs based on commercial land use to identify Compounds of Potential Concern (COPCs). The GW-VI ESLs adopt a target incremental lifetime cancer risk (ILCR) of 1E-06, or 1 in 1,000,000, to calculate risk-based screening levels for individual carcinogens. For non-carcinogenic compounds, the GW-VI SLs are based on a hazard quotient (HQ) of 1. PCE and TCE were not detected above the associated screening level; consequently, there are no groundwater COPCs that are carried forward for further assessment (Table 2).

The groundwater TCE concentrations in samples collected from Block 2 were also compared to the RWQCB groundwater trigger level for commercial land use (20 $\mu\text{g}/\text{L}$) to determine if they represent a short-term exposure concern. The TCE detections in groundwater were all below the trigger level, indicating that acute exposure is not anticipated based on the current commercial use of Block 2.

The soil gas sample results for locations proximal to the building located at Block 2 (EBSV-2 and EBSV-3) were compared to the SG ESLs for commercial land use to identify indoor

air COPCs. The RWQCB uses a generic attenuation factor (AF) to back-calculate a health-protective soil gas concentration from a risk-based indoor air concentration. The SG ESLs adopt an empirical soil gas-to-indoor-air attenuation factor of 0.03 to perform the calculation; this value is conservative because it represents the 95th percentile value in the United States Environmental Protection Agency (EPA) vapor intrusion database. Benzene, ethylbenzene, total xylenes, and PCE were detected above the associated commercial SG ESLs (Table 5).

The EPA endorses an upper-bound cancer risk management value of 1E-04 for exposure to multiple carcinogens. This value represents an incremental increase of 1 in 10,000 in the chance of developing cancer over the course of a lifetime. For evaluating the noncarcinogenic hazards for multiple constituents, the HQs are summed to produce a hazard index (HI). If the site-specific exposure level exceeds the effects-based threshold (i.e., the HI exceeds a value greater than 1), there may be vapor intrusion concern for potential chronic, non-carcinogenic effects.

The ratio of the maximum measured concentration to the associated SG ESL was calculated for each COPC and used to estimate potential risk and hazard using the following equation at each location:

$$Risk\ or\ Hazard = \frac{C_{SG}}{SG\ ESL}$$

Where:

C_{SG} = Concentration in soil gas ($\mu\text{g}/\text{m}^3$)

For carcinogens, the ratio must be multiplied by 1E-06 to provide an estimate of risk probability. The resulting ILCR and HI estimates for the vapor intrusion pathway, based on the maximum detected constituent concentrations and the SG ESLs, are presented below:

Location EBSV-2			Location EBSV-3		
	ILCR	HQ		ILCR	HQ
Ethylbenzene	5.2E-06	0.006	Benzene	1.2E-06	0.04
Total Xylenes	--	0.3	PCE	1.3E-06	0.02
PCE	2.0E-05	0.2	Total	2.5E-06	0.06
Total	2.5E-05	0.5			

The risk characterization that was completed using the SG ESLs presented above represents the worst case exposure scenario for commercial building occupants. Carcinogenic compounds ethylbenzene, benzene, and PCE individually produce an ILCR within the EPA's acceptable risk range at locations EBSV-2 and EBSV-3. The cumulative (i.e., total) cancer risk is also within the acceptable risk range for EBSV-2 and EBSV-3 at $2.5E-05$ and $2.5E-06$, respectively. The individual hazard quotients for each COPC is below the noncancer threshold of 1. The total hazard index is also below the threshold level of 1 for EBSV-2 and EBSV-3 at 0.5 and 0.6, respectively, indicating that chronic noncancer health effects are not anticipated to occur.

9.0 CONCLUSIONS AND PRELIMINARY RECOMMENDATIONS

The results from Langan's March 2020 Phase II ESA indicated that the site is underlain by a layer of fill material with little to no elevated concentrations of heavy metals. No metal concentrations in soil exceeded State of California Class I non-RCRA hazardous waste criteria. The fill material will likely be characterized as Class II non-hazardous waste. Subsurface material has not been sampled beneath the existing building. Where explored, the native material beneath the fill layer does not contain hazardous levels of contaminants and may likely be disposed of as non-hazardous material or potentially unrestricted material but final soil acceptance is dependent on the receiving landfill or facility's acceptance criteria.

Groundwater was encountered at approximately 7.5 to 20 bgs at the site. If dewatering and discharge of groundwater is required for construction a permit should be obtained from the EBMUD.

The groundwater analytical results indicate that VOC compound PCE was detected at concentrations exceeding the respective residential and commercial ESLs (cancer) for vapor intrusion in two of the four samples analyzed and TCE was detected at a concentration exceeding the respective residential ESL (cancer) in one of the four samples analyzed. TCE was not detected in the soil vapor samples. The soil vapor analytical results indicate that VOC compounds benzene, ethylbenzene, m/p-xylenes and PCE were detected at concentrations exceeding their respective GW-VI ESLs. Most of these VOC compounds were not detected in soil samples collected from the site. Thus, the contamination is more likely associated with an off-site source and is likely associated with elevated PCE in soil attributed to PCE in groundwater, specifically by Block 2. With this information, Langan reviewed available information on GeoTracker and EnviroStor to assess the potential sources of groundwater and soil vapor concentrations found during Phase II ESA. A list of potential offsite sources as well as the Sites names and Geotracker or EnviroStor links are provided in Table 6 below. Per the Plan for Implementation of Low-Threat Underground

Storage Tank Case Closure Policy and Additional Program Improvements (Plan), State Water Board Resolution No. 2012-0062, Langan evaluated the potential for petroleum related VOCs in soil vapor to naturally biodegrade beneath the site. Generally, petroleum related VOCs biodegrade rapidly under aerobic conditions, and if biodegradation is complete it produces only water and carbon dioxide. No significant concentrations (greater than 100 mg/kg) of TPHg were detected in the shallow fill zone (less than six feet bgs). Significant concentrations (greater than 100 mg/kg) of TPHd were detected in the shallow fill zone (less than six feet) at EB-1-0.5, EB-2-0.5, and EB-5-0 through EB-8-0.5 at concentrations ranging from 150 mg/kg to 400 mg/kg. The concentration of TPHd at EB-1-0.5 exceeded the residential ESL of 260 mg/kg at 400 mg/kg. In addition, oxygen was detected up to 21.7 %V at five feet bgs, which suggests a bioattenuation zone is present beneath the site.

Given the concentration of oxygen and vertical separation distance, there is a potential for petroleum related VOCs (ethylbenzene and xylenes) to biodegrade beneath the Site. The chlorinated solvents PCE and TCE (detected above the residential SG ESLs) do not have the propensity to naturally biodegrade in aerobic environments.

Per the proposed development plan, four buildings will be developed within the site, Building A, Building B, Building C, and Building D. Building A is proposed for residential, and there are exceedances of ethylbenzene and xylenes at EB-7 and EB-8 within the footprint of the proposed Building A. Building B is proposed for similar use, and the concentrations of ethylbenzene and xylenes also exceed the residential ESLs. Building D is also proposed for residential, specifically for affordable housing, and there are exceedance of benzene and PCE beneath and within the footprint. Building C, is the only building proposed for commercial use, and significant concentrations of benzene, ethylbenzene and PCE were detected at EB-1 and/or EB-2. As a result, Langan recommends additional soil vapor sampling to further evaluate potential vapor intrusion.

10.0 LIMITATIONS

Descriptions of specific field activities and historical events are based on our observations and on information provided by others. The opinions and information presented in this report apply to site conditions and the information that was available at the time the work was performed and do not apply to changes of which we are not aware or have not had the opportunity to evaluate. Langan makes no guarantees or warranties with respect to the accuracy or completeness of this information.

TEST ENVIRONMENTAL INCHES 750650003 LAKE MERRITT BART.GPJ T&R.GDT. 3/12/20

Boring terminated at a depth of 20 feet below ground surface.
Boring backfilled with cement grout.
Groundwater not encountered at time of drilling.

Project No.:
750650003\

Figure:

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions		Symbols	Typical Names
Coarse-Grained Soils <small>(more than half of soil > no. 200 sieve size)</small>	Gravels <small>(More than half of coarse fraction > no. 4 sieve size)</small>	GW	Well-graded gravels or gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
	Sands <small>(More than half of coarse fraction < no. 4 sieve size)</small>	SW	Well-graded sands or gravelly sands, little or no fines
		SP	Poorly-graded sands or gravelly sands, little or no fines
		SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
Fine-Grained Soils <small>(more than half of soil < no. 200 sieve size)</small>	Silts and Clays <small>LL = < 50</small>	ML	Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL	Organic silts and organic silt-clays of low plasticity
	Silts and Clays <small>LL = > 50</small>	MH	Inorganic silts of high plasticity
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic silts and clays of high plasticity
Highly Organic Soils		PT	Peat and other highly organic soils

SAMPLE DESIGNATIONS/SYMBOLS

GRAIN SIZE CHART		
Classification	Range of Grain Sizes	
	U.S. Standard Sieve Size	Grain Size in Millimeters
Boulders	Above 12"	Above 305
Cobbles	12" to 3"	305 to 76.2
Gravel coarse fine	3" to No. 4 3" to 3/4" 3/4" to No. 4	76.2 to 4.76 76.2 to 19.1 19.1 to 4.76
Sand coarse medium fine	No. 4 to No. 200 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200	4.76 to 0.075 4.76 to 2.00 2.00 to 0.420 0.420 to 0.075
Silt and Clay	Below No. 200	Below 0.075

- Sample taken with Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter. Darkened area indicates soil recovered
- Classification sample taken with Standard Penetration Test sampler
- Undisturbed sample taken with thin-walled tube
- Disturbed sample
- Sampling attempted with no recovery
- Core sample
- Analytical laboratory sample
- Sample taken with Direct Push or Drive sampler
- Sonic

- Unstabilized groundwater level
- Stabilized groundwater level

SAMPLER TYPE

- C Core barrel
- CA California split-barrel sampler with 2.5-inch outside diameter and a 1.93-inch inside diameter
- D&M Dames & Moore piston sampler using 2.5-inch outside diameter, thin-walled tube
- O Osterberg piston sampler using 3.0-inch outside diameter, thin-walled Shelby tube
- PT Pitcher tube sampler using 3.0-inch outside diameter, thin-walled Shelby tube
- S&H Sprague & Henwood split-barrel sampler with a 3.0-inch outside diameter and a 2.43-inch inside diameter
- SPT Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and a 1.5-inch inside diameter
- ST Shelby Tube (3.0-inch outside diameter, thin-walled tube) advanced with hydraulic pressure

"When Quality Counts"

Analytical Report

WorkOrder: 2003414 A

Report Created for: Langan

135 Main St, Suite 1500
San Francisco, CA 94105

Project Contact: Arthur Machado

Project P.O.:

Project: 750650003; Lake Merritt Bart

Project Received: 03/09/2020

Analytical Report reviewed & approved for release on 03/25/2020 by:

Yen Cao

Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: Langan
Project: 750650003; Lake Merritt Bart
WorkOrder: 2003414 A

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate \$250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

* If metals are requested for water samples and the water type (Matrix) is not specified on the chain of custody, MAI will default to metals by E200.8.						Comments / Instructions <u>PLEASE CC</u> <u>DSUTHERLAND@LANGAN.COM</u>	
Please provide an adequate volume of sample. If the volume is not sufficient for a MS/MSD a LCS/LCSD will be prepared in its place and noted in the report.

McC Campbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 2003413

Report Created for: Langan

135 Main St, Suite 1500
San Francisco, CA 94105

Project Contact: Arthur Machado

Project P.O.:

Project: 750650003; Lake Merritt Bart

Project Received: 03/09/2020

Analytical Report reviewed & approved for release on 03/16/2020 by:

Angela Rydelius
Laboratory Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: Langan
Project: 750650003; Lake Merritt Bart
WorkOrder: 2003413

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: Langan
Project: 750650003; Lake Merritt Bart
WorkOrder: 2003413

Analytical Qualifiers

J Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
a19 Reporting limit near, but not identical to our standard reporting limit due to variable sample volume
b1 Aqueous sample that contains greater than ~1 vol. % sediment
b8 Sample diluted prior to digestion due to high sediment content.
e2 Diesel range compounds are significant; no recognizable pattern
e7 Oil range compounds are significant
e8 Pattern resembles kerosene/kerosene range/jet fuel range

Quality Control Qualifiers

F2 LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.

The following SampIDs: 001A, 002A, 003A, 004A, 005A contain testgroup Multi Range_W.

Comments:

NOTE: Soil samples are discarded 60 days after results are reported unless other arrangements are made (Water samples are 30 days).
Hazardous samples will be returned to client or disposed of at client expense.

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

MAI clients MUST disclose any dangerous chemicals known to be present in their submitted samples in concentrations that may cause immediate harm or serious future health endangerment as a result of brief, gloved, open air, sample handling by MAI staff. Non-disclosure incurs an immediate \$250 surcharge and the client is subject to full legal liability for harm suffered. Thank you for your understanding and for allowing us to work safely.

* If metals are requested for water samples and the water type (Matrix) is not specified on the chain of custody, MAI will default to metals by E200.8.
 Please provide an adequate volume of sample. If the volume is not sufficient for a MS/MSD a LCS/LCSD will be prepared in its place and noted in the report.

Chain of Custody (COC) Information

- Chain of custody present? Yes No
- Chain of custody signed when relinquished and received? Yes No
- Chain of custody agrees with sample labels? Yes No
- Sample IDs noted by Client on COC? Yes No
- Date and Time of collection noted by Client on COC? Yes No
- Sampler's name noted on COC? Yes No
- COC agrees with Quote? Yes No NA

Sample Receipt Information

- Custody seals intact on shipping container/cooler? Yes No NA
- Shipping container/cooler in good condition? Yes No
- Samples in proper containers/bottles? Yes No
- Sample containers intact? Yes No
- Sufficient sample volume for indicated test? Yes No

Sample Preservation and Hold Time (HT) Information

- All samples received within holding time? Yes No NA
- Samples Received on Ice? Yes No

(Ice Type: WET ICE)

- Sample/Temp Blank temperature Temp: 0.5°C NA
- Water - VOA vials have zero headspace / no bubbles? Yes No NA
- Sample labels checked for correct preservation? Yes No
- pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)? Yes No NA

UCMR Samples:

pH tested and acceptable upon receipt (200.8: ≤2; 525.3: ≤4; 530: ≤7; 541: <3; 544: <6.5 & 7.5)? Yes No NA

Free Chlorine tested and acceptable upon receipt (<0.1mg/L)? Yes No NA

"When Quality Counts"

Analytical Report

WorkOrder: 2003414

Report Created for: Langan

135 Main St, Suite 1500
San Francisco, CA 94105

Project Contact: Arthur Machado

Project P.O.:

Project: 750650003; Lake Merritt Bart

Project Received: 03/09/2020

Analytical Report reviewed & approved for release on 03/16/2020 by:

Yen Cao

Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: Langan
Project: 750650003; Lake Merritt Bart
WorkOrder: 2003414

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: Langan
Project: 750650003; Lake Merritt Bart
WorkOrder: 2003414

Analytical Qualifiers

A	The reported value is determined using a "single point" calibration by GC-ECD as allowed by the method.
B	Analyte detected in the associated Method Blank and in the sample
J	Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
S	Spike recovery outside accepted recovery limits
a3	Sample diluted due to high organic content.
c1	Surrogate recovery outside of the control limits due to the dilution of the sample.
c2	Surrogate recovery outside of the control limits due to matrix interference.
c12	Surrogate recovery outside of the control limits
d7	Strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
e2	Diesel range compounds are significant; no recognizable pattern
e7	Oil range compounds are significant
e8	Pattern resembles kerosene/kerosene range/jet fuel range
j1	See attached narrative

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.
F3	The surrogate standard recovery and/or RPD is outside of acceptance limits.
F7	LCS/LCSD recovery for this compound is above acceptance limits but the sample analytes were not detected; therefore, the data is reportable.
F10	MS/MSD outside control limits. Physical or chemical interferences exist due to sample matrix.

Case Narrative

Client: Langan
Project: 750650003; Lake Merritt Bart

Work Order: 2003414
March 16, 2020

jl:

Samples 2003414-016A, -018A, -020A, -022A, -004A, -005A, -007A, -008A, -009A, -010A, -012A, -014A were analyzed on an instrument sequence with a passing closing CCV that was analyzed outside of the method specified 12 hour time window due to tower error that stopped the sequence prior to its completion. Results are estimated.

**Corrective Action Plan for Lake Merritt RT
Affordable Senior Housing Project (Building B)**

DRAFT CORRECTIVE ACTION FACT SHEET

March 15, 2024

Lake Merritt BART Station Redevelopment

Block 1 – Building B in Oakland
Site Cleanup Program Case No. RO0003559

Summary – Alameda County Department of Environmental Health (ACDEH) is the environmental regulatory agency providing oversight of investigation and cleanup of subsurface contamination at the Site to facilitate redevelopment of a proposed senior affordable housing. ACDEH is distributing this *Fact Sheet* to inform community members and other interested stakeholders about environmental corrective action activities at Lake Merritt Bay Area Rapid Transit (BART) transit-oriented development (TOD) Block 1 – Building B project located at the Lake Merritt BART station in Oakland (Site). Bay Area Rapid Transit – BART (the Property Owner) is working with East Bay Asian Local Development Corporation – EBALDC (the developer) and ACDEH to investigate environmental impacts and implement corrective actions and mitigation measures at the Site in conjunction with redevelopment. This *Fact Sheet* contains information on the Site background, environmental investigations, proposed corrective actions/mitigation measures, next steps, and informational contacts.

Site Background – EBALDC is leasing (from BART) the roughly 1.4-acre Site (APN # 001-0169-001) is located in a mixed commercial and residential area of Oakland. The Site currently includes a plaza with BART entrances above the underground Lake Merritt BART station and an asphalt-paved BART parking lot over the remainder of the block. Previously, the Site was utilized as a gasoline service station as early as 1952. The former gasoline service station building previously on-site was demolished in 1960. Although EBALDC did not contaminate the Site, they are

Public Comment Period March 18 – April 17, 2024

ACDEH invites you to review and comment on the *Draft Corrective Action Plan*. All comments must be received by 5 p.m. on April 17, 2024, sent to:

Drew York
ACDEH Case Manager
1131 Harbor Bay Parkway
Alameda, CA 94502
Andrew.york@acgov.org

voluntarily cleaning it up to support development.

Site Redevelopment – The City of Oakland oversees redevelopment activities. The proposed development of the Site will consist of two buildings, Building A and Building B. This *Fact Sheet* pertains to Building B which includes construction of a seven-story, concrete residential building to be used for senior housing.

Environmental Investigations – Site-wide environmental investigations have reported the presence of elevated levels of soluble lead in soil primarily from existing fill material beneath the Site.

Proposed Corrective Actions – ACDEH is requiring corrective actions to reduce the human health risk to construction workers, the adjacent community, and future Site occupants from the potential for exposure to chemicals of concern in soil at the Site. The *Draft Corrective Action Plan (Draft CAP)*, dated 1 March 2024, proposes the following actions:

- Excavating soil beneath portions of the ground surface to facilitate construction and remove the historically contaminated soil, and
- Transporting soil to a licensed, off-Site disposal facility.

Community Protection Measures – The Property Owner, Developer, and its environmental contractors, under the oversight of ACDEH, will protect surrounding community from dust and other environmental related nuisances during implementation of corrective actions including measures to protect the surrounding community including:

- Controlling dust during soil disturbing activities by using water and covering soil stockpiles,
- Monitoring noise levels during work hours and reducing equipment speeds or using mufflers, as needed,

- Cleaning truck tires and undercarriages to prevent dust track out,
- Using flaggers and traffic signage to safely manage construction-related traffic,
- Maintaining perimeter Site fencing with signage that includes a phone number for more information, and
- Conducting work in accordance with all guidelines to limit risks associated with COVID-19

Next Steps – ACDEH will review and consider all public comments before making a final decision on the *Draft CAP*. ACDEH will send a *Response to Comments* document to all those who commented and provided contact information.

The *Draft CAP*, as well as all Site documents presenting previous environmental investigation activities and results are available online for public download at the State Water Resources Control Board (Water Board) GeoTracker website at

https://geotracker.waterboards.ca.gov/profile_report?global_id=T10000020306.

Should the *Draft CAP* be approved, environmental work at the Site is anticipated to begin in June 2024 in conjunction with redevelopment construction activities.

For more information about the proposed corrective actions, related Site documents, how to access the Site documents, or general Site questions, please contact:

Block 1 Building B – Senior Housing

Cleanup Program Site Case No. RO0003435
GeoTracker Global ID T10000014553
Lake Merritt BART Development

Dear Responsible Parties:

On July 20, 2020, the property developers, East Bay Asian Local Development Corporation, (EBALDC) and Strada Investment Group (Strada), with acknowledgement from the current property owner, Bay Area Rapid Transit (BART), entered into a Voluntary Remedial Action Agreement (VRAA) with Alameda County Environmental Health Department (ACEHD) to provide regulatory oversight of environmental site investigations and cleanup under the subject Cleanup Program Site (CPS) Case RO0003435 to facilitate redevelopment of two parcels located at 51 9th Street (Assessor Parcel Number [APN] 1-169-1; herein after referred to as "Block 1") and 107 8th Street (APN 1-171-2; herein after referred to as "Block 2") both located in Oakland California and described below

On November 16, 2022, and December 12, 2022, the responsible parties identified in the VRAA for RO0003435, executed new VRAAs with different developer entity names with acknowledgement from the property owner, BART, to provide regulatory oversight of environmental site investigations and cleanup on Block 1

Ronald Browder

under the following CSP Cases to facilitate the phased redevelopment (Phase 1 & 2) of the Block 1 parcel starting in 2023:

- RO0003559 – Block 1, Building B – Senior Housing
 - VRAA signed by property owner, BART, and developer, Chinatown Senior Housing, LP;
- RO0003560 – Block 1, Building A – Market Rate
 - VRAA signed by property owner, BART, and developer, LMTOD Property, LLC; and
- RO0003561 – Block 1 – Paseo & Remainder Parcel
 - VRAA signed by property owner, BART, and developer, LMTOD Property, LLC.

A detailed description of the history of regulatory oversight for the Lake Merritt transit-oriented development (TOD) redevelopment project is provide in *Attachment 1* of ACEHD directive letter dated January 24, 2023.

SITE STATUS

On January 16, 2024, a conference call was conducted with representatives from BART, EBALDC, their environmental consultant, Langan, and ACEHD to discuss the path for the Site as documented in the *Meeting Notes* dated January 16, 2024, and uploaded to the case file on the State Water Board’s GeoTracker website. Deliverables outlined during the meeting included but were not limited to submittal of a draft corrective action plan (*Draft CAP*), distribution of a *Draft CAP Fact Sheet*, submittal of updated project schedules, groundwater and soil vapor probe decommissioning work plan and report, and permit/plans/approvals from other agencies.

On March 15, 2024, the *Draft CAP Fact Sheet* was distributed to recipients and sensitive receptors surrounding the Site and the 30-day public comment period was initiated on March 18, 2024, to facilitate comments on the *Draft CAP*, dated March 1, 2024, and prepared on behalf of EBALDC by Langan. Public comments relating to proposed corrective actions were not received, and the public comment period was closed on April 17, 2024.

On April 3, 2024, a conference call was conducted with BART, EBALDC, Langan, and ACEHD to discuss ACEHD comments on the *Draft CAP*. Subsequent to the April 4th meeting and closure of the public comment period on April 17, 2024, the *Final CAP* was submitted for ACEHD review and approval. A summary of corrective actions is presented in *Attachment 1* of this directive letter.

DOCUMENTS REVIEWED

ACEHD has reviewed the case files for the subject environmental cleanup cases associated with the Block 1, Building B – Senior Housing redevelopment prepared by Langan Engineering & Environmental Services, Inc (Langan) on behalf of EBALDC:

- **Corrective Actions**

- *Final Corrective Action Plan* (the “*Final CAP*”), dated April 26, 2024;

- **Work Plans**

- *Well Abandonment Work Plan* (the “*Well Destruction Work Plan*”), dated April 26, 2024;

- **Investigation Reports**

- *Revised Soil Waste Characterization Report* (the “*Waste Characterization Report*”), dated April 26, 2024;

- **Project Schedules**

- *Environmental Baseline Schedule Lake Merritt BART – Block 1 – Building B* (the “*Baseline Schedule*”), dated April 26, 2024;

- **Other Agency Documents**

- *Lake Merritt BART – Building B, Affordable Senior Housing, Permit Set Bldg. B* (the “*Bid Addendum Set*”), dated February 28, 2024, and revised on April 18, 2024, prepared by Pyatok Architects; and
- *Lake Merritt BART – Building B* (the “*Permit Plan Set*”), dated February 28, 2024, prepared by Pyatok Architects.

The above listed documents present a summary of site investigations, remedial action plans, site-specific remedial goals, projected site schedule for environmental related work and plans sets for the redevelopment of Block 1. A detailed summary of the above listed documents is included in **Attachment 1 – Document Summary**.

ACEHD FINDINGS & CONDITIONAL APPROVAL OF THE WELL DESTRUCTION & FINAL CAP

With the provision that the information provided to this agency is accurate and representative of currently known Site conditions, this letter provides ACEHD’s conditional approval of implementation of the groundwater monitoring well and soil vapor probe destruction and proposed soil remedial actions during Site redevelopment presented in the documents listed above in accordance with the *Well Destruction Work Plan* and *Final CAP*. ACEHD concurs that implementation of the proposed remedial actions will reduce the contaminant mass of metals in soil and minimize risk to on- and off-Site receptors to residual subsurface contamination in soil, soil vapor and groundwater to levels that are protective of human health. Therefore, ACEHD approves of the implementation of the proposed remedial actions at the Site provided the conditions of approval and requested deliverables listed below are met.

TECHNICAL REPORTS AND DELIVERABLES REQUEST

ACEHD's request that you submit the deliverables provided in **Attachment 2 – List of Deliverables & Compliance Dates** and **Attachment 3 – Deliverable Requirements**. The requisite deliverables must be:

- (a) Submitted to ACEHD by the compliance dates listed in **Attachment 2** and approved by ACEHD prior to the start of each of the associated phases of corrective action implementation and site redevelopment activities.
- (b) Prepared in accordance with the requirements provided in **Attachment 3**.
- (c) Uploaded to the Case file on the State Water Resources Control Board's GeoTracker database in accordance with requirements listed in *Responsible Party(ies) Legal Requirement & Obligations Instructions* included as **Attachment 4**.

CLOSING

Thank you for your cooperation. If you have any questions, please call me at (510) 639-1276 or send me an email message at andrew.york@acgov.org

Sincerely,

A handwritten signature in blue ink, appearing to read "Drew J. York".

Directive Letter June 4, 2024

Issue Date:

ATTACHMENT 1 –DOCUMENT SUMMARY

Final Corrective Action Plan

The *Final CAP* presents details on the remedial excavation to remove the soluble lead concentrations in soil exceeding State of California hazardous waste criteria during construction, which totals approximately 58 cubic yards of soil. The objective of the *Final CAP* is to minimize exposure to construction workers, the surrounding community, and future site users to constituents in the soil by removing the concentrations in soil that exceed State of California hazardous waste criteria and disposing of them off-site at a permitted landfill facility. The extent of contaminated soil that will be removed is presented on *Figure 2* of the *Final CAP* includes plans and specifications of remedial excavation using standard excavation equipment and disposal of impacted soil off-site at a permitted landfill. The boundaries of the remedial excavation will be established using survey equipment and marked in the field prior to selective removal of surface asphalt and soil excavation. Plans and specifications for the corrective action activities are presented on *Figure 2* and include the following:

- Removal of the upper 1.5 feet below ground surface (bgs) of Class II non-hazardous soil and temporarily place on plastic sheeting for use as backfill.
 - Survey the top and bottom extents of the Class I State of California non-RCRA hazardous soil layer.
- Remedial excavation of lead-impacted Class I State of California non-resource conservation and recovery act (RCRA) hazardous soil from approximately 1.5 feet bgs to a total depth of 5 feet bgs.
- Direct load the Class I State of California non-RCRA hazardous soil into trucks for off-site disposal at a permitted landfill.
- Backfill excavation area and regrade the Site with the Class II non-hazardous soil, and
- Import clean fill (if warranted) in accordance with ACEHD's *Soil Import/Export Characterization Requirements*, dated August 1, 2018, and revised on August 9, 2019.

Well Abandonment Work Plan

The *Well Abandonment Work Plan* presents the procedures for the removal of one groundwater monitoring well (EB-24) and two soil vapor probes (EBSV-32 and EBSV-33). These procedures include the removal of existing well boxes for both the groundwater well and soil vapor probes, pressure grouting the groundwater monitoring well, over-drilling the two soil vapor probes and backfilling the soil vapor probe boreholes with neat cement grout via a tremie pipe to the existing ground surface. After tremie grouting, the groundwater well borehole will be pressure grouted for 15 minutes with 5 pounds per square inch (PSI) of pressure. All well abandonment procedures will be completed by a licensed C-57 driller and will be observed under the supervision of a California licensed Professional Geologist and inspected by Alameda County Public Works Agency.

Revised Soil Waste Characterization Report

The *Revised Soil Waste Characterization Report* documents subsurface investigation activities to delineate the horizontal and vertical extent of soluble lead in soil identified at historical boring EB-24 and to pre-characterize soil encountered during construction. The scope of work included the advancement of 11 exploratory borings (EB-24, EB-24-N, EB-24-NN, EB-24-E, EB-24-EE, EB-24-W, EB-24-WW, SS-1, SS-2, SS-3, and SS-5) to depths ranging from 2.5 feet bgs to 12 feet bgs as presented on *Figure 2* of the *Revised Soil Waste Characterization Report*. Results from the *Revised Soil Waste Characterization Report* indicate that approximately 58 cubic yards of material containing soluble lead concentrations exceeding the State of California Class I non-RCRA hazardous waste criteria are located in the proximity of EB-24 at depths of approximately 1.5 feet bgs to 5 feet bgs. During remedial excavation this impacted soil will be handled and disposed of as State of California Class I non-RCRA hazardous waste. The remaining fill material that is excavated during construction will be disposed or regraded as Class II non-hazardous material as needed based on the grading plan.

Project Schedule

The *Baseline Project Schedule* identifies milestones and important target dates, such as submittal of documents, ACEHD review and approval, the anticipated start and end of construction, and the target occupancy date. The *Baseline Project Schedule* aid in the anticipated allocation of resources to allow for reasonable and timely preparation and review of documents.

ACEHD's review of the *Baseline Project Schedule* indicates the baseline schedule for Building B is out of date and, therefore, is required to be updated as requested in *Item 3.a* in *Attachment 2 & 3* of this directive letter. Subsequent *Updated Project Schedules* must be updated throughout the lifecycle of the project as a planning and scheduling tool and be submitted to ACEHD on Monday of each week during implementation of the corrective actions and site redevelopment activities to be reflective of the actual project timetables.

Other Agency Documents

Two drawing sets have been uploaded the case file on GeoTracker and include the *Lake Merritt BART – Building B Permit Set Drawings*, prepared by Pyatok Architects (Pyatok) and the *Lake Merritt BART – Building B Bid Addendum 1 Drawings*, dated February 28, 2024, and revised for a bid addendum on April 18, 2024, and prepared by Pyatok. These two plan sets present the current development plans for the Site including the construction of a seven-story, concrete residential building for senior housing. The building will include an 11-inch-thick reinforced concrete slab on grade supported by piles and five to six foot thick pile caps. Excavation depths for Building B are anticipated to primarily range between one and six feet bgs to accommodate grading, structural excavation/foundation installation, and utility trenching. The elevator pit will require an isolated deeper excavation with an approximate depth of up to 12 feet bgs.

ATTACHMENT 2 - LIST OF DELIVERABLES & COMPLIANCE DATES

PURPOSE

This document identifies deliverables requested by Alameda County Environmental Health Department (ACDEH) for the above referenced Cleanup Program Site (CPS) case and provides compliance dates for submittal of these deliverables. These deliverables are being requested pursuant to ACDEH's conditions of approval regarding proposed groundwater monitoring well destruction activities and corrective action plans including the following documents prepared by Langan on behalf of EBALDC:

- *Well Abandonment Work Plan* (the "Well Destruction Work Plan"), dated April 26, 2024; and
- *Final Corrective Action Plan* (the "Final CAP"), dated April 26, 2024;

As required in ACDEH's directive letter dated October 19, 2023, ACDEH requests that you prepare the following deliverables in accordance with the requirements provided in **Attachment 3 – Deliverable Requirements** and submit the deliverables to the State Water Resources Control Board's GeoTracker website in compliance with the requirements identified in ACDEH's *Responsible Party(ies) Legal Requirement/Obligations Instructions* included as **Attachment 4**. ACDEH also requests email notification verifying upload of the requested deliverables to the Case file on GeoTracker be provided to the primary caseworker, Drew York (andrew.york@acgov.org).

LIST OF DELIVERABLES AND COMPLIANCE DATES

Prior to the start of all site demolition and earthwork activities including grading and remedial excavation, submittal and ACDEH-approval of the following deliverables:

1. ONSITE GROUNDWATER MONITORING WELL AND SOIL VAPOR PROBE DESTRUCTION

- a. **Deliverable:** On-Site Groundwater Monitoring Well and Soil Vapor Probe Decommissioning Report
Submittal Compliance Date: Thirty (30) days after decommissioning of probes
File Name: RO3559_WELL_SVP_DCM_R_XXXX-XX-XX

2. PERMITS, PLANS, AND APPROVALS FROM OTHER AGENCIES (ACDEH APPROVAL NOT REQUIRED)

- a. **Local Planning Department Entitlement Approvals**
 - i. **Deliverable:** California Environmental Quality Act (CEQA) Compliance Documents
Submittal Compliance Date: Thirty (30) days after City Adoption
File Name: RO3559_DEV_CEQA_XXXX-XX-XX

Attachment 2 - List of Deliverables & Compliance Dates

b. Local Building Department Construction & Demolition Permits

- i. **Deliverable:** Approved Building Permit Plan Set
Submittal Compliance Date: Sixty (60) days prior to the start of foundation and hardscape demolition
File Name: RO3559_BLD_PERMIT_XXXX-XX-XX

- ii. **Deliverable:** Demolition & Grading Permits
Submittal Compliance Date: One (1) week prior to subsurface disturbance work at the Site
File Name: RO3559_DEMO_GRADING_PERMIT_XXXX-XX-XX

Recurring deliverable requirements throughout the implementation of corrective actions at the Site for submittal and ACDEH-approval:

3. SCHEDULES AND STATUS REPORTS

- a. **Deliverable:** Updated Project Schedules
Submittal Compliance Date: Monthly after submittal Baseline Project Schedule
File Name: RO3559_UPDATED_PROJ_SCHD_2024-06-14 (first update)
RO3559_UPDATED_PROJ_SCHD_XXXX-XX-XX (subsequent updates)

- b. **Deliverable:** Weekly Status Reports
Submittal Compliance Date: First report is required to be submitted the first Monday after commencement of foundation/hardscape removal or earthwork activities and each Monday thereafter until installation of final groundcover at the Site is completed.
File Name: RO3559_STATUS_R_XXXX-XX-XX

Prior to backfilling remedial excavations and fill import activities, submittal and ACDEH-approval of the following deliverables:

4. REMEDIAL ACTION COMPLETION & FILL IMPORT DOCUMENTATION

- a. **Deliverable:** Remedial Completion Documentation Submittal Package
Submittal Compliance Date: Fifteen (15) days prior to the start of backfilling
File Name: RO3559_REM_SOIL_EXC_COMP_XXXX-XX-XX

- b. **Deliverable:** Application for Determination of Fill Material Suitability
Submittal Compliance Date: Thirty (30) days prior to the start of backfilling
File Name: RO3559_SOIL_IMPORT_XXXX-XX-XX

Prior to building occupancy, submittal and ACDEH-approval of the following deliverables:

5. REMEDIAL ACTION COMPLETION REPORTS

- a. **Deliverable:** Remedial Action Completion Report
Submittal Compliance Date: Sixty (60) days after completion of remedial actions
File Name: RO3559_RACR_XXXX-XX-XX

Attachment 2 - List of Deliverables & Compliance Dates

- b. **Deliverable:** Soil Import Summary Report
Submittal Compliance Date: Sixty (60) days after completion of soil import
File Name: RO3559_RACR_XXXX-XX-XX

6. **GEOTRACKER COMPLIANCE**

- a. **GeoTracker Database Compliance**
Deliverable: Electronic Deliverable Format (EDF), logs, etc.
Submittal Compliance Date: ongoing as investigation and reports are submitted

ATTACHMENT 3 - DELIVERABLE REQUIREMENTS

PURPOSE

The purpose of this document is to identify requisite elements for each of the deliverables requested by Alameda County Department of Environmental Health (ACEHD) as conditions of approval for implementation of proposed remedial actions and Site redevelopment.

ACEHD requests that you prepare the deliverables listed in **Attachment 2 - List of Deliverables & Compliance Dates** in accordance with the corresponding Technical Comments and Deliverable Requirements provided below and submit the deliverables to the State Water Resources Control Board's GeoTracker website in compliance with the requirements identified in **Attachment 4**.

DELIVERABLES REQUIREMENTS

Prior to the start of all site demolition and earthwork activities including grading and remedial excavation, submittal and ACEHD-approval of the following deliverables:

1. ONSITE GROUNDWATER MONITORING WELL AND SOIL VAPOR PROBE DESTRUCTION

- a. **On-Site Groundwater Monitoring Well and Soil Vapor Decommissioning Report** – A *Report* documenting the permitted destruction of the existing groundwater monitoring well and two existing soil vapor probes in accordance with an approved *Work Plan*. The *Report* must include appropriate documentation (permits, waste disposal documentation, etc.). Final disposal documentation requires full and complete disposal forms, with a minimum of three accepting signatures.

2. PERMITS, PLANS, AND APPROVALS FROM OTHER AGENCIES (ACEHD APPROVAL NOT REQUIRED)

- a. **Local Planning Department Entitlement Approvals** – Submittal of the following documents approved by the City of Oakland Planning Department. The documents must be accompanied by a transmittal letter prepared by the Environmental Consultant that states that the documents are consistent with the permit plans presented in *Lake Merritt BART – Building B* (the "*Permit Plan Set*"), dated February 28, 2024, prepared by Pyatok Architects and the corrective actions proposed in a *Final CAP* and if not, must identify changes to the Site redevelopment, subterranean foundational elements (garages, elevator pits), and first floor building plans. ACEHD notes that substantial changes may invalidate the conclusions of the protectiveness of the proposed redevelopment of the Site with respect to the residual contamination and the proposed corrective actions presented in the *Final CAP*.
 - i. California Environmental Quality Act (CEQA) Compliance Documents

Attachment 3 - Deliverable Requirements

- ii. Documentation of the redevelopment Project approval by the City of Oakland Planning Department

- b. **Local Building Department Construction & Demolition Permits** – Submittal of the following documents approved by the City of Oakland Building Department. The documents must be accompanied by a transmittal letter prepared by the Environmental Consultant that states that the documents are consistent with the Site development plans and corrective actions presented in the *Final CAP*.
 - i. The Building Permit Plan Set

 - ii. Demolition and Grading Permits

Recurring deliverable requirements throughout the implementation of corrective actions at the Site for submittal and ACEHD-approval:

3. SCHEDULES AND STATUS REPORTS

- a. **Updated Project Schedules** – The *Project Schedule* is a living document that must be updated throughout the lifecycle of the project as a planning and scheduling tool. *Updated Project Schedules* must be submitted to ACEHD on Monday of each week during implementation of the remedial and potential corrective actions and site redevelopment activities to be reflective of the actual project timetables.

- b. **Weekly Status Reports** – *Weekly Status Reports* must be submitted to ACEHD on Monday of each week during implementation of the remedial and corrective actions and site redevelopment activities. The reports must include at a minimum:
 - 1. A description of approved remedial and corrective actions implemented, and discovery of unknown environmental conditions and contingency measures taken during the previous week;

 - 2. A description of approved remedial and corrective actions that are planned to be conducted during the next current week;

 - 3. Documentation showing compliance with the requirements of the *Final CAP* and the results of community protection monitoring, including:
 - i. Identification of the number and duration of dust/volatile organic compound (VOC) action level exceedances (collectively, *Action Level Exceedances*);

 - ii. A summary of corrective actions implemented to address *Action Level Exceedances*;

 - iii. A figure depicting the inner quartile range of dust/VOC measurements at each monitoring station;

Attachment 3 - Deliverable Requirements

- iv. A wind-rose diagram;
- v. A statement identifying if a potential unacceptable exposure to contaminated dust or volatile organic compounds (VOCs) occurred during the reporting period;
- vi. Raw data collected from each monitoring station (as an appendix/attachment); and
- vii. A copy of the Complaint Log and discussion of complaints received, and mitigation measures taken to resolve the complaints

Prior to backfilling remedial excavations and fill import activities, submittal and ACEHD-approval of the following deliverables:

4. REMEDIAL ACTION COMPLETION & FILL IMPORT DOCUMENTATION

All contaminated soil exported from the site must be disposed of at an off-Site permitted disposal facility unless otherwise approved by ACEHD. ACEHD requires that imported or exported soil to other than a permitted disposal facility be characterized in accordance with the ACEHD's *Soil Import/Export Characterization Requirements* which was last revised on August 9, 2019 (ACEHD's *Fill Guidance*). The *Fill Guidance* provides requirements for the characterization of soil to determine its suitability for use at another site. These requirements have been prepared to ensure that unsuitable soil is not imported to environmental cleanup sites or exported from environmental cleanup sites to properties with sensitive land uses. The *Fill Guidance* is for characterization of soil only and does not address requirements for characterization of other fill material including, but not limited to crushed rock, pea gravel, recycled concrete, or flowable material.

Written approval is required from ACEHD prior to the import or on-Site re-use of recycled aggregates (including crushed concrete or asphalt). Please be advised that ACEHD has adopted the New Jersey Department of Environmental Protection Solid and Hazardous Waste Management Program's *Guidance for Characterization of Concrete and Clean Material Certification for Recycling* dated January 12, 2010, and *Recycled Asphalt Pavement and Asphalt Millings Reuse Guidance* dated March 2013 amended with applicable ESLs.

- a. **Remedial Action Completion Documentation Submittal Package** – A submittal package with a transmittal letter prepared by the Environmental Consultant documenting that remedial soil excavation has been completed in accordance with the *Final CAP*. The submittal package must be submitted to ACEHD for review and approval prior to backfilling remedial excavations. ACEHD suggests the submittal package be submitted via email correspondence to facilitate quick review and backfill approval. At a minimum, the report must include scaled figures (plan views and cross-sections) showing confirmation sampling locations and extents of excavation, tabulated volumes of soil excavated disposition (on-Site stockpile, direct haul to off-Site disposal facility, on-Site consolidation), volumes of contaminated groundwater removed and disposition (temporary storage in on-Site tanks, discharged to sanitary sewer or storm drain- if warranted), subsurface infrastructure removed and disposition, tabulated soil and groundwater analytical results compared to cleanup goals, and draft soil and groundwater laboratory analytical reports.

Attachment 3 - Deliverable Requirements

- b. **Application for Determination of Fill Material Suitability** – If soil is imported to the Site for construction or as part of an environmental engineering controls, ACEHD requires the submittal of the *Application for Determination of Fill Material Suitability* to support requirements outlined in ACEHD’s *Fill Guidance*. Submittal of the application and requisite supporting documents must be submitted to ACEHD for review and approval prior to import of fill. Requisite documents are outlined in the *Application* and include but are not limited to proposed sources, sampling and profiling protocols, analytical laboratory reports, and tables with analytical results and applicable environmental screening levels.

Prior to building occupancy, submittal and ACEHD-approval of the following deliverables:

5. REMEDIAL ACTION COMPLETION REPORTS

- a. **Remedial Action Completion Report (RACR)** – A comprehensive report documenting implementation of the remedial actions presented in the *Final CAP* demonstrating that remedial action objectives have been met or identifying any remedial action objectives that have not yet been met. The *RACR* must include as-built drawings and photo documentation and must include a certification by the remedial action design engineer that the remedial measures were implemented in accordance with the approved *Final CAP*. The *RACR* must also include copies of all permits and must document at a minimum the following (if applicable):
- i. Description of the remedial soil excavation activities including at a minimum the information submitted in the *Remedial Soil Excavation Completion Documentation Submittal Package*, the final disposition of soil (on-Site consolidation and capping, off-Site disposal), a figure depicting the surveyed locations and depths of consolidated lead impacted soil, copies of all manifests or other waste disposal documentation, and final laboratory analytical reports for soil confirmation samples and pre-characterization results of in-situ sampling and/or stockpiling sampling for soil disposed of off-Site.
 - ii. Description of groundwater removal activities with supporting documentation, including but not limited to tables, figures, laboratory analytical reports, copies of discharge reports, and corrective actions associated with unauthorized releases during construction activities.
 - iii. Description of removal of subsurface infrastructure in source areas (e.g., oil/water separation and piping, sanitary sewer laterals) and copies of waste manifests.
 - iv. Description of discovery of unexpected subsurface structures (e.g., tanks, vaults, sumps), contingency measures implemented, and copies of laboratory analytical reports and waste manifests.
 - v. Certification of compliance with the *Final CAP* protocols during implementation of remedial measures including but not limited to agency notification and reporting requirements, pre-field activities (site security and access, traffic control, excavation permits, notification and utility clearance), waste management, soil and groundwater management, storm water management, dust and odor emission control, and contingency measures for discovery of unexpected underground structures.

Attachment 3 - Deliverable Requirements

- vi. As-built plans showing the surveyed locations of consolidated impacted soil (plans and cross-sections)
 - vii. Photo-logs and field notes
- b. **Soil Import Summary Report**– If soil is imported to the Site, a *Report* documenting the import/export of soil (if not disposed of at a permitted disposal facility) must be drafted in accordance with the *Fill Guidance*. The *Report* must be uploaded to the GeoTracker information repositories for both the fill material source area and the destination. At a minimum the *Report* must include the following:
- i. A cover letter from the owner of the proposed fill source material that states, at a minimum, the following: “I have read and acknowledge the content, recommendations, and/or conclusions contained in the attached document or report submitted on my behalf to ACEHD.” This cover letter must be signed by the owner of the proposed fill source material or a legally authorized representative of the owner of the proposed fill source material.
 - ii. A statement that fill material characterization was conducted under the responsible charge of a Qualified Professional. This statement must be accompanied by the signed and dated seal of the Qualified Professional with responsible charge.
 - iii. Summary tables of soil import logs. These logs must include the following information for each delivery of fill material: arrival date, manifest number or truck tag, quantity of fill material delivered, originating facility, and profile number.
 - iv. A figure depicting the location and depth of imported soil. If fill material from multiple sources has been imported, the location and depth of imported soil from each source must be distinguished.
 - v. Copies of all manifests or other documentation of soil import as an appendix.
 - vi. Copies of all fill characterization profiles as an appendix.

6. GEOTRACKER COMPLIANCE

- a. **GeoTracker Database Compliance** - On-going compliance by uploading all environmental documents related to the subject site including but not limited soil, groundwater and soil vapor analytical data, monitoring well depth-to-water measurements, and surveyed location and elevation data for sampling locations, documents and reports, maps, and boring logs to GeoTracker.

ATTACHMENT 4

Alameda County Environmental Cleanup Oversight Programs (LOP and SCP)	REVISION DATE: May 19, 2020
	ISSUE DATE: July 25, 2012
	PREVIOUS REVISIONS: September 17, 2013, May 15, 2014, December 12, 2016, December 14, 2017
SECTION: ACDEH Procedures	SUBJECT: Responsible Party(ies) Legal Requirements / Obligations

REPORT & DELIVERABLE REQUESTS

Alameda County Department of Environmental Health (ACDEH) Cleanup Oversight Programs, Local Oversight Program (LOP) and Site Cleanup Program (SCP) require submission of all reports in electronic form to the State Water Board's (SWB) GeoTracker website in accordance with California Code of Regulations, Title 23, Chapter 30, Division 3, Article 2, Section 3892 and Chapter 16, Article 11, Division 3.

Leaking Underground Fuel Tank (LUFT) Cases

Reports and deliverable requests are pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party (RP) in conjunction with an unauthorized release from a petroleum underground storage tank (UST) system.

Site Cleanup Program (SCP) Cases

For non-petroleum UST cases, reports and deliverables requests are pursuant to California Health and Safety Code Section 101480.

ELECTRONIC SUBMITTAL OF REPORTS

A complete report submittal includes the PDF report and all associated electronic data files, including but not limited to GEO_MAP, GEO_XY, GEO_Z, GEO_BORE, GEO_WELL, and laboratory analytical data in Electronic Deliverable Format™ (EDF). Additional information on these requirements is available on the State Water Board's website (http://www.waterboards.ca.gov/water_issues/programs/ust/electronic_submittal/)

- Do not upload draft reports to GeoTracker
- Rotate each page in the PDF document in the direction that will make it easiest to read on a computer monitor.

GEOTRACKER UPLOAD CERTIFICATION

Each report submittal is to include a GeoTracker Upload Summary Table with GeoTracker valid values¹ as illustrated in the example below to facilitate ACDEH review and verify compliance with GeoTracker requirements.

GeoTracker Upload Table Example

Report Title	Sample Period	PDF Report	GEO_MAPS	Sample ID	Matrix	GEO_Z	GEO_XY	GEO_BORE	GEO_WELL	EDF

¹ GeoTracker Survey XYZ, Well Data, and Site Map Guidelines & Restrictions, CA State Water Resources Control Board, April 2005

Alameda County Environmental Cleanup Oversight Programs (LOP and SCP)	REVISION DATE: NA
	ISSUE DATE: December 14, 2017
	PREVIOUS REVISIONS: September 17, 2013, May 15, 2014, December 12, 2016
SECTION: ACDEH Procedures	SUBJECT: Responsible Party(ies) Legal Requirements / Obligations

ACKNOWLEDGEMENT STATEMENT

All work plans, technical reports, or technical documents submitted to ACDEH must be accompanied by a cover letter from the responsible party that states, at a minimum, the following: "I have read and acknowledge the content, recommendations and/or conclusions contained in the attached document or report submitted on my behalf to the State Water Board's GeoTracker website." This letter must be signed by the Responsible Party, or legally authorized representative of the Responsible Party.

PROFESSIONAL CERTIFICATION & CONCLUSIONS/RECOMMENDATIONS

The California Business and Professions Code (Sections 6731, 6735, and 7835) requires that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments be performed under the direction of an appropriately licensed or certified professional and include the professional registration stamp, signature, and statement of professional certification. Additional information is available on the Board of Professional Engineers, Land Surveyors, and Geologists website at: <http://www.bpelsg.ca.gov/laws/index.shtml>.

UNDERGROUND STORAGE TANK CLEANUP FUND

For LUFT cases, RP's non-compliance with these regulations may result in ineligibility to receive grant money from the state's Underground Storage Tank Cleanup Fund (Senate Bill 2004) to reimburse the cost of cleanup. Additional information is available on the internet at: https://www.waterboards.ca.gov/water_issues/programs/ustcf/

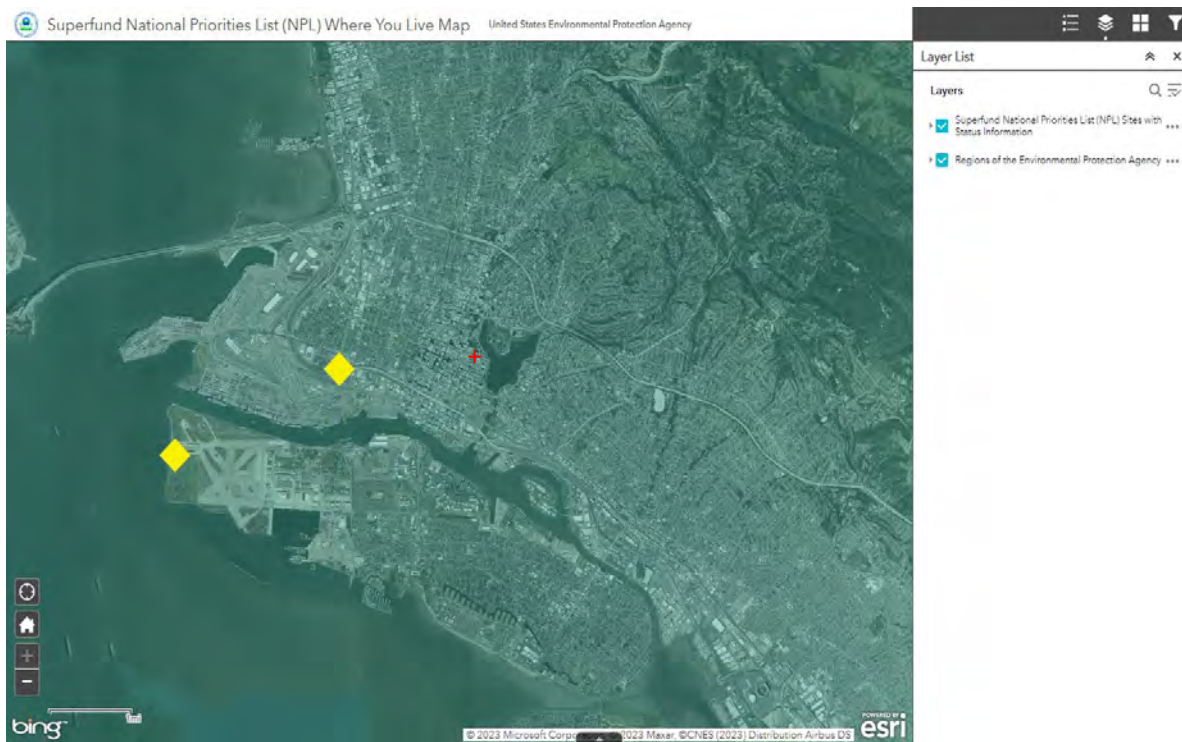

AGENCY OVERSIGHT

Significant delays in conducting site assessment/cleanup or report submittals may result in referral of the case to the Regional Water Board or other appropriate agency, including the County District Attorney, for possible enforcement actions. California Health and Safety Code, Section 25299.76 authorizes enforcement including administrative action or monetary penalties of up to \$10,000 per day for each day of violation.

USFWS IPaC Endangered Species and Critical Habitats

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
Phone: (916) 414-6600 Fax: (916) 414-6713

In Reply Refer To:

February 27, 2024

Project Code: 2024-0054960

Project Name: Lake Merritt BART Senior Affordable Housing Project (Building B)

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed, and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through IPaC by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2))

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: <https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf>

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see [Migratory Bird Permit | What We Do | U.S. Fish & Wildlife Service \(fws.gov\)](https://www.fws.gov/partner/council-conservation-migratory-birds).

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see <https://www.fws.gov/library/collections/threats-birds>.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit <https://www.fws.gov/partner/council-conservation-migratory-birds>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office

PROJECT SUMMARY

Project Code: 2024-0054960
Project Name: Lake Merritt BART Senior Affordable Housing Project (Building B)
Project Type: Residential Construction
Project Description: The project site is at 51 9th Street and bounded by Fallon Street to the east, 8th Street to the south, Oak Street to the west, and 9th Street to the north on part of a single parcel (Assessor's Parcel Number (001-0169-001) of about 0.26 acre. Oakland Downtown is west of the project site which is located in Oakland Chinatown.

The East Bay Asian Local Development Corporation (EBALDC) proposes to develop and manage the Lake Merritt Bay Area Rapid Transit District (BART) Affordable Senior Housing project.

The proposed project would be the affordable housing anchor for a larger multi-phase, multi-block transit-oriented development (TOD), in partnership with Strada Investment Group and BART, that would strengthen the existing neighborhood with an extensive suite of community benefits. The entire development would include four new buildings across two blocks (Buildings A through D, sited east and south of the Lake Merritt BART Station). The redevelopment TOD project would consist of a high-density mix of market-rate and affordable residential housing (including the proposed project, referred to as 'Building B'), office and community space; ground-floor retail, and restaurant; a childcare center; a new public open space; and public space improvements. The Lake Merritt BART Affordable Senior Housing project is the first of the four buildings to start construction and be completed.

Project Location:

The approximate location of the project can be viewed in Google Maps: <https://www.google.com/maps/@37.7970493,-122.26465390615323,14z>

Counties: Alameda County, California

ENDANGERED SPECIES ACT SPECIES

There is a total of 12 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries¹, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

-
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MAMMALS

NAME	STATUS
Salt Marsh Harvest Mouse <i>Reithrodontomys raviventris</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/613	Endangered

BIRDS

NAME	STATUS
California Least Tern <i>Sternula antillarum browni</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/8104	Endangered
California Ridgway's Rail <i>Rallus obsoletus obsoletus</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4240	Endangered
Western Snowy Plover <i>Charadrius nivosus nivosus</i> Population: Pacific Coast population DPS-U.S.A. (CA, OR, WA), Mexico (within 50 miles of Pacific coast) There is final critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8035	Threatened

REPTILES

NAME	STATUS
Alameda Whipsnake (=striped Racer) <i>Masticophis lateralis euryxanthus</i> There is final critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/5524	Threatened
Green Sea Turtle <i>Chelonia mydas</i> Population: East Pacific DPS No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/6199	Threatened
Northwestern Pond Turtle <i>Actinemys marmorata</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/1111	Proposed Threatened

AMPHIBIANS

NAME	STATUS
California Red-legged Frog <i>Rana draytonii</i> There is final critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2891	Threatened
Foothill Yellow-legged Frog <i>Rana boylei</i> Population: Central Coast Distinct Population Segment (Central Coast DPS) No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5133	Threatened

FISHES

NAME	STATUS
Tidewater Goby <i>Eucyclogobius newberryi</i> There is final critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/57	Endangered

INSECTS

NAME	STATUS
Monarch Butterfly <i>Danaus plexippus</i> No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate

FLOWERING PLANTS

NAME	STATUS
Santa Cruz Tarplant <i>Holocarpha macradenia</i> There is final critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/6832	Threatened

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

Above-Ground Storage Tanks Information for Explosive and Flammable Hazards Assessment

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > [ASD Calculator](#)

Acceptable Separation Distance (ASD) Electronic Assessment Tool

The Environmental Planning Division (EPD) has developed an electronic-based assessment tool that calculates the Acceptable Separation Distance (ASD) from stationary hazards. The ASD is the distance from above ground stationary containerized hazards of an explosive or fire prone nature, to where a HUD assisted project can be located. The ASD is consistent with the Department's standards of blast overpressure (0.5 psi-buildings) and thermal radiation (450 BTU/ft² - hr - people and 10,000 BTU/ft² - hr - buildings). Calculation of the ASD is the first step to assess site suitability for proposed HUD-assisted projects near stationary hazards. Additional guidance on ASDs is available in the Department's guidebook "Siting of HUD- Assisted Projects Near Hazardous Facilities" and the regulation 24 CFR Part 51, Subpart C, Siting of HUD-Assisted Projects Near Hazardous Operations Handling Conventional Fuels or Chemicals of an Explosive or Flammable Nature.

Note: Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the ASD result fields with the mouse.

Acceptable Separation Distance Assessment Tool

Is the container above ground?

Yes: No:

Is the container under pressure?

Yes: No:

Does the container hold a cryogenic liquified gas?

Acceptable Separation Distance (ASD) Electronic Assessment Tool

The Environmental Planning Division (EPD) has developed an electronic-based assessment tool that calculates the Acceptable Separation Distance (ASD) from stationary hazards. The ASD is the distance from above ground stationary containerized hazards of an explosive or fire prone nature, to where a HUD assisted project can be located. The ASD is consistent with the Department's standards of blast overpressure (0.5 psi-buildings) and thermal radiation (450 BTU/ft² - hr - people and 10,000 BTU/ft² - hr - buildings). Calculation of the ASD is the first step to assess site suitability for proposed HUD-assisted projects near stationary hazards. Additional guidance on ASDs is available in the Department's guidebook "Siting of HUD- Assisted Projects Near Hazardous Facilities" and the regulation 24 CFR Part 51, Subpart C, Siting of HUD-Assisted Projects Near Hazardous Operations Handling Conventional Fuels or Chemicals of an Explosive or Flammable Nature.

Note: Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the ASD result fields with the mouse.

Important Farmlands

Project site and surroundings are classified as urban lands.
There are no important farmlands on or in the vicinity of the project site.

The screenshot shows the USDA Web Soil Survey interface. At the top, there is a navigation bar with links for Contact Us, Subscribe, Archived Soil Surveys, Soil Survey Status, Glossary, Preferences, Link, Logout, and Help. Below this is a secondary navigation bar with buttons for Area of Interest (AOI), Soil Map (selected), Soil Data Explorer, Download Soils Data, and Shopping Cart (Free). The main content area is divided into a search and legend section on the left and a map section on the right. The search section shows the location: Alameda County, California, Western Part (CA610). The legend section contains a table with the following data:

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
147	Urban land-Baywood complex	2.2	100.0%
Totals for Area of Interest		2.2	100.0%

The map section shows an aerial view of an urban area with a red outline indicating the area of interest. The map includes a scale of 1:3,230 and a warning: "Warning: Soil Map may not be valid at this scale." The map also shows a scale bar for 500 feet.

Section 106 Documentation

Memorandum

To	Heather Klein, City of Oakland	Page	1
CC	Betty Marvin, City of Oakland		
Subject	East Bay Asian Local Development Corporation Lake Merritt BART Affordable Senior Housing Project, 51 9 th Street, Oakland – Section 106 of the National Historic Preservation Act Review		
From	Heather Miller, MA, Architectural Historian Karen Gardner, RPA, Archaeologist Karin G. Beck, RPA, RPH, Archaeologist		
Date	April 9, 2024		

Introduction

The East Bay Asian Local Development Corporation (EBALDC) proposes to develop and manage the Lake Merritt Bay Area Rapid Transit District (BART) Affordable Senior Housing Project (hereafter referred to as the “proposed project”). The proposed project is the first phase of a larger two-block, multi-phased planned unit development to redevelop existing BART-owned properties adjacent to the underground Lake Merritt BART Station. The first phase of development is located at 51 9th Street, which is a single parcel (Assessor’s Parcel Number [APN] 001-0169-001) and encompasses an entire city block bounded by Fallon Street to the east, 8th Street to the south, Oak Street to the west, and 9th Street to the north in Oakland. The second phase of development is located at 107 8th Street, which is also one parcel, (APN 001-0171-002) and is bounded by Oak, 7th, Madison, and 8th Streets). The project site is on the southern part of the city block at 51 9th Street that currently is used for BART station entrances/exits and a surface parking lot.

The project site lies within the Lake Merritt Station Area Plan (LMSAP), a plan by the City, BART, and other stakeholders for the future development of the area. The City certified an Environmental Impact Report (EIR) for the LMSAP in November 2014, pursuant to the California Environmental Quality Act (CEQA).¹ The 2014 LMSAP EIR analyzed the environmental impacts of adoption and implementation of the LMSAP. In 2021, EBALDC proposed the Lake Merritt BART Station Redevelopment Project (Project) within the LMSAP. This redevelopment proposal covers two phases and four buildings to provide a high-density mix of market-rate and affordable residential units; office and community space; ground-floor retail, and restaurant; a childcare center; a new public open space; and public space improvements. The proposed project includes the affordable senior housing project and associated public realm improvements, including street, sidewalk, landscaping, and open space amenities. Existing BART facilities and structures on the block would remain as-is. The City approved the Lake Merritt BART Station Redevelopment Project CEQA Checklist that tiered off the 2014 LMSAP EIR, concluding that the project would not result in substantial changes or involve new information not already analyzed in the 2014 LMSAP EIR because the uses, scale, and intensity of development at the project site is within the broader development assumptions analyzed in the 2014 LMSAP EIR. The City’s analysis also determined that the project would not cause new significant impacts not previously identified in the 2014 LMSAP EIR or result in a substantial increase in the severity of previously identified significant impacts, including those to identified historical resources. Therefore, no new mitigation measures would be necessary to reduce significant impacts. No

¹ *Lake Merritt Station Area Plan Final EIR*, Certified November 18, 2014. SCH No. 2012032012. Oakland Case Nos. ZS11225, ER1100-17, GP13287, ZT13288, RZ13289.

changes occurred with respect to circumstances surrounding the LMSAP that would cause significant environmental impacts to which the project would contribute considerably, and no new information had been put forward that showed that the project would cause significant environmental impacts. Therefore, no supplemental environmental review was required in accordance with Public Resources Code Section 21166, and CEQA Guidelines Sections 15162 through 15164.² The project was approved by the Oakland City Planning Commission on July 20, 2022. The approval was made contingent upon the project complying with the Standard Conditions of Approval and Mitigation Monitoring and Reporting Program (SCAMMRP), which includes all mitigation measures identified in the Lake Merritt BART Station Redevelopment CEQA Checklist (approved by the Commission on May 19, 2021).

EBALDC has applied for assistance from the U.S. Department of Housing and Urban Development (HUD). Because of this federal involvement, the project is considered an undertaking that requires review under Section 106 of the National Historic Preservation Act (Section 106). HUD is the lead agency for compliance with the National Environmental Policy Act and Section 106. AECOM prepared this memorandum in support of HUD's responsibilities in compliance with Section 106 review. This memorandum includes a description of the undertaking, the Area of Potential Effects (APE), the methodology used to identify and evaluate historic properties³ within the APE, the affected historic properties, and an assessment of potential effects resulting from the undertaking. This analysis was prepared by Heather Miller, M.A., and Karen Gardner, M.A., who meet the Secretary of the Interior's Professional Qualification Standards (36 Code of Federal Regulations [C.F.R.] Part 61) for architectural history and archaeology, respectively.

As a result of this study, the Section 106 finding of **No Adverse Effect** is appropriate.

Description of the Undertaking

Project Location

The proposed project site is located at 51 9th Street, a city block bounded by Fallon Street to the east, 8th Street to the south, Oak Street to the west, and 9th Street to the north Street in Oakland. The undertaking is located on the southern portion of a 1.38-acre parcel (APN 001-0169-001). The building footprint itself, excluding public realm and open space improvements, is approximately 0.26 acre in size (**Figure 1, Project Location and Figure 2, Project Site Plan**).

Project Description

The proposed project would be the affordable housing anchor for a larger multiphase, multi-block transit-oriented development (TOD), in partnership with Strada Investment Group and BART, which would strengthen the existing neighborhood with an extensive suite of community benefits. The entire development would include four new buildings across two blocks owned by BART, at the Lake Merritt BART Station, and would consist of a high-density mix of market-rate and affordable residential housing (including the proposed project, referred to as 'Building B' and inclusive of associated public improvements at the project site, such as street, sidewalk, landscaping, and open space amenities), office and community space; ground-floor retail, and restaurant; a childcare center; a new public open space; and public space improvements. The Lake Merritt BART Affordable Senior Housing project is the first of the four buildings to start construction and be completed.

The proposed project would construct a new 7-story, approximately 85-foot tall, 79,300-square-foot building on the southern portion of the existing 1.38-acre parcel, **as shown in Figure 3, Conceptual**

² *Lake Merritt BART Station Redevelopment Project CEQA Checklist*, Prepared by ESA, May 2021, City Project No. PLN20-038.

³ In relation to Section 106, "historic property" means any precontact or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP).

Renderings. The Building B project footprint is 11,633 gross square feet (or approximately 20 percent of the entire parcel). The mixed-use residential and retail building would be developed with approximately 97 units of affordable housing, targeted for senior households (55+), as well as Special Needs and formerly Homeless households, with Area Median Incomes ranging from 30% to 60%.

As shown in **Figure 4, Ground Floor Plan**, the ground floor would include a community room/lounge, service offices, restrooms, bike room, storage, trash and utility space. The ground floor would also provide approximately 3,235 square feet of commercial space at the western portion of the building, adjacent to and interacting with the Lake Merritt BART Station entrance and a publicly accessible open space area, referred to as the paseo. Approximately 354 square feet of the commercial space would be utilized for a community-serving, limited-service restaurant or café, and approximately 2,881 square feet would be utilized for a Commercial Kitchen. The upper levels (2nd through 7th floors) would be occupied by approximately 97 senior residential units (22 studios, 70 one-bedroom and 5 two-bedroom units), of which 44 would be reserved for special needs and homeless populations. The 7th floor would also contain a community room/lounge and an outdoor rooftop deck.

No vehicle parking would be constructed onsite as part of the proposed project. A secure bicycle parking room on the ground floor would be provided for residents, with a capacity for 54 bicycles, comprised of 49 long-term and 5 short-term spaces. An additional six bicycle parking spaces, four long-term and two short-term, would be provided for commercial uses. The project would also provide approximately 5,636 square feet of open space, including part of the publicly accessible paseo area and 2,562 square feet for two community rooms/lounges and the outdoor roof deck. There are 41 trees on the existing one-block parcel, all of which would be removed as part of redevelopment of the site. Almost all of the trees are in the public right-of-way along the sidewalks on portions of the block where BART facilities would be left-as-is. The estimated number of trees within the Building B footprint is approximately five and fewer than another ten on the adjoining sidewalks along 8th and Fallon Streets. New trees would be planted as part of the landscaping plan in accordance with the City's master street tree list and Tree Planting Guidelines. The intersection corners and street signals adjoining the proposed project would also be upgraded to enhance pedestrian safety,

Building B would also be set back from the adjacent underground BART station structure. Piles for the Building B foundation would be set back from the underground BART station by a minimum of 10 feet. The Building B foundation would be set back from the BART station from 1.5 feet above the structure to 8 feet below the structure (**Figure 5, Building B Section**).

Area of Potential Effects

The Area of Potential Effects (APE) accounts for potential effects to historic properties, which are any precontact or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP). To address direct effects within the limits of staging and construction for the proposed project, the APE encompasses the area of direct impacts (ADI), which is defined as the limits of the project site, consisting of most of the single parcel (APN 001-0169-001). To address indirect effects to adjacent historic properties, the APE also encompasses properties one parcel deep within immediate view of the project site. While four properties along 8th Street south of the project site are located within, and contributors to, the NRHP-eligible 7th Street/Harrison Square Residential District, the district spans 11 city blocks and was not brought into the APE in its entirety (**Figure 6, APE Map**). Effects to these four properties in the APE, and the historic district as a whole, will be addressed in Assessments of Effects later in this document.

The building would be supported on a structural slab that would be founded on piles approximately 70 feet to 110 feet in length. The maximum depth of excavation is estimated to be approximately 130 feet below the ground surface (bgs), which is the extent of the vertical APE.

Identification of Historic Properties

Records Search

AECOM conducted a records search at the Northwest Information Center (NWIC) at Sonoma State University in Rohnert Park on January 11, 2024. The records search included the APE and a one-block buffer to identify known cultural resources in the vicinity of the APE. The records search resulted in the identification of one previously recorded archaeological resource in the records search buffer, but none in the APE (**Table 1**). Five previously recorded built environment resources are located in the APE, including one NRHP-listed building, and one large historic district with four buildings within the APE (**Table 2**).

Previously Recorded Archaeological Resources

The NWIC records search identified no previously recorded archaeological resources in the APE. One archaeological resource was identified within a one block buffer (see **Table 1**).

**Table 1
 Archaeological Resources Within One Block Radius of the APE**

Primary Number	Trinomial	Name	Precontact or Historic	Description	In APE?
P-01-10796	--	Isolated burial site	Precontact	Single burial with groundstone mortar, discovered in 1906 while excavating foundation for a house.	No

Notes:

APE = Area of Potential Effects

Previously Recorded Built Environment Resources

The NWIC records search identified five previously recorded built environment resources, including one NRHP-listed building and one large historic district with four buildings that were previously recorded in the APE (see **Table 2**).

**Table 2
 Previously Recorded Built Environment Resources in the APE**

Primary Number	Address	Name	Built Date(s)	NRHP Status	NRHP Status Code*

P-01-004464; Contributor to P-01-004478	59 8 th Street, Oakland	Sullivan House (Contributor to 7 th Street/Harrison Square Residential District)	1896	Contributor to NRHP- eligible district	2D2, 3D
P-01-004465; Contributor to P-01-004478	61 8 th Street, Oakland	Josephs House (Contributor to 7 th Street/Harrison Square Residential District)	1892-1893; Addition 1905-1906	Contributor to NRHP- eligible district	2D2, 3D

Notes:

*NRHP Status Code reflects the designation assigned by the OHP

NRHP = National Register of Historic Places

OHP = Office of Historic Preservation

1S = Individually listed in the NRHP

2D2 = Contributor to a historic district determined eligible for listing in the NRHP by consensus through Section 106 process

3D = Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation

3S = Appears individually eligible for listing in the NRHP

P-01-004650

Originally constructed in 1908, the Madison Park Apartments at 100 9th Street is a five-story apartment building that was listed in the NRHP in 1982. This building is located northwest from the project site. While not stated in the NRHP nomination, the building appears to have been listed under Criterion C with a period of significance of 1908.

P-01-004478

The 7th Street/Harrison Square Residential District was recorded in 1985 on Historic Resources Inventory sheets as part of the Oakland Heritage Survey. The district largely consists of residences constructed between 1889 and 1910 and one park. It is located along five blocks of 7th Street, the cross streets from Harrison to Fallon streets, extending in some places to 8th Street and 6th Street. The district was found eligible for listing in the NRHP in a local survey “as a surviving area of middle- and lower-middle-class housing constructed largely between 1889 and 1910” (OCHS 1984). Surveyors in 1984 identified two-thirds of the buildings in the district boundary (79) as contributors, 39 properties as non-contributors, and 5 vacant lots. The district is located south and southwest from the project site.

Four properties along 8th Street, south of the project site, are located within, and contributors to, the NRHP-eligible 7th Street/Harrison Square Residential District.

P-01-004462 (Contributor to P-01-004478)

51 8th Street, also called the Lougee-Baumgartner House, was completed in 1891. This building is located directly across 8th Street, south from the project site. According to the author of the Historic Resources Inventory form prepared as part of the “7th Street/Harrison Square Residential District” survey, the residence was described as “among Oakland’s most elaborate and most intact surviving large Queen Anne residences, distinguished by its richly varied forms, ornamentation and surface treatments” (OCHS 1983). Therefore, 51 8th Street was one of two

properties in the historic district identified as “Primary Contributors.” The other property is Harrison Square, formerly known as Harrison Railroad Park at the 600 block of Harrison Street, approximately 0.25-miles southwest from the project site.

51 8th Street is also designated as a City of Oakland Heritage Property. Heritage Properties are defined in the Preservation Element of the Oakland General Plan as “properties which definitively warrant preservation but which are not Landmarks.” Heritage Properties are protected by design review, environmental review, demolition findings, and the California Historical Building Code.

P-01-004463 (Contributor to P-01-004478)

55 8th Street is a transitional Queen Anne and Colonial Revival style cottage completed in 1898. This building is located directly across 8th Street, south from the project site. The building was identified as a contributor to the 7th Street/Harrison Square Residential District for “architecture and history” (OCHS 1984).

P-01-004464 (Contributor to P-01-004478)

59 8th Street, also called the Sullivan House, is a Queen Anne style cottage completed in 1896. This building is located directly across 8th Street, south from the project site. The building was identified as a contributor to the 7th Street/Harrison Square Residential District for “architecture and history” (OCHS 1984).

P-01-004465 (Contributor to P-01-004478)

61 8th Street, also called the Josephs House, is a three-story Queen Anne residence completed in 1893. This building is located directly across 8th Street, south from the project site. The building was identified as a contributor to the 7th Street/Harrison Square Residential District for “architecture and history” (OCHS 1984).

Additional Background Research

Oakland Cultural Heritage Survey Records

The Oakland Cultural Heritage Survey (OCHS) is the City’s inventory of buildings in Oakland and contains varying levels of information on buildings and historic districts of possible historical or architectural interest. Review of the OCHS provided information on two additional built environment resources in the APE (**Table 3**). The OCHS ratings system is nuanced with categories for resources that may achieve a higher level of importance or contribution with restoration, further research, or other contingencies.

**Table 3
 Built Environment Resources in the APE – OCHS Search Results**

Address	Name	Built Date(s)	OCHS Rating	Local Status	NRHP Status
94 9 th Street / 900 Oak Street, Oakland	Serbian Orthodox Church of St. George	1910-1911; 1924-1925	B+3	Local Register of Historical Resources	Appears eligible
80-82 & 88-90 9 th Street, Oakland	Tutt-Sieman-Chew double flats	1903-1904; Moved 1916-1917	C3	Designated Heritage Property	Unevaluated

Notes:

B+3 = Major importance, not in a historic district
 C3 = Secondary importance, not in a historic district
 NRHP = National Register of Historic Places
 OCHS = Oakland Cultural Heritage Survey

94 9th Street / 900 Oak Street

Originally completed in 1911 as an Episcopal chapel, the Serbian Orthodox Church of St. George is at the northeast intersection of 9th and Oak streets. This building is located directly across 9th Street, north from the project site. A large addition was constructed in 1926 and rededicated as the Serbian Orthodox Church of St. George. The building was found eligible for listing in the NRHP under Criterion A “as the ‘Mother Church for all Serbs in the Bay Area’” (OCHS 1982). The church was added to the City’s Local Register of Historical Resources when it was City’s Preservation Study List (OCHS 2000; Yee 1995).

80-82 & 88-90 9th Street

Originally completed in 1904 at a different location, these two mirror-image, two-story Colonial Revival style apartment buildings were moved to the current location around 1917. These buildings are located directly across 9th Street, north from the project site. The buildings were recorded on an Oakland Landmarks Preservation Advisory Board – Oakland Landmark, S-7/S20 Preservation Combining Zone, and Heritage Property Application Form in 2014. The buildings were identified as locally significant under the areas of “Architecture,” “Community,” and “Social/humanitarian,” and were not evaluated for NRHP eligibility. The property was designated a Heritage Property by Landmarks Board on July 14, 2014 (Fong 2014; Marvin 2024).

Historic Maps

The following maps were reviewed using the listed online sources:

- San Francisco Public Library
 - 1889 Sanborn Fire Insurance Map
 - 1912 Sanborn Fire Insurance Map
 - 1950 Sanborn Fire Insurance Map
 - 1952 Sanborn Fire Insurance Map

- U.S. Geological Survey
 - 1895 *San Francisco, Calif.* 15-minute topographic quadrangle
 - 1899 *San Francisco, Calif.* 15-minute topographic quadrangle
 - 1915 *San Francisco, Calif.* 15-minute topographic quadrangle
 - 1949 *Oakland West, Calif.* 7.5-minute topographic quadrangle

City of Oakland

AECOM reviewed construction date information available online, including City of Oakland parcel data to identify previously unrecorded properties 50 years or older within the project APE. As a result, four new historic-age properties were identified for recordation and evaluation. One of the properties, Laney College at 900 Fallon Street, is a large, 60-acre campus sited immediately east from the project site. It is outside the scope of work for this project to record and evaluate the entire campus, therefore, for the purpose of this project, the campus will be assumed eligible for listing in the NRHP and treated as a historic property.

Tribal Consultation

The Native American Heritage Commission (NAHC) was contacted on December 27, 2023, for a search of its Sacred Lands File (SLF) and a list of Native Americans who may have information related to Native American cultural resources in the vicinity of the proposed project. The NAHC responded on January 10, 2024, stating that a search of the SLF yielded positive results and recommended contacting the following tribes for further information: the Amah Mutsun Tribal Band of Mission San Juan Bautista, the Confederated Villages of Lisjan Nation, and the Northern Valley Yokut/Ohlone Tribe. The NAHC also provided a list of 14 individuals from eight tribes (including the three specified above) with a potential interest in the project vicinity. HUD's Tribal Directory Assessment Tool was also searched for a list of federally recognized tribes with an interest in Alameda County. Only the California Valley Miwok Tribe was listed, whose tribal territory is outside of the current project vicinity.

Cheyenne Zepeda, Cultural Resource Manager of the Confederated Villages of Lisjan Nation, responded to the NAHC's notification letter with an email request to AECOM dated January 25, 2024, requesting consultation. AECOM, on behalf of EBALDC and HUD, established contact with the tribe and the initial consultation meeting was held (virtually) with the Tribe, EBALDC, and AECOM on February 14, 2024. Project data was requested by the Tribe, which included cultural reports, site records, as well as the 2014 LMSAP. These materials were sent to Chairperson Corrina Gould on February 20, 2024. After multiple emails (February 20 and 27, 2024) and attempts via telephone (February 27 and 29, 2024 and March 13, 2024) to contact the Tribe without success (the voicemail box was always full and no email replies were received), AECOM used an SMS message on March 13, 2024, to communicate efforts towards follow-up and scheduling another meeting, if needed. On the same day, AECOM received an email from Chairperson Gould stating the Tribe was satisfied and that consultation was closed.

On February 27, 2024, EBALDC sent letters describing the project with a map depicting the APE to the Native American individuals specified by the NAHC, including the Amah Mutsun Tribal Band of Mission San Juan Bautista, the Confederated Villages of Lisjan Nation, and the Northern Valley Yokut/Ohlone Tribe, requesting information or concerns regarding the APE. EBALDC received an email on March 9, 2024, from Chairperson Katherine Perez of the Northern Valley Yokut/Ohlone Tribe requesting consultation and further project documentation. AECOM sent project data including cultural reports, site records, as well as the 2014 LMSAP on March 14, 2024. On March 19, 2024, members of EBALDC and AECOM met virtually with Chairperson Perez. After reviewing the project details, Chairperson Perez recommended Cultural Resources Awareness Training for the construction crew by a Native American and an Alert Sheet for reference of protocols in case of discovery; consultation with the Northern Valley Yokut/Ohlone Tribe is closed.

On March 15, 2024, AECOM received a form letter via email from Irenne Zwierlein, Chairperson of the Amah Mutsun Tribal Band of San Juan Bautista, which stated that if there was there was cultural sensitivity in the vicinity of 1-mile of the project area the Tribe recommends sensitivity training for all individuals associated with earth-moving activities, a qualified archaeological monitor be present during earth-moving activities, and a qualified Native American monitor also be present during earth-moving activities.

No other responses were received by EBALDC or AECOM to date. On April 9, 2024, EBALDC sent follow-up emails and calls requesting comments or concerns regarding resources in the project’s APE. No further concerns were raised during these outreach efforts.

Survey

Archaeological Survey

Because the entire APE has been previously developed and paved, and the area was adjacent to the mass excavation for the construction of the BART station (see **Plate 4** – Excavation of Lake Merritt BART complex), it was determined that no native ground would be available to observe. Therefore, an archaeological survey was not conducted.

Built Environment Survey

AECOM conducted an intensive survey of the APE to identify all potential historic properties on February 29, 2024. Survey efforts included resurvey of six previously recorded built environment resources and five new properties at least 50 years old that required recordation and evaluation (**Table 4**) (**Figure 6, APE Map**). Archaeologist Jay Rehor, MA, RPA, under direction and guidance from Architectural Historian Heather Miller, MA, who meets the Secretary of the Interior’s Professional Qualification Standards for History and Architectural History, visited the APE to photograph potential historic properties. Each resource was recorded on California Department of Parks and Recreation (DPR) 523 forms. For architectural descriptions and significance evaluations, refer to the DPR 523 forms located in **Attachment A**. Note: Madison Park Apartments at 100 9th Street was not resurveyed because it is listed in the NRHP, and the 7th Street/Harrison Square Residential District was not resurveyed because it is beyond the scope of this project.

Environmental Setting

To evaluate potential historic properties for eligibility to the NRHP, AECOM compiled contexts related to major precontact and historical themes associated with the project site.

Environmental Context

Drawings and early written accounts of Oakland note that the area was relatively flat and covered with oak trees, with a marsh—later known as Lake Merritt—extending westward from the San Antonio Bay (Malcolm Margolin, quoted in Reed 2002:55). Much of Oakland was covered with sand dunes prior to urbanization. The project site is mapped in Urban Land-Baywood complex soils (U.C. Davis SoilWeb2024). “Urban Land” suggests that the project site contains fill or has been impacted by cutting and filling. Baywood soils are excessively drained soils that formed in old sand dunes along the coast (National Cooperative Soil Series 2024).

A preliminary geotechnical investigation for the project site was completed on January 23, 2020, (updated April 9, 2021) and determined that the project site is not within a liquefaction hazard zone as mapped in the California Geologic Survey’s 2003 *State of California Seismic Hazard Zones, Oakland West Quadrangle Official Map*.⁴

Precontact Context

Milliken et al. (2007) presented one of the most recent contributions to the understanding of precontact lifeways in the San Francisco Bay Area; their work offers a hybrid system of understanding the precontact chronology of the region by combining the Early-Middle-Late Period temporal sequence of Beardsley (1954, cited in Milliken et al. 2007) and using Fredrickson’s (1973, cited in Milliken et al. 2007) pattern, aspect, and phase concept to differentiate units of culture. This hybridized perspective allows for a more complex and nuanced understanding of the precontact era of the region. The following section is adapted from Milliken et al. (2007). The dates presented below, in conjunction with the hybridized cultural and temporal sequence, are based on calibrated (cal) radiocarbon dates.

⁴ Langan Engineering and Environmental Services, Inc., 2020. *Preliminary Geotechnical Investigation Lake Merritt BART Redevelopment, Oakland, California*, January 23.

Early Holocene (Lower Archaic) 8000 – 3500 cal B.C.

Early occupation of the San Francisco Bay region is characterized by the use of millingslabs, handstones, and flaked tools including the use of large wide-stemmed and leaf-shaped projectile points. Archaeobotanical remains from a site in Contra Costa, CA-CCO-696, suggest an economy focused on acorns and other vegetal items. In the North Bay Area, CA-SON-348/H yielded a deposit of mussel, fish, bird, and pinniped remains. Data from these early sites indicate a mobile forager economic patterning.

Early Period (Middle Archaic) 3500 – 500 cal B.C.

Indicators of a general trend toward a more sedentary lifestyle are the hallmarks of this time period. New ground stone technology and the first cut shell beads in mortuary settings imply regional symbolic integration and an increase in trade throughout the Bay Area. Mortars and pestles are documented for the first time during this time period. In the Central Bay Area, the Lower Berkeley Pattern is characterized by mortars and pestles and a burial complex with ornamental grave associations. With the exception of the North Bay, where variations of foraging economies persisted through this period, this represents the movement from forager to a semi-sedentary land use.

Lower Middle Period (Initial Upper Archaic) 500 cal B.C. – cal A.D. 430

A somewhat abrupt change in shell bead styles during this time period is indicative of a possible cultural disruption. The omnipresent rectangular shell beads that had been employed for 3,000 years were replaced by different bead styles. Olivella saucer beads became common and *Haliotis* ornaments began to appear. New bone tools and ornaments, such as elk femur spatulae, whistles, and basketry tools were produced. While millingslabs were still in use at some locations, there was a general shift to the use of mortars and pestles throughout this period.

Upper Middle Period (Late Upper Archaic) cal A.D. 430 – 1050

During the Upper Middle Period, the Olivella saucer bead trade network collapsed, sea otter hunting increased, and the Meganos mortuary pattern appeared and began to spread within the interior of the East Bay. The Meganos complex is characterized by dorsally extended burials, such as at the Santa Rita village site, CA-ALA-413 in the Livermore Valley. Saucer beads began to disappear as burial accompaniments, replaced by rough-edged, full saddle *Olivella* beads with small perforations. Such small perforations are marks of the Bead Horizon M2a. This bead horizon is marked by mixed *Olivella* saddle beads with 1.0- to 1.5-millimeter perforations that date to cal A.D. 430 – 600. During this horizon, a number of new items appear in Central Bay sites, including fishtail charmstones, new *Haliotis* ornament forms, and mica ornaments. Bead Horizon M3 is the apex of the Upper Middle Period, characterized by small, delicate square saddle *Olivella* beads in burials, often in off-village single component cemeteries. Single barbed bone fish spears, ear spoons, and large mortars appear during the M3 horizon. The Meganos complex spread down into the Santa Clara Valley throughout this period but did not extend into the West or North Bay.

Initial Late Period (Lower Emergent) cal A.D. 1050 – 1550 and the Terminal Late Period

Lifeways during this period became more socio-economically complex as a new level of sedentism and status ascription emerged. Items identified with the Augustine Pattern begin to appear during this time period concurrently with the Bead Horizon L1. The cultural items affiliated with this bead horizon include the arrow, the flanged pipe, the banjo effigy ornament, and the *Olivella* callus cup bead. The Stockton series of serrated projectile points began to appear in central California. Mortuary evidence is indicative of increasing social stratification. Partial cremation, often associated with elaborate grave offerings, appeared in some places and reappeared in other places. During the Terminal Late Period, the Bead Horizon L1 abruptly disappeared, around cal A.D. 1500. Clamshell disk beads, Bead Horizon L2, began to appear and extend across the North Bay. However, the only shell beads in the South and Central Bay mortuary patterns from this period were *Olivella* lipped and spire-lopped beads. In the North Bay, the toggle harpoon, hopper mortar, plain corner-notched arrow-sized projectile point and clamshell disk beads, among other items, all appear in this region. The hopper mortar does not appear to have spread into the Central or South Bay. Additionally, while the

corner-notched points replaced the Stockton serrated points in the North Bay and in the Central Bay, the Desert side-notched points seem to spread into the South Bay from the Central Coast.

Ethnographic Context

Ethnographic literature (Kroeber 1976; Levy 1978; Milliken 1995) indicates the project site is within the traditional territory of the Ohlone tribe. The Ohlone language is one of the five languages that existed within the San Francisco Bay Area that also included Bay Miwok, Plains Miwok, Patwin, and Wappo (Milliken 1995:13). These language groups are often treated as distinct and cohesive language units. However, Milliken (1995) points out that this can create a “misleading and overly simplistic view” of the complex mosaic that was, and the cultural variation that existed in, the aboriginal San Francisco Bay Area (Milliken 1995:13). The vicinity of the project was likely inhabited by the Huichun. Huichun territory extended over a large area along the East Bay shore, from Temescal Creek in Oakland north to the lower San Pablo and Wildcat Creek drainages in present-day Richmond (Milliken 1995:243). The tribe was the basic unit of political organization for the Ohlone-speaking people. Tribes consisted of one or more villages and there were a number of camps within each tribe’s territory. Territory boundaries were often defined by physiographic features (Levy 1978:487). An extensive trade network with neighboring groups existed. Trade items included obsidian from the upper valley of the Napa River; shells from the coast; sinew-backed bows from the east; and tobacco, basketry materials, and ornamented pigments from various locations (Milliken 1995:16).

Domed structures thatched with tule grass, wild alfalfa, ferns, or *carrizo* (reeds) were the most common type of dwelling structure. Sweathouses, used by both adult men and women, were constructed by excavating a pit in stream banks and building the remainder of the structure against the bank. Dance enclosures were circular or oval and included a woven fence of brush or laurel branches. Such assembly houses or dance plazas were located in the center of the village with dwellings along the periphery (Levy 1978:492).

Subsistence practices included harvesting plant, fish, and animal resources in their local environments. Acorns were probably one of the most important plant foods used by the Ohlone. The coast live oak and valley oak were the favored type of acorn (Levy 1978:491; Milliken 1995:16). Acorns were ground and leached to remove bitter tannins and then were made into mush or bread. Seeds, such as those from the gray pine or holly-leaf cherry and berries, such as elderberries and manzanita also played an important role in the Ohlone diet. Meat sources included, but were not limited to, deer, sea lion, rabbit, elk, and antelope. The most important fish were salmon, steelhead, and sturgeon. Fowl and waterfowl also comprised an important part of the Ohlone diet (Levy 1978:491). A sexual division of labor existed. Women harvested plant foods and spent a considerable portion of time weaving baskets that were used for gathering, storing, and preparing foodstuffs. Men augmented the food supply by fishing and hunting for game (Milliken 1995:16). Those who lived closer to the coast relied heavily upon fish and shellfish, while those who lived farther inland relied more upon hunting (Milliken 1995:18).

Historic Context⁵

City of Oakland

The proposed project site is within the Rancho San Antonio land grant, which was originally granted to Luis Maria Peralta in 1820 for his service to the Spanish government. His 43,000-acre rancho included what are now the cities of Oakland, Berkeley, Alameda, and parts of San Leandro and Piedmont. Peralta’s land grant was confirmed after Mexico’s independence from Spain in 1822, and this title was honored when California entered the Union by treaty in 1848. The City of Oakland was

⁵ This historic context is adapted from “Chapter 9: Historic Resources” in the *Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report*, June 2010, which informed the 2014 LMSAP EIR and the “Bart Transit Operations Facility and Lake Merritt Plaza Redesign Project – National Historic Preservation Act Section 106 Historic Properties Memorandum,” prepared by AECOM for BART, dated February 9, 2018.

incorporated in 1852, and officially recognized by the State in 1854. The project site is in one of the oldest areas of the city located on the outskirts of town and was the site of the only graveyard known as the Oakland Cemetery. According to Gene Anderson, Oakland historian and researcher and historical maps, the cemetery was located between Oak and Fallon streets, between 8th and 9th streets. In 1857, due to the need for more land, a new cemetery was approved by the City Council and burials from Oakland Cemetery were moved to the new location on Webster Street.

Oakland grew around its waterfront, with development limited only by the available modes of transportation. Steam ferry service to San Francisco was established in 1850, and by 1869 the first horse-car followed a route from the estuary up Telegraph Avenue to 40th Street. On November 8, 1869, the transcontinental railroad's first west-bound trip rolled through Oakland along Central Pacific tracks, which terminated at the new 7th Street station. By 1891, Oakland's first streetcar ran along Broadway to the City of Berkeley.

Subsequent to the devastation of the 1906 earthquake and fire in San Francisco, numerous refugees lived for months in tents set up in Lakeside Park on the shores of Lake Merritt. The influx of people to Oakland escaping the devastation from across the bay prompted the development of new residential areas in Oakland to accommodate displaced San Francisco residents. Older neighborhoods became more densely populated as new apartment buildings and related growth became part of Oakland's residential fabric.

Throughout the 20th century, commercial enterprises and industrial development, particularly the Port of Oakland and the Oakland Municipal Airport, played a vital role in Oakland's growth. During World War II, the Port provided land and facilities to the Army and Navy. By 1943, Oakland had become the largest shipping center on the West Coast and within two decades was the largest container terminal on the West Coast. As suburbs grew outward during the 1950s, the inner core of the City began to decline as residents left for the outlying areas. The perception of Oakland, as with many large cities during the 1960s and 1970s, was that of a neglected urban core with high unemployment, racial tension, and reduced economic opportunity. This trend began to reverse in the 1980s as reinvestment and redevelopment helped to invigorate the City's image and prospects.

Oakland's Chinatown

Chinese were the first Asian people to come to Oakland in significant numbers. They came from the Pearl River Delta region of southeast China, lured by the discovery of gold near Sacramento. Some came to Oakland in the 1850s. They lived in at least four different parts of a new and growing Oakland and were moved from place to place to accommodate the development needs of other private interest and institutions, until they settled at the corner of 8th and Webster Streets either in the late 1860s or 1870s. This corner remains the center of the Oakland Commercial District today.

The 1906 San Francisco earthquake and fire significantly increased Oakland's Chinese population. While some people returned to San Francisco, thousands of others stayed in Oakland. With a larger resident population, some moved into what is today the 7th Street/Harrison Square Residential District. Oakland's Chinatown, while relatively compact and small, thrived during World War II because it was near shipyards that brought in thousands of workers from other states. These workers went to Chinatown for food, haircuts and other personal needs. There were also significant numbers of Japanese and Filipinos who either lived or worked in or near Chinatown in the first half of the 20th century. For instance, a 1940 map developed by Japanese American historians in Oakland indicates a number of Japanese businesses in or near the core of Chinatown, reflecting a significant Japanese business presence. President Roosevelt's executive order to "relocate" Japanese on the U.S. West Coast in effect eliminated the presence of Japanese businesses and residents in Chinatown and other parts of Oakland during and after 1942. The Japanese population has subsequently been more dispersed.

Oakland's Chinatown substantially grew between the 1880s and 1960s. Immediately east of the Chinatown Commercial District and immediately north of the 7th Street/Harrison Square Residential

April 9, 2024
Page 14

District are three blocks with significant history for the Chinatown community. The three blocks are bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south. The three blocks are part of what was once called the Madison Square area in the last half of the 19th century and into the 20th century. As the young city expanded from its core at the estuary northward along Broadway, the Madison Square area became a desirable residential area for a growing white middle class in the late 19th century and into the early 20th century.

As Oakland continued to grow in the early decades of the 20th century, middle-class white Madison Square area residents moved further away from the core, giving housing opportunities for a gradually increasing Chinese population that had spiked upwards because the earthquake and fire that devastated San Francisco in 1906 brought over thousands of San Francisco Chinese suddenly displaced. Several thousand of them decided to stay in Oakland, at least doubling Oakland's Chinese population.

For approximately 40 years – the 1920s to the 1960s – Chinese families occupied many, if not, most of residential properties (duplexes, four-plexes, and apartments) on two of those blocks – Jackson to Madison, 8th and 9th; and Oak to Fallon, 8th and 9th. (Madison Square Park was between Madison and Oak, 8th and 9th). A 1951 Sanborn map shows 20 multiple-dwelling residential buildings on those two blocks, along with the Chinese Episcopal Church, the Ming Quong Home for Chinese Girls, and a gasoline station.

The Chinese families and individuals found the location to be convenient because it was immediately east of commercial Chinatown centered at 8th and Webster streets. There were important cultural and social services in commercial Chinatown, such as Chinese schools, family and business associations, and services like barber and herb shops. It was also near Lincoln Elementary School, which educated generations of Chinese children.

By the early 1960s, major public-works projects began to transform the three blocks. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

In 1963, at the urging of Oakland and other East Bay officials, BART decided to permanently locate its operational headquarters, which was in San Francisco on an interim basis, in Oakland. In addition, it drew up plans to open three downtown Oakland stations, one of them underneath the three blocks from Madison to Fallon between 8th and 9th Streets.

Those decisions had deep impact on the property owners, residents, businesses, and cultural institutions on those three blocks. From 1964 to 1966, BART acquired the rights to 24 parcels of property on the three blocks (one was the city-owned Madison Square Park). The acquisition costs ranged widely, from \$10,250 to \$52,750, but many were generally about \$30,000 per parcel.

BART records show that 16 of the parcel owners were Chinese. This ultimately meant the displacement of approximately 75 Chinese households, according to Willard T. Chow, who wrote his Ph.D. dissertation for the University of California at Berkeley in 1974 on Chinese settlement in the East Bay.

The displaced Chinese households, along with other families and residents, spread to other parts of Oakland and beyond. The change was especially difficult for elderly Chinese, who felt comfortable living in close proximity to commercial Chinatown and whose grasp of English was weak or non-existent. Moving away meant an inconvenience and a cultural and linguistic disruption. For the Chinese Episcopal Church that occupied the southwest corner of 9th and Madison Streets, its move to the Oakland hills resulted in a loss of many of its Chinese congregants who stopped attending the church because it was too far away.

Page 15

BART and the Lake Merritt BART Station Complex

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. Because of the underground station and connecting structures, ground disturbance and construction activities on top of and adjacent to the BART facilities are restricted and must be reviewed and approved by BART to ensure that these activities do not harm the structures. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed “at risk” if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks.

Project Site

Today the project site contains entrances and exits to the underground Lake Merritt BART Station, an AC Transit bus stop and sheltered area, and a surface parking lot that serves the BART station. The dotted red line in the exhibits that follow shows the location for Building B. Publicly accessible open space and a high-rise mixed use building are proposed north of Building B as part of redevelopment of the City block. The block was historically developed with residential properties. The 1889 Sanborn Fire Insurance Map depicts a large, two-story residence with three porches near the center of the block, an elevated water tank at the northeast corner, and a detached two-story outbuilding and attached woodshed just north of the water tank in what is now the 9th Street roadway (**Plate 1 - top**) (Sanborn 1889).

By 1911, the large two-story residence was demolished or moved, and eight residences and apartment buildings were constructed on the block. A large two-story residence and an elevated water tank and windmill occupied the northwest quadrant of the block, and the remaining eight residences and apartment buildings were constructed close together on the west half of the block (**Plate 1 - bottom**) (Sanborn 1911).

The large two-story residence and an elevated water tank and windmill that occupied the northwest quadrant of the block was replaced with the Ming Quong Home for Chinese Girls around 1936. By 1950, a two-story, six-unit apartment building near the southwest corner of the block had been demolished and a three-story, 24-unit apartment building was constructed on the same lot (**Plate 2 - top**). Lastly, a gas station was built at the undeveloped southeast quadrant of the block between 1950 and 1952 (**Plate 2 - bottom**) (Sanborn 1950; *Oakland Tribune* 1968 August 11; Sanborn 1952).

By 1965, two apartment buildings on the block that fronted Oak Street and the gas station were demolished, and the remaining buildings on the block/project site were demolished between 1965 and 1968 (**compare Plate 3 and Plate 4**). The majority of the project site block was excavated for the BART tunnel (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968).

Description of Historic Properties in APE

As a result of background research, survey, and significance evaluation, nine historic properties are within the APE. While four properties along 8th Street south of the project site (MR 05-08) are located within, and contributors to, the NRHP-eligible 7th Street/Harrison Square Residential District (MR 12), the district spans 11 city blocks and was not brought into the APE in its entirety. Additionally, one of the properties, Laney College at 900 Fallon Street (MR 04), is a large, 67-acre campus sited immediately east from the project site. It is outside the scope of work for this project to record and evaluate the entire campus, therefore, for the purpose of this project, the campus will be assumed eligible for listing in the NRHP and treated as a historic property. See **Table 5** and descriptive summaries for each historic property below. For full architectural descriptions and significance evaluations, refer to the DPR 523 forms located in **Attachment A**.

**Table 5
 Historic Properties in the APE**

Notes:

*NRHP Status Code reflects the designation assigned by the OHP

1S = Individually listed in the NRHP

2D2 = Contributor to a multi-component resource determined eligible for NR by consensus through Section 106 process. Listed in the CRHR.

3D = Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation

3S = Appears eligible for NR individually through survey evaluation.

Page 21

Serbian Orthodox Church of St. George at 94 9th Street / 900 Oak Street – MR 01

The Serbian Orthodox Church of St. George is a one- and two-story modified church building was found eligible for listing in the NRHP in 1985 for its association with the Serbian Orthodox population in the Bay Area; it was known as the “Mother Church for all Serbs in the Bay Area” (**Photograph 1**). The current survey continues to find the at 94 9th Street/900 Oak Street eligible for listing at the local level in the NRHP and the California Register of Historical Resources (CRHR) under Criterion A/1 and retains sufficient integrity to its period of significance, 1926, when the congregation added the rear social hall and classroom space and dedicated the building with its new name. This historic property is located north from the project site.

Photograph 1: Serbian Orthodox Church of St. George at 94 9th Street / 900 Oak Street (MR 01)

80-82 & 88-90 9th Street, Oakland – MR 02

The two, mirror-image, two-story “Classic Box” Colonial Revival style flat buildings were constructed in 1903-1904 and were moved to the property between 1916-1917 (**Photograph 2**). The flats buildings were designated as a local Heritage Property by the Landmarks Board on July 14, 2014. At the time of this survey, the two Colonial Revival flats at 80-82 & 88-90 9th Street also appear to meet the criteria for listing in the NRHP at the local level and the CRHR under Criterion C/3. The two flats retain their overall integrity, despite their relocation between 1916 and 1917. This historic property is located north from the project site.

Laney College at 900 Fallon Street – MR 04 (Assumed eligible for the purpose of this project)

The 67-acre New Formalism-style Laney College campus that was completed in 1971 and consists of roughly two dozen buildings, surrounding a central eight-story triangular, concrete administration building (**Photograph 3**). Buildings located along the campus perimeter are typically two- to three-stories, with exposed concrete and brick exteriors, and flat roofs. The first floors generally feature multi-light windows, entries, or exterior passthroughs with staircases accessing the campus courtyards. For the purpose of this project, this property is assumed eligible for listing in the NRHP and the CRHR for its significance at the local level as a Post-Modern-style, master-planned college campus and appears to retain integrity to its period of significance, 1971, the year the campus was completed. This historic property is located east from the project site.

Page 24

Lougee-Baumgartner House at 51 8th Street – MR 05

This two and three-and-a-half-story, Queen Anne style residence was constructed between 1890 and 1891 (**Photograph 4**). It was inventoried and evaluated on a Historic Resources Inventory (HRI) form by the Oakland Cultural Heritage Survey (OCHS) in 1983 as part of the “7th Street/Harrison Square Residential District” survey efforts. The author of the HRI form stated that the residence was “among Oakland’s most elaborate and most intact surviving large Queen Anne residences, distinguished by its richly varied forms, ornamentation and surface treatments” and identified the building as a “Primary Contributor” to the “7th Street/Harrison Square Residential District” which OCHS concluded was eligible for listing in the NRHP. The property at 51 8th Street was determined a contributor to the NRHP-eligible “7th Street/Harrison Square Residential District,” which is eligible under NRHP Criterion A and C (see description of 7th Street/Harrison Square Residential District significance below in MR 12), in 2009. While changes have been made to the building since then, it retains sufficient integrity to continue to convey its significance as a contributor and is a therefore reconfirmed as a historic property. This historic property is located south from the project site.

Photograph 4: Lougee-Baumgartner House at 51 8th Street (MR 05)

55 8th Street – MR 06

This two-story with an attic, Queen Anne and Colonial Revival transitional style residence was constructed between 1897 and 1898 (**Photograph 5**). It was inventoried and evaluated on an HRI form by the OCHS in 1984 as part of the “7th Street/Harrison Square Residential District” survey efforts. The author of the HRI form stated that the residence was a contributor to the “Seventh Street/Harrison Square Residential District” “for its architecture and history” which OCHS concluded was eligible for listing in the NRHP. The property at 55 8th Street was determined a contributor to the NRHP-eligible “7th Street/Harrison Square Residential District,” which is eligible under NRHP Criterion A and C (which is eligible under NRHP Criterion A and C (see description of 7th Street/Harrison Square Residential District significance below in MR 12), in 2009. Minimal changes have been made to the building since then (see B6), and it retains sufficient integrity to continue to convey its significance as a contributor and is a therefore reconfirmed as a historic property. This historic property is located south from the project site.

Photograph 5: 55 8th Street (MR 06)

Page 26

Sullivan House at 59 8th Street – MR 07

This two-story with an attic, Queen Anne style residence was constructed in 1896 (**Photograph 6**). It was inventoried and evaluated on an HRI form by the OCHS in 1984 as part of the “7th Street/Harrison Square Residential District” survey efforts. The author of the HRI form stated that the residence was a contributor to the “Seventh Street/Harrison Square Residential District” “for its architecture and history” which OCHS concluded was eligible for listing in the NRHP. The property at 59 8th Street was determined a contributor to the NRHP-eligible “7th Street/Harrison Square Residential District,” which is eligible under NRHP Criterion A and C (which is eligible under NRHP Criterion A and C (see description of 7th Street/Harrison Square Residential District significance below in MR 12), in 2009. It does not appear that any changes have been made to the building since then, it retains sufficient integrity to continue to convey its significance as a contributor and is a therefore reconfirmed as a historic property. This historic property is located south from the project site.

Photograph 6: Sullivan House at 59 8th Street (MR 07)

Josephs House at 61 8th Street – MR 08

This three-story with an attic, Queen Anne style residence was constructed between 1892 and 1893 (**Photograph 7**). It was inventoried and evaluated on an HRI form by the OCHS in 1984 as part of the “7th Street/Harrison Square Residential District” survey efforts. The author of the HRI form stated that the residence was a contributor to the “Seventh Street/Harrison Square Residential District” “for its architecture and history” which OCHS concluded was eligible for listing in the NRHP. The property at 61 8th Street was determined a contributor to the NRHP-eligible “7th Street/Harrison Square Residential District,” which is eligible under NRHP Criterion A and C (see description of 7th Street/Harrison Square Residential District significance below in MR 12), in 2009. It does not appear that any changes have been made to the building since then, it retains sufficient integrity to continue to convey its significance as a contributor and is therefore reconfirmed as a historic property. This historic property is located south from the project site.

Photograph 7: Josephs House at 61 8th Street (MR 08)

7th Street/Harrison Square Residential District – MR 12

The “7th Street/Harrison Square Residential District” was recorded in 1985 on HRI sheets as part of the OCHS. The district largely consists of residences constructed between 1889 and 1910 and one park (see **Figure 6** and **Photograph 8**). It is located along five blocks of 7th Street, the cross streets from Harrison to Fallon streets, extending in some places to 8th Street and 6th Street. The district was found eligible for listing in the NRHP in a local survey “as a surviving area of middle- and lower-middle-class housing constructed largely between 1889 and 1910,” but no specific NRHP criteria, period of significance, or character-defining features were identified as part of the significance evaluation. Based on the themes and built dates of the buildings recorded within in the district and the historic themes in (in order of importance) of architecture, social/ education, exploration/settlement, and economic/industrial, the district is assumed significant under NRHP Criterion A for its important association within the residential growth of Oakland during the 19th and early 20th centuries, and under NRHP Criterion C as concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing. The period of significance of the district appears to be from the 1860s when the earliest buildings were constructed to 1910 when most of the lots were built out. Character-defining features of the district are assumed to consist of the extant contributing buildings, their size and scale, late 19th and early 20th century architectural styles and details, and the historic street grid pattern. Surveyors in 1984 identified two-thirds of the buildings in the district boundary (79) as contributors, 39 properties as non-contributors, and 5 vacant lots. The district is located south and southwest from the project site.

Photograph 8: Four Contributing Buildings to the 7th Street/Harrison Square Residential District (on left half of frame) (MR 12)

Madison Park Apartments at 100 9th Street - MR 13

The Madison Park Apartments, a five-story building with 98 apartment units and a full basement, is one of the largest surviving early wood apartment buildings in the San Francisco Bay Area (**Photograph 9**). Originally constructed in 1908 by Charles MacGregor, the building was rehabilitated in 1995 to repair damage from the 1989 Loma Prieta earthquake (Madison Park Apartments 2017). The property is listed in the NRHP for its architectural significance, although the OHP assigned the property NRHP status code 7J (Undetermined) in 1993, following the earthquake. While not stated on the NRHP nomination, the building appears to be eligible under Criterion C with a period of significance of 1908 and Architecture as the NRHP area of significance. This historic property is located northwest from the Project site.

Photograph 9: Madison Park Apartments (MR 13)

Assessment of Effects

The Criteria of Adverse Effect pursuant to 36 C.F.R. 800.5(a)(1) were applied to assess effects of the undertaking on historic properties within the APE:

An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the NRHP. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance, or be cumulative.

Several examples of adverse effects are listed in 36 C.F.R. 800.5(a)(2), including:

- (i) Physical destruction of or damage to all or part of the property*
- (ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary's standards for the treatment of historic properties (36 C.F.R. part 68) and applicable guidelines.*
- (iii) Removal of the property from its historic location*
- (iv) Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance*
- (v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features*
- (vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization*
- (vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance*

Application of Criteria of Adverse Effects on Built Environment Historic Properties

Nine built environment historic properties are within the APE, including a portion of a NRHP-eligible district (MR 13), and the Laney College campus (MR 4) that is assumed eligible for the purpose of this project.

(i) Physical destruction of or damage to all or part of the property

The proposed project be contained within the block bound by Fallon, 8th, Oak, and 9th Streets (APN 001-0169-001-00) and will not physically destroy or damage any part of the nine adjacent historic properties in the APE.

(ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary's standards for the treatment of historic properties (36 C.F.R. part 68) and applicable guidelines.

Not applicable. The proposed project is on an empty parking lot and is not a historic property.

(iii) Removal of the property from its historic location

No historic properties within the APE will be relocated as part of the proposed project.

(iv) Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance

The proposed project would not change the use of any of the historic properties within the APE. Of the nine historic properties in the APE, no physical features of the immediate setting were identified as character-defining features.

(v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features

The proposed project would introduce a new 7-story, approximately 85-foot tall, 79,318-square-foot building on the southern portion of the existing 0.26-acre parcel which is currently used as a parking lot. While the new building would introduce new visual, atmospheric, and audible elements both during construction, and after completion, since the 1960s, the setting of the historic properties in the APE has changed dramatically. These changes include the demolition of single-family and multi-family residential dwellings in a two-block area (the present BART parking area and the current Madison Square Park) in the 1960s, removal of Caroline Square (immediately west from the project site) in the 1960s, creation of Madison Square Park in the late 1960s, construction of the LMA Building in 1969, construction of the Joseph P. Bort MetroCenter between 1982 and 1984, and finally the demolition of the LMA Building in 2009.

Given the extensive alterations to the existing urban fabric within the APE since the 1960s, particularly on the sites associated with the Lake Merritt BART station, the proposed project would not diminish the historic integrity of any of the nine historic properties in the APE to a level where could no longer convey their historic significance.

(vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization

Not applicable.

(vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance

Not applicable.

Potential Effects to Archaeological Resources

No previously recorded archaeological resources were identified in or adjacent to the APE as a result of background research. However, the APE is sensitive for precontact and historic-period resources due to the location being only 200 to 400 feet west of the historic-era tidal marsh shoreline and the resources that that environment offered to precontact people, the presence of precontact burial (P-01-10796) identified nearby the APE, as well as the APE being the previous location of the Oakland Cemetery for a brief period in the 1850s. Historic-period burials were removed in 1857. The surface sensitivity for potentially encountering archaeological resources in the APE is reduced from moderate to low due to the various land uses over time, including the construction and removal of residential buildings and the excavation and construction of the BART station adjacent to the APE. Any resources that may be encountered would have the potential to be eligible for the NRHP and may be adversely affected by the undertaking.

The greatest potential for encountering intact archaeological resources is in the location of the proposed foundation piles needed to support the concrete slab. Buried sensitivity for potential archaeological resources is mapped as high in the APE. Maximum excavation for building foundation pilings is 130 feet below ground surface for piles approximately 70 to 110 feet in length.

The following are standard conditions of approval (SCAs) that relate to cultural resources imposed by the City of Oakland and included as part of the City's approval of the plans for the proposed project. The following applies to construction in the event of accidental discovery of buried materials.

Standard Condition of Approval: Archaeological and Paleontological Resources – Discovery During Construction

Pursuant to CEQA Guidelines section 15064.5(f), in the event that any historic or prehistoric subsurface cultural resources are discovered during ground disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented.

In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense.

In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant.

Standard Condition of Approval: Archaeologically Sensitive Areas – Pre-Construction Measures

The project applicant shall implement Provision A (Intensive Pre-Construction Study) and Provision B (Construction ALERT Sheet) concerning archaeological resources. If Native American archaeological resources are identified or suspected in a project site, the City shall consult with a Native American representative(s) registered with the Native American Heritage Commission that is traditionally and culturally affiliated with the geographic area as described in Public Resources Code Section 21080.3.

Provision A: Intensive Pre-Construction Study.

The project applicant shall retain a qualified archaeologist to conduct a site-specific, intensive archaeological resources study for review and approval by the City prior to soil-disturbing activities occurring on the project site. The purpose of the site-specific, intensive archaeological resources study is to identify early the potential presence of history-period archaeological resources on the project site. At a minimum, the study shall include:

- a. Subsurface presence/absence studies of the project site. Field studies may include, but are not limited to, auguring and other common methods used to identify the presence of archaeological resources.
- b. A report disseminating the results of this research.
- c. Recommendations for any additional measures that could be necessary to mitigate any adverse impacts to recorded and/or inadvertently discovered cultural resources.

If the results of the study indicate a high potential presence of historic-period archaeological resources on the project site, or a potential resource is discovered, the project applicant shall hire a qualified archaeologist to monitor any ground disturbing activities on the project site during construction and prepare an ALERT sheet pursuant to Provision B below that details what could potentially be found at the project site. Archaeological monitoring would include briefing construction personnel about the type of artifacts that may be present (as referenced in the ALERT sheet, required per Provision B below) and the procedures to follow if any artifacts are encountered, field recording and sampling in accordance with the Secretary of Interior's Standards and Guidelines for Archaeological Documentation, notifying the appropriate officials if human remains or cultural resources are discovered, and preparing a report to document negative findings after construction is completed if no archaeological resources are discovered during construction.

Provision B: Construction ALERT Sheet.

The project applicant shall prepare a construction "ALERT" sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil-disturbing activities within the project site.

The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones. Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible location at the project site.

Standard Condition of Approval: Human Remains – Discovery During Construction

Pursuant to CEQA Guidelines section 15064.5(e)(1), in the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native

American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant.

Mitigation Measures

Mitigation measures in addition to the standard conditions of approval are also recommended to address the interests raised during Native American tribal consultation. These measures include sensitivity training for all individuals associated with earth-moving activities, a qualified archaeological monitor be present during earth-moving activities, and a qualified Native American monitor also be present during earth-moving activities.

Conclusion

The project, which is subject to Section 106 review, has been analyzed for potential effects on historic properties in the APE. This memorandum presents a description of the undertaking, the APE, the methodology used to identify and evaluate historic properties within the APE, the affected historic properties, and an assessment of potential effects resulting from the undertaking. Background research and survey did not identify archaeological resources in the APE but identified low to high potential for precontact and historic-period archaeological resources to be present in the vertical APE.

As a result of background research, survey, and significance evaluation, nine historic properties were identified in the APE. Because the project would not alter, directly or indirectly, any of the characteristics of the historic properties that qualify them for inclusion in the NRHP, a finding of **No Adverse Effect** with (36 CFR 800.5(b)) is recommended.

The APE was determined to be archaeologically sensitive. The Section 106 finding of **No Adverse Effect** is conditional upon the implementation of the SCAs and mitigation measures identified by the City of Oakland.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Serbian Orthodox Church of St. George, located at 94 9th Street / 900 Oak Street was originally constructed between 1910 and 1911 and is sited at the northeast intersection of 9th and Oak streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately south of the property and the BART station is immediately southwest (see **Sketch Map**). The church building has a rectangular plan and rests on a slab concrete foundation. Between 1924 and 1926, new owners heavily modified the building with a two-story rear addition that faces 9th Street and non-originally stucco siign (**Photograph 1**). The building is wood frame that has been clad in stucco siding on the western-facing façade and the south side, and the east and north sides feature horizontal wood boards (**Photograph 2**). The building is topped with a gable and flat roof system, clad in built-composition shingles and a belt cornice underscores the flat roof portion. Fenestration details include aluminum sash and lancet windows. The western-facing facade is characterized by a U-shaped plan, composed of a shed roof that is interrupted by gabled dormers. The hollow of the U-shaped plan is filled with a low-walled partial porch entry that is accessed by a broad flight of stairs. (SEE CONTINUATION SHEET).

*B10. Significance: Theme Religion Area Oakland, Alameda County

Period of Significance 1926 Property Type Church Applicable Criteria NRHP A/CRHR 1

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

On June 30, 1985, the Oakland Cultural Heritage Survey inventoried and evaluated the Serbian Orthodox Church of St. George for potential eligibility for listing on the National Register of Historic Places (NRHP). The survey found the church eligible for the NRHP under Criterion A for its association with the Serbian Orthodox population in the Bay Area; it was known as the "Mother Church for all Serbs in the Bay Area." The current survey continues to find the at 94 9th Street/900 Oak Street eligible for listing at the local level in the NRHP and the California Register of Historical Resources (CRHR) under Criterion A/1 and retains sufficient integrity to its period of significance, 1926, when the congregation added the rear social hall and classroom space and dedicated the building with its new name. Therefore, the building is a historical resource for purposes of the California Environmental Quality Act (CEQA) and a historic property under Section 106 of the National Historic Preservation Act (NHPA). At the local level Oakland Cultural Heritage Survey (OCHS) assigned an individual property rating of "B+3", which means Major Importance: Especially fine architectural example, major historical importance, not in a historic district. The church is also designated as a City of Oakland Heritage Property because it was added to the City's Preservation Study List in 2000 (OCHS 2000). (SEE CONTINUATION SHEET)

Continuation Update

***P3a. Description (continued):**

The north arm includes a wood single-entry door, while the south arm includes a wood double-entry door; each entry is covered by a mansard-like awning. The porch entry is enclosed with a cross-topped arch, gate and fence constructed of wrought iron; it is flanked on each side by an aluminum sash window. Other details include a wood-framed prayer box on the exterior of the façade, exterior light fixtures, two air vents near the foundation, and a plaque in the porch entry that reads, "Serbian Orthodox Church – St. George – Dedicated 1926" (**Photographs 3 and 4**).

The south side features details primarily added between 1924 and 1926; although, it includes some original details from the 1910 to 1911 construction (**Photograph 5**). These include three original stained-glass lancet windows at the west end of the elevation; they are flanked on each side by fixed sash windows of varying size. Other details include wood surrounds on the fenestration, as well as an air vent near the foundation. The east half of the elevation is characterized by a recessed arch entrance adorned with a stucco-clad keystone, accentuated by an exterior light fixture. The fenestration pattern includes aluminum sash windows on both the second and ground levels, surrounded by wood, with three sets of these windows appearing in pairs. The north side is not visible to the public right-of-way. The rear (east) side is the exposed horizontal wood siding and is also the location of a steel-framed fire escape system (**Photograph 2**).

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the Historic Resource Inventory (HRI) form authored by the Oakland Cultural Heritage Survey on June 30, 1982. Please see attached HRI for further details.

The Serbian Orthodox Church of St. George was historically known as the "Mother Church for all Serbs in the Bay Area." It has always been the focus of Serbian ethnic activities in the East Bay. The organization traces back to a 1916 Oakland Serbian Orthodox group called "Education," for learning and cultural appreciation, affiliated with a central office in Sarajevo, Bosnia. In 1923, it reorganized to meet local needs, especially for a weekly school teaching Serbian language and culture. Early in 1924, the group purchased the present property from St. Paul's Episcopal Church, which had constructed the original church sanctuary, small office, and sacristy building to house the Mission of the Good Samaritan, which St. Paul's organized and supported. F. E. Brigham's large Queen Anne residence had occupied the site earlier. The stained glass of the three lancet windows seem to date from this pre-Serb period, as its iconography is more Episcopal than Orthodox.

The name St. George was chosen for the Serbian Orthodox Church at the time of incorporation in November 1924. Immediately it was decided the physical needs demanded a major addition for social hall, kitchen, classrooms, and meeting rooms. Which the addition built (see **Plate 1**), and the debt paid off, the church was consecrated on December 19, 1926 by Bishop Mardarjie, the first Serbian Hierarch in the United States. Over a hundred people attended the dedication banquet. Through the years the people of the church have kept alive and transmitted their Serbian heritage by using the language and the Cyrillic alphabet, by celebrating their country's special religious rites, by maintaining strong in-group social ties, by participating in the world-wide politics of their religion and country, and by enjoying cultural activities such as the Serbian Singing Society, a tamburitza-playing band, and shared ethnic recipes. According to the Harvard Encyclopedia of American Ethnic Groups, Serbs make up 40% of the population of Yugoslavia and are distinguished from their fellow South Slavs by their own branch of Orthodox Christianity (as opposed to the Roman Catholicism of the Croats) and by their use of Cyrillic and the Julian calendar. In the United States, the predominant force holding Serbs together is their church which sustains a strong community life in a relatively small group of Serbian centers, of which St. George's is one. The first Serb arrived in San Francisco before the Gold Rush, and the first purely Serbian Church in the United States was the one in Jackson, California (1893). The Serbian Orthodox Church of St. George was consecrated the same year as the first Serbian-Orthodox Bishop in the U.S. was selected. The church is the nucleus of the organization making up Serbian-American social life.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, the Serbian Orthodox Church of St. George appears to have significant association with important historic events. The building on this parcel, constructed between 1910 and 1911, and altered between 1924 and 1926, is associated with the Serbian-Orthodox population in Oakland and the East Bay. Research indicated the people became known as the "Mother Church of Serbs in the East Bay," and also operated as the nucleus of Serbian-American social life in Oakland. As a result, the building played a distinct and important role in the Serbian population and their religious affiliations. Therefore, Serbian Orthodox Church of St. George meets eligibility

Page 5 of 7

*Resource Name or # (Assigned by recorder) Serbian Orthodox Church of St. George, MR 01

Recorded by: H. Miller *Date: February 29, 2024

Continuation Update

for inclusion in the NRHP and CRHR under Criterion A/1.

Under NRHP Criterion B or CRHR Criterion 2, the Serbian Orthodox Church of St. George is not significant for any associations with the lives of persons important to history. Research did not indicate that any individuals, such as related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C or CRHR Criterion 3, the Serbian Orthodox Church of St. George is not significant because it is not an important example of a type, period, or method of construction. The heavily modified church building lacks distinctive design that would merit listing on the NRHP and CRHR. There is no master architect or builder associated with this building; therefore, it is not significant as the work of a master.

Under NRHP Criterion D or CRHR Criterion 4, the Serbian Orthodox Church of St. George is not significant as a source (or likely source) of important information regarding history. It does not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis and Conclusion

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The Serbian Orthodox Church of St. George meets the criteria of significance for eligibility for listing in the NRHP and CRHR under Criteria A/1 at the local level and retains sufficient historic integrity to convey its significance. The building remains in its original location, the setting of which is in the modified area south of Lake Merritt. The property is still used as a Serbian church and social center, so it retains integrity of association. It retains a high level of integrity of design, materials, and workmanship because there appear to be no alterations to the building since it was altered by the Serbian church and dedicated the building with its new name. And finally, in terms of feeling, the most subjective of integrity considerations, the property continues to look like a building of its period.

In conclusion, the Serbian Orthodox Church of St. George appears eligible for listing in the NRHP and CRHR under Criteria A/1 at the local level and retains sufficient integrity to convey its significance. Therefore, the building is a historical resource for purposes of the California Environmental Quality Act (CEQA) and a historic property under Section 106 of the National Historic Preservation Act (NHPA). The boundary for the historic property/historical resource is the legal parcel.

The two mirror-image flat buildings were constructed in 1903-1904 and were moved to the property between 1916-1917 (**Photograph 1**). They are sited mid-block on the north side of 9th Street between Oak Fallon streets. The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately south of the property and the BART station is one-block to the southwest (see **Sketch Map**). A narrow, gated driveway is sited between the two buildings and provides access to a small, flat roof, detached garage. The wood frame, two-story "Classic Box" Colonial Revival style flat buildings have rectangular plans and rest on raised foundations. Exteriors are clad in narrow horizontal wood siding with Corinthian corner pilasters and brick veneer on the foundation of the porch façade. The buildings are topped with cross-hip-and-gable roof systems with moderate overhang and covered in composition shingles. Tall friezes with egg-and-dart details and dentils underscore the roofline and small hipped roof dormers project from the center of the façade roof plane. Dual primary entries with transoms are on the façade, are accessed by concrete and brick stairs, and are protected by a Corinthian column supported, flat roof porch. Windows consist of one-over-one vinyl replacements throughout. Windows on the façade are framed by Corinthian pilasters and a Palladian arranged window on the first story. Shallow, full-height bay windows line the exterior walls that face the shared driveway (**Photograph 1**) and the cross-gable portions of the building are on the outside walls (**Photographs 2 and 3**).

*B10. Significance: Theme Architecture

Area Oakland, Alameda County

Period of Significance 1903-1904; 1916-1917

Property Type Multi-family flats

Applicable Criteria NRHP C/CRHR3

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

On April 17, 2014, Darryl Fong inventoried and evaluated the two Colonial Revival flats as a local Heritage Property and was designated as such by the Landmarks Board on July 14, 2014 (Fong 2014; Marvin 2024). Heritage Properties are defined in the Preservation Element of the Oakland General Plan as "properties which definitively warrant preservation, but which are not Landmarks." Heritage Properties are protected by design review, environmental review, demolition findings, and the California Historical Building Code (Oaklandca.gov 2024). At the local level Oakland Cultural Heritage Survey (OCHS) assigned an individual property rating of "C3" to property at 80-82 & 88-90 9th Street, which in this case means Secondary importance, not in a historic district. At the time of this survey, the two Colonial Revival flats at 80-82 & 88-90 9th Street also appear to meet the criteria for listing in the National Register of Historic Places (NRHP) at the local level, and the California register of Historical Resources (CRHR) under Criterion C/3. The two flats retain their overall integrity, despite their relocation between 1916 and 1917. Therefore, the buildings are historical resources for purposes of the California Environmental Quality Act (CEQA) and historic properties under Section 106 of the National Historic Preservation Act (NHPA). (SEE CONTINUATION SHEET)

Continuation Update

***P3a. Description (continued):**

The buildings demonstrate a "Classic Box" variation of Colonial Revival architecture. The southwest facing facades include offset partial porch entries supported by Corinthian porch columns; the porch roof includes iron-railed balconies (formerly balustrered). The porch entries cover two single-entry doors that provide access to each separate unit. The porch entries are flanked by a wood-framed Palladian window with Corinthian details. The second level sash windows include faux Corinthian capitals. The side elevations include additional one-over-one-sash windows with Corinthian column details. The rear elevations are not visible to the public right-of-way; however, aerials and review of the former Heritage Property form indicate they include full-width lattice-enclosed utility porches on the second and ground levels. A detached flat roof garage building flanks the rear elevations. Other details include Corinthian style corner boards on the exterior walls (**Photographs 2 and 3**).

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the Heritage Property application form authored by Darryl Fong on April 14, 2014. See attached application for further details.

The Colonial Revival flats remain as well-preserved architectural examples of early twentieth century "Classic Box" Georgian Colonial Revival flats buildings. The structures were moved to present location between 1916 and 1917 and placed in unique "opposite" orientation to each other on three (original) parcels with a central common driveway and garages at the rear. These grand side-by-side twin flats are prominently sited across 9th Street from the Lake Merritt BART station and are the only early residential structures remaining on this block face.

A search of the 1911 to 1912 Sanborn maps, volumes 1 and 2, turned up a matching footprint on 10th Street between Webster and Harrison, where five double flats buildings were displaced by construction of two buildings that still stand, 1001-19 Harrison/304 10th Street (1915) and 312-32 10th Street (1916). Notes in the 1915 tax assessor's block books indicate that two of the Harrison Street pairs of flats were moved to 915 and 925 Fallon Street between 9th and 10th Streets (around the corner from 80-90 9th Street; these buildings, owned in 1917 by H.A. Marckresi [?] Co., were demolished in 1973). The 1916 book is missing and the 1917 book notes the two buildings on Gus Sieman's formerly vacant lots at today's 80-90 9th Street as "Imp. House moved." The building that is now 80-90 9th Street is the only one of the five with angled bays on the sides. This identifies it as the westernmost and last built of the five double flats buildings at 10th and Harrison.

Developer of the new buildings on 10th Street was Eugene R. Tutt, hardware dealer, plumbing contractor, and capitalist (occupation "own income" in 1910 census), who had also developed the cluster of flats on 10th and Harrison between circa 1901 and 1904. Double flats (and triple: one nearby example is at 701-11 Alice) were a building type well suited to blend into neighborhoods that were gradually intensifying from single family residential. As development accelerated after the 1906 earthquake, Tutt's block became increasingly commercial. He apparently determined that the decade-old flats were not the highest and best use of the site, but were too good to demolish, and in some way placed all of them with new owners who would relocate them to nearby residential sites. The block where three of the five pairs went, Fallon to Oak and 9th to 10th, was very little developed in 1915 and was fairly fully built up by 1917.

Tutt's 1915 to 1916 buildings at 10th and Harrison were designed by A.W. Smith, a prolific and inventive early 20th century Oakland architect who could well have also designed Tutt's elegant and ingenious Colonial Revival flats (constructed before Oakland instituted building permits in 1905). In addition to the 10th and Harrison group, three other sets of twins of 80-90 9th Street are known to the Oakland Cultural Heritage Survey, also developed by Tutt in 1903-04 (and therefore also pre-permit and without identified designer or builder). When they were built at 14th and Brush Streets, they were in another gradually intensifying downtown fringe neighborhood like 10th and Harrison. They were moved in 1978-79 from the 980 freeway and are now at 815-17/821-23 20th Street, 1808-10/1812-18 West Street, and 780-90 17th/1712-18 West Street in the Oak Center Historic District. Each pair is separated into two buildings ("Too big to move and too good to destroy," according to a 1979 article). The pair at 17th and West is set at 90 degrees to each other.

The owners of 80-90 9th Street at its new location in 1917 were Gus and Flora Sieman. Gus was born in Australia c.1868 and is listed as a "storekeeper" in the 1918 city directory. The 1936 WPA housing survey describes him as "retired" (and landlord of the flats). The other residents were a "white" truck driver working for the WPA and two "oriental" households headed by a printer (Suey Won Lowe, of Suey-Won Printing Co., 167 9th Street, according to 1936 directories) and a merchant whose business was at 8th and Franklin. Oakland's present Chinatown was a well-developed community by that time. In 1938 George Chew bought the property, and his descendants have owned it ever since. George Chew (1905-2000) was born in Los Angeles and was a prominent member of the Bay

Area Chinese community for decades. His obituary describes him as “a past Grand President of the Chinese American Citizens Alliance, President of the Pan American Loong Kong Tien Yee Association, Vice President of the Chinese Consolidated Benevolent Association and Director of the Chinese Times.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from “Chapter 9: Historic Resources” in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

“By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed “at risk” if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks.”

Colonial Revival Architecture

These flat buildings are built in the Colonial Revival style, most popular in America between circa 1880 and 1950. The style refers to the rebirth in interest of the early English and Dutch colonial styles. Houses built in the period between 1915 and 1930 often include details influenced by early examples of American architecture, with 1920 to 1930 representing a time when the most accurate details were integrated into the designs. Residences are typically one- to three-stories and hallmarks of the classical style include a symmetrically arranged façade with central door flanked by balanced windows, an accentuated front door with portico or porch hood supported by columns, multi-pane windows (commonly in pairs), fanlights, pediments, and roof dormers. Wall cladding materials varied greatly and could include brick, wood shingles, wide and narrow horizontal wood siding, as well as stucco. Roof types within the style also varied greatly from side-gable, hipped, Gambrel (Dutch Colonial), and second-story overhang. Reverence of Colonial Revival architecture spanned nearly six decades and was adapted for urban and suburban settings from rowhouses to large classical-inspired houses. Although large examples come to mind when Colonial Revival is mentioned, single-story examples very popular in the United States in the 1940s. The style also evolved over time to accommodate modern lifestyles with post-war examples featuring integrated garages on the facades and more reserved architectural details (McAlester 2013 :408-429; Harris 1998:106-208).

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, the Colonial Revival flats have no significant association with important historic events. The buildings on this parcel, constructed between 1903 and 1904, are associated with residential development in Oakland and the East Bay; however, many residents likely occupied these buildings, but research did not reveal that the building played a distinct or important role in the economic development of the in the area.

Under NRHP Criterion B or CRHR Criterion 2, the Colonial Revival flats are not significant for any associations with the lives of persons important to history. Research did not indicate that any individuals, like Eugene R. Tutt, or George Chew, related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C or CRHR Criterion 3, the Colonial Revival flats are significant as an important type, period, and method of construction: Colonial Revival, at the local level. The Colonial Revival style building proliferated on main streets and residential corridors throughout the nation between 1880 and 1950. The Colonial Revival flats at 80-82 & 88-90 9th Street are a remarkable and excellent example reflecting the twentieth century trends of this style. The buildings on this parcel retain the high artistic value and distinctive design that would merit listing in the NRHP and the CRHR. A.W. Smith may be the master architect responsible for the buildings; however, research did not reveal enough

Continuation Update

information to support the claim.

Under NRHP Criterion D or CRHR Criterion 4, the Colonial Revival flats are not significant as a source (or likely source) of important information regarding history. They do not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis and Conclusion

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The Colonial Revival flats meet the criteria of significance for eligibility for listing in the NRHP and CRHR under Criteria C/3 at the local level and they retain sufficient historic integrity to convey their significance. The buildings remain in their original location, the setting of which is in the modified area south of Lake Merritt. The property is still used as a multiple-family residential property, so it retains integrity of association. It retains a high level of integrity of design, materials, and workmanship because there appear to be no alterations to either building since their construction. And finally, in terms of feeling, the most subjective of integrity considerations, the property continues to look like buildings of its period.

In conclusion, the Colonial Revival flats at 80-82 & 88-90 9th Street is a City of Oakland Heritage Property and are also eligible for listing in the NRHP and CRHR under Criteria C/3 at the local level and retain sufficient integrity to convey their significance. Therefore, the buildings are historical resources for purposes of the California Environmental Quality Act (CEQA) and historic properties under Section 106 of the National Historic Preservation Act (NHPA). The boundary for the historic property/historical resource is the legal parcel.

This light industrial building was constructed in 1956 and is sited at the northwest intersection of 9th and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately south of the property and the BART station is one-block to the southwest (see **Sketch Map**). The Contemporary style building is a single-story with a rectangular plan and a concrete foundation. The building is composed of a flat roof clad in built-up material with wide, overhanging eaves and parapets; the rear elevation includes a stepped parapet. The building is constructed of concrete masonry unit (CMU) block. Fenestration details include anodized metal framed, fixed windows with concrete sills and glass block. Access into the building is defined by two entries on the southern-facing facade. An industrial roll-up garage door flanked by a single-entry door and two glass block windows is on the west end and a recessed entry covered by a projecting eave that wraps onto the east elevation. The recessed entrance includes a concrete ramp and staircase, a single-entry door with a transom and sidelight, an anodized metal framed sash window, and square brick veneer that extends onto the east elevation. A portion of the brick work extends south and creates a breezeway. The east side includes a planter box along the foundation, three anodized metal framed sash windows, and a projecting concrete wall at the north end. The west side features two additional glass block windows and an exterior access ladder. (**Photograph 2**). The rear (north) side lacks wall openings.

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

The commercial building evaluated on this form was constructed in 1956. Two years after construction year the building was in danger of being demolished by the city when the City Planning Commission considered creating two city blocks of surface parking to support the convention center, auditorium, and exposition buildings, by razing the buildings bounded by Oak, Fallon, 8th and 10th Streets. During the Commission's hearing, "Charles Hansen, owner of a ball-bearing firm at 52 9th St., pleaded that the two blocks, including his year-old plant be spared from the project. He contended the city would save \$750,000 if parking could be provided on property already owner by the city" (*Oakland Tribune* 1958 September 26). It is unclear what type of business currently operates out the building.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [*north and northwest from the property at 55 8th Street*]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

Contemporary Architecture

This light industrial building utilizes elements of the Contemporary style, popular between circa 1940 and 1980. The style is generally characterized by strong roof forms including flat, gabled, shed, or butterfly, typically with deep overhangs and/or exposed beams; large windows, and non-traditional exterior finishes. This architectural style emerged and proliferated through innovations in building materials that occurred in the late 1930s, including creation of exterior-grade plywood, laminated engineered wood with industrial glues, and large plate glass windows. These building materials allowed architects to create designs that blurred the line between indoor and outdoor spaces, utilizing large windows further highlighted through large spans of uninterrupted wall space. Exterior cladding materials could also include vertical wood siding, concrete block, stucco, flagstone, and mullion-free glass; angular massing; sun shades, screens, or shadow block accents. Entrances into Contemporary style buildings are most often restrained or hidden from view with privacy screens. The Contemporary style was relatively inexpensive to build and was applied to single-family, multi-family, religious, commercial, school, and government buildings. More exaggerated roof forms like triangular, parabolic, or arched forms were used on commercial buildings rather than residential construction (McAlester 2013: 628-632).

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, this building has no significant association with important historic events. The building on this parcel, constructed in 1956, is associated with infill development; but research did not reveal that the building played a distinct or important role in any respective industries, or that the building played an important role in the economic development of the area south of Lake Merritt.

Under NRHP Criterion B or CRHR Criterion 2, this building is not significant for any associations with the lives of persons important to history. Research did not indicate that any individuals, such as original business owner Charles Hansen or subsequent owners related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Page 4 of 4

*Resource Name or # (Assigned by recorder) 52 9th Street, MR 03

Recorded by: H. Miller *Date: February 29, 2024

Continuation Update

Under NRHP Criterion C or CRHR Criterion 3, this building is not significant because it is not an important example of a type, period, or method of construction. Contemporary style buildings were in wide use during the twentieth century on industrial properties throughout California. The light industrial commercial building at 52 9th Street is a typical and unremarkable example reflecting the trends of this style. The building on this parcel also lacks distinctive design that would merit listing on the NRHP and CRHR. IT does not appear that is no master architect or builder associated with this building; therefore, it is not significant as the work of a master.

Under NRHP Criterion D or CRHR Criterion 4, the building at 52 9th Street is not significant as a source (or likely source) of important information regarding history. It does not appear to have any likelihood of yielding important information about historic construction materials or technologies.

At the local level, this building has not been surveyed by the Oakland Cultural Heritage Survey (OCHS). Based on this survey and evaluation, it appears that is should be assigned an individual property rating of "E3" which means Of no particular interest, not in a historic district (Oaklandca.gov 2024).

Integrity Analysis and Conclusion

Although the building generally retains integrity of location, setting, design, materials, workmanship, feeling, and association to its date of construction, it does not meet any of the significance criteria necessary for eligibility for listing in either the NRHP or CRHR.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This property consists of the 67-acre New Formalism-style Laney College campus that was completed 1971 (Photograph 1). The campus is bound by Fallon Street at the west, 5th Avenue at the east, 7th Street at the south, 10th Street at the north, and is bisected by the Merritt Channel (see Sketch Map). The campus consists of roughly two dozen buildings. The primary public access point to the campus is at the intersection of Fallon Street and 9th Street. The view from this intersection is dominated by the eight-story triangular, concrete administration building that features a flat roof and is punctuated with recessed, paired aluminum windows. Buildings located along the campus perimeter are typically two- to three-stories, with exposed concrete and brick exteriors, and flat roofs. The first floors generally feature multi-light windows, entries, or exterior passthroughs with staircases accessing the campus courtyards.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This two and three-and-a-half-story, Queen Anne style residence was constructed between 1890 and 1891 and is sited at the southwest intersection of 8th and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is one-block to the northwest (see **Sketch Map**). The parcel is lined with a modern metal security fence and gate system. A two-story shed and hipped roof addition are constructed at the rear of the property. The building has a roughly rectangular plan and rests on a raised foundation with a half-story basement level. It is topped with a cross-hip-and-gable roof system with narrow overhang and covered with composition shingles. Several types of wood siding cover the exterior including flush, horizontal wood boards on the basement half-story and first story and straight and fish scale wood singles on the second and attic half-story. Primary entry is gained on the northern-facing façade through stairs that extend from the sidewalk to the raised first-story, wrap around porch that features arches and spindle work details (**Photograph 2**). The entry consists of a pair of glazed, wood panel doors with fixed transoms above (**Photograph 3**). A second-story integral balcony porch is above the primary entry porch and also features arches and spindle work details. Carved, decorative wood brackets line the area above the second-story balcony porch and in the end gable, flanking a small, two-part replacement window. Windows throughout the building generally consist of one-over-one and fixed, vinyl frame replacement windows, with two-part sliding vinyl frame replacement windows in the half-story basement level.  (Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The property at 51 8th Street was inventoried and evaluated on a Historic Resources Inventory (HRI) form by the Oakland Cultural Heritage Survey (OCHS) in 1983 as part of the "7th Street/Harrison Square Residential District" survey efforts (see attached HRI form). The author of the HRI form stated that the residence was "among Oakland's most elaborate and most intact surviving large Queen Anne residences, distinguished by its richly varied forms, ornamentation and surface treatments" and identified the building as a "Primary Contributor" to the "7th Street/Harrison Square Residential District" which OCHS concluded was eligible for listing in the National Register of Historic Places (NRHP) (OCHS 1983; OCHS 1984). OCHS found the district eligible for listing in the NRHP "as a surviving area of middle- and lower-middle-class housing constructed largely between 1889 and 1910" (OCHS 1984), but no specific NRHP criteria, period of significance, or character-defining features were identified as part of the significance evaluation. *Date of Evaluation: March 2024

(This space reserved for official comments.)

***P3a. Description (continued):**

The two-story shed and hipped roof addition at the rear of the property contains entries at the ground level as well as the main first story (Photograph 3). The main first story entries are accessed by a long, wood frame staircase that leads to a narrow deck area where the two entry doors are protected by gable door shelters. The ground level entries are located beyond arched wall openings, cut into exterior wall below the deck.

***B10. Significance (continued):**

Based on the themes and built dates of the buildings recorded within in the district and the historic themes in (in order of importance) of architecture, social/ education, exploration/settlement, and economic/industrial, the district is assumed significant under NRHP Criterion A for its important association within the residential growth of Oakland during the 19th and early 20th centuries, and under NRHP Criterion C as concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing. The period of significance of the district appears to be from the 1860s when the earliest buildings were constructed to 1910 when most of the lots were built out. Character-defining features of the district are assumed to consist of the extant contributing buildings, their size and scale, late 19th and early 20th century architectural styles and details, and the historic street grid pattern.

The "7th Street/Harrison Square Residential District" survey documents from the early 1980s were submitted to the Northwest Information Center (NWIC) and the property at 51 8th Street was assigned a California Historical Resources Status Code of 3D: "Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation" (BERD 2024). In 2009 a United States Department of Housing and Urban Development (HUD) report was prepared and submitted to NWIC that appears to have reevaluated and reconfirmed 51 8th Street as a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" and received concurrence from the State Historic Preservation Officer (SHPO) because it was assigned a California Historical Resources Status Code of 2D2: "Contributor to a multi-component resource determined eligible for NRHP by consensus through Section 106 process. Listed in the CRHR" (BERD 2024). Therefore, the property at 51 8th Street is a historic property under Section 106 of the National Historic Preservation Act (NHPA). However, a copy of the 2009 HUD report nor an updated recordation and evaluation of the property at 51 8th Street were on-file at NWIC.

At the local level, as a result of the "7th Street/Harrison Square Residential District" survey efforts, OCHS assigned an individual property rating of "A1+" to property at 51 8th Street which in this case means Highest Importance: Outstanding architectural example, and in a National Register quality/eligible district. The property at 51 8th Street was also designated as a City of Oakland Heritage Property in 2015. Heritage Properties are defined in the Preservation Element of the Oakland General Plan as "properties which definitively warrant preservation but which are not Landmarks." Heritage Properties are protected by design review, environmental review, demolition findings, and the California Historical Building Code (Oaklandca.gov 2024).

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the HRI form authored by OCHS in 1983.

"The first appearance of \$1,500 worth of improvements for this parcel in the 1890 city tax assessor's block book and the increase in that value to \$2,000 in the 1892 books (the 1891 book is missing) suggests that the Lougee-Baumgartner House was partially completed by mid-1890 and finished by mid-1892. The owner shown in the 1890 and 1892 block books, Charles H. Lougee, is first listed as a resident here in the January 1, 1892 directory, indicating that the house was finished in 1891. Lougee is listed in the 1888-9 to 1894 directories as a "wrecker" but in earlier directories was also listed as a "carpenter", suggesting that he may have built the house at 51 8th Street himself. His name first appears in the 1875-6 directory residing at a house at what is now 1523 8th Street (see SHRI form), which he also appears to have built. In 1876-77 he had been listed as a carpenter with Western Development Company, construction arm of Central Pacific Railroad which during that period was developing railroad worker housing near Lougee's 1523 Street residence. Lougee continued to live at 1523 Street apparently building house next door at 1509 Street until 1888-9 when directory shows him living on Filbert Street where he remained until moving into subject [property].

Lougee lived at 51 8th Street until between mid-1882 and mid-1893, when the block books show the owner as Albert W. Craig, employed at Craig and Mosher in San Francisco. The 1894 directory shows that Lougee had moved to Grove Street. His short residency at 51 8th Street is characteristic of many nineteenth century carpenter-builders, who would live in one of their recently completed houses until their next group of houses was finished.

The 1895 block books shows another new owner, A.J. Baumgartner, secretary for Oakland Preserving Company, who continued to

own the house at least through mid-1900. The 1895 directory shows he lived here with A.F. and John J. Baumgartner, but only A.F. Baumgartner is listed as a residence here after 1896."

Several modifications have been made to the building since it was initially constructed including enclosing the rear single-story porch, construction of single-story garages along Fallon Street, conversion of garages into living quarters and second-story addition and porch constructed above. Changes made since the OCHS survey include replacement of all of the original wood windows with modern vinyl frame windows and the installation of the modern metal security fence and gate system.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

NRHP RE-EVALUATION

The property at 51 8th Street is located within the Lake Merritt Station Area Planning Area which is an approximately one-half mile radius around the nearby Lake Merritt BART Station. As directed in the *Draft Environmental Impact Report for Lake Merritt Station Area Plan* in "Chapter 3.8: Cultural and Historic Resources," several mitigation measures were developed to reduce redevelopment impacts to historical resources including "Future Site-specific Surveys and Evaluations" which states, "Although most of the Project Area has been surveyed by the City of Oakland's OCHS, evaluations and ratings may change with time and other conditions. As such, there may be numerous other previously unidentified historical resources which would be affected by future redevelopment activities, including demolition, alteration, and new construction. For any future development project that would occur on or immediately adjacent to buildings 50 years old or older that have not been surveyed within the last 10 years, the City shall require specific surveys and evaluations of such properties to determine their potential historical significance at the federal, state, and local levels. Intensive-level surveys and evaluations shall be completed by a qualified architectural historian who meets the Secretary of the Interior's Standards for architectural history. For all historical resources identified as a result of site-specific surveys and evaluations, the City shall ensure that future redevelopment activities, including demolition, alteration, and new construction, would avoid, adaptively reuse, and/or appropriately relocate such historical resources in accordance with measure "a" (Avoidance, Adaptive Reuse, or Appropriate Relocation of Historically Significant Structures), above. Site-specific surveys and evaluations that are more than 5 years old shall be updated to account for changes which may have occurred over time" (City of Oakland 2013: 3.8-58).

Because the last documentation and evaluation of the property at 51 8th Street occurred at least 15 years ago, and the currently available documentation is 40 years old, this recordation and evaluation serves as an update to identify any changes that have been made and to re-evaluate the property for NRHP-eligibility accordingly.

Under NRHP Criterion A, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" which is significant for its association within residential growth of Oakland during the 19th and early 20th centuries.

Under NRHP Criterion B, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant for any associations with the lives of persons important to history. Research has never indicated that any individuals, such as early resident and builder Charles H. Lougee or subsequent early owner Andrew F. Baumgar, or others related to the development and use of

this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" as part of the concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing.

Under NRHP Criterion D, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant as a source (or likely source) of important information regarding history. They do not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The building has not been moved so it retains integrity of location. The setting of the building since it was found to be a contributor to the "7th Street/Harrison Square Residential District" in the 1980s as part of the OCHS survey has remained largely unchanged. Changes made since the OCHS survey include replacement of all of the original wood windows with modern vinyl frame windows and the installation of the modern metal security fence and gate system which has affected integrity of design, materials, and workmanship, but overall the building continues to convey the feeling of an 1890s residence and its association with the 7th Street/Harrison Square Residential District."

Several modifications have been made to the building since it was initially constructed including enclosing the rear single-story porch, construction of single-story garages along Fallon Street, conversion of garages into living quarters and second-story addition and porch constructed above. Changes made since the OCHS survey include replacement of all of the original wood windows with modern vinyl frame windows and the installation of the modern metal security fence and gate system.

CONCLUSION

In conclusion, the property at 51 8th Street was determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" in 2009. While changes have been made to the building since then (see B6), it retains sufficient integrity to continue to convey its significance as a contributor, and is a therefore reconfirmed as a historic property under Section 106 of the National Historic Preservation Act (NHPA).

This two-story with an attic, Queen Anne and Colonial Revival transitional style residence was constructed between 1897 and 1898 and is sited at near the southwest intersection of 8th and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is one-block to the northwest (see **Sketch Map**). The parcel is lined with a modern metal security fence and gate system. The building has a roughly rectangular plan and rests on a slab foundation with a full-story basement level. It is topped with a cross-hip-and-gable roof system with narrow overhang and is covered with composition shingles. Several types of wood siding cover the exterior including wide and narrow horizontal wood boards on the basement and main story levels with wood shingles in the end gables and the frieze. Brick veneer on the façade of the basement level around the integrated single-car garage with a modern overhead garage door are later additions. Primary entry into the residence is gained on the northern-facing façade through stairs that extend from the sidewalk to the raised first-story. The entry is protected in an integral porch that is supported on a Tuscan column with a brick pier. The single flush wood door has a fixed transom above and is protected by a metal security door (**Photograph 2**). Windows generally consist of one-over-one wood frame with a fixed, two-part wood frame window on the façade with a stained-glass upper sash. A small, multi-light Palladian window is at the attic level on the façade.

The property at 55 8th Street was inventoried and evaluated on a Historic Resources Inventory (HRI) form by the Oakland Cultural Heritage Survey (OCHS) in 1984 as part of the "7th Street/Harrison Square Residential District" survey efforts (see attached HRI form). The author of the HRI form stated that the residence was a contributor to the "Seventh Street/Harrison Square Residential District" "for its architecture and history" which OCHS concluded was eligible for listing in the National Register of Historic Places (NRHP) (OCHS 1984; OCHS 1985). OCHS found the district eligible for listing in the NRHP "as a surviving area of middle- and lower-middle-class housing constructed largely between 1889 and 1910" (OCHS 1985), but no specific NRHP criteria, period of significance, or character-defining features were identified as part of the significance evaluation. BUILDING, STRUCTURE, AND OBJECT RECORD

Page 3 of 5

*NRHP Status Code 2D2, 3D

*Resource Name or # (Assigned by recorder) 55 8th Street, MR 06

Based on the themes and built dates of the buildings recorded within in the district and the historic themes in (in order of importance) of architecture, social/ education, exploration/settlement, and economic/industrial, the district is assumed significant under NRHP Criterion A for its important association within the residential growth of Oakland during the 19th and early 20th centuries, and under NRHP Criterion C as concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing. The period of significance of the district appears to be from the 1860s when the earliest buildings were constructed to 1910 when most of the lots were built out. Character-defining features of the district are assumed to consist of the extant contributing buildings, their size and scale, late 19th and early 20th century architectural styles and details, and the historic street grid pattern.

The "7th Street/Harrison Square Residential District" survey documents from the early 1980s were submitted to the Northwest Information Center (NWIC) and the property at 55 8th Street was assigned a California Historical Resources Status Code of 3D: "Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation" (BERD 2024). In 2009 a United States Department of Housing and Urban Development (HUD) report was prepared and submitted to NWIC that appears to have reevaluated and reconfirmed 55 8th Street as a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" and received concurrence from the State Historic Preservation Officer (SHPO) because it was assigned a California Historical Resources Status Code of 2D2: "Contributor to a multi-component resource determined eligible for NRHP by consensus through Section 106 process. Listed in the CRHR" (BERD 2024). Therefore, the property at 55 8th Street is a historic property under Section 106 of the National Historic Preservation Act (NHPA). However, a copy of the 2009 HUD report nor an updated recordation and evaluation of the property at 55 8th Street were on-file at NWIC.

At the local level, as a result of the "7th Street/Harrison Square Residential District" survey efforts, OCHS assigned an individual property rating of "C1+" to property at 55 8th Street which in this case means Secondary Importance: Superior or visually important example, or very early (pre-1906), and in a National Register quality/eligible district (Oaklandca.gov 2024).

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the HRI form authored by OCHS in 1984.

"According to Assessor's Block Books the first owner and builder-contractor was James A. Smilie, who constructed the building in 1897-98. Born in Canada in 1851, Smilies came to Oakland with his brother Robert in 1875, returned in 1881, and finally established himself with Robert in 1886 as Smilie Brothers, building and contractors, also owners of a lumber yard in Oakland and a fruit farm near Fresno. Guinn says they constructed the Macdonough Block, the Central Bank Building and the Dalziel & Moller block in Oakland, the pre-1906 Union Savings Bank and six more store buildings in San Francisco, the Palamaras Hotel in Pomona and the Wilcox Block in Los Angeles. Most of these are now demolished, and only a few residences, like this and 701-03 Fallon, remain to shoe the firm's work. Smilie was also president of the Builders Exchange. He kept these houses for income."

It appears that the only changes made to the building since the OCHS survey is replacement of the overhead garage door between 2022 and 2024.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along

BUILDING, STRUCTURE, AND OBJECT RECORD

Page 4 of 5

*Resource Name or # (Assigned by recorder) 55 8th Street, MR 06

Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

NRHP RE-EVALUATION

The property at 55 8th Street is located within the Lake Merritt Station Area Planning Area which is an approximately one-half mile radius around the nearby Lake Merritt BART Station. As directed in the *Draft Environmental Impact Report for Lake Merritt Station Area Plan* in "Chapter 3.8: Cultural and Historic Resources," several mitigation measures were developed to reduce redevelopment impacts to historical resources including "Future Site-specific Surveys and Evaluations" which states, "Although most of the Project Area has been surveyed by the City of Oakland's OCHS, evaluations and ratings may change with time and other conditions. As such, there may be numerous other previously unidentified historical resources which would be affected by future redevelopment activities, including demolition, alteration, and new construction. For any future development project that would occur on or immediately adjacent to buildings 50 years old or older that have not been surveyed within the last 10 years, the City shall require specific surveys and evaluations of such properties to determine their potential historical significance at the federal, state, and local levels. Intensive-level surveys and evaluations shall be completed by a qualified architectural historian who meets the Secretary of the Interior's Standards for architectural history. For all historical resources identified as a result of site-specific surveys and evaluations, the City shall ensure that future redevelopment activities, including demolition, alteration, and new construction, would avoid, adaptively reuse, and/or appropriately relocate such historical resources in accordance with measure "a" (Avoidance, Adaptive Reuse, or Appropriate Relocation of Historically Significant Structures), above. Site-specific surveys and evaluations that are more than 5 years old shall be updated to account for changes which may have occurred over time" (City of Oakland 2013: 3.8-58).

Because the last documentation and evaluation of the property at 55 8th Street occurred at least 15 years ago, and the currently available documentation is 40 years old, this recordation and evaluation serves as an update to identify any changes that have been made and to re-evaluate the property for NRHP-eligibility accordingly.

Under NRHP Criterion A, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" which is significant for its association within residential growth of Oakland during the 19th and early 20th centuries.

Under NRHP Criterion B, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant for any associations with the lives of persons important to history. Research has never indicated that any individuals, such as early resident and builder James A. Smilie, or others related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" as part of the concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing.

Under NRHP Criterion D, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant as a source (or likely source) of important information regarding history. They do not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The building has not been moved so it retains integrity of location. The setting of the building since it was found to be a contributor to the "7th Street/Harrison Square Residential District" in the 1980s as part of the OCHS survey has remained largely unchanged. It appears that the only changes made to the building since the OCHS survey is replacement of the non-original overhead garage door between 2022 and 2024 which is minimal and does not affect integrity of design, materials, workmanship, and feeling of an 1890s residence, nor its association with the 7th Street/Harrison Square Residential District."

BUILDING, STRUCTURE, AND OBJECT RECORD

CONCLUSION

In conclusion, the property at 55 8th Street was determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" in 2009. Minimal changes have been made to the building since then (see B6), and it retains sufficient integrity to continue to convey its significance as a contributor and is a therefore reconfirmed as a historic property under Section 106 of the National Historic Preservation Act (NHPA).

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This two-story with an attic, Queen Anne style residence was constructed in 1896 and is sited near the center of the block at the southwest intersection of 8th and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is one-block to the northwest (see **Sketch Map**). The parcel is lined with a modern metal security fence and gate system. The building has a roughly rectangular plan and rests on a slab foundation with a full-story basement level. It is topped with a stacked gable roof system with narrow overhang and is covered with composition shingles. Three-sided bays are featured on the northern-facing façade and the east and west sides (**Photographs 1 and 2**). Several types of wood siding cover the exterior including wide and narrow horizontal wood boards on the basement and main story levels with fish-scale wood shingles in the end gables. Additional ornamentation in the end gables consist of a carved floral patterned apex panel, turned bosses in the bargeboard, and bow garland details in the frieze. Primary entry into the residence is gained on the northern-facing façade through stairs that extend from the sidewalk to the raised first-story. The entry is protected in an integral porch that is supported on turned wood posts. The multi-light glazed wood door has a fixed transom above and is protected by a metal security door. Windows consist of one-over-one wood frame with a small, four-over-one window at the attic level on the façade. A former single-car garage opening at the full-story basement level is boarded over.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The property at 59 8th Street was inventoried and evaluated on a Historic Resources Inventory (HRI) form by the Oakland Cultural Heritage Survey (OCHS) in 1984 as part of the "7th Street/Harrison Square Residential District" survey efforts (see attached HRI form). The author of the HRI form stated that the residence was a contributor to the "Seventh Street/Harrison Square Residential District" "for its architecture and history" which OCHS concluded was eligible for listing in the National Register of Historic Places (NRHP) (OCHS 1984; OCHS 1985). OCHS found the district eligible for listing in the NRHP "as a surviving area of middle- and lower-middle-class housing constructed largely between 1889 and 1910" (OCHS 1985), but no specific NRHP criteria, period of significance, or character-defining features were identified as part of the significance evaluation. ***B10. Significance (continued):**

Based on the themes and built dates of the buildings recorded within in the district and the historic themes in (in order of importance) of architecture, social/ education, exploration/settlement, and economic/industrial, the district is assumed significant under NRHP Criterion A for its important association within the residential growth of Oakland during the 19th and early 20th centuries, and under NRHP Criterion C as concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing. The period of significance of the district appears to be from the 1860s when the earliest buildings were constructed to 1910 when most of the lots were built out. Character-defining features of the district are assumed to consist of the extant contributing buildings, their size and scale, late 19th and early 20th century architectural styles and details, and the historic street grid pattern.

The "7th Street/Harrison Square Residential District" survey documents from the early 1980s were submitted to the Northwest Information Center (NWIC) and the property at 59 8th Street was assigned a California Historical Resources Status Code of 3D: "Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation" (BERD 2024). In 2009 a United States Department of Housing and Urban Development (HUD) report was prepared and submitted to NWIC that appears to have reevaluated and reconfirmed 55 8th Street as a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" and received concurrence from the State Historic Preservation Officer (SHPO) because it was assigned a California Historical Resources Status Code of 2D2: "Contributor to a multi-component resource determined eligible for NRHP by consensus through Section 106 process. Listed in the CRHR" (BERD 2024). Therefore, the property at 55 8th Street is a historic property under Section 106 of the National Historic Preservation Act (NHPA). However, a copy of the 2009 HUD report nor an updated recordation and evaluation of the property at 59 8th Street were on-file at NWIC.

At the local level, as a result of the "7th Street/Harrison Square Residential District" survey efforts, OCHS assigned an individual property rating of "C1+" to the property at 59 8th Street which in this case means Secondary Importance: Superior or visually important example, or very early (pre-1906), and in a National Register quality/eligible district (Oaklandca.gov 2024).

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the HRI form authored by OCHS in 1984.

"Assessor's Block Books indicate it was built between mid-1895 and mid-1896 for R.E. and Margaret Sullivan. A printing foreman, Robert E. Sullivan was listed living at 57 8th Street beginning in 1897. This is part of a row of four fairly intact Queen Anne residences that define and anchor the northeast corner of the district."

It appears that the only changes made to the building since the OCHS survey is replacement boards on the garage opening at the full-story basement level.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

NRHP RE-EVALUATION

The property at 59 8th Street is located within the Lake Merritt Station Area Planning Area which is an approximately one-half mile radius around the nearby Lake Merritt BART Station. As directed in the *Draft Environmental Impact Report for Lake Merritt Station Area Plan* in "Chapter 3.8: Cultural and Historic Resources," several mitigation measures were developed to reduce redevelopment impacts to historical resources including "Future Site-specific Surveys and Evaluations" which states, "Although most of the Project Area has been surveyed by the City of Oakland's OCHS, evaluations and ratings may change with time and other conditions. As such, there may be numerous other previously unidentified historical resources which would be affected by future redevelopment activities, including demolition, alteration, and new construction. For any future development project that would occur on or immediately adjacent to buildings 50 years old or older that have not been surveyed within the last 10 years, the City shall require specific surveys and evaluations of such properties to determine their potential historical significance at the federal, state, and local levels. Intensive-level surveys and evaluations shall be completed by a qualified architectural historian who meets the Secretary of the Interior's Standards for architectural history. For all historical resources identified as a result of site-specific surveys and evaluations, the City shall ensure that future redevelopment activities, including demolition, alteration, and new construction, would avoid, adaptively reuse, and/or appropriately relocate such historical resources in accordance with measure "a" (Avoidance, Adaptive Reuse, or Appropriate Relocation of Historically Significant Structures), above. Site-specific surveys and evaluations that are more than 5 years old shall be updated to account for changes which may have occurred over time" (City of Oakland 2013: 3.8-58).

Because the last documentation and evaluation of the property at 59 8th Street occurred at least 15 years ago, and the currently available documentation is 40 years old, this recordation and evaluation serves as an update to identify any changes that have been made and to re-evaluate the property for NRHP-eligibility accordingly.

Under NRHP Criterion A, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" which is significant for its association within residential growth of Oakland during the 19th and early 20th centuries.

Under NRHP Criterion B, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant for any associations with the lives of persons important to history. Research has never indicated that any individuals, such as early residents Robert E. and Margaret Sullivan, or others related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" as part of the concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing.

Under NRHP Criterion D, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant as a source (or likely source) of important information regarding history. They do not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis and Conclusion

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The building has not been moved so it retains integrity of location. The setting of the building since it was found to be a contributor to the "7th Street/Harrison Square Residential District" in the 1980s as part of the OCHS survey has remained largely unchanged. It appears that the only changes made to the building since the OCHS survey is replacement boards on the garage opening at the full-story basement level which is minimal and does not affect integrity of design, materials, workmanship, and feeling of an 1890s residence, nor its association with the 7th Street/Harrison Square Residential District."

In conclusion, the property at 59 8th Street was determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" in 2009. It does not appear that any changes have been made to the building since then, it retains sufficient integrity to continue to convey its significance as a contributor and is a therefore reconfirmed as a historic property under Section 106 of the National Historic Preservation Act (NHPA).

This three-story with an attic, Queen Anne style residence was constructed between 1892 and 1893 and is sited mid-block on the south side of 8th Street between Oak and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is one-block to the northwest (see **Sketch Map**). The parcel is lined with a modern metal security fence and gate system. The building has a roughly rectangular plan and rests on a concrete foundation. It is topped with a cross-hip-and-gable roof system with narrow overhang and is covered with composition shingles. A three-sided bay that extends from the second story to the roofline is on the west side (**Photograph 2**). The exterior is sheathed in wide, flush horizontal wood boards. The northern-facing façade features a full-height, three-sided bay. Most of the decorative details expressed in the building are concentrated in and around the façade end gable which features a fanlight attic window, multiple sunbursts, and latticework of diamonds and turned knobs. Primary entry into the residence is gained on the northern-facing façade through stairs that extend from the sidewalk. The entry is protected by a pedimented porch that is supported on turned wood posts. The recessed entry is paneled in the fashion of 1900-1910 and may date to when the building was converted for multi-family living and is accessed by a modern metal security door. Windows consist of one-over-one aluminum frame replacements throughout. The building currently contains nine apartments.

***B10. Significance (continued):**

Based on the themes and built dates of the buildings recorded within in the district and the historic themes in (in order of importance) of architecture, social/ education, exploration/settlement, and economic/industrial, the district is assumed significant under NRHP Criterion A for its important association within the residential growth of Oakland during the 19th and early 20th centuries, and under NRHP Criterion C as concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing. The period of significance of the district appears to be from the 1860s when the earliest buildings were constructed to 1910 when most of the lots were built out. Character-defining features of the district are assumed to consist of the extant contributing buildings, their size and scale, late 19th and early 20th century architectural styles and details, and the historic street grid pattern.

The "7th Street/Harrison Square Residential District" survey documents from the early 1980s were submitted to the Northwest Information Center (NWIC) and the property at 61 8th Street was assigned a California Historical Resources Status Code of 3D: "Appears eligible for NRHP as a contributor to a NRHP eligible multi-component resource through survey evaluation" (BERD 2024). In 2009 a United States Department of Housing and Urban Development (HUD) report was prepared and submitted to NWIC that appears to have reevaluated and reconfirmed 55 8th Street as a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" and received concurrence from the State Historic Preservation Officer (SHPO) because it was assigned a California Historical Resources Status Code of 2D2: "Contributor to a multi-component resource determined eligible for NRHP by consensus through Section 106 process. Listed in the CRHR" (BERD 2024). Therefore, the property at 55 8th Street is a historic property under Section 106 of the National Historic Preservation Act (NHPA). However, a copy of the 2009 HUD report nor an updated recordation and evaluation of the property at 61 8th Street were on-file at NWIC.

At the local level, as a result of the "7th Street/Harrison Square Residential District" survey efforts, OCHS assigned an individual property rating of "C1+" to property at 61 8th Street which in this case means Secondary Importance: Superior or visually important example, or very early (pre-1906), and in a National Register quality/eligible district (Oaklandca.gov 2024).

HISTORIC CONTEXT

Property Specific

The following context was excerpted and adapted from the HRI form authored by OCHS in 1984.

"Assessor's Block Books indicate the house was built between mid-1892 and mid-1893 for Frank B. Josephs, a police clerk who later became an attorney with [an] office in the Blake & Moffit Block at the northeast corner of 8th and Broadway. Josephs was first listed in the subject house in the 1892-93 directory. The Block Books also imply that the lower floor was inserted and the building converted to flats between mid-1905 and mid-1906: the latter date would coincide with the post-earthquake housing boom. The owner then was Stella A. Ogden, wife of George B. Ogden, who sold monuments and real estate in San Francisco. The subject property was not their residence but a source of income."

It does not appear that any changes have been made to the building since the OCHS survey.

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along

Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

NRHP RE-EVALUATION

The property at 61 8th Street is located within the Lake Merritt Station Area Planning Area which is an approximately one-half mile radius around the nearby Lake Merritt BART Station. As directed in the *Draft Environmental Impact Report for Lake Merritt Station Area Plan* in "Chapter 3.8: Cultural and Historic Resources," several mitigation measures were developed to reduce redevelopment impacts to historical resources including "Future Site-specific Surveys and Evaluations" which states, "Although most of the Project Area has been surveyed by the City of Oakland's OCHS, evaluations and ratings may change with time and other conditions. As such, there may be numerous other previously unidentified historical resources which would be affected by future redevelopment activities, including demolition, alteration, and new construction. For any future development project that would occur on or immediately adjacent to buildings 50 years old or older that have not been surveyed within the last 10 years, the City shall require specific surveys and evaluations of such properties to determine their potential historical significance at the federal, state, and local levels. Intensive-level surveys and evaluations shall be completed by a qualified architectural historian who meets the Secretary of the Interior's Standards for architectural history. For all historical resources identified as a result of site-specific surveys and evaluations, the City shall ensure that future redevelopment activities, including demolition, alteration, and new construction, would avoid, adaptively reuse, and/or appropriately relocate such historical resources in accordance with measure "a" (Avoidance, Adaptive Reuse, or Appropriate Relocation of Historically Significant Structures), above. Site-specific surveys and evaluations that are more than 5 years old shall be updated to account for changes which may have occurred over time" (City of Oakland 2013: 3.8-58).

Because the last documentation and evaluation of the property at 59 8th Street occurred at least 15 years ago, and the currently available documentation is 40 years old, this recordation and evaluation serves as an update to identify any changes that have been made and to re-evaluate the property for NRHP-eligibility accordingly.

Under NRHP Criterion A, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" which is significant for its association within residential growth of Oakland during the 19th and early 20th centuries.

Under NRHP Criterion B, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant for any associations with the lives of persons important to history. Research has never indicated that any individuals, such as early resident Frank B. Josephs or subsequent early owner Stella A. Ogden, or others related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C, this building has been previously determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" as part of the concentration of Italianate, Queen Anne, and Colonial Revival style lower-and-middle-class housing.

Under NRHP Criterion D, this building and the NRHP-eligible "7th Street/Harrison Square Residential District" have been previously determined not significant as a source (or likely source) of important information regarding history. They do not appear to have any likelihood of yielding important information about historic construction materials or technologies.

Integrity Analysis

Buildings, structures, objects, sites, and districts listed in, eligible for listing in, or that appear eligible for listing in the NRHP are considered historic properties under the regulations for Section 106 of the National Historic Preservation Act (NHPA). Eligibility for listing buildings, structures, objects, sites, and districts (i.e., resources) in the NRHP rests on twin factors of historic significance and integrity. A resource must have both significance and integrity to be considered eligible.

Integrity is determined through applying seven factors to the historic resource: location, design, setting, workmanship, materials, feeling, and association. These seven can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven criteria and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

The building has not been moved so it retains integrity of location. The setting of the building since it was found to be a contributor to the "7th Street/Harrison Square Residential District" in the 1980s as part of the OCHS survey has remained largely unchanged. It does not appear that any changes have been made to the building since the OCHS survey and therefore retains integrity of design, materials, workmanship, and feeling of an 1890s residential building, and association with the 7th Street/Harrison Square Residential District."

Page 5 of 5

Recorded by: H. Miller *Date: February 29, 2024

*Resource Name or # (Assigned by recorder) 61 8th Street, MR 08
 Continuation Update

CONCLUSION

In conclusion, the property at 61 8th Street was determined a contributor to the NRHP-eligible "7th Street/Harrison Square Residential District" in 2009. While changes have been made to the building since then (see B6), it retains sufficient integrity to continue to convey its significance as a contributor, and is therefore reconfirmed as a historic property under Section 106 of the National Historic Preservation Act (NHPA).

This two-part commercial block building was constructed between 1946 and 1946 and is sited mid-block on the south side of 8th Street between Oak and Fallon streets (**Photograph 1**). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is one-block to the northwest (see **Sketch Map**). The utilitarian building has a rectangular plan, is constructed of brick masonry, and is topped with a flat roof system (**Photographs 1 and 2**). Primary entry into the building is through a metal security door on the east end of the northern-facing façade and features a fixed transom above. An overhead garage door dominates the west half of the first-story façade and is protected by a metal security gate. A three-part, metal frame fixed window is sited between the doors and a tile apron lines the lower portion of the façade. The second story is punctuated by six, two-over-two vinyl frame replacement windows with brick sills.

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

The commercial building evaluated on this form was completed in 1946 as a brick and concrete factory. It was constructed by owner/builder Shale Ortzow in a design by Jack Y. Long (OCHS 1983). Ortzow was born in Russia in 1882 and was living in Sioux City, Iowa with his wife Annie as of 1907 and working as a building contractor. By 1920 the Ortzow family had relocated to Oakland and Shale continued work as a building contractor until his death in 1962 (Ancestry.com 2024b). Oakland-based civil engineer Jack Y. Long designed the building who was born Oakland in 1914. After high school he worked with steel fabricators in San Francisco and Sacramento and eventually secured a position with the state designing bridges. Two years after this building was completed, Long became the chairman of the Construction Industries Committee of the Oakland Chamber of Commerce (Ancestry.com 2024b; *Oakland Tribune* 1948 March 19).

The 1951 edition of Sanborn Fire Insurance Maps depict the building as a two-story warehouse with sheet metal works (Sanborn Map and Publishing Company 1951). Blue Ribbon Products, conveyers of fine coffee, occupied the building in the early 1950s (*Oakland Tribune* 1952 April 19). The building was intentionally excluded from the Oakland Cultural Heritage Survey (OCHS) in the mid-1980s of the adjacent "7th Street/Harrison Square Residential District."

At the local level, the property has been assigned an Oakland Cultural Heritage Survey (OCHS) individual property rating of "D3" which means Minor Importance, not in a historic district (Oaklandca.gov 2024).

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

Two-Part Commercial Block

The two-part commercial block building was the most common type of small commercial buildings constructed in the United States from the mid-nineteenth to mid-twentieth century. It is generally two to four stories in height, features a division between public and private access and use, and fronts directly onto the sidewalk. Mid-twentieth century examples of this building type take on a simple, reserved, and unpretentious appearance and show the influences of the popular Modern style of the time in their design and materials (Longstreth 1987: 24).

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, this building has no significant association with important historic events. The building on this parcel, constructed in ca. 1945, is associated with commercial development of the area south of Lake Merritt however, many businesses occupied this building, but research did not reveal that the building played an important role in the economic development of the area.

Under NRHP Criterion B or CRHR Criterion 2, this building is not significant for any associations with the lives of persons important to history.

Page 4 of 5

*Resource Name or # (Assigned by recorder) 73 8th Street, MR 10

Recorded by: H. Miller *Date: February 29, 2024

Continuation Update

Research did not indicate that any individuals, such as business owners related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C or CRHR Criterion 3, this building is not significant because it is not an important example of a type, period, or method of construction. The two-part commercial block building type proliferated on main streets and commercial rows throughout the nation during the mid-nineteenth and mid-twentieth centuries. The commercial building at 73 8th street is an unremarkable example reflecting the twentieth century trends of this style. The building on this parcel also lacks high artistic values that would merit listing on the NRHP and CRHR. There is no indication that building designer Jack Y. Long, nor owner/builder Shale Ortzow are considered masters in their respective fields; therefore, it is not significant as the work of a master.

Under NRHP Criterion D or CRHR Criterion 4, this building is not significant as a source (or likely source) of important information regarding history. It does not appear to have any likelihood of yielding important information about historic construction materials or technologies.

At the local level, the property has been assigned an OCHS individual property rating of "D3" which means Minor Importance, not in a historic district. The building remains little changed since and this individual property rating remains accurate.

Integrity Analysis and Conclusion

In addition to the building's lack of significance, it also has losses to its historic integrity. While the building has integrity of location, setting, and association, the replacement windows and doors have affected integrity of design, workmanship, materials, and feeling of the original ca. 1945 building. The building, therefore, does not meet any of the significance criteria necessary for eligibility for listing in either the NRHP or the CRHR.

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

The commercial building evaluated on this form was developed in 1920 as a garage and paper storage for the *Oakland Tribune*. It was constructed by James H. Pedgrift in a design by Edward Foulkes (OCHS 1982). Architect Edward Thomas Foulkes was born on August 14, 1874 in Monmouth, Oregon. Foulkes studied at Stanford University, Massachusetts Institute of Technology and the Ecole Des Beaux Arts in Paris. He designed many buildings in northern California and Oregon but he primarily worked in Oakland. His portfolio includes the Tribune Tower (1920), Joaquin Miller Memorial Amphitheater (1931), and City Hall (1914). Foulkes died on December 10, 1967 in Oakland, California (*Oakland Tribune* 1967 December 11). Builder James H. Pedgrift was born on February 24, 1877, on the west coast of England. He immigrated to the United States in 1883 and arrived in California in 1902. Pedgrift was a partner at an Oakland building and construction firm. At the time that 77 8th Street was constructed, Pedgrift served as president of the General Contractors Association of Alameda County. He died on February 10, 1948 in Oakland (*Oakland Tribune* 1948 February 12; *Oakland Tribune* 1919 April 20).

The 1952 edition of Sanborn Fire Insurance Maps depict the building as a two-story building housing janitorial supplies with a second-floor warehouse (Sanborn Map and Publishing Company 1952). In 1961, the Thermostat Sales & Service Co. occupied the building and by 1967 was replaced by the Stove Plumbers Supplies Company (*Oakland Tribune* 1961 August 23; *Oakland Tribune* 1967 October 16). Oakland Cultural Heritage Survey (OCHS) recorded the building in 1982, but the exterior was heavily remodeled into its current appearance ca. 1984 (OCHS 1982; City of Oakland Building Department 1983) (see Plate 1). The building was intentionally excluded from the Oakland Cultural Heritage Survey (OCHS) in the mid-1980s of the adjacent "7th Street/Harrison Square Residential District."

Plate 1. 1982 photograph of 77 8th Street (Source: OCHS 1982)

At the local level, the property has been assigned an Oakland Cultural Heritage Survey (OCHS) individual property rating of "Ec3" which means Of no particular interest, potentially C "secondary importance" or superior example if restored, and not in a historic district (Oaklandca.gov 2024). A Re-evaluation was prepared by PCHS in August 1995 that reconfirmed the OCHS individual property rating of "Ec3" and also gave the building a California Historical Resources Status Code of 5S (now 5S2): "Individually listed or designated locally." The author of the re-evaluation did state that the building was ineligible for listing in the National Register of Historic Places "since its architectural integrity has been seriously compromised and there are more significant examples" (OCHS 1995; BERD 2024).

Two-Part Commercial Block

The two-part commercial block building was the most common type of small commercial buildings constructed in the United States from the mid-nineteenth to mid-twentieth century. It is generally two to four stories in height, features a division between public and private access and use, and fronts directly onto the sidewalk. Mid-twentieth century examples of this building type take on a simple, reserved, and unpretentious appearance and show the influences of the popular Modern style of the time in their design and materials (Longstreth 1987: 24).

Modern Architecture

The building was heavily modified from its original appearance ca. 1984 into its current Modernist style. Modern architecture began in the late 1920s and early 1930s and extended through the 1970s, although the modern era in the United States is most closely associated with the two decades following World War II. The overarching label of "Modern," although imprecise, can generally be characterized by buildings exhibiting simple volumes (in institutional and commercial buildings) and a lack of decorative detail. Additional characteristics include a use of materials in place of decorative details, and the use of natural colors and textures of materials to embellish a building (for example, employing brick or concrete for decorative effect). The modern era was also a time, however, when new materials and construction methods were explored. An example is curtain wall construction, which utilizes aluminum frames for window walls in place of steel, and new material combinations in the solid spandrel panels that separate them. Additional examples include thin shell construction, folded plate construction, and the hyperbolic paraboloid (Painter 2010: 22-23).

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, this building has no significant association with important historic events. The building on this parcel, constructed in 1920, is associated with commercial development of south of Lake Merritt; however, many businesses occupied this building, but research did not reveal that the building played an important role in the economic development of the area itself.

Under NRHP Criterion B or CRHR Criterion 2, this building is not significant for any associations with the lives of persons important to history. Research did not indicate that any individuals, such as business owners related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C or CRHR Criterion 3, this building is not significant because it is not an important example of a type, period, or method of construction. The two-part commercial block building proliferated on main streets and commercial rows throughout the nation during the late nineteenth and early twentieth centuries. The building at 77 9th Street was an unremarkable example reflecting the twentieth century trends of this style, but has been heavily modified since its original construction in 1920. The building on this parcel also lacks the high artistic value and distinctive design that would merit listing on the NRHP and CRHR. There is no indication that Edward Foulkes is a master architect nor James H. Pedgrift is a master builder; therefore, it is not significant as the work of a master.

Under NRHP Criterion D or CRHR Criterion 4, this building is not significant as a source (or likely source) of important information regarding history. It does not appear to have any likelihood of yielding important information about historic construction materials or technologies.

At the local level, the property has been assigned an OCHS individual property rating of "Ec3" which means Of no particular interest, potentially C "secondary importance" or superior example if restored, and not in a historic district. The building remains little changed since and this individual property rating remains accurate. However, the 1995 re-evaluation that assigned a California Historical Resources Status Code of 5S (now 5S2): 'Individually listed or designated locally' appears to be data entry error. Because of the significant alterations and lack of significance, the building should be assigned a California Historical Resources Status Code of 6Z: Found ineligible for National Register, California Register or local designation through survey evaluation.

Integrity Analysis and Conclusion

In addition to the building's lack of significance, it also has substantial losses to its historic integrity. While the building has integrity of location, setting, and association, the complete exterior remodel in ca. 1984 have affected integrity of design, workmanship, materials, and feeling of the original 1920 building. The building, therefore, does not meet any of the significance criteria necessary for eligibility for listing in either the NRHP or the CRHR.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

This single-story commercial building was originally constructed in 1946 and is sited at the southeast intersection of 8th and Oak streets (Photograph 1). The Lake Merritt Bay Area Rapid Transit (BART) System parking lot is immediately north of the property and the BART station is immediately northwest (see Sketch Map). The Streamline Moderne, one-part Commercial Block building has a rectangular plan and is largely constructed of board-formed reinforced concrete. The south end of the west side is sheathed with vertical grooved plywood siding. Restrained Streamline Moderne details are limited to base-relief fluting with at the northwest corner, flanking the primary entry, and between the storefront window bays. The building is topped with a rainbow domed roof that is obscured by a flat roof parapet. Primary entry into the building is on the northern-facing façade and consists of double metal security doors with a fixed transom above and is protected by a conical awning. The entry is accessed by a low-grade ramp that is lined with metal railing. An ATM is installed on the exterior wall west of the entry. A metal security door employee entry is on the south end of the west side. Windows consist of fixed, aluminum, multi-light storefront windows on the northern-facing facade and west side. The two westernmost bays on the façade and northernmost bay on the west side feature curved awnings with stretched vinyl. A 1,200-square-foot surface parking is west of the building and a row of bollards lines the west side of the building (Photograph 2).

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The property at 91 8th Street does not appear to meet the criteria for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR), nor does it appear to be an historical resource for purposes of the California Environmental Quality Act (CEQA). The property does not retain integrity to its original construction and does not meet any of the significance criteria necessary for eligibility for listing in either the NRHP or CRHR. The property has been evaluated in accordance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code.

***B10. Significance (continued):**

HISTORIC CONTEXT

Property Specific

This commercial building was originally developed in 1946. The 1951 edition of the Sanborn Fire Insurance Maps depict a 425-square-foot addition at the northwest (Sanborn Map and Publishing Company 1951). The building has been in continual use as a store, typically as a convince store or liquor store (*Oakland Tribune* 1955 April 2; *Oakland Tribune* 1956 March 21). The building was intentionally excluded from the Oakland Cultural Heritage Survey (OCHS) in the mid-1980s of the adjacent "7th Street/Harrison Square Residential District."

At the local level, the property was assigned an Oakland Cultural Heritage Survey (OCHS) individual property rating of in the 1980s of "'3" which means Less than 45 years old, not in a historic district (Oaklandca.gov 2024).

Lake Merritt Bay Area Rapid Transit (BART)

The following context for the immediate setting of the property was excerpted and adapted from "Chapter 9: Historic Resources" in the Lake Merritt Station Area Plan, Existing Conditions and Key Issues Report, June 2013.

"By the early 1960s, major public-works projects began to transform the three blocks [north and northwest from the property at 55 8th Street]. The biggest project was the new Bay Area Rapid Transit District (BART), created by the California Legislature in 1957 to provide a fixed-rail mass transit system. BART won voter approval in three Bay Area counties to operate, one of them being Alameda County, which includes Oakland as the county seat.

All of the buildings and the Madison Square Park infrastructure on the three blocks bounded by Jackson Street on the west, 9th Street on the north, Fallon Street on the east, and 8th Street on the south were demolished between 1965 and 1968 to construct the Lake Merritt BART station (Cartwright Aerial Surveys 1965 May 18; HistoricAerials.com 1968). Construction of the station began in the late 1960s and officially opened in 1972. The six-story BART administrative and engineering headquarters building at 800 Madison Street was officially open for business in December of 1971. One significant change was moving Madison Square Park one block to the west (Jackson to Madison between 8th and 9th Streets), giving BART two contiguous blocks to establish its headquarters building and a parking lot (Madison to Fallon between 8th and 9th Streets) and building the Lake Merritt Station underground.

In 2006, the BART headquarters building above the Lake Merritt Station was deemed "at risk" if a major earthquake struck. Subsequently, the six-story building was dismantled in 2009 and operational headquarters moved to the Kaiser complex along Lakeside Drive. That move has provided an opportunity for BART, the City of Oakland, Laney College, and the surrounding community, including Chinatown, to envision redeveloping the three Madison Square blocks."

Streamline Moderne Architecture

Streamline Moderne (or Art Moderne), popular from 1920 to the commencement of World War II, is characterized by smooth stucco wall surface; rounded corners, parapets, and windows; emphasis on the horizontal through the use of banded surfaces and banded windows; curved projecting wings; glass brick; round windows (ship portholes); steel (ship) railing and door and window trim; and an asymmetrical façade (McAlester and McAlester 1984:465; Blumenson 1981:79).

EVALUATION

Under NRHP Criterion A or CRHR Criterion 1, this building has no significant association with important historic events. The building on this parcel, constructed in 1946, is associated with commercial development of the area south of Lake Merritt; however, many businesses occupied this building, but research did not reveal that the building played an important role in the economic development of the area itself.

Under NRHP Criterion B or CRHR Criterion 2, this building is not significant for any associations with the lives of persons important to history. Research did not indicate that any individuals, such as business owners related to the development and use of this building made demonstrably important contributions to history at the local, state, or national level.

Under NRHP Criterion C or CRHR Criterion 3, this building is not significant because it is not an important example of a type, period, or method of construction. The streamline modern style building proliferated on main streets and commercial rows throughout the nation during the late nineteenth and early twentieth centuries. This commercial building is an unremarkable, and late example reflecting the twentieth century trends of this style. The building also lacks the high artistic value that would merit listing on the NRHP. There is no master architect or builder associated with this building; therefore, it is not significant as the work of a master.

Page 4 of 4

*Resource Name or # (Assigned by recorder) 91 8th Street, MR 11

Recorded by: H. Miller *Date: February 29, 2024

Continuation Update

Under NRHP Criterion D or CRHR Criterion 4, this building is not significant as a source (or likely source) of important information regarding history. It does not appear to have any likelihood of yielding important information about historic construction materials or technologies.

At the local level, the property was assigned an Oakland Cultural Heritage Survey (OCHS) individual property rating in the 1980s of “*3” which means Less than 45 years old, not in a historic district (Oakland.ca.gov 2024). Because the building is now 78 years old and based on this recordation and evaluation, it appears that a new individual property rating of “E: Of no particular interest, not in a historic district” is more appropriate.

Integrity Analysis and Conclusion

In addition to the building’s lack of significance, it also has substantial losses to its historic integrity. While the building retains integrity of location, setting, and association, the additional periods of construction and expansion represent a loss of integrity of design, workmanship, materials, and feeling of the original 1946 building. The building, therefore, does not meet any of the significance criteria necessary for eligibility for listing in either the NRHP or the CRHR.

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - Contact your Field or Regional Environmental Officer (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the **Barrier Performance Module** (</programs/environmental-review/bpm-calculator/>)

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - Contact your **Field or Regional Environmental Officer** (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the **Barrier Performance Module** (</programs/environmental-review/bpm-calculator/>)

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

HUD DNL Calculator Worksheets

Future Exterior Noise Levels at the Building B Facades and the edges of the Paseo with 10-year traffic volume forecasts 10-year traffic forecasts

For the future conditions with the proposed Building B, one set of exterior noise level worksheets was prepared for the west, north, and east facades of Building B. Two sets of exterior noise levels worksheets were prepared for the south facade of Building B: one is labeled South 50 ft, and the second is labeled South 100 ft. The first set covers the building's lower levels where residential units are planned. The second set covers the upper level where residential units and the rooftop deck/community garden are planned. For the future conditions with the paseo, exterior noise level worksheets were prepared for west, north, and east sides of the publicly accessible walkway and outdoor space.

Airport Noise Level

Loud Impulse Sounds? Yes No

Combined DNL for all Road and Rail sources

Combined DNL including Airport

Site DNL with Loud Impulse Sound

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - Contact your Field or Regional Environmental Officer (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the **Barrier Performance Module** (</programs/environmental-review/bpm-calculator/>)

Tools and Guidance

Day/Night Noise Level Assessment Tool User Guide (</resource/3822/day-night-noise-level-assessment-tool-user-guide/>)

Day/Night Noise Level Assessment Tool Flowcharts (</resource/3823/day-night-noise-level-assessment-tool-flowcharts/>)

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > [DNL Calculator](#)

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

Airport Noise Level

Loud Impulse Sounds?	<input type="radio"/> Yes <input checked="" type="radio"/> No
Combined DNL for all Road and Rail sources	65
Combined DNL including Airport	N/A
Site DNL with Loud Impulse Sound	

Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location
- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
 - **Contact your Field or Regional Environmental Officer** (</programs/environmental-review/hud-environmental-staff-contacts/>)
 - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
 - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
 - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
 - Construct noise barrier. See the Barrier Performance Module (</programs/environmental-review/bpm-calculator/>)

HUD DNL Calculator Worksheets

Input Data: Supporting Traffic Information

The following LOS worksheets are from Appendix C: Study Intersection LOS Report, in the 2021 City of Oakland CEQA Checklist, Appendix E (which is contained within City staff report for Case File Number PLN20108-PUDF01 51-9th Street, and approved by the Planning Commission on July 20, 2022). Intersection through and turning movements from the LOS worksheets were used to derive daily volumes along street segments in the project vicinity.

HUD DNL Calculator Worksheets

Input Data: Supporting Traffic Information

Using volume forecasts from City and Alameda Countywide Travel Demand for 2025 and 2035, future street and I-80 volumes were derived as inputs to the HUD noise assessment tool.

HUD STRaCAT Worksheets

[Home \(/\)](#) > STraCAT

Sound Transmission Classification Assessment Tool (STraCAT)

Overview

The Sound Transmission Classification Assessment Tool (STraCAT) is an electronic version of Figures 17 and 19 in The HUD Noise Guidebook. The purpose of this tool is to document sound attenuation performance of wall systems. Based on wall, window, and door Sound Transmission Classification (STC) values, the STraCAT generates a composite STC value for the wall assembly as a whole. Users can enter the calculated noise level related to a specific Noise Assessment Location in front of a building façade and STraCAT will generate a target required attenuation value for the wall assembly in STC. Based on wall materials, the tool will state whether the composite wall assembly STC meets the required attenuation value.

How to Use This Tool

Location, Noise Level and Wall Configuration to Be Analyzed

STraCAT is designed to calculate the attenuation provided by the wall assembly for one wall of one unit. If unit exterior square footage and window/door configuration is identical around the structure, a single STraCAT may be sufficient. If units vary, at least one STraCAT should be completed for each different exterior unit wall configuration to document that all will achieve the required attenuation. Additionally, if attenuation is not based on a single worst-case NAL, but there are multiple NALs which require different levels of attenuation around the structure, a STraCAT should be completed for each differing exterior wall configuration associated with each NAL.

Exterior wall configurations associated with an NAL include those with parallel (facing) or near-parallel exposure as well as those with perpendicular exposure. When a façade has parallel or perpendicular exposure to two or more NALs, you should base the required attenuation on the NAL with the highest calculated noise level. For corner units where the unit interior receives exterior noise through two facades, the STraCAT calculation should incorporate the area of wall, window and door materials pertaining to the corner unit's total exterior wall area (i.e., from both walls).

Information to Be Entered

Users first enter basic project information and the NAL noise level that will be used as the basis for required attenuation. This noise level must be entered in whole numbers. STraCAT users then enter information on wall, window and door component type and area. Again, as noted above, the wall, window and door entries are based on one unit, and one wall (except for corner units as discussed above). The tool sums total wall square footage based on the combined area of walls, doors and windows for the façade being evaluated.

Users may input STC values for materials in one of two ways. The tool includes a dropdown menu

of common construction materials with STC values prefilled. If selected construction materials are not included in this dropdown menu, the user may also enter the STC for a given component manually. Verification of the component STC must be included in the ERR. Documentation includes the architect or construction manager's project plans showing wall material specifications. For new construction or for components that will be newly installed in an existing wall, documentation also includes the manufacturer's product specification sheet (cut sheet) documenting the STC rating of selected doors and windows.

Required STC Rating and Determination of Compliance

Finally, based on project information entered the tool will indicate the required STC rating for the wall assembly being evaluated and whether or not the materials specified will produce a combined rating that meets this requirement. Note that for noise levels above 75 dB DNL, either HUD (for 24 CFR Part 50 reviews) or the Responsible Entity (for 24 CFR Part 58 reviews) must approve the level and type of attenuation, among other processing requirements. Required attenuation values generated by STraCAT for NALs above 75 dB DNL should therefore be considered tentative pending approval by HUD or the RE.

HUD BarrHUD Building Performance Module

Results

This HUD module was used to estimate the noise attenuation provided by a partition on the rooftop level for users of the Building B rooftop deck.

Home (/) > Programs (/programs/) > Environmental Review (/programs/environmental-review/) > BPM Calculator

Barrier Performance Module

This module provides to the user a measure on the barrier's effectiveness on noise reduction. A list of the input/output variables and their definitions, as well as illustrations of different scenarios are provided.

Calculator

View Day/Night Noise Level Calculator (/programs/environmental-review/dnl-calculator/)

View Descriptions of the Input/Output variables.

Note: Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the Input and Output variables with the mouse.

WARNING: If there is direct line-of-sight between the Source and the Observer, the module will report erroneous attenuation. "Direct line-of-sight" means if the 5' tall Observer can see the noise Source (cars, trucks, trains, etc.) over the Barrier (wall, hill/excavation, building, etc.), the current version of Barrier Performance Module will not accurately calculate the attenuation provided. In this instance, there is unlikely to be any appreciable attenuation.

Note: Barrier height must block the line of sight

Combined Road/Rail DNL with Barrier Reduction:

Input/Output Variables

Input Variables

The following variables and definitions from the barrier being assessed are the input required for the web-based barrier performance module:

- H = Barrier Height
- S = Noise Source Height
- O = Observer Height (known as the receiver)
- R¹ = Distance from Noise Source to Barrier
- D¹ = Distance from the Observer to the Barrier
- α = Line of sight angle between the Observer and the Noise Source, subtended by the barrier at observer's location

Output Variables

Definitions of the output variables from the mitigation module of the Day/Night Noise Level Assessment Tools as part of the Assessment Tools for Environmental Compliance:

- h = The shortest distance from the barrier top to the line of sight from the Noise source to the Observer.
- R = Slant distance along the line of sight from the Barrier to the Noise Source
- D = Slant distance along the line of sight from the Barrier to the Observer

The "actual barrier performance for barriers of finite length" is noted on the worksheets(in the Guidebook) as **FS**.

Barrier Implementation Scenarios

Noise Waiver

MEMORANDUM

TO: Whom It May Concern

FROM: Edward Manasse, Deputy Director of Planning and Alternate NEPA Certifying Officer,
City of Oakland

DATE: Jun 7, 2024

RE: Special Environmental Clearance and Waiver of EIS for the Lake Merritt BART Affordable
Senior Housing Project, 51 9th Street, Oakland, CA 94607

The Environmental Assessment conducted for the Lake Merritt BART Affordable Senior Housing Project contains a Noise Assessment prepared per HUD guidelines for new construction of housing at the above-named address. Based upon this Assessment, the proposed site is impacted by future traffic noise at the building exteriors with noise levels up to 71 DNL which is "Normally Unacceptable" per HUD Guidelines.

Under authority granted to me under 24 CFR Part 51, Section 51.104 (b)(1) and to provide a relatively noise-free environment for the proposed project's residents, I am requiring the following noise mitigations be included in the final project:

1. NOI-1: Noise Control Measures for Interior Noise Levels in Residential Units

To achieve HUD's 45 dB interior noise threshold, the window assemblies for Building B on Levels 2 through 6, where residential units are planned, shall be designed to achieve the minimum STC ratings illustrated in the attached figure (which also is included in the Environmental Assessment as Figure 11). These STC ratings shall be included in the construction specifications and drawings. For Level 7, because of the greater vehicle traffic noise along its southern façade due to the elevated I-880 freeway, all window assemblies where residential units are planned shall be designed to achieve a higher minimum STC rating as shown the attached figure. The minimum STC ratings on the attached figure shall be included in the construction specifications and drawings.

2. NOI-2: Noise Control Measures for Outdoor Rooftop Deck

To achieve HUD's 65 dB noise threshold for outdoor spaces, the rooftop deck shall be designed with a partition surrounding the rooftop deck with the following specifications:

- the partition shall be made of 3/8-inch-thick tempered glass, or comparable material and construction, as identified by an acoustical engineer and approved by the City, to achieve the outdoor noise threshold,
- the partition, if constructed with glass, shall be laminated to provide additional noise attenuation; and
- the partition shall be at least 6 feet tall, as measured from the ground elevation of the rooftop deck, to block line-of-sight for rooftop deck users from the vehicular traffic noise sources.

3. NOI-3: Mechanical Ventilation

Mechanical ventilation must be provided to units where windows must be closed to maintain a relatively noise-free environment.

Under my authority as the Alternate NEPA Certifying Officer and Environmental Clearance Officer, per 24 CFR Section 51.104(b)(1), I am waiving the requirement to prepare an EIS for the project as it has been demonstrated to me that the noise exposure of the proposed living areas and rooftop outdoor space ancillary to the residential uses on site can be adequately mitigated, and no other issues or statutes were found to be of concern in the Environmental Assessment which would merit preparation of an EIS.

Edward Manasse (11/17/2024) (6:23 PM)

Jun 7, 2024

1. INTRODUCTION

1.1. BACKGROUND

The East Bay Asian Local Development Corporation (EBALDC) proposes to develop and manage the Lake Merritt Bay Area Rapid Transit District (BART) Affordable Senior Housing project (hereafter referred to as the “proposed project”).

The project site is at 51 9th Street and bounded by Fallon Street to the east, 8th Street to the south, Oak Street to the west, and 9th Street to the north on part of a single parcel (Assessor’s Parcel Number (001-0169-001). Oakland Downtown is west of the project site which is located in Oakland Chinatown. The project site and local vicinity are shown in Figure 1, Project Location.

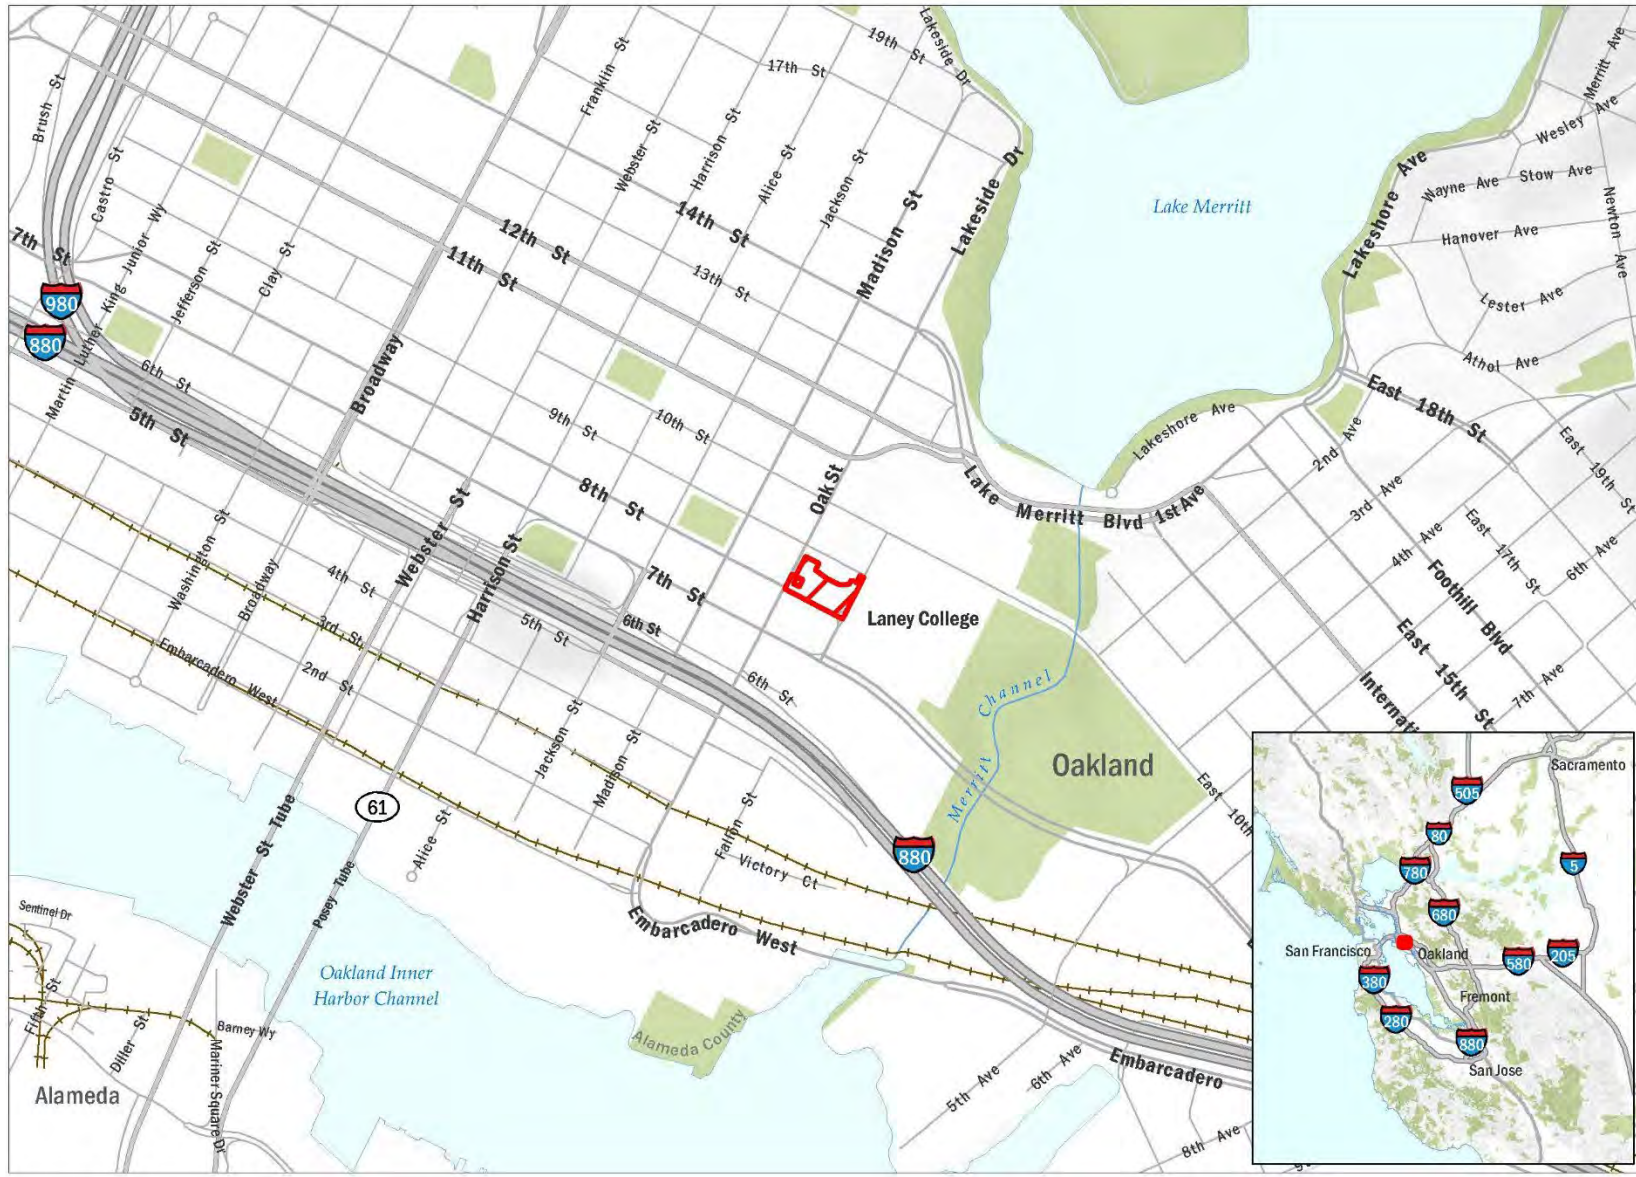

The proposed project would be the affordable housing anchor for a larger multi-phase, multi-block transit-oriented development (TOD), in partnership with Strada Investment Group and BART, that would strengthen the existing neighborhood with an extensive suite of community benefits. The entire development, which was approved by the City of Oakland, as a planned unit development, would include four new buildings across two blocks (refer to Figure 2, Buildings A through D, sited east and south of the Lake Merritt BART Station). The redevelopment TOD project would consist of a high-density mix of market-rate and affordable residential housing (including the proposed project, referred to as ‘Building B’), office and community space; ground-floor retail, and restaurant; a childcare center; a new public open space; and public space improvements. The Lake Merritt BART Affordable Senior Housing project is the first of the four buildings to start construction and be completed.

1.2. PROJECT DESCRIPTION

The proposed project would construct a new 7-story, approximately 85-foot tall, 79,318-square-foot building on the southern portion of the existing 1.38-acre parcel. The proposed Building B footprint would be 11,633 gross square feet (or approximately 20 percent of the entire parcel). The mixed-use residential and retail building would be developed with approximately 97 units of affordable housing, targeted for senior households (55+), as well as special needs and formerly homeless households, with Area Median Incomes (AMIs) ranging from 30% –60% AMI.

As shown in Figure 3, the ground floor would include a community room/lounge, service offices, restrooms, bike room, storage, trash and utility space. The ground floor would also provide approximately 3,235 square feet of commercial space at the western portion of the building, adjacent to and interacting with the Lake Merritt BART Station entrance and a new publicly accessible paseo area (also approved as part of the two-block planned unit development for the redevelopment TOD project) that would serve as a pedestrian friendly walkway connecting Laney College and the Lake Merritt BART Station. The walkway would be on top of the underground BART station and would provide an active space with seating areas, landscaping, public art, and lighting. Approximately 354 square feet of the commercial space would be utilized for a community-serving limited-service restaurant or café and approximately 2,881 square feet would be utilized for a Commercial Kitchen. The upper levels (2nd through 7th floors) would consist of approximately 97 senior residential units (22 studios, 70 one-bedroom and 5 two-bedroom units), of which 44 would be reserved for special needs and homeless populations. Typical floor plans for the 3rd through 6th floors are shown in Figure 4. The 7th floor would also contain a community room/lounge and an outdoor rooftop deck, as shown in Figure 5.

Figure 6. Building B Renderings

BIRD-EYED VIEW LOOKING NORTH WEST

STREET VIEW, 8TH ST. AND FALLON ST

BIRD-EYED VIEW LOOKING SOUTH EAST

STREET VIEW, 8TH ST. AND OAK ST

No vehicle parking would be constructed onsite as part of the proposed project. A secure bicycle parking room on the ground floor would be provided for residents, with a capacity for 54 bicycles, comprised of 49 long-term and 5 short-term spaces. An additional six bicycle parking spaces, four long-term and two short-term, would be provided for commercial uses. The project would also provide approximately 2,562 square feet for two community rooms/lounges and the outdoor roof deck. A publicly accessible paseo with space for a food court, public gatherings and possibly a play area would be constructed north of Building B and also provide a convenient, pedestrian friendly connection between Laney College and the Lake Merritt BART Station. The paseo would be an amenity that is of part of the overall redevelopment of the block that would also include Building A to the north.

The building would tie into an existing water main on 8th Street for potable and fire water suppression. The building would also tie into an existing sewer main on 8th Street. New stormwater infrastructure would be constructed, including new storm drain laterals connecting to existing storm drain mains, as well as new storm drain inlets and manholes. The proposed project intends to meet Greenpoint Rated standards for Gold level certification. Exterior light sources would be designed to not create significant light and glare onto adjacent properties through the use of shielding and reflectors, in compliance with the City of Oakland’s (City’s) Uniformly Applied Development Standards that are imposed as Standard Conditions of Approval (SCAs).

The building would be setback from the adjacent underground BART station and tunnel structures. Piles for the building would be set back from the underground BART structures by a minimum of 10 feet and the building foundation would also be set back 1.5 feet from above the BART structures to 8 feet below the BART structures. These setbacks were based on the “zone of influence” defined by BART to protect BART underground structures and within which shoring is required for excavations. The building elevation and relationship to the BART tunnel are illustrated in Figure 7.

Figure 7. Building B Elevation (facing west)

The building would be supported on a structural concrete slab that would be founded on piles approximately 70 feet to 110 feet in length. The maximum depth of excavation is estimated to be approximately 130 feet below the ground surface where the piles would be installed.

The proposed project’s final development plans for its vertical and horizontal improvements were approved by the Oakland City Planning Commission on July 20, 2022. The approval was made contingent upon the project complying with the Standard Conditions of Approval and Mitigation Monitoring and Reporting Program (SCAMMRP), which includes all mitigation measures identified in the Lake Merritt

BART Station Redevelopment California Environmental Quality Act (CEQA) Checklist (approved by the Commission on May 19, 2021). In making this approval, the City determined that the project was consistent with and helped fulfill the 2014 Lake Merritt Station Area Plan and evaluated in a project EIR.^{1,2}

1.3. ENVIRONMENTAL JUSTICE STUDY AREA

The study area for environmental justice is made up of six U.S. Census Tract Block Groups that are within a 0.25-mile radius of the project site. These block groups are generally within the City of Oakland’s historic Chinatown neighborhood, and are listed in Table 1 below. The reference area against which the study area was compared for minority and household income characteristics is the City of Oakland. The City of Oakland, within Alameda County, is between the City of Berkeley to the north and the City of San Leandro to the south and contains the study area for the proposed project within its limits.

Figure 8. Environmental Justice Study Area

2. TITLE VI/ENVIRONMENTAL JUSTICE ASSESSMENT

2.1. REGULATORY BACKGROUND

This project has been developed in accordance with Title VI of the Civil Rights Act of 1964, as amended; Executive Order (EO) 12898, “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations”; and EO 14096, “Revitalizing Our Nation’s Commitment to Environmental Justice for All.” Title VI states that “No person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.” EO 12898 requires each federal agency (or its designee) to take the appropriate and necessary steps to identify and address “disproportionately high and adverse” effects of federal or federally funded projects on minority and low-income populations.

Additionally, President Biden’s EO 13985 (January 20, 2021) “Advancing Racial Equity and Support for Underserved Communities Through the Federal Government” serves to “pursue a comprehensive approach to advancing equity for all, including people of color and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality.” The subsequent EO 14008 (January 27, 2021), “Tackling the Climate Crisis at Home and Abroad,” and EO 14096 (April 21, 2023), “Revitalizing Our Nation’s Commitment to Environmental Justice for All,” reinforces the vision of EO 13895 by setting long-term planning goals and providing guidance on financial support for disadvantaged communities.

EO 14008 launched the “Justice40 Initiative,” a federal government commitment that 40 percent of the overall benefit of certain federal climate, clean energy, affordable and sustainable housing, and other investments flow to disadvantaged communities. The investments are intended to confront a history of underinvestment in disadvantaged communities and bring resources to communities that have suffered a legacy of pollution and environmental hazards.

The following definitions are provided in EO 13985:

- a) The term “equity” means the consistent and systematic fair, just, and impartial treatment of all individuals, including individuals who belong to underserved communities that have been denied such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and other persons of color; members of religious minorities; lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons; persons with disabilities; persons who live in rural areas; and persons otherwise adversely affected by persistent poverty or inequality.
- b) The term “underserved communities” refers to populations sharing a particular characteristic, as well as geographic communities, that have been systematically denied a full opportunity to participate in aspects of economic, social, and civic life, as exemplified by the list in the preceding definition of “equity.”

2.2. METHODOLOGY

To assess whether or not the project could lead to disproportionately high and adverse effects on a minority and/or low-income population, demographic characteristics of the study area were reviewed. The analysis of environmental justice impacts in this report leverages data from the latest American

Community Survey (ACS) (U.S. Census Bureau 2022). ACS 5-Year Estimates for race, ethnicity, and poverty levels were examined for the six block groups that make up the study area, as well as for the City of Oakland, which was used as a reference.

The following definitions are used in accordance with Title VI and the pertinent EJ circulars:

- Minorities are defined as all people except for Non-Hispanic white as defined by the ACS. This includes persons who self-identified themselves as American Indian or Alaskan Native, Asian, Black or African American, Native Hawaiian or other Pacific Islander, or Hispanic or Latinos.
- Low-income individuals are defined as those whose income is at or below 200 percent of the poverty level established for households by the Department of Health and Human Services (HHS) poverty guidelines. This assumption is more inclusive of low-income populations, accounting for higher incomes in the Bay Area as compared to the rest of the United States.

In 2024, 200 percent of the poverty threshold for a family of four was \$62,400. For the purpose of this analysis, low-income households are considered to be those below \$60,000 in annual household income. This is due to U.S. Census Bureau ACS 5-year estimates only reporting income in brackets of \$10,000 (i.e., \$50,000 – \$59,999). Therefore, the data is not granular enough to report up to \$62,400.

In addition, this methodology considers the Climate and Economic Justice Screening Tool (CEJST), an interactive mapping tool to identify disadvantaged communities that are marginalized by underinvestment and overburdened by pollution. Federal agencies are using CEJST to identify communities, based on 2010 census tract boundaries, that can benefit from their funding programs. The tool uses datasets as indicators of burden; disadvantaged communities are those at or above a defined threshold for one or more environmental, climate, or other burdens and at or above a defined threshold for an associated socioeconomic burden. The datasets cover climate change, energy, health, housing, legacy pollution, transportation, water and wastewater, and workforce development.

2.3. ANALYSIS

According to 2018-2022 ACS data (the latest available 5-year estimates), the percentage of the City of Oakland population that is considered ethnic and racial minority is 66.54 percent and the percentage of the population living below 200 percent of the U.S. Census Bureau-defined poverty line is 38.53 percent. These percentages are used as thresholds for defining environmental justice communities. A study area block group is considered an environmental justice community if the percentage of low-income or ethnic and racial minority population exceeds that of the reference area, the City of Oakland.

According to Table 2 and Table 3, four EJ communities are present in the study area. As stated above, EJ communities were identified if the percent minority population or percent low-income population for a block group was greater than that of the reference area, the City of Oakland. These EJ communities are census tract 4033.01, block group 1; 4033.01, block group 2; 4033.02, block group 2; and 4033.04, block group 2. Three of these block groups have both a minority population and low-income population greater than the City of Oakland, while one only has a low-income population greater than the City of Oakland.

Table 2. Minority Communities within the Study Area

Census Tract	Block Group	Minority Population	Total Population	Percent Minority	Compared to the Reference Area, is the Block Group an EJ Community in terms of Ethnicity? ¹
City of Oakland	N/A	307287	461,826	66.54%	N/A
4033.01	1	580	637	91.05%	Yes
4033.01	2	1027	1,193	86.09%	Yes
4033.02	1	217	690	31.45%	No
4033.02	2	487	1,075	45.30%	No
4034.01	1	342	904	37.83%	No
4034.02	2	25	30	83.33%	Yes

¹ If the percent minority in a census tract block group exceeds the average percent minority for the City of Oakland at 66.54 percent, the census tract block group is identified as an EJ community.

Source: U.S. Census Bureau, 2018-2022 American Community Survey 5-Year Estimates; Data compiled by AECOM in 2024.

Table 3. Low-Income Communities within the Study Area

Census Tract	Block Group	Low-Income Population	Total Population with Census Income ¹	Percent Low-Income	Compared to the Reference Area, is the Block Group an EJ Community in terms of Income? ²
City of Oakland	N/A	65,672	170,446	38.53%	N/A
4033.01	1	290	341	85.04%	Yes
4033.01	2	236	271	87.08%	Yes
4033.02	1	35	223	15.70%	No
4033.02	2	342	773	44.24%	Yes
4034.01	1	162	699	23.18%	No
4034.02	2	22	56	39.29%	Yes

¹ The population of the City of Oakland with income reported in the Census is smaller than the total population.

² If the percent minority in a census tract block group exceeds the average percent low-income for the City of Oakland at 38.53 percent, the census tract block group is identified as an EJ community.

Source: U.S. Census Bureau, 2018-2022 American Community Survey 5-Year Estimates; Data compiled by AECOM in 2024

The project site is within census tract 4033, which is generally bounded by Alice Street to the west, 12th Street to the north, the Lake Merritt Channel to the east, and the Oakland Estuary to the south (shown in Figure 9). The CJEST identifies the entire census tract as a disadvantaged community, as well as the census tracts to the northwest and to the east. Socioeconomically, the census tract is low income - in the 66th percentile of the individuals below the 200% federal poverty line and greater than or equal to the 90th percentile for households in linguistic isolation and low high school attainment. In terms of pollution burden, the census tract is greater than or equal to the 90th percentile for particulate matter with aerodynamic diameter less than 2.5 microns (PM_{2.5}) exposure and is low income; in the 85th percentile for diesel particulate matter exposure; in the 99th percentile for traffic proximity and volumes; and has experienced historic underinvestment and remains low income.

Figure 9. CEJST Disadvantaged Community Mapping (census tracts shaded in darker bluish gray are disadvantaged communities)

2.3.1. Conclusion

While four out of six block groups in the study area have been identified as environmental justice communities and the entire census tract encompassing the project site is defined as a disadvantaged community, the proposed project is not anticipated to result in disproportionately high and adverse impacts. A disproportionately high and adverse effect on a community of concern is commonly defined by federal agencies for environmental assessments pursuant to the National Environmental Policy Act as an adverse effect that either is predominantly borne by a minority population and/or a low-income population; or will be suffered by the minority population and/or low income population, and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population.

The project is not anticipated to result in any substantially high adverse impacts. Table 4 below summarizes potential EJ-related resource areas, and their relevance to the proposed project. Since the

project would not result in adverse impacts, it would also not result in disproportionately high and adverse impacts to any of the EJ communities identified in the study area.

Table 4. Analysis of Proposed Action’s Disproportionate Impacts on Environmental Justice Communities

Environmental Resource	Impacts Summary	Relevance to Title VI/Environmental Justice
Air Quality	<p>The proposed project would result in temporary generation of criteria air pollutant emissions, including ROG, NO_x, PM₁₀, and PM_{2.5}. Additionally, fugitive dust emissions of PM₁₀ and PM_{2.5} may occur.</p> <p>Compliance with the City of Oakland’s Standard Conditions of Approval (SCAs) would be required for the project. The SCAs include air quality controls for criteria pollutants and fugitive dust during construction, as well as requirements to prevent the release of toxic air contaminants from stationary sources (i.e., during project operations). Compliance with the SCAs would reduce localized emissions during construction. Additionally, the project would not result in long-term increases in criteria air pollutants or toxic air contaminants, and would also be required to comply with long-term SCAs.</p>	<p>Project-related construction air quality would not violate or contribute substantially to an existing or projected air quality violation. The proposed project would not have an adverse effect related to air quality; therefore, no disproportionate adverse impacts on Title VI/environmental justice communities would occur.</p>
Biology	<p>The proposed project would not result in loss of habitat for any special status species identified in the study area. Additionally, it would comply with City SCAs to preserve or replace existing trees and vegetation at the project site and to ensure that nesting birds and roosting bats are protected during construction. Further, the project would plant replacement trees and include more planter areas than now exist onsite .</p>	<p>Project-related construction impacts to trees, nesting birds, and roosting bats would be prevented by compliance with City SCAs, and no adverse effects would occur related to biological resources. Therefore, no disproportionate adverse impacts on Title VI/environmental justice communities would occur.</p>
Hazards and Hazardous Materials	<p>A Phase I ESA and Phase II ESA were completed for the project site by Langan. There was one identified Recognized Environmental Conditions (REC), a Vapor Encroachment Concern (VEC), and one identified Historical REC (HREC), a Historical Gas Station, associated with the project site. Results of soil, groundwater, and soil vapor revealed no hazardous levels of contaminants in the native material beneath the fill. Groundwater analytical results detected contaminants exceeding both residential and/or commercial environmental screening levels. Specifically, exceedances of chemicals of concern such as ethylbenzene and xylenes, as well as tetrachloroethylene (PCE) and trichloroethylene (TCE), were found within the proposed footprint of the project. The project applicant entered into a Voluntary Remedial Action Agreement with the Alameda County Department of Environmental Health (ACDEH) in November 2022 (ACDEH 2022). The agreement stipulates that the ACEDH will provide environmental oversight during redevelopment and/or remedial action to ensure the</p>	<p>The project applicant has entered into a Voluntary Remedial Action Agreement and will comply with City SCAs and ACDEH requirements. A Corrective Action Plan to clean up the site has been prepared, and implementation of its measures is required by ACDEH and when completed, the ACDEH will issue a letter of no further action. The project site is not near a Superfund or CERCLIS site. Based on these facts, the project would not result in an adverse impact related to hazards and hazardous materials, and would therefore not result in a disproportionately high and adverse impact to Title VI/environmental justice communities.</p>

Environmental Resource	Impacts Summary	Relevance to Title VI/Environmental Justice
	<p>site would not pose a threat to human health or the environment.</p> <p>In response to further testing and ongoing consultations with ACEDH, the project applicant has prepared a Corrective Action Plan, the purpose of which describes the excavation of historically contaminated soils, containing soluble lead concentrations exceeding the California Class I non-RCRA hazardous waste criteria and their transport to a licensed off-site disposal facility. ACEDH has announced that the plan is available for public review and comment and will finalize the plan with the project applicant. To confirm that all steps have been followed and the site contamination remediated to acceptable levels, the project applicant must provide a ACEDH with a compliance report. If approved by ACEDH, a no further action notice will be issued and the case will be closed.</p> <p>The project site is not listed on the California Department of Toxic Substances Control (DTSC) Hazardous Waste and Substances Site List (Cortese) (California Department of Toxic Substances Control 2024, State Water Resources Control Board 2024). Additionally, the project site is not located within 0.25 mile of a Superfund or CERCLIS site (U.S. EPA 2024).</p> <p>In addition to the Corrective Action Plan, the project would also comply with hazardous material-related City SCAs. These SCAs regulate the use of hazardous materials during construction, and ensure that the proper surveys and documentation of hazardous materials at the project site are completed as part of the project.</p>	
Noise	<p>The proposed project would generate temporary, short-term noise and vibration from equipment operating at the project site during construction. As a residential project, future occupation of the site by senior households is not anticipated to result in a substantial long-term increase in noise or vibration. The project would be required to comply with City SCAs related to construction and operational noise and vibration. This compliance would ensure that construction is limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday, between 9:00 a.m. and 5:00 p.m. on Saturday, and that no construction would occur on Sundays or federal holidays. It would also ensure that measures are included to reduce construction noise to the extent feasible, and to prevent long-term noise and vibration effects on the local community.</p>	<p>Based on the project's compliance with City SCAs related to noise and vibration, the project would not result in an adverse impact related to noise. Therefore, no disproportionate adverse impacts on Title VI/environmental justice communities would occur.</p>
Transportation	<p>The project may result in a minor adverse impact to local traffic both in the short term during project construction. The long-term traffic impacts are associated with the project's operational phase (i.e.,</p>	<p>The project may result in temporary traffic disruptions during construction, but this effect is anticipated to be minor, as the</p>

Environmental Resource	Impacts Summary	Relevance to Title VI/Environmental Justice
	<p>when the proposed building is occupied). Temporary effects on traffic would be reduced by compliance with City SCAs that require preparation and implementation of a Traffic Control Plan approved by the City.</p> <p>The proposed project would place emphasis on alternative modes of transportation, such as bicycle, pedestrian, and public transportation. The project would integrate with existing public transportation infrastructure, as it is sited atop the Lake Merritt BART Station, which provides regional connectivity throughout the Bay Area via rail transit. Additionally, there are multiple Alameda County Transit (AC Transit) bus stops near the project site.</p> <p>The project would not provide any new vehicle parking, but would provide bicycle parking on the ground floor. There are existing Class II bike lanes on the street network surrounding the project site, as well as sidewalks. The City conditions of approval for the Planned Unit Development and horizontal improvements include improvements along the sidewalks, intersection corners, and crosswalks to enhance pedestrian safety.</p> <p>The project is anticipated to result in a limited number of new vehicle trips. According to the project's Transportation Impact Report (TIR), the proposed project (Building B within the greater planning context of the station) would result in approximately 250 daily vehicle trips, of which 12 trips would occur in the weekday AM peak hour, and 19 would occur in the weekday PM peak hour.</p>	<p>project would comply with transportation-related City SCAs.</p> <p>In terms of operations, the project would place emphasis on alternative modes of transportation. While the project is anticipated to result in a limited number of new vehicle trips, this effect on roadway network operations is consistent with the 2014 LMSAP EIR and the 2021 CEQA Checklist analyses of the project's transportation impacts. Therefore, no substantial transportation-related effects are anticipated, and the project would therefore not result in a disproportionately high and adverse impact to Title VI/environmental justice communities.</p>

3. PUBLIC OUTREACH TO TITLE VI/ENVIRONMENTAL JUSTICE POPULATIONS

A key component of Title VI/environmental justice is engaging these populations as part of the planning process. EBALDC has engaged the public through extensive efforts. Engagement efforts included stakeholder meetings and interviews, community design workshops, and community surveys. The project was also discussed at the Design Review Committee of the City Planning Commission on April 14, 2021. These efforts informed EBALDC as to local community needs, and helped shape the project's design. The project was designed to include the following based on the community's needs: a food hub with restaurants and outdoor seating to create a food destination/venue in the neighborhood; a pedestrian paseo to increase landscaping, greening of the block, and opportunities for gathering and play space; a direct connection between Laney College and the Lake Merritt BART Station; pedestrian improvements that involve wider sidewalks, curb bulbs and ramps, and high visibility crosswalks; and community rooms and gathering spaces within the residential building.

4. CONCLUSION

The applicant will comply with City of Oakland SCAs, and has included community conscious elements in the project design as a result of their public outreach efforts to date. Additionally, the project would have the benefit of providing affordable housing options to vulnerable populations, to include seniors, Special Needs, and formerly Homeless households. It would also provide community gathering spaces and greening for the neighborhood. Based on the analysis above, and the public outreach efforts of the project applicant, the proposed project would not result in a disproportionately high and adverse impact on environmental justice communities in the study area.

GEOTECHNICAL INVESTIGATION
Lake Merritt BART
Block 1 – Building B and Paseo
Oakland, California

1.0 INTRODUCTION

This report presents the results of the geotechnical investigation performed by Langan for the proposed Building B and paseo portions of the Block 1 development at the Lake Merritt Bay Area Rapid Transit (BART) Station in Oakland, California. We understand the Lake Merritt BART redevelopment project will consist of two adjacent sites, designated Block 1 and Block 2, as shown on Figure 1, Site Location Map, and that development plans for Block 2 will proceed at a later time. Previously, we performed a preliminary geotechnical investigation for Blocks 1 and 2 and presented the results in a letter report dated 23 January 2021, revised 9 April 2021.

Block 1 is bound by Fallon Street on the southeast, 8th Street on the southwest, Oak Street on the northwest, and 9th Street on the northeast. The Lake Merritt BART station crosses below Block 1, and the station transitions to a BART tunnel beneath Fallon Street, as shown on the Site Plan, Figure 2. At street level, the northwestern portion of Block 1 is occupied by a plaza with entrances to the underground BART station. An asphalt-paved BART parking lot occupies the remainder of the block to the southeast.

Plans for Block 1 are to construct an approximately 275-foot-tall, 28-story, market rate residential building, designated Building A, in the northeastern portion of the site, and an approximately 85-foot-tall, 7-story, concrete affordable senior housing building, designated Building B, in the southwestern portion of the site. The buildings will be constructed within the existing parking lot adjacent to, but not over, the BART station. A pedestrian paseo is planned between Buildings A and B, within an easement over the BART station. A 6-foot-square, 5-foot-deep cistern will be constructed in the southern portion of the Building B site to store stormwater.

Currently, only the Building B and paseo portions of the Block 1 redevelopment are in design; we understand Building A will be developed later. This report is for the Building B and paseo portions of the development only; recommendations for Building A will be provided in a separate report. The extents of Building B and the paseo comprise about two-thirds of Block 1 and are irregular in shape, with maximum plan dimensions of about 220 by 320 feet, as shown on the Site Plan, Figure 2.

Building B will be constructed at grade. According to the project structural engineer, DCI Engineers, dead plus live column loads for Building B will range from about 400 to 650 kips. The paseo is being designed to impose no new loads (on average across the project site) as it will be constructed over the BART station.

2.0 SCOPE OF SERVICES

Our scope of our services, as outlined in our proposal dated 30 July 2021 and our budget increase requests dated 9 June 2022 and 15 May 2023, consisted of reviewing available subsurface information for the site and vicinity, further exploring soil and groundwater conditions at the site, performing engineering studies, and preparing geotechnical recommendations for Building B and the paseo at Block 1. Using the results of our field investigation and engineering studies, we developed conclusions and recommendations regarding the following:

- soil and groundwater conditions at the site
- seismic hazards, including ground rupture, liquefaction, and seismic settlements
- ground improvement, if needed
- the most appropriate foundation type(s) for Building B
- design criteria for the most appropriate foundation type(s), including values for vertical and lateral capacities
- estimated foundation settlements, including total and differential settlement
- lateral earth pressures for design of elevator pit and other below-grade walls
- site grading, including soil subgrade preparation and criteria for fill quality and compaction
- pavement and concrete flatwork
- underground utilities
- excavation, temporary slopes, and dewatering
- 2022 California Building Code (CBC) seismic design parameters
- construction considerations.

Our geotechnical conclusions and recommendations for design of the project are presented in this report. Langan is also providing environmental consulting services for the project; the results of our environmental studies are published in separate reports.

3.0 FIELD INVESTIGATION AND LABORATORY TESTING

During our preliminary geotechnical investigation, we evaluated subsurface conditions at Block 1 by reviewing available boring logs provided by BART and performing one cone penetration test (CPT), designated CPT-2. To further evaluate subsurface conditions at Block 1 and provide final design-level geotechnical recommendations for the development, we drilled three borings, designated B-2 through B-4, and advanced two CPTs, designated CPT-3 and SCPT-4/4a; the approximate locations of the borings and CPTs are shown on Figure 2.

Prior to performing our field investigation, we purchased a railroad insurance policy for the duration of our field investigation as required by BART, coordinated access to the boring and CPT locations within the BART parking lot with BART personnel, obtained permits from Alameda County Public Works Agency (ACPWA), notified Underground Service Alert (USA), and checked that the boring and CPT locations were clear of underground utilities using an independent private utility locator.

3.1 Borings

Borings B-2 through B-4 were drilled in the Lake Merritt BART station parking lot by Pitcher Drilling from 3 to 12 January 2022 using a truck-mounted rotary wash drill rig. Borings B-2 and B-4 were drilled to depths of about 151½ feet below the ground surface (bgs), and Boring B-3 was drilled to a depth of about 251½ feet bgs. In-situ downhole geophysical suspension logging was performed in boring B-3. Logs of the borings are presented on Figure A-1 through A-3 in Appendix A. The soil encountered in the borings was classified in accordance with the Soil Classification Chart, Figure A-4.

Soil samples were obtained using four different types of samplers: two driven split-barrel samplers and two pushed thin-walled samplers. The sampler types are as follows:

- Sprague & Henwood (S&H) split-barrel sampler with a 3.0-inch outside diameter and 2.5-inch inside diameter, lined with steel or brass tubes with an inside diameter of 2.43 inches
- Standard Penetration Test (SPT) split-barrel sampler with a 2.0-inch outside diameter and 1.5-inch inside diameter, without liners
- Shelby Tube sampler with a 3.0-inch outside diameter and a 2.875-inch inside diameter
- Pitcher Barrel (PB) sampler with a spring-loaded Shelby Tube.

The sampler types were chosen on the basis of soil type being sampled and desired sample quality for laboratory testing. In general, the S&H sampler was used to obtain samples in medium stiff to very stiff cohesive soil and the SPT sampler was used to evaluate the relative density of sandy soil. The Shelby Tube sampler was used to obtain relatively undisturbed samples of stiff to very stiff cohesive soil, and the Pitcher Barrel sampler was used to obtain relatively undisturbed samples of very stiff to hard cohesive soil.

The SPT and S&H samplers were driven with a 140-pound downhole safety hammer falling 30 inches. The samplers were driven up to 18 inches and the hammer blows required to drive the samplers every six inches of penetration were recorded and are presented on the boring logs. The driving of samplers was discontinued if the observed (recorded) hammer blows was 60 for six inches or less of penetration. The blow counts required to drive the S&H and SPT samplers 12 inches (or less if 60 blows were achieved) were converted to approximate SPT N-values using factors of 0.7 and 1.2, respectively. The N-values are shown on the boring logs. The blow counts used for this conversion were: 1) the last two blow counts if the sampler was driven more than 12 inches, 2) the last one blow count if the sampler was driven more than six inches but less than 12 inches, and 3) the only blow count if the sampler was driven six inches or less.

The Shelby Tube sampler is pushed hydraulically into the soil; the pressure required to advance the sampler is shown on the logs, measured in pounds per square inch (psi). The Pitcher Barrel sampler uses a spring-loaded Shelby Tube to sample the soil. The Shelby Tube extends below the Pitcher Barrel and the spring-loaded mechanism pushes the Shelby Tube into the soil. The spring within the Pitcher Barrel compresses when hard soils are encountered, and the Shelby Tube retracts into the Pitcher Barrel as the spring compresses. When the spring is fully compressed, the Pitcher Barrel encompasses the Shelby Tube, and teeth at the end of the Pitcher Barrel cut into the soils to advance the sampler.

Upon completion, boring B-3 was completed as a standpipe piezometer so that the groundwater level can be measured over time. The piezometer was installed with a screened section from approximately 20 to 30 feet bgs. The remaining boreholes were backfilled with cement grout under the observation of an ACPWA inspector in accordance with the requirements of the ACPWA, and the pavement was patched. The soil cuttings from the borings were collected in 55-gallon drums, which were stored temporarily off-site, tested, and eventually properly disposed.

3.2 Cone Penetration Tests

The two CPTs for our final investigation, CPT-3 and SPCT-4/4a, were performed on 3 January 2022, and CPT-2, from our preliminary investigation, was performed on 15 November 2019. The CPTs were advanced by Gregg Drilling, LLC. (Gregg) of Martinez, California using a truck-mounted rig. CPTs are performed by hydraulically pushing a 1.7-inch-diameter cone-tipped probe into the ground. While the CPT probe is advanced, electrical strain gauges or load cells within the cone measure soil parameters continuously during the entire depth. Soil data is recorded in the field and then processed to provide engineering information, such as the types, approximate strength characteristics, and consolidation characteristics of the soil encountered.

The CPTs were advanced to depths of about 100 feet bgs; SCPT-4 was initially pushed to partial depth without the seismic cone and was subsequently repushed nearby as SCPT-4a. SCPT-4a was performed using a seismic cone in order to estimate the dynamic response of local soils during an earthquake and to correlate shear wave velocity measurements with the downhole geophysical testing. The CPT logs, showing tip resistance and friction ratio by depth, as well as interpreted SPT N-values and interpreted soil classifications, are presented in Appendix B. Soil types were estimated using the classification chart included in Appendix B. The shear wave velocity results from SCPT-4a are also provided in Appendix B.

Pore-pressure dissipation tests (PPDT) were performed at CPT-2 and SCPT-4 to measure hydrostatic water pressures and to determine the approximate depth of the groundwater level. The variation of pore pressure with time is measured behind the tip of the cone and recorded. For this investigation, the durations of the test were approximately 900 and 1370 seconds. The PPDT results are presented in Appendix B.

After completion, the CPTs were backfilled with cement grout in accordance with ACPWA requirements, and the pavement was patched.

3.3 Down-Hole Geophysical Logging

Upon completion of drilling in boring B-3, NorCal Geophysical Consultants Inc. performed in-situ downhole suspension logging to measure the shear and compression wave velocity of the soil within the boring. The details of the suspension logging methodology, procedures, and the results are presented in Appendix C. The results of the geophysical logging were used in our seismic hazards evaluation and to determine site class in accordance with the 2022 CBC.

3.4 Laboratory Testing

The soil samples recovered from the borings were reexamined in the office to confirm soil classifications, and representative samples were selected for laboratory testing. The laboratory testing program was designed to evaluate engineering properties of the soil at the site. Samples were tested to measure moisture content, dry density, gradation, fines content, plasticity, unconsolidated undrained triaxial shear strength, and consolidation characteristics. The results of the laboratory tests are shown on the boring logs and presented in Appendix D as Figures D-1 through D-18. In addition, a corrosion test was performed on a bulk sample of the shallow soil and the results are presented in Appendix E.

3.5 Previous Investigations by Others

Subsurface conditions at the site and vicinity were previously investigated by others in 1963 for the development of the Lake Merritt BART station and tunnel. The available borings in the vicinity of Block 1 include three borings (designated as K-005-6, K-005-7, and K-005-23) drilled to depths ranging from about 60 to 64 feet bgs. The approximate locations of the borings are shown on Figure 2. Logs of the borings by others are included in Appendix F.

4.0 SITE AND SUBSURFACE CONDITIONS

Site and subsurface conditions are discussed in this section. A regional geologic map is presented on Figure 3 and an idealized subsurface profile for Block 1 is shown on Figure 4.

4.1 Site Conditions

Block 1 is bound by Fallon Street on the southeast, 8th Street on the southwest, Oak Street on the northwest, and 9th Street on the northeast. At street level, the northwestern portion of Block 1 is occupied by a plaza with entrances to the underground BART station. An asphalt-paved BART parking lot occupies the remainder of the block to the southeast. A topographic survey prepared by BKF Engineers, the project civil engineer, indicates that the ground surface across Block 1 varies between Elevations 17 and 28.4 feet¹, with the low elevation at the intersection of 8th Street and Fallon Street and the high elevation at the intersection of Oak Street and 9th Street.

¹ All elevations based on City of Oakland Datum (COOVD). Elevations referenced are from a topographic survey titled "Lake Merritt BART Building B, Oakland, CA, 94607," Sheet C2.1, by BKF Engineers, dated 22 December 2022.

The Lake Merritt BART station crosses below Block 1, and the station transitions to a BART tunnel beneath Fallon Street. The BART station and tunnel were built in the 1960s using cut-and-cover methods. On the basis of available as-built BART drawings², we understand the BART station beneath the northwest portion of the site consists of a box structure approximately 62 feet wide and 33 to 35 feet tall. Below the central portion of the site, the bottom of the station is about 35 to 38 feet bgs, and the bottom of the station is relatively level at about Elevation -13 feet. Based on the as-built BART drawings, the cover soil and pavement section above the BART station is about one to three feet thick, increasing in thickness to the northwest between Fallon Street and the Lake Merritt BART station. The cover soil and pavement thickness will be confirmed by others by potholing.

4.2 Subsurface Conditions

Where explored in Block 1, the borings encountered undocumented fill consisting of sand with variable silt content in the upper five to ten feet. It is not known whether the fill was placed in a controlled (compacted) manner, as we were not provided records of how it was placed. However, the fill was likely placed during construction of the cut-and-cover Lake Merritt BART station. The fill is underlain by Merritt Sand which consists of medium dense to dense sand with variable silt and clay content. The Merritt Sand extends to depths of about 15 to 21½ feet bgs, corresponding to approximate Elevations 2 to 9 feet. The sand is underlain by the Alameda formation, which is comprised of medium stiff to hard clay with variable sand and silt content. The clays and silts of the Alameda formation have low to high plasticity, with plasticity indices (PI) ranging from 7 to 58, and are overconsolidated,³ with overconsolidation ratios (OCR) ranging from approximately 1.2 to 5.

Groundwater was encountered in boring B-4 at a depth of about 6½ bgs during drilling, corresponding to about Elevation 17.1 feet; however, this is not considered a stabilized groundwater level. The results of pore pressure dissipation tests performed in CPT-2 (performed in November 2019) and SCPT-4 (performed in January 2022) indicate that groundwater is present at depths ranging from 19½ and 17½ feet bgs, respectively, corresponding to approximate Elevations 5.1 and 5.2 feet. Groundwater was measured in a piezometer (designated EB-24)

² "Oakland Downtown Lake Merritt Station, Sections A, G, H, J" as-built plans dated 9 January 1967 by San Francisco BART District.

³ An underconsolidated clay has not yet achieved equilibrium under the existing load; a normally consolidated clay has completed consolidation under the existing load; and an overconsolidated clay has experienced a load greater than it is currently under.

installed by Langan’s environmental personnel within the Building B footprint at a depth of about 16.7 feet bgs, corresponding to about Elevation 5.3 feet, in June 2023. In piezometer B-3, groundwater was measured at a depth of about 18.2 feet, corresponding to about Elevation 5.7 feet, in September 2023. According to our review of the CGS Seismic Hazard Zone Report for the Oakland West Quadrangle (CGS, 2003), historic high groundwater level in the project vicinity is between 10 and 20 feet bgs. Considering the site’s proximity to the San Francisco Bay, the groundwater level may be influenced by the tides. Additionally, fluctuations in the groundwater levels should be expected during periods of heavy seasonal rainfall and due to climate change.

5.0 REGIONAL SEISMICITY AND FAULTING

The project site is in a seismically active region. Numerous earthquakes have been recorded in the region in the past, and moderate to large earthquakes should be anticipated during the life of the proposed development. The Hayward, San Andreas, and San Gregorio faults are the major faults closest to the site. These and other faults of the region are shown on Figure 5. For each of these faults, as well as other active faults within about 50 kilometers (km) of the site, the distance from the site and estimated mean Moment magnitude⁴ [2014 Working Group on California Earthquake Probabilities (WGCEP) (2015) and Uniform California Earthquake Rupture Forecast Version 3 (UCERF3) as detailed in the United States Geological Survey Open File Report 2013-1165] are summarized in Table 1. The mean Moment magnitude presented on Table 1 was computed assuming full rupture of the segment using Hanks and Bakun (2008) relationship.

⁴ Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approx. Distance from fault (km)	Direction from Site	Mean Characteristic Moment Magnitude
Total Hayward-Rodgers Creek Healdsburg	5.7	East	7.6
Contra Costa (Lafayette)	16	East	6.1
Contra Costa Shear Zone (connector)	19	Northeast	6.6
Contra Costa (Larkey)	20	East	6.0
Franklin	20	East	6.7
Total Calaveras	20	East	7.5
Mount Diablo Thrust	22	East	6.6
Contra Costa (Dillon Point)	25	Northeast	6.1
San Andreas 1906 event	25	Southwest	8.1
Concord	27	East	6.4
Mission (connected)	27	Southeast	6.1
Total San Gregorio	31	West	7.6
Pilarcitos	31	Southwest	6.7
Green Valley	32	Northeast	6.8
Clayton	33	Northeast	6.4
Contra Costa (Vallejo)	35	North	5.6
Greenville	35	East	7.1
Contra Costa (Lake Chabot)	36	North	5.6
Monte Vista - Shannon	36	South	7.0
West Napa	41	North	6.8
Great Valley 05 Pittsburg - Kirby Hills	41	Northeast	6.3

Note: The table above is a summary and does not include all the fault segmentation, alternate traces and low activity faults included in the UCERF3 model.

Figure 5 also shows the earthquake epicenters for events with magnitude greater than 5.0 from January 1800 through August 2014. Since 1800, four major earthquakes have been recorded on the San Andreas fault. In 1836 an earthquake with an estimated maximum intensity of VII on the Modified Mercalli (MM) scale (Figure 6) occurred east of Monterey Bay on the San Andreas fault (Topozada and Borchardt 1998). The estimated Moment magnitude, M_w , for this earthquake is about 6.25. In 1838, an earthquake occurred with an estimated intensity of about VIII-IX (MM), corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM),

an M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The Loma Prieta Earthquake occurred on 17 October 1989 in the Santa Cruz Mountains with an M_w of 6.9, the epicenter of which is approximately 91 km from the site.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake ($M_w = 6.2$).

The most recent earthquake to affect the Bay Area occurred on 24 August 2014 and was located on the West Napa fault, approximately 47 km northeast of the site, with an M_w of 6.0.

The 2016 U.S. Geologic Survey (USGS) predicted a 72 percent chance of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area in 30 years (Aagaard et al. 2016). More specific estimates of the probabilities for different faults in the Bay Area are presented in Table 2.

TABLE 2
Estimates of 30-Year Probability (2014 to 2043) of a
Magnitude 6.7 or Greater Earthquake

Fault	Probability (percent)
Hayward-Rodgers Creek	33
N. San Andreas	22
San Gregorio	16
Mount Diablo Thrust	16
Greenville	6

6.0 SEISMIC HAZARDS

During a major earthquake on a segment of one of the nearby faults, strong to very strong shaking is expected to occur at the site. Strong shaking during an earthquake can result in ground failure

such as that associated with liquefaction⁵, lateral spreading⁶, and cyclic densification⁷. Our evaluation of these hazards, based on the available subsurface information from the site and engineering studies, is discussed in the remainder of this section.

The California Geologic Survey (CGS) has prepared a map titled *State of California Seismic Hazard Zones, Oakland West Quadrangle Official Map*, dated 14 February 2003. This map was prepared in accordance with the Seismic Hazards Mapping Act of 1990. The map indicates the site is not within a seismic hazard zone, as shown on Figure 7.

6.1 Soil Liquefaction and Associated Hazards

When a saturated, cohesionless soil liquefies during a major earthquake, it experiences a temporary loss of shear strength as a result of a transient rise in excess pore water pressure generated by strong ground motion. Flow failure, lateral spreading, differential settlement, loss of bearing, ground fissures, and sand boils are evidence of excess pore pressure generation and liquefaction.

We used the procedures presented in Boulanger and Idriss (2014) to evaluate the liquefaction potential at the site using the results of the borings and CPTs. These procedures are updates of the simplified procedures developed by Seed et al. (1971) and Idriss and Boulanger (2008). To estimate volumetric strain and associated liquefaction-induced settlement, we used the procedures developed by Tokimatsu and Seed (1987), Cetin (2009), and Zhang et al. (2002).

The level of ground shaking used in our liquefaction evaluation was based on the Risk-Targeted Maximum Considered Earthquake (MCE_R) mapped values. A peak geometric mean ground acceleration (PGA_M) of 0.805g was used in our analyses. This PGA_M was obtained from mapped

⁵ Liquefaction is a transformation of soil from a solid to a liquefied state during which saturated soil temporarily loses strength resulting from the buildup of excess pore water pressure, especially during earthquake-induced cyclic loading. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits.

⁶ Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces. Lateral spreading is generally the most pervasive and damaging type of liquefaction-induced ground failure generated by earthquakes.

⁷ Cyclic Densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing differential settlement.

values specified in the provisions of the 2022 California Building Code (CBC)/ASCE 7-16 for the MCE_R , using site class D. We assumed an earthquake magnitude of 7.6, which is the maximum Moment magnitude for the Hayward fault, located 5.7 km from the site, as shown in Table 1.

In our analyses using the CPT results, soil that has significant amount of plastic fines, with an I_p greater than 2.6, were considered too cohesive to liquefy. Additionally, soil with a cone tip resistance q_{c1N} greater than 160 tons per square foot (tsf) was considered too dense to liquefy. We also considered the approach for soil classification and behavior presented in Robertson (2016). In this approach, CPT data is used to determine dilative and contractive behavior. The soil classification and behavior chart uses the normalized CPT tip resistance and friction ratio to separate material into clayey, sandy, and transitional soil types. The chart further uses another parameter, CD, to divide the dilative and contractive behavior of these soil types. A CD value of 70 or higher separates the soil between contractive and dilative tendencies. To capture transitional and borderline material, we used a CD cut-off value of 80. Soil that was classified as dilative based on the contractive-dilative boundary (Robertson 2016) was considered to have a buildup in pore water pressure and potentially liquefy, however, would not settle significantly.

In the CPTs and borings performed at the site, thin, discontinuous layers of medium dense silty sand and clayey sand were encountered below the design groundwater table (10 feet bgs). These layers vary in thickness from about ½ foot to 5 feet and were encountered at a depth of 10 feet in boring B-2, at depths of approximately 20 and 40 feet bgs in boring B-4, and at a depth of about 36 feet in SCPT-4a. Based on our observations and the results of our liquefaction analyses, we conclude these layers could potentially liquefy during a major earthquake on a nearby fault. We calculate liquefaction-induced settlement of less than ¼ inch for the layers in borings B-2 and B-4 and about ¾ inch for the layer in SCPT-4a.

6.2 Lateral Spreading

Lateral spreading is a phenomenon in which a surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. The surficial blocks are transported downslope or in the direction of a free face, such as a channel, by earthquake and gravitational forces. Lateral spreading is generally the most pervasive and damaging type of liquefaction-induced ground failure generated by earthquakes. Lateral spreading generally occurs in loose to medium dense sand layers with a blowcount of less than 15.

We evaluated the potential for lateral spreading at the site using an empirical relationship developed by Youd, Hansen, and Bartlett (2002). This relationship incorporates the thickness of

the liquefiable layer with corrected blow counts $[(N_1)_{60-CS}]$ less than 15; the fines content and mean grain-size diameter of the liquefiable soil; the relative density of the liquefiable soil; the magnitude and distance of the earthquake from the site; the slope of the ground surface; and, boundary conditions, such as a free face; to estimate the horizontal ground movement. The potentially liquefiable layers are isolated and discontinuous, and have corrected blow counts $[(N_1)_{60-CS}]$ greater than 15. Therefore, we judge the potential for lateral spreading at the site is low.

6.3 Cyclic Densification

Cyclic densification (also referred to as seismic densification and differential compaction) can occur during strong ground shaking in loose, clean granular deposits above the water table, resulting in ground surface settlement.

Up to 10 feet of undocumented fill is present at the site. The fill consists of loose to medium dense sand with variable silt and clay content. Using the Pradel (1998) method for evaluating seismically induced settlement in dry sand, we estimate that up to 1 inch of cyclic densification could occur within the fill during a major earthquake; however, because of the heterogeneity of the fill, the settlement could be erratic. The settlement could affect near-surface improvements that are supported within the fill in its current condition.

6.4 Fault Rupture

Historically, ground surface displacements closely follow the traces of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act and no known active or potentially active faults exist on the site. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure at the site is very low.

6.5 Tsunami Risk

Recent published maps (California Emergency Agency, 2009) indicate the site is not within the tsunami inundation zone; therefore, we conclude the risk of tsunami inundation for the site is low.

7.0 DISCUSSION AND CONCLUSIONS

Based on our review of the subsurface conditions at the site and the results of our engineering studies, we conclude that development of the site is feasible from a geotechnical standpoint. The site can be developed as proposed, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concerns for this site are:

- the presence of existing BART station below the site
- foundation support for Building B
- total and differential consolidation settlement in the Alameda formation as a result of static loads from Building B
- design and construction of Building B and the paseo to meet the requirement that the development pose no adverse impact to BART structures during all phases of the project.

These and other geotechnical issues are discussed in this and the following sections.

7.1 BART Considerations

The presence of the BART station beneath Block 1 will have a significant impact on the selection of an appropriate foundation system for Building B and on the design of the paseo. Design and construction of the project should address the BART Facilities Standards Design Criteria, Structural, Design and Construction Near Existing BART Structures and Geo-Structures R3.2 December 2020. All criteria should be considered in the design and construction processes (see Appendix G for the comprehensive list of criteria); select criteria are summarized below:

- New structures near existing structures shall be designed and constructed so as not to impose any temporary or permanent adverse effects on existing BART structures. Potential impacts to the existing BART structures by new design and construction shall be identified at the planning stage of design.
- Analyses of the existing BART structures are required when there are changes to the existing BART structures, or temporary or permanent changes to loading upon the existing BART structures due to the new design and construction.

- The minimum clearance between any parts of the adjacent BART structures to exterior face of substructures (including temporary elements) shall be 7 feet 6 inches (7.5 feet). In addition, the substructures shall be located such that the loads from the foundations of the new structures shall not impact the BART structures.
- The temporary BART Zone of Influence (ZOI) is defined as the area above or below a line from the critical point of the substructure at a slope of 1½ horizontal to 1 vertical.
- The geotechnical engineer for the proposed structure shall determine the permanent effects or influence on the existing BART's structure based upon the soil and groundwater conditions in the vicinity of the proposed structures and the existing BART's structures. Particular attention shall be paid to liquefiable soil, expansive soil, and lateral spreading. The slope of the permanent ZOI shall not be steeper than the slope of the temporary ZOI as defined above.
- Shoring is required for excavations in the temporary and permanent ZOI.
- Seismic and wind loads shall be accounted for in the shoring design for temporary and permanent shoring (see Geo-Structures 7.3 A for details).
- Shoring shall maintain at-rest soil conditions and be monitored for movement.
- Soil redistribution caused by temporary shoring or existing foundation system shall be analyzed.
- Shoring support shall extend at least 10 feet below the base of the excavation or into a competent soil or rock layer, whichever is deeper, unless the geotechnical engineer shows that vertical and horizontal support requirements can be developed at less than 10 feet below the excavation depth. The minimum depth of shoring below the excavation depth shall be 2 feet.
- Where groundwater control is proposed, changes in groundwater elevation shall be evaluated together with the consequences to the structures located in proximity to the dewatering.
- Dewatering shall be monitored for changes in groundwater level; recharge program will be required if existing groundwater level is expected to drop more than two feet.

- Piles (if used) shall be predrilled to a minimum of 10 feet below the line of influence. If driven piles are used, piles shall be driven in a sequence away from BART structures.
- BART structures shall be monitored for vibration during pile driving operations for all driven piles within 100 feet of the BART structures (if used).
- No piles shall be allowed between steel-lined BART tunnels.
- When pile foundations are used, steel-lined tunnels shall be monitored for movement and deformation.
- A vibration monitoring plan shall be prepared to document the potential for induced vibration and noise from construction equipment and procedures, with respect to their effect on adjacent structures, BART facilities and operations.
- Where basements are excavated, the average vertical loading can be increased to the extent that it is balanced by the weight of the removed material. The effects of soil rebound in such cases shall be fully analyzed for each construction stage.
- Minimum soil cover of 8 feet on underground structures shall be maintained wherever possible.

Our interpretations of the BART station location and the location where the temporary ZOI would intersect the exterior ground surface elevations are shown on Figure 2. These interpretations are based on as-built drawings provided by San Francisco BART District (1967), the existing surface topography provided by BKF Engineers (2022), and proposed development plans provided by Pyatok Architects (2022).

We conclude almost the entire Building B footprint and the paseo are within the BART ZOI. Therefore, the BART guidelines will have to be considered during the design and construction of the Building B and paseo development. BART engineers will review the final geotechnical report, the structural plans and calculations, and the temporary shoring plans and calculations (if any). Furthermore, BART may require that structure-soil-structure interaction analysis be performed using finite element or finite difference analysis methods to evaluate the effect of the development on BART facilities.

7.2 Foundations and Settlement

Factors influencing the selection of a safe, economical foundation system with adequate capacities for Building B are:

- the presence of the adjacent BART station and BART’s guidelines and requirements for development near their structures
- the presence of undocumented fill in the upper 5 to 10 feet
- the presence of deep, medium stiff to hard, moderately compressible clay to significant depth
- the weight and variation in weight of the proposed structure
- total and differential settlement of the building and nearby improvements.

Almost the entire footprint of Building B is within the BART zone of influence, as shown on Figure 2, and the building is planned to be at grade. Shallow foundations bearing within the BART ZOI would increase stresses on BART and will not be an acceptable foundation system. We conclude deep foundation systems consisting of piles or drilled shafts extending through and gaining capacity in the Merritt Sand and Alameda formation clay below the BART ZOI will be needed for Building B. Deep foundations are viable provided they are double cased within the ZOI to provide an air void to prevent vertical and lateral stresses from acting on BART and provided the estimated settlements beneath the BART facilities are acceptable. We anticipate double casing for Building B piles will range from about 3 to 45 feet long, depending on the location of the piles within the Building B footprint.

7.2.1 Pile Foundations

We considered several pile types for this project, including driven steel H-piles, cast-in-place drilled piers, and augered cast-in-place (ACIP) piles. Driven piles generate noise and vibrations, which would likely be unacceptable because of the site’s proximity to the BART structures. In addition, piles would need to extend through the dense Merritt Sand; predrilling would be needed. Drilled piers can be installed as deep as necessary with various diameters; they will require casing and/or drilling fluid to prevent caving, as the shaft will extend below the groundwater table. ACIP piles can be installed through the Merritt Sand and below groundwater to depths of about 115 feet below construction grade; some contractors can install longer ACIP piles. Additional advantages of ACIP piles are that ACIP piles generate low noise and vibration

during installation. Drilled piers and ACIP piles create spoils from drilling, which will need to be off-hauled. Based on discussions with the team, we understand ACIP piles are the preferred pile type.

Because their capacity depends heavily on the method of installation, ACIP piles should be designed and installed by a design-build specialty contractor familiar with these types of piles. ACIP piles are installed by drilling to the required depth with a continuous flight, hollow stem auger. When the auger reaches the required depth, cement grout or concrete is injected through the bottom port of the auger. Grout or concrete is injected continuously as the augers are slowly withdrawn. While the grout is still fluid, a steel reinforcing cage is inserted into the shaft. ACIP piles can range in diameter; 16-, 18- and 24-inch-diameter piles are typical in this region, and we understand 36-inch-diameter ACIP piles are feasible.

The portions of the ACIP piles within the BART zone of influence will need to be constructed with a permanent air void so that there is no vertical or lateral load transfer from the new building to the BART structures. Typically, the permanent void consists of an annular space between the side of the pile and an outer casing. The piles will need to be structurally designed to fully resist the lateral building loads; lateral resistance cannot be provided by soil against piles, pile caps, or grade beams within the BART zone of influence. A compressible material will need to be provided below the floor slab and around pile caps that is designed to prevent application of vertical and lateral pressures within the BART zone of influence.

A test program will be needed to confirm pile integrity and pile capacity. The test program will consist of axial load testing and integrity testing. Axial load testing will include top-down compression load tests; tension load tests are not required provided the piles for the compression tests are equipped with strain gauges so that skin friction mobilized below the double casing can be evaluated.

Integrity testing of ACIP piles can be performed by methods such as thermal integrity profiling (TIP) and crosshole sonic logging (CSL). TIP is performed by embedding thermal wires within the pile concrete that read the concrete temperature during curing. The temperature sensors are typically spaced every foot along the length of the wire. The wires are typically attached to a center bar or reinforcing cage. During curing of the concrete, the hydrating cement generates heat, increasing the temperature in the shaft. The temperature readings during curing can be correlated to evaluate pile shape and integrity, concrete quality, and location of reinforcing cage.

CSL testing is achieved by installation of at least four 2-inch-inside-diameter tubes. These tubes are usually attached to the reinforcing cage along the full length of the elements. After concrete has been poured, the tubes are filled with water. During testing, a transmitter emits an ultrasonic signal in one tube, and the signal is sensed sometime later by a receiver in another tube. Poor concrete or soil inclusions between the tubes will delay or disrupt the signal.

7.2.2 Settlement Evaluation

To evaluate the distribution of stresses in the ground resulting from construction of Building B and the anticipated settlement of the foundations, we performed soil consolidation settlement analysis using the software program Settle3 by Rocscience Inc., version 5.008, build date 24 November 2020. We modeled the soil stratigraphy, soil parameters, and groundwater based on the conditions encountered in the borings and CPTs. We evaluated preliminary pile spacing and lengths for 18- to 24-inch-diameter ACIP piles using column loads and a preliminary pile foundation plan provided by DCI Engineers. Ultimately, the design-build pile subcontractor will need to perform further analysis to determine pile spacing, diameter, and length.

Based on our initial analysis, we preliminarily conclude that, using the column loads and a preliminary pile layout provided by DCI, piles with 3- to 42.5-foot-long double casing and average lengths of 115 feet will settle about 1 to 2½ inches, including elastic compression and long-term consolidation settlement. Differential settlement beneath the building is anticipated to be about 1 inch in a horizontal distance of 30 feet. Considering the stress distribution below BART, we estimate settlement of less than 1 inch, with less than ½ inch differential settlement over a horizontal distance of 30 feet. The effect of this settlement on the BART structures will need to be evaluated by a structural engineer. If the settlement causes an adverse impact on BART, the piles may need to be lengthened to reduce settlement. Final estimates of foundation settlement will need to be determined after final design of the foundation system.

7.3 Paseo Improvements

We understand paseo improvements will consist of new flatwork, planters, and other surface improvements to be constructed within the easement over the BART station. The project also includes replacement of the existing waterproofing membrane on top of the station. To maintain the existing loading condition over the BART station, any new loads from paseo improvements will be offset using lightweight fill materials, such as geofoam, to replace existing overburden soil.

Construction of the Paseo improvements and replacement of the existing waterproofing membrane will require temporary excavation and removal of overburden soil. The BART Facilities Standards Design Criteria (Structural and Geo-Structural) require that the effects of hydrostatic uplift pressure be accounted for whenever groundwater is present.

As discussed in Section 4.1, as-built BART drawings indicate that the overburden soil and pavement is one to three feet thick. Prior to soil excavation and removal, groundwater levels within the on-site piezometers will need to be measured, and a buoyancy evaluation will need to be performed by DCI Engineers, with input from Langan, to check that the weight of the station structure is sufficient to resist uplift forces associated with groundwater after removal of soil overburden. Per the BART Facilities Standards Design Criteria (Structural and Geo-Structural), for the short term (temporary) construction condition, a minimum factor of safety of 1.05 against uplift shall be maintained for the entire length of the structure, and soil shear strength and friction should not be considered in the buoyancy evaluation. Depending on the results of the buoyancy evaluation, if acceptable to BART, the groundwater level may need to be temporarily lowered by dewatering to maintain an acceptable factor of safety against uplift or soil removal may need to be sequenced such that only a portion of the station is exposed at one time.

7.4 Groundwater

Based on the data obtained during our field investigation and from piezometers at the site, we judge groundwater is present about 16½ to 19½ feet bgs, between approximate Elevations 5.1 and 5.7 feet. The groundwater level measured at 6½ feet bgs (Elevation 17.1 feet) during drilling of boring B-4 does not appear to be a stabilized reading because it is not consistent with the CPT or piezometer data. The historic high groundwater level at the site is between 10 and 20 feet bgs. We conclude a design high groundwater level of about 10 feet bgs, about Elevation 12 feet, should be used for design of the project.

The design groundwater level does not account for the effect, if any, of sea level rise. According to a City of Oakland report titled “Oakland Preliminary Sea Level Rise Road Map, Fall 2017,” the site is outside of low-lying areas mapped as being susceptible to sea level rise, defined as the Mean Higher High Water (MHHW) level plus 72 inches.

7.5 Excavation, Temporary Cut Slopes, and Dewatering

We anticipate that temporary excavations will be needed in localized areas to construct pile caps, the elevator pit, the cistern, and underground utilities. The soil to be excavated consists

predominantly of sand, which can be excavated using conventional earth-moving equipment such as loaders and backhoes; however, sand can be susceptible to caving. Excavations deeper than five feet that will be entered by workers will need to be shored or sloped for safety in accordance with the Occupational Safety and Health Administration (OSHA) standards (29 CFR Part 1926). Because the excavations will be localized, we anticipate cut slopes will be feasible. Recommendations for temporary cut slopes and shoring are provided in Section 8.3.

We anticipate that groundwater will not be encountered within the excavations. However, if localized water is present during excavation, dewatering will be needed. Where excavations encounter groundwater, wet, disturbed subgrade soil will likely require stabilization prior to placement of improvements. Groundwater encountered in excavations will need to be pumped out prior to constructing improvements.

7.6 Construction Considerations

Existing site improvements, including existing foundation, pavements, and structural elements, will need to be demolished and completely removed prior to construction. During demolition and site preparation, debris and concrete rubble encountered in the fill will need to be removed. Ho-rams, jackhammers and other similar equipment may be needed to remove larger obstacles, if encountered. Overexcavations made to remove foundations and structures will need to be properly backfilled with engineered fill.

Construction equipment used for the project will need to comply with BART's criteria regarding surcharging the existing station.

8.0 RECOMMENDATIONS

Our recommendations regarding site preparation and grading, foundation design, below-grade walls, floor slabs, seismic design, and other geotechnical aspects of this project are presented in the remaining sections of this report.

8.1 Earthwork

The site should be prepared and fill and backfill should be compacted in accordance with the recommendations presented in the following sections.

8.1.1 Site Preparation

Grading operations should commence after removal of existing pavement, utilities, landscaping, and other obstructions within the development area. Obstructions will need to be completely removed before piles can be installed. Following demolition, all areas to receive improvements should be stripped of vegetation and organic topsoil. The stripped organic soil can be stockpiled for later use in landscaped areas, if approved by the architect; organic topsoil should not be used as compacted fill.

We anticipate excavations for this project can be made using conventional earth-moving equipment except where obstructions (if any) are encountered within the fill. If concrete rubble is encountered within the fill, it may require hoe rams or jackhammers to remove.

Underground utilities should be removed to the service connections and properly capped or plugged with concrete. Where existing utility lines will not interfere with the planned construction, they may be abandoned in place, provided the lines are filled with lean concrete or cement grout to the limits of the project. Voids resulting from demolition activities should be properly backfilled with lean concrete or engineered fill, as described below.

8.1.2 Subgrade Preparation

The subgrade exposed at portions of the site that will receive site improvements should be scarified to a depth of at least twelve inches, moisture-conditioned to near optimum moisture content, and compacted to at least 90 percent relative compaction.⁸ If the soil subgrade is disturbed during installation of utilities or pile caps, the subgrade should be re-rolled prior to construction of the overlying improvements.

Subgrade preparation and placement of fill within the public right-of-way should conform to City of Oakland requirements. The upper six inches of soil subgrade in pavement areas should be compacted to at least 95 percent relative compaction.

8.1.3 Fill Placement

Fill placed as backfill behind below-grade walls and in utility trenches should consist of onsite native soil or imported soil that is non-corrosive, free of organic matter or other deleterious material, contains no rocks or lumps larger than four inches in greatest dimension, has a liquid limit of less than 25 and a plasticity index lower than 12, and is approved by the Geotechnical

⁸ Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557 laboratory compaction procedure.

Engineer. On-site native soil may be suitable for reuse as backfill provided it is non-corrosive and meets the requirements given herein. Appropriate analytical testing should be performed to determine its suitability for re-use.

Fill should be placed in horizontal lifts not exceeding eight inches in loose thickness, moisture-conditioned to near the optimum moisture content, and compacted to at least 90 percent relative compaction. Fill thicker than five feet or clean sand or gravel (soil with less than 10 percent fines by weight) used as fill should be compacted to at least 95 percent relative compaction. All aggregate base materials should also be compacted to at least 95 percent relative compaction. A flowable cement grout or lean concrete may be used to backfill areas not accessible to compaction equipment.

Langan should approve all sources of fill at least three days before use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed import material. A bulk sample of approved fill should be provided to the geotechnical engineer at least three working days before use at the site in order to obtain a compaction curve.

8.2 Utilities

Excavations for utility trenches can likely be made with a backhoe. Utility trenches should be excavated a minimum of four inches below the bottom of pipes or conduits and have clearances of at least four inches on both sides. All trenches should conform to CAL-OSHA requirements. Backfill for utility trenches and other excavations is also considered fill, and it should be compacted according to the recommendations previously presented. Special care should be taken when backfilling utility trenches within the building footprint. Poor compaction may result in excessive settlements and damage to the building.

To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of sand or fine gravel. After the pipes and conduits are tested, inspected (if required) and approved, they should be covered to a depth of at least six inches with sand or fine gravel, which should be mechanically tamped. Backfill should meet the fill and compaction requirements as presented in Section 8.1 above. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements resulting in damage to the pavement section.

Thrust blocks, if needed, should be designed using an allowable passive resistance in soil of 260 pounds per cubic foot (pcf), which includes a factor of safety of about 1.5. BART may not allow the use of thrust blocks within the BART station zone of influence.

8.3 Temporary and Permanent Slopes

We anticipate that the majority of the site grading for the project will consist of performing localized excavations for the proposed cistern, pile caps, the elevator pit, and utility trenches. Where space permits, excavations may be temporarily sloped. Unsupported temporary cut slopes in fill or native soils should be no steeper than 1.5:1 (horizontal to vertical). The contractor should be familiar with applicable local, state, and federal regulations for unshored excavations, including the current OSHA Excavation and Trench Safety Standards. The contractor should be solely responsible for the maintaining a safe working environment inside and around all excavations.

If lack of space precludes the use of temporary cut slopes, the soil and improvements surrounding the proposed excavation should be supported using temporary shoring. Temporary shoring within the BART zone of influence should be designed in accordance with the BART Facilities Standards Design Criteria, Structural, Design and Construction Near Existing BART Structures and Geo-Structures R3.2 December 2020 (Appendix G). Shoring should also be designed for surcharging due to vehicular traffic and construction equipment, as applicable. We can provide recommendations for design of temporary shoring if needed.

Permanent fill and cut slopes, if planned, should not be steeper than 2:1 (horizontal to vertical).

8.4 Foundations

To support building loads, reduce settlement to the desired performance, and prevent any surcharge on BART, we recommend Building B be supported on piles that are double cased to provide an air void through the ZOI. Based on preliminary discussions with the team, we understand 18- and/or 24-inch-diameter ACIP piles that are designed to support the building loads and control settlement are planned for Building B. Because Building B is almost entirely within the BART zone of influence, the upper portion of the piles should be double cased with a permanent void between the casings that extends below the zone of influence. The void between the interior and outer casings must be wide enough to accommodate the calculated story drift at the ground floor level. The double casing should extend sufficiently deep such that no vertical or lateral loads are applied to the BART structures. Because of the use of double casing and

compressible material, no lateral resistance will be provided by the soil within the zone of influence on the foundation system, including the piles, pile caps, and grade beams. In addition, the building floor should be designed as a structurally support slab to span between pile caps.

ACIP piles are installed by design-build or specialty contractors, and we cannot provide specific recommendations for their design. This pile type is designed and installed by several experienced contractors in the Bay Area. The design capacities, pile lengths, double casing lengths, and elastic deflection of ACIP piles should be determined by the design-build contractor; the piles should be designed by a professional engineer. The foundation contractor should provide the results of their analyses to confirm that the double casing is sufficiently long such that no vertical or lateral loads are applied to the BART structures and to show the predicted settlement. We should review the pile design and test program submittals prior to installation.

The ACIP piles should gain capacity in friction in the Merritt Sand and Alameda formation clay below the double-cased section. Pile lengths should be selected to support the vertical and lateral building loads and to control long-term total and differential static consolidation settlement of the Alameda formation clay, as specified by the design team. For preliminary design, we recommend an ultimate friction capacity for dead plus live loads of 2,000 pounds per square foot (psf) be used. We note that pile lengths may need to be increased to reduce settlement to prevent an adverse effect on the BART structure.

Because the soil around the piles will not provide lateral resistance within the BART zone of influence, we are not providing lateral pile deflection or bending moment profiles. For lateral evaluation of the piles, we recommend the soil parameters in Table 3 be used below the double cased section of the pile.

TABLE 3
Recommended LPILE Parameters
Below Double-Cased Portion of Pile

Depth (feet bgs) ¹		Soil Type	Soil Model	Angle of Friction (deg.)	Cohesion (psf)	Effective Unit Weight (pcf)	Strain at 50% Max Stress (in/in) or Soil Modulus, k (pci)
Top of Layer	Bottom of Layer						
0	10	Fill	Sand (Reese, et al.)	31	0	130	default
10	19	Native Sand	Sand (Reese, et al.)	34	0	67.6 ²	default
19	36	Native Clay	Stiff Clay without Free Water	0	2,000 – 2,800	62.6	default
36	42	Native Sand	Sand (Reese, et al.)	34	0	62.6	default
42	75	Native Clay	Stiff Clay without Free Water	0	2,800 – 4,750	55.6	default
75	141	Native Clay	Stiff Clay without Free Water	0	3,000 – 4,310	55.6	default
141	149	Native Clay	Stiff Clay without Free Water	0	4,310	55.6	default

Note:

1. The soil parameters in Table 3 may be used below the double-cased portion of the pile. Design groundwater level is 10 feet bgs.

We collaborated with the project structural engineer to preliminarily evaluate the performance of the pile system under static loading conditions. On a preliminary basis (for initial estimating only – not for final design), we conclude piles will be an average of 115 feet long to achieve the settlements estimated in Section 7.2. The design-build pile subcontractor should perform analyses to design the piles and provide elastic settlement estimates for the piles. The piles should be designed by a professional engineer. We should update our long-term settlement estimates after the pile design is finalized.

Piles should be spaced at least three pile diameters center-to-center to prevent vertical capacity reductions due to pile group interaction effects; the outer auger-tip diameter should be used

when determining the pile spacing for the piles. Piles within six diameters, center to center, should not be installed within the same 12-hour period to help prevent communication between piles. The piles should be designed to accommodate the corrosive conditions presented in Appendix E.

We recommend that indicator and test piles be installed to: 1) evaluate installation methodology; 2) confirm production pile lengths; and 3) confirm the design capacities of the piles. Static compression load testing should be performed on at least two piles to evaluate load versus deflection. Tension load testing is not required. At least one test pile should be equipped with double casing. The test pile locations should be selected by the geotechnical engineer and approved by the structural engineer. Test piles can be used as production piles, provided they are not damaged during load testing. If an uncased test pile is planned, it should not be installed in a production pile location.

The reaction piles should be installed before the test piles, as indicator piles, so that the installation parameters can be evaluated. Indicator piles should be installed with the same equipment and using the same procedure that will be used for test piles and production piles, including but not limited to predrilling depth and predrill auger diameter.

The static compression load tests should be performed in accordance with the current version of ASTM D1143. Equipment used for the static test (load frame, jacks, and reaction piles) should be capable of applying at least 200 percent of the allowable dead plus live design load or 150 percent of the allowable total loads (including wind and/or seismic), whichever is greater. The static load tests should be interpreted using accepted criteria per the 2022 CBC to determine the ultimate capacities of the piles. Redundant pairs of strain gauges should be installed in the test piles spaced at about 20-foot intervals.

We recommend integrity testing be performed on all of the test and reaction piles, and on at least 5 percent of the production piles. Acceptable integrity testing techniques include TIP and CSL, as discussed in Section 7.2.1. TIP should be performed in accordance with ASTM D7949, *Standard Test Methods for Thermal Integrity Profiling of Concrete Deep Foundations*. CSL integrity testing should be performed in accordance with ASTM D6760, *Standard Test Method for Integrity Testing of Concrete Deep Foundations by Ultrasonic Crosshole Testing*.

As the geotechnical engineer of record, we should observe the installation and testing of the piles to check that the site conditions are as anticipated and the pile installation and testing are

performed in accordance with the project documents. Automated monitoring should be performed during installation of all piles; the contractor should provide a tablet or alternative option for Langan personnel to safely observe the installation parameters in real time. An automated monitoring report for each pile should be sent to Langan for review within 24 hours of pile installation. Following the receipt of pile load test results, we will require about one to two weeks to review and evaluate the load test results and to propose recommendations for production pile installation.

A pile design submittal, load test work plan, and installation work plan should be provided to us for review and approval at least five working days prior to the indicator pile and pile load test programs. The submittal and work plans should include calculations and shop drawings and should describe the proposed pile installation equipment and methodology, including, but not limited to, the pile installation equipment, monitoring equipment, pile diameter, proposed embedment layer and embedment depth, pile length, pile capacity, and proposed pile load test set-up and procedure, and a sample automated monitoring report. The automated monitoring report should include drilling depth, drilling/advancement rate, retraction rate, torque, rotations per minute (rpm), crowd or down pressure, pumping rate, grout pressure, total grout volume, and grout factor. The work plan should include a calculation justifying the number of strokes that the contractor plans to pump at the bottom of each pile to develop at least five feet of pressure head above the auger tip. The work plan should also include a site plan showing the locations of indicator, test, and reaction piles relative to permanent foundation elements and a drawing showing the layout of the load test set up. The structural engineer should review mill certificates for the steel and any welding procedures.

The contractor should be prepared to confirm the pile depth using an alternative method in addition to the automated system. A functional pressure gauge should be installed to monitor grout pressure head. A minimum pressure head of five feet should be developed at the beginning of grouting by pumping extra strokes at the pile tip and maintained at all times during grouting of the pile. If at any point this minimum pressure head is lost or if the grouting of the pile is stopped, the contractor should stop retracting the auger or mandrel, readvance the auger or mandrel five feet below the top of grout, and resume grouting. Grout return should occur at the ground surface when the auger is no less than five feet below grade. If any communication, bleeding, bubbling, or drop or rise in grout level is observed during or after installation of a pile, the pile should be redrilled or replaced.

The grout pump should be calibrated prior to the start of the project, immediately after any pump maintenance is performed, at any indication that the pump is operating differently from the last calibration, and regularly throughout production pile installation; at a minimum, the grout pump should be calibrated weekly. The grout factor (i.e., ratio of used volume of grout/concrete to theoretical volume for the specified pile size) $\pm 7.5\%$ that is calculated on the test pile(s) should be used for the installation of the production piles. However, it should not be less than 1.05. The grout factor should be achieved for the total pile length, as well as for every 5-foot segment. During center bar placement, the bar should be placed without difficulty or resistance. If excessive effort is required to install the center bar, the bar should be removed and the pile should be redrilled and regouted.

8.5 Below-Grade Wall Design

Below-grade walls, including elevator pit walls, should be designed to resist lateral pressures imposed by the adjacent soil and any surcharge loads. Because the site is in a seismically active area, walls greater than six feet tall should be checked for the seismic condition. The increment during seismic loading should be added to active earth pressures. We used the procedures outlined in (Sitar et al. 2012) to compute the seismic active pressure increment. Table 4 presents the active, at-rest, and total pressure (active plus seismic pressure increment) for walls with level backfill. The more critical condition of either at-rest pressure for static conditions or active pressure plus a seismic pressure increment for seismic conditions should be checked. Total pressures as equivalent fluid weights (triangular distribution) are presented for a peak ground acceleration of 0.54g corresponding to the Design Earthquake (DE) level of shaking.

TABLE 4
Equivalent Fluid Weights for Below-Grade Wall Design

Drainage Condition	Static Conditions		Seismic Conditions*
	Active Equivalent Fluid Weight (pcf)	At-rest Equivalent Fluid Weight (pcf)	Total Equivalent Fluid Weight for DE (Active plus Seismic Increment)
			(PGA=0.54g) (pcf)
Drained and Above Design Groundwater**	40	61	40 + 34 = 74
Undrained and/or Below Design Groundwater	82	93	82 + 17 = 99

* The more critical condition of either at-rest pressure for static conditions or active pressure plus a seismic pressure increment for seismic conditions should be checked.

** Design groundwater level is at Elevation 12 feet, per Section 7.4.

Where vehicular traffic will pass within 10 feet of below-grade walls, temporary traffic loads should be considered in the design of the walls. Traffic loads may be modeled by a uniform pressure of 100 psf applied in the upper 10 feet of the walls.

If the walls will be designed for drained conditions, they should be properly backdrained to prevent the buildup of hydrostatic pressure. One acceptable method for backdraining the walls is to place a prefabricated drainage panel against the backside of the walls. Groundwater from the drainage panel can be allowed to flow into the soil; a collector pipe is not necessary. We should check the manufacturer’s specifications for the proposed drainage panel materials to verify they are appropriate for their intended use.

To protect against moisture migration, below-grade walls should be waterproofed, and water stops placed at all construction joints. The waterproofing should be placed directly against the backside of the walls unless the manufacturer of the waterproofing directs otherwise.

8.6 Floor Slab

The floor should consist of a structurally supported slab designed to span between pile caps and grade beams. The floor slab and pile caps should be underlain by a compressible foam to reduce the potential for load transfer within the BART zone of influence.

Moisture is likely to condense on the underside of the at-grade floor slabs, even though they will be above the design groundwater level. Consequently, a moisture barrier should be considered if movement of water vapor through the slabs would be detrimental to their intended use. A typical moisture barrier consists of a capillary moisture break and a water vapor retarder.

The capillary moisture break should consist of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class C vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of ASTM E1643. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The particle size of the gravel/crushed rock should meet the gradation requirements presented in Table 5.

TABLE 5
Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
<i>Gravel or Crushed Rock</i>	
1 inch	90 – 100
3/4 inch	30 – 100
1/2 inch	5 – 25
3/8 inch	0 – 6

Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the floor slab should have a low w/c ratio - less than 0.45. The slab should be properly cured. Before the floor covering is placed, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

8.7 Pavement Design

8.7.1 Asphalt Pavement

The State of California flexible pavement design method was used to develop the recommended asphalt concrete pavement sections. We expect the near-surface soil will generally consist of sandy fill, as discussed in Section 4.2. Resistance value (R-value) testing was not part of our

original scope of services; however, based on the results of R-value tests on similar soil from previous projects, we anticipate that the fill likely has an R-value ranging from about 30 to 50. We selected an R-value of 30 for our design. During construction, we should sample the on-site soil to confirm its R-value and update the pavement section recommendations, if needed.

The project civil engineer, BKF Engineers, informed us that the proposed pavement sections should be designed for traffic indices (TIs) of 5.0, 6.0, and 7.0, which correspond to residential, commercial, and minor arterial street classifications, respectively. Table 6 presents our preliminary recommendations for asphalt pavement sections assuming a subgrade R-value of 30 and TIs varying from 5.0 to 7.0.

TABLE 6
Recommended Asphalt Pavement Sections
for Subgrade R-value of 30

TI	Asphalt Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
5.0	3.0	6.0
6.0	3.5	7.5
7.0	4.0	9.5

Pavement components (e.g. asphalt concrete and aggregate base) should conform to the current Caltrans Standard Specifications. The aggregate base should be moisture conditioned, placed in horizontal lifts not exceeding eight inches in loose thickness, and compacted to a relative compaction of at least 95 percent. The finished compacted aggregate base should be firm and unyielding and be proof rolled prior to placement of the new AC. If unstable areas are identified during proof rolling, or if the contractor is unable to achieve the recommended degree of compaction, the aggregate base in these areas may need to be removed in order to repair the underlying sub-base or soil subgrade.

The upper six inches of the soil subgrade in pavement areas should be moisture-conditioned to above optimum moisture content and compacted to at least 95 percent relative compaction.

8.7.2 Concrete Pavement

Concrete pavement design is based on a maximum single-axle load of 18,000 pounds and a maximum tandem axle of 32,000 pounds (corresponds to a garbage truck). The recommended rigid pavement section for these axle loads is seven inches of Portland cement concrete over six inches of Caltrans Class 2 aggregate base. If only passenger cars or light trucks will use the pavement, such as in parking areas, the recommended minimum pavement section is five inches of Portland cement concrete over six inches of Class 2 aggregate base. Class 2 aggregate base should conform to the current State of California Department of Transportation (Caltrans) Standard Specifications.

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at 15-foot spacing. Where the outer edge of a concrete pavement meets asphalt pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. Recommendations for subgrade preparation and aggregate base compaction for concrete pavement are the same as those described for asphalt pavement.

8.7.3 Interlocking Pavement

We understand that impervious, interlocking pavers are being considered for use in some areas for parking and pedestrian access. As noted in Section 8.7.1, R-value testing has not been performed on the on-site fill, and we have assumed an R-value of 30 for design. During construction, we should test the fill on site to confirm its R-value.

Pedestrian paver sections should consist of 60- to 80-millimeter pavers set on one to two inches of bedding sand over at least four inches of aggregate base. Vehicular paver sections should consist of 80-millimeter (3.15 inch) pavers. We recommend using vehicular pavers that consist of interlocking shapes that fully lock on all sides and have an aspect ratio of 3:1 or less. The vehicular pavers should be placed on a 2-inch-thick sand leveling course (i.e. bedding sand) underlain by Class 2 aggregate base. Our preliminary recommendations for vehicular interlocking paver sections are presented in Table 7.

TABLE 7
Preliminary Recommended Vehicular Interlocking Paver Sections
for Subgrade R-value of 30

Design TI	Interlocking Paver (inches)	Bedding Sand (inches)	Class 2 Aggregate Base (R=78) (inches)
5.0	3.15	2.0	6.0
6.0	3.15	2.0	8.5
7.0	3.15	2.0	11.5

The subgrade and aggregate base beneath the pedestrian and vehicular pavers should be compacted in accordance with the recommendations previously provided for asphalt concrete pavements. The bedding sand should be moisture-conditioned and mechanically tamped.

Concrete pavers should conform to the product requirements of ASTM C936, Standard Specification for Solid Concrete Interlocking Paving Units (ASTM 2008b). Installation of the unit pavers, including use of a vibratory plate to seat the pavers, should be performed in accordance with the manufacturer’s recommendations. Vehicular pavements should be designed with edge restraints at the perimeter (typically concrete curbs).

8.8 Concrete Flatwork

Exterior concrete flatwork should be supported on compacted subgrade and at least four inches of Class 2 aggregate base. The subgrade and aggregate base should be compacted to at least 95 percent relative compaction and provide a smooth, non-yielding surface for support of the concrete flatwork. Recommendations for subgrade preparation beneath concrete flatwork and fill placement are provided in Sections 8.1.2 and 8.1.3, respectively.

Within the City of Oakland right of way, sidewalks and streets should conform to City standards.

8.9 Drainage

Drainage control design should be in accordance with the BART Facilities Standards Design Criteria for drainage (BART 2022). In addition, drainage control design should include provisions for positive surface gradients so that surface runoff is not permitted to pond, particularly above

slopes or adjacent to building foundations, roadways, pavements, or slabs. Surface runoff should be directed away from slopes and foundations, collected, and directed to a storm drain or paved roadway. Discharge from the roof gutter and downspout systems should be included in the collection system and not allowed to infiltrate the subsurface near the structure. To reduce the potential for water ponding adjacent to the structure, we recommend the ground surface within a horizontal distance of five feet from the building slope down away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas.

8.10 Seismic Design

The site is generally underlain by dense to very dense sands and medium stiff to hard clays; our evaluation of measurements from the downhole geophysical logging in boring B-3 indicate the average shear wave velocity in the upper 30 meters (V_{s30}) at the site is about 960 feet per second. Therefore, for seismic design in accordance with the provisions of 2022 California Building Code (CBC), we judge the site is Site Class D. A site-specific ground motion analysis is required for structures on Site Class D sites with S_1 greater than or equal to 0.2, in accordance with the 2022 CBC and by reference ASCE 7-16, unless the criteria listed in the exceptions in Section 11.4.8 of ASCE 7-16 as modified by Supplement 3 of ASCE 7-16 are met. We understand from the project structural engineer, DCI Engineers, that these criteria will be met for the project. Therefore, for seismic design in accordance with the provisions of 2022 CBC/ASCE 7-16 and Supplement 3, we recommend the following:

- Risk-Targeted Maximum Considered Earthquake (MCE_R) ground motion parameter spectral response acceleration (5% critical damping) for 0.2 seconds (S_s) and 1 second (S_1) of 1.739g and 0.660g, respectively
- Site Class D
- Site Coefficients F_a and F_v of 1.0 and 1.7, respectively
- MCE_R and Design Earthquake (DE) spectral response acceleration parameters at short periods, S_{MS} and S_{DS} , of 1.739g and 1.159g, respectively
- MCE_R and DE spectral response acceleration parameters at one-second period, S_{M1} and S_{D1} , of 1.683g and 1.122g, respectively (these values have been increased by 50% in accordance with ASCE 7-16 Supplement 3).

8.11 Construction Monitoring

Prior to construction, survey points should be established and monitored to evaluate the effects of the construction on the adjacent BART structures. The locations of the survey points should

be selected with our input, as geotechnical engineer of record, so the surveying can provide the most value to the project. The survey points should be used to monitor the vertical and horizontal movements of the existing improvements and should be read at least weekly throughout the duration of construction. Results of survey monitoring should be submitted to us and the construction team after each weekly reading for review in a format that is easy to interpret. In addition, a site conditions survey should be performed prior to performing any work at the site.

8.12 Corrosion Potential

The design of elements in contact with the ground, such as buried metal utilities and concrete, should be designed to account for the corrosion potential of the soil, as presented in Appendix E. A corrosion expert should be consulted during the design phase for the most economical and effective corrosion protection, if necessary.

9.0 FUTURE GEOTECHNICAL SERVICES

During final design we should be retained to consult with the design team as geotechnical questions arise. Technical specifications and design drawings should incorporate Langan's recommendations. When authorized, Langan will assist the design team in preparing specification sections related to geotechnical issues such as earthwork, foundations, and excavation support. Langan should also, when authorized, review the project plans, as well as Contractor submittals relating to materials and construction procedures for geotechnical work, to check that the designs incorporate the intent of our recommendations.

Langan has investigated and interpreted the site subsurface conditions and developed the foundation design recommendations contained herein and is therefore best suited to perform quality assurance observation and testing of geotechnical-related work during construction. The work requiring quality assurance confirmation and/or special inspections per the Building Code includes, but is not limited to, earthwork, backfill, and installation of foundations. Our engineer should observe pile installation and testing. We should also observe fill placement and perform field density tests to check that adequate fill compaction has been achieved.

Recognizing that construction observation is the final stage of geotechnical design, quality assurance observation during construction by Langan is necessary to confirm the design assumptions and design elements, to maintain our continuity of responsibility on this project, and allow us to make changes to our recommendations, as necessary. The foundation system and general geotechnical construction methods recommended herein are predicated upon Langan

reviewing the final design and providing construction observation services for the owner. Should Langan not be retained for these services, we cannot assume the role of geotechnical engineer of record, and the entity providing the final design and construction observation services must serve as the engineer of record.

10.0 OWNER AND CONTRACTOR RESPONSIBILITIES

The Contractor is responsible for construction quality control, which includes satisfactorily constructing the foundation system and any associated temporary works to achieve the design intent while not adversely impacting or causing loss of support to neighboring properties, structures, utilities, roadways, etc. Construction activities that can alter the existing ground conditions such as excavation, fill placement, foundation construction, etc. can also induce stresses, vibrations, and movements in nearby structures and utilities, and disturb occupants. Contractors are solely responsible to ensure that their activities will not adversely affect the structures and utilities. Contractors must also take all necessary measures to protect the existing structures, utilities, etc. during construction.

11.0 LIMITATIONS

The conclusions and recommendations provided in this report result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings as well as architectural, structural, and civil information provided by the design team. Actual subsurface conditions could vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others. Any proposed changes in structures or their locations should be brought to Langan's attention as soon as possible so that we can determine whether such changes affect our recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation, as they may affect our recommendations.

This report has been prepared to assist the Owner, architects, structural engineer, and civil engineer in the design process and is only applicable to the design of the specific project identified. The information in this report cannot be utilized or depended on by engineers or contractors who are involved in evaluations or designs of facilities on adjacent properties which are beyond the limits of that which is the specific subject of this report.

5

I Not felt by people, except under especially favorable circumstances. However, dizziness or nausea may be experienced.

Sometimes birds and animals are uneasy or disturbed. Trees, structures, liquids, bodies of water may sway gently, and doors may swing very slowly.

II Felt indoors by a few people, especially on upper floors of multi-story buildings, and by sensitive or nervous persons.

As in Grade I, birds and animals are disturbed, and trees, structures, liquids and bodies of water may sway. Hanging objects swing, especially if they are delicately suspended.

III Felt indoors by several people, usually as a rapid vibration that may not be recognized as an earthquake at first. Vibration is similar to that of a light, or lightly loaded trucks, or heavy trucks some distance away. Duration may be estimated in some cases.

Movements may be appreciable on upper levels of tall structures. Standing motor cars may rock slightly.

IV Felt indoors by many, outdoors by a few. Awakens a few individuals, particularly light sleepers, but frightens no one except those apprehensive from previous experience. Vibration like that due to passing of heavy, or heavily loaded trucks. Sensation like a heavy body striking building, or the falling of heavy objects inside.

Dishes, windows and doors rattle; glassware and crockery clink and clash. Walls and house frames creak, especially if intensity is in the upper range of this grade. Hanging objects often swing. Liquids in open vessels are disturbed slightly. Stationary automobiles rock noticeably.

V Felt indoors by practically everyone, outdoors by most people. Direction can often be estimated by those outdoors. Awakens many, or most sleepers. Frightens a few people, with slight excitement; some persons run outdoors.

Buildings tremble throughout. Dishes and glassware break to some extent. Windows crack in some cases, but not generally. Vases and small or unstable objects overturn in many instances, and a few fall. Hanging objects and doors swing generally or considerably. Pictures knock against walls, or swing out of place. Doors and shutters open or close abruptly. Pendulum clocks stop, or run fast or slow. Small objects move, and furnishings may shift to a slight extent. Small amounts of liquids spill from well-filled open containers. Trees and bushes shake slightly.

VI Felt by everyone, indoors and outdoors. Awakens all sleepers. Frightens many people; general excitement, and some persons run outdoors.

Persons move unsteadily. Trees and bushes shake slightly to moderately. Liquids are set in strong motion. Small bells in churches and schools ring. Poorly built buildings may be damaged. Plaster falls in small amounts. Other plaster cracks somewhat. Many dishes and glasses, and a few windows break. Knickknacks, books and pictures fall. Furniture overturns in many instances. Heavy furnishings move.

VII Frightens everyone. General alarm, and everyone runs outdoors.

People find it difficult to stand. Persons driving cars notice shaking. Trees and bushes shake moderately to strongly. Waves form on ponds, lakes and streams. Water is muddied. Gravel or sand stream banks cave in. Large church bells ring. Suspended objects quiver. Damage is negligible in buildings of good design and construction; slight to moderate in well-built ordinary buildings; considerable in poorly built or badly designed buildings, adobe houses, old walls (especially where laid up without mortar), spires, etc. Plaster and some stucco fall. Many windows and some furniture break. Loosened brickwork and tiles shake down. Weak chimneys break at the roofline. Cornices fall from towers and high buildings. Bricks and stones are dislodged. Heavy furniture overturns. Concrete irrigation ditches are considerably damaged.

VIII General fright, and alarm approaches panic.

Persons driving cars are disturbed. Trees shake strongly, and branches and trunks break off (especially palm trees). Sand and mud erupts in small amounts. Flow of springs and wells is temporarily and sometimes permanently changed. Dry wells renew flow. Temperatures of spring and well waters varies. Damage slight in brick structures built especially to withstand earthquakes; considerable in ordinary substantial buildings, with some partial collapse; heavy in some wooden houses, with some tumbling down. Panel walls break away in frame structures. Decayed pilings break off. Walls fall. Solid stone walls crack and break seriously. Wet grounds and steep slopes crack to some extent. Chimneys, columns, monuments and factory stacks and towers twist and fall. Very heavy furniture moves conspicuously or overturns.

IX Panic is general.

Ground cracks conspicuously. Damage is considerable in masonry structures built especially to withstand earthquakes; great in other masonry buildings - some collapse in large part. Some wood frame houses built especially to withstand earthquakes are thrown out of plumb, others are shifted wholly off foundations. Reservoirs are seriously damaged and underground pipes sometimes break.

X Panic is general.

Ground, especially when loose and wet, cracks up to widths of several inches; fissures up to a yard in width run parallel to canal and stream banks. Landsliding is considerable from river banks and steep coasts. Sand and mud shifts horizontally on beaches and flat land. Water level changes in wells. Water is thrown on banks of canals, lakes, rivers, etc. Dams, dikes, embankments are seriously damaged. Well-built wooden structures and bridges are severely damaged, and some collapse. Dangerous cracks develop in excellent brick walls. Most masonry and frame structures, and their foundations are destroyed. Railroad rails bend slightly. Pipe lines buried in earth tear apart or are crushed endwise. Open cracks and broad wavy folds open in cement pavements and asphalt road surfaces.

XI Panic is general.

Disturbances in ground are many and widespread, varying with the ground material. Broad fissures, earth slumps, and land slips develop in soft, wet ground. Water charged with sand and mud is ejected in large amounts. Sea waves of significant magnitude may develop. Damage is severe to wood frame structures, especially near shock centers, great to dams, dikes and embankments, even at long distances. Few if any masonry structures remain standing. Supporting piers or pillars of large, well-built bridges are wrecked. Wooden bridges that "give" are less affected. Railroad rails bend greatly and some thrust endwise. Pipe lines buried in earth are put completely out of service.

XII Panic is general.

Damage is total, and practically all works of construction are damaged greatly or destroyed. Disturbances in the ground are great and varied, and numerous shearing cracks develop. Landslides, rock falls, and slumps in river banks are numerous and extensive. Large rock masses are wrenched loose and torn off. Fault slips develop in firm rock, and horizontal and vertical offset displacements are notable. Water channels, both surface and underground, are disturbed and modified greatly. Lakes are dammed, new waterfalls are produced, rivers are deflected, etc. Surface waves are seen on ground surfaces. Lines of sight and level are distorted. Objects are thrown upward into the air.

TEST GEOTECH LOG 750650005_LAKE MERRITT BART BLOCK 1.GPJ TEMPLATE_CA-MODIFIED.GDT 12/1/23

Boring terminated at a depth of 151.5 feet below ground surface (bgs).
Boring backfilled with cement grout.
Groundwater level obscured by drilling method.
PP = Pocket penetrometer
TV = Torvane

¹ S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.7 and 1.2, respectively, to account for sampler type and hammer energy.
² Elevations based on the topographic survey by BKF Engineers, titled "Lake Merritt BART Building B, Oakland, CA 94607," Sheet C2.1, dated 12/22/22. Elevations reference the City of Oakland Vertical Datum (COVD).

Boring location: See Site Plan, Figure 2

Logged by: PSM
Drilled By: Pitcher Services, LLC

Date started: 1/3/22 Date finished: 1/6/22

Drilling method: Rotary Wash

Hammer weight/drop: 140 lbs./30 inches Hammer type: Automatic

Samplers: Sprague & Henwood (S&H), Standard Penetration Test (SPT), Pitcher Barrel (PB)

TEST GEOTECH LOG 750650005_LAKE MERRITT BART BLOCK 1.GPJ TEMPLATE_CA-MODIFIED.GDT 12/1/23

Boring terminated at a depth of 151.5 feet below ground surface (bgs).
Boring backfilled with cement grout.
Groundwater encountered at 6.5 feet bgs during drilling.
PP = Pocket penetrometer
TV = Torvane

¹ S&H and SPT blow counts for the last two increments were converted to SPT N-Values using factors of 0.7 and 1.2, respectively, to account for sampler type and hammer energy.
² Elevations based on the topographic survey by BKF Engineers, titled "Lake Merritt BART Building B, Oakland, CA 94607," Sheet C2.1, dated 12/22/22. Elevations reference the City of Oakland Vertical Datum (COVD).

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions	Symbols	Typical Names
Coarse-Grained Soils (more than half of soil > no. 200 sieve size)	Gravels (More than half of coarse fraction > no. 4 sieve size)	GW Well-graded gravels or gravel-sand mixtures, little or no fines
		GP Poorly-graded gravels or gravel-sand mixtures, little or no fines
		GM Silty gravels, gravel-sand-silt mixtures
		GC Clayey gravels, gravel-sand-clay mixtures
	Sands (More than half of coarse fraction < no. 4 sieve size)	SW Well-graded sands or gravelly sands, little or no fines
		SP Poorly-graded sands or gravelly sands, little or no fines
		SM Silty sands, sand-silt mixtures
		SC Clayey sands, sand-clay mixtures
Fine -Grained Soils (more than half of soil < no. 200 sieve size)	Silts and Clays LL = < 50	ML Inorganic silts and clayey silts of low plasticity, sandy silts, gravelly silts
		CL Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, lean clays
		OL Organic silts and organic silt-clays of low plasticity
	Silts and Clays LL = > 50	MH Inorganic silts of high plasticity
		CH Inorganic clays of high plasticity, fat clays
		OH Organic silts and clays of high plasticity
Highly Organic Soils	PT	Peat and other highly organic soils

APPENDIX B
CONE PENETRATION TEST RESULTS

GREGG DRILLING, LLC.
 GEOTECHNICAL AND ENVIRONMENTAL INVESTIGATION SERVICES

January 4, 2022

Langan
 Attn: Paul Marien

Subject: CPT Site Investigation
 Lake Merritt BART
 Oakland, California
 GREGG Project Number: D2229001

Dear Paul:

The following report presents the results of GREGG Drilling Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	<input checked="" type="checkbox"/>
2	Pore Pressure Dissipation Tests	(PPD)	<input checked="" type="checkbox"/>
3	Seismic Cone Penetration Tests	(SCPTU)	<input checked="" type="checkbox"/>
4	Membrane Interface Probe	(MIP)	<input type="checkbox"/>
5	Hydraulic Profiling Tool	(HPT)	<input type="checkbox"/>
6	Groundwater Sampling	(GWS)	<input type="checkbox"/>
7	Soil Sampling	(SS)	<input type="checkbox"/>
8	Vapor Sampling	(VS)	<input type="checkbox"/>

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact me at 949-903-6873.

Sincerely,
 Gregg Drilling, LLC.

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (PPDT). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a “knock out” plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

Figure CPT

Gregg 15cm² Standard Cone Specifications

Dimensions	
Cone base area	15 cm ²
Sleeve surface area	225 cm ²
Cone net area ratio	0.85
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)

Note: The repeatability during field use will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (1990). Typical plots display SBT based on the non-normalized charts of Robertson et al (1986). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (1990) which can be displayed as SBT_n, upon request. The report also includes spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBT_n and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Professor Robertson (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling LLC does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Note that it is not always possible to clearly identify a soil type based solely on q_t , f_s , and u_2 . In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

ZONE	SBT

Cone Penetration Test (CPT) Interpretation

Gregg uses a proprietary CPT interpretation and plotting software. The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997). The interpretation is presented in tabular format using MS Excel. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameters.

Input:

- 1 Units for display (Imperial or metric) (atm. pressure, $p_a = 0.96$ tsf or 0.1 MPa)
- 2 Depth interval to average results (ft or m). Data are collected at either 0.02 or 0.05m and can be averaged every 1, 3 or 5 intervals.
- 3 Elevation of ground surface (ft or m)
- 4 Depth to water table, z_w (ft or m) – input required
- 5 Net area ratio for cone, a (default to 0.85)
- 6 Relative Density constant, C_{Dr} (default to 350)
- 7 Young's modulus number for sands, α (default to 5)
- 8 Small strain shear modulus number
 - a. for sands, S_G (default to 180 for SBT_n 5, 6, 7)
 - b. for clays, C_G (default to 50 for SBT_n 1, 2, 3 & 4)
- 9 Undrained shear strength cone factor for clays, N_{kt} (default to 15)
- 10 Over Consolidation ratio number, k_{ocr} (default to 0.3)
- 11 Unit weight of water, (default to $\gamma_w = 62.4$ lb/ft³ or 9.81 kN/m³)

Column

- 1 Depth, z , (m) – CPT data is collected in meters
- 2 Depth (ft)
- 3 Cone resistance, q_c (tsf or MPa)
- 4 Sleeve resistance, f_s (tsf or MPa)
- 5 Penetration pore pressure, u (psi or MPa), measured behind the cone (i.e. u_2)
- 6 Other – any additional data
- 7 Total cone resistance, q_t (tsf or MPa) $q_t = q_c + u(1-a)$

8	Friction Ratio, R_f (%)	$R_f = (f_s/q_t) \times 100\%$
9	Soil Behavior Type (non-normalized), SBT	see note
10	Unit weight, γ (pcf or kN/m^3)	based on SBT, see note
11	Total overburden stress, σ_v (tsf)	$\sigma_{vo} = \sigma z$
12	In-situ pore pressure, u_o (tsf)	$u_o = \gamma_w (z - z_w)$
13	Effective overburden stress, σ'_{vo} (tsf)	$\sigma'_{vo} = \sigma_{vo} - u_o$
14	Normalized cone resistance, Q_{tn}	$Q_{tn} = (q_t - \sigma_{vo}) / \sigma'_{vo}$
15	Normalized friction ratio, F_r (%)	$F_r = f_s / (q_t - \sigma_{vo}) \times 100\%$
16	Normalized Pore Pressure ratio, B_q	$B_q = u - u_o / (q_t - \sigma_{vo})$
17	Soil Behavior Type (normalized), SBT_n	see note
18	SBT_n Index, I_c	see note
19	Normalized Cone resistance, Q_{tn} (n varies with I_c)	see note
20	Estimated permeability, k_{SBT} (cm/sec or ft/sec)	see note
21	Equivalent SPT N_{60} , blows/ft	see note
22	Equivalent SPT $(N_1)_{60}$ blows/ft	see note
23	Estimated Relative Density, D_r , (%)	see note
24	Estimated Friction Angle, ϕ' , (degrees)	see note
25	Estimated Young's modulus, E_s (tsf)	see note
26	Estimated small strain Shear modulus, G_o (tsf)	see note
27	Estimated Undrained shear strength, s_u (tsf)	see note
28	Estimated Undrained strength ratio	s_u/σ'_v
29	Estimated Over Consolidation ratio, OCR	see note

Notes:

- 1 Soil Behavior Type (non-normalized), SBT (Lunne et al., 1997 and table below)
- 2 Unit weight, γ either constant at 119 pcf or based on Non-normalized SBT (Lunne et al., 1997 and table below)
- 3 Soil Behavior Type (Normalized), SBT_n Lunne et al. (1997)
- 4 SBT_n Index, I_c $I_c = ((3.47 - \log Q_{tn})^2 + (\log F_r + 1.22)^2)^{0.5}$
- 5 Normalized Cone resistance, Q_{tn} (n varies with I_c)

$Q_{tn} = ((q_t - \sigma_{vo})/pa) (pa/(\sigma'_{vo})^n)$ and recalculate I_c , then iterate:

When $I_c < 1.64$, $n = 0.5$ (clean sand)
 When $I_c > 3.30$, $n = 1.0$ (clays)
 When $1.64 < I_c < 3.30$, $n = (I_c - 1.64)0.3 + 0.5$
 Iterate until the change in n , $\Delta n < 0.01$

6 Estimated permeability, k_{SBT} based on Normalized SBT_n (Lunne et al., 1997 and table below)

7 Equivalent SPT N_{60} , blows/ft Lunne et al. (1997)

$$\frac{(q_t/p_a)}{N_{60}} = 8.5 \left(1 - \frac{I_c}{4.6} \right)$$

8 Equivalent SPT $(N_1)_{60}$ blows/ft $(N_1)_{60} = N_{60} C_N$
 where $C_N = (p_a/\sigma'_{vo})^{0.5}$

9 Relative Density, D_r , (%) $D_r^2 = Q_{tn} / C_{Dr}$
 Only SBT_n 5, 6, 7 & 8 Show 'N/A' in zones 1, 2, 3, 4 & 9

10 Friction Angle, ϕ' , (degrees) $\tan \phi' = \frac{1}{2.68} \left[\log \left(\frac{q_c}{\sigma'_{vo}} \right) + 0.29 \right]$
 Only SBT_n 5, 6, 7 & 8 Show 'N/A' in zones 1, 2, 3, 4 & 9

11 Young's modulus, E_s $E_s = \alpha q_t$
 Only SBT_n 5, 6, 7 & 8 Show 'N/A' in zones 1, 2, 3, 4 & 9

12 Small strain shear modulus, G_o
 a. $G_o = S_G (q_t \sigma'_{vo} p_a)^{1/3}$ For SBT_n 5, 6, 7
 b. $G_o = C_G q_t$ For SBT_n 1, 2, 3 & 4
 Show 'N/A' in zones 8 & 9

13 Undrained shear strength, s_u $s_u = (q_t - \sigma_{vo}) / N_{kt}$
 Only SBT_n 1, 2, 3, 4 & 9 Show 'N/A' in zones 5, 6, 7 & 8

14 Over Consolidation ratio, OCR $\text{OCR} = k_{ocr} Q_{t1}$
 Only SBT_n 1, 2, 3, 4 & 9 Show 'N/A' in zones 5, 6, 7 & 8

The following updated and simplified SBT descriptions have been used in the software:

SBT Zones

- 1 sensitive fine grained
- 2 organic soil
- 3 clay
- 4 clay & silty clay
- 5 clay & silty clay
- 6 sandy silt & clayey silt

SBT_n Zones

- 1 sensitive fine grained
- 2 organic soil
- 3 clay
- 4 clay & silty clay

7	silty sand & sandy silt	5	silty sand & sandy silt
8	sand & silty sand	6	sand & silty sand
9	sand		
10	sand	7	sand
11	very dense/stiff soil*	8	very dense/stiff soil*
12	very dense/stiff soil*	9	very dense/stiff soil*

*heavily overconsolidated and/or cemented

Track when soils fall with zones of same description and print that description (i.e. if soils fall only within SBT zones 4 & 5, print 'clays & silty clays')

Estimated Permeability (see Lunne et al., 1997)

SBT _n	Permeability (ft/sec)	(m/sec)

Pore Pressure Dissipation Tests (PPDT)

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure (u) with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In situ horizontal coefficient of consolidation (c_h)
- In situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100} , the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests completed for this project is included in Table 1.

Figure PPDT

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (V_s) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg Drilling's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d / \Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

NORCAL GEOPHYSICAL CONSULTANTS INC. REPORT

January 24, 2022

LANGAN

504 14th Street, Third Floor
Oakland, CA 94612

Subject: Borehole Geophysical Logging Investigation
Lake Merritt BART Station
Oakland, California

NORCAL Job No: NS215143

Attention: Mr. Daniel Wagstaffe,

This report presents the findings of a Borehole Geophysical Logging (BGL) investigation performed by NORCAL Geophysical Consultants, Inc., a Terracon company (NORCAL), in support of a geotechnical study being conducted by LANGAN at the Lake Merritt BART Station parking lot located at 51 9th Street in Oakland, California. The BGL survey was authorized under LANGAN Subcontractor Agreement signed by Lori Simpson, Senior Vice President, dated December 23, 2021. The field work was performed on January 6th, 2022 by NORCAL Professional Geophysicist Charles Carter (PGp. 1051). Safety and logistic support were provided by Paul Marien of LANGAN.

The BGL investigation was conducted in one geotechnical borehole designated as B-3. Borehole B-3 was located in the northern portion of the parking lot, as shown in Plate 1. The purpose of the BGL survey was to measure shear (S-) wave and compressional (P-) wave velocities in the borehole. The borehole was drilled to a depth of 250 feet.

1.0 SCOPE OF SERVICES

Our scope of services for this project consisted of conducting a BGL investigation in Borehole B-3. Our scope also included processing and interpreting the BGL data and presenting our findings in a written report.

2.0 BOREHOLE CONDITIONS

The borehole was advanced with a 6-inch diameter rotary wash drilling method through the fill and unconsolidated sediments to 33 feet bgs. A 4.9-inch bit was then used to drill from 33 feet to 237 feet bgs, and a 3.9-inch bit was used to drill from 237 feet to 250 feet bgs. Six-inch steel conductor casing was installed in the upper 9 feet to prevent sloughing from loose fill or soil. Borehole stability was very good. The borehole lost less than one foot of depth due to sediment sloughing.

3.0 BOREHOLE GEOPHYSICAL LOGGING SURVEY

Detailed descriptions of the PS-wave Suspension methodology, our data acquisition and data analysis procedures and results presentation, are provided in Appendix A. The appendix includes a table listing the interval P- and S-wave velocities measured in the borehole.

In addition to PS-wave Suspension logging, the caliper tool was used as a survey technique to assess the relative consolidation of the borehole. The caliper data was also used to identify borehole irregularities that may affect the PS-suspension data quality. Velocity anomalies are common in areas where the borehole walls have lost their natural rigidity due to sloughing or washouts.

4.0 RESULTS

The results of the suspension borehole logging survey are illustrated by the velocity versus depth graph for B-3, as shown on Plate 2. The graph depicts the variations in S-wave velocity (V_s) and P-wave velocity (V_p) versus depth. V_s are indicated by the red triangles and V_p are indicated by the blue squares. These are interval velocities (see Appendix A) and, as such, are the values that should be used in any geotechnical evaluation. To the right of the PS-wave velocity plots, we present a shaded caliper log (labeled as Borehole Diameter).

5.0 DISCUSSION

As shown on Plate 2, the seismic velocities measured in B-3 are between 700- to 2,500 feet per second (ft/s) for V_s , and between 2,200- and 7,700-ft/s for V_p . The measurements made in saturated sediments have P-wave velocities above 4,800 ft/s. Borehole washouts detected in the caliper logs between 20- and 60-ft did affect the shear wave signal strength, and therefore, caused additional acquisition and analysis time. In general, the shear-wave velocities vary with changes in stratigraphy, with higher velocities usually corresponding to coarse grained sediments like sands and gravel and lower velocities usually recorded in muds and clay.

6.0 STANDARD CARE AND WARRANTY

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. We performed our services in a manner consistent with the standard of care ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the performance of services or products delivered under this agreement, expressed or implied, is made by NORCAL.

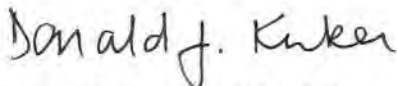

We appreciate the opportunity to provide our services to Langan for this project. If you have any questions or require additional geophysical services, please do not hesitate to contact us.

Sincerely,

NORCAL Geophysical Consultants, a Terracon Company

APPENDIX A

PS-WAVE SUSPENSION VELOCITY SURVEY

The Suspension logger is a highly specialized downhole tool that measures P- and S-wave velocities at discrete depths. The following presents a narrative on its operation and the data reduction procedures we used in computation of suspension P- and S-wave velocities. Also presented are tabulated velocity data tables interpreted for the suspension logging survey in Borehole B-3.

1.0 METHODOLOGY

We measured downhole compressional (P-) and shear (S-) wave velocities using a Robertson Geologging, Ltd. digital suspension logging system. A schematic diagram depicting the probe configuration is shown in Figure A-1. The suspension logging tool is equipped with a dipole seismic energy source hammer located near the base of the probe and a pair of detectors (receivers) designated as near receiver (R1) and far receiver (R2), located within the middle to the upper sections of the probe. The distance from the energy source to the closest receiver is 6.97 feet (2.125 meters) when assembled with a detachable 1-meter isolation tube. The in-line distance between the receiver pair is 3.28 feet (1.0 meter). Each receiver contains one horizontal and one vertical oriented element. The horizontal receiver elements preferentially record shear wave motion. The vertical receiver elements preferentially record first arriving P-wave energy.

Suspension seismic data are collected at discrete depths in fluid-filled portions of the borehole. At each measurement depth, the energy source is activated via commands from the surface control console. This activation causes a metal solenoid to strike the metal strike cylinder. This hammer strike generates a pressure wave in the fluid which transmits energy to the borehole wall. The force of the pressure wave applied to the borehole wall produces seismic waves (both P-wave and S-waves) in the adjacent formation (C. Kitsunozaki, 2000). The seismic waves propagate up the borehole wall to the two detectors. The displacement caused by the seismic waves at the borehole wall creates a pressure gradient in the borehole fluid which is detected by the receiver elements within the probe which is suspended in the borehole fluid. The receivers in the suspension logger are hydrophones which detect pressure changes in the borehole fluid. The source hammer and horizontal elements in the receivers are oriented parallel to one another. By striking the metal strike cylinder on opposite sides of the probe (referred to as left strike and right strike) the amplitudes of both the positive and negative polarity S-waves are maximized.

Figure A-1: Suspension logger schematic diagram

When assembled with a 1-meter isolation tube, the suspension logging tool is approximately 19.8 feet long (Figure A-1). By definition, the depth reference point of the tool is half-way between the two receivers. Since this point is approximately 12-ft from the probe tip, the maximum depth of a suspension logging survey, given a non-sloughing borehole, will be reported as at least 12 feet less than the total depth of the borehole. When in operation, the probe is centralized in the borehole with flexible rubber rings positioned just below the source. This is necessary to maintain a gap between the probe housing and borehole wall.

2.0 DATA ACQUISITION

We measured seismic velocities with the suspension logger at stationary depth positions in the fluid-filled borehole distributed vertically at 0.5-meter (1.6-ft) intervals in B-3. Borehole B-3 was drilled to a depth of 250-ft below ground surface. Steel conductor casing was installed to 9 feet bgs. The borehole fluid did not drop below the conductor casing during data acquisition. Since the PS logger needs a fluid-filled, open borehole to transmit energy from the source to the formation, the upper bound of the PS survey was approximately 11.5 feet. Both receiver elements must be below the casing to detect the waves travelling in the formation which is a minimum of 0.5 meters below the casing.

At each measurement station, the energy source fired 3 times in succession. This cycling of the seismic energy resulting in a “left” and “right” strike for the shear waves (recorded with the horizontal elements) and a third strike for the P-waves (recorded with the vertical elements). While recording P-waves and S-waves, an analog low pass filter of 20 KHz was applied to the signals detected by the vertical and horizontal receiver elements. This filtering was used to suppress interference from ambient acoustic noise. High frequency digital filters were used to filter out P-waves for shear-wave velocity picking.

3.0 DATA ANALYSIS

3.1 SEISMIC RECORDS

Suspension P- and S-wave velocities were calculated with the computer software program **PS Logger** published by **Robertson Geologging**. Sample suspension seismic records are presented in Figures A-2, A-3, and A-4. Suspension P- and S-wave velocities were calculated with the computer software program **PSLogger** published by **Robertson Geologging**. Sample suspension seismic records are presented in Figures A-2, A-3, and A-4. Each record displays six seismic wave traces. The upper four traces were detected by the near and far horizontal receiver elements. These traces are labeled according to the element type (H=horizontal), the polarity of the first arrival of the shear waves (n=normal and r=reverse) and the relative distance from the

source. For example, the top wave trace is labeled “far Hn” because it was recorded with the horizontal component furthest from the source using the first strike which produces shear waves with a normal polarity first arrival. The seismic wave traces produced by the second strike of the source produce shear waves with a reverse polarity first arrival.

The lower two traces were detected by the near and far vertical receiver elements and are used to identify P-wave arrivals. These traces are labeled according to the element type (V = vertical) and the relative distance from the source. For example, the bottom wave trace is labeled “near V” because it was recorded to identify P-waves with the vertical component of the near receiver. P-wave traces are produced during the third shot. The direction of impact is inconsequential for the P-waves detected by the vertical elements in the receivers and is therefore not addressed by separate waveforms.

Figure A-2: Sample seismic record at depth 56 ft (17 m) bgs.

Figure A-3: Sample seismic record at depth 98 ft (30 m) bgs

Figure A-4 Sample Waveform Record at a depth of 200 ft (61 m) bgs

3.2 S-WAVE ARRIVALS

On the seismic records shown in Figures A-2, A-3 and A-4, the red traces (Cycle 1) were created by right side hammer impacts and the green traces (Cycle 2) were created by left side hammer impacts of the strike cylinder. Pairing the traces produced by opposite directions of impact reveals a phase reversal that is associated with the onset (arrival) of S-wave energy. However, because there can be slight discrepancies in timing between Cycle 1 and Cycle 2, the reversal point may not occur at the same exact time on both traces. Therefore, the onset of S-wave energy is further defined as the point where there is also a significant increase or decrease in amplitude within the phase reversal time window. S-waves are further distinguished from P-waves by the lower frequency wavelets. These arrival times are depicted by open red and green circles on the upper four wave traces.

3.3 P-WAVE ARRIVALS

P-wave arrivals are identified as the point where the wave traces produced by the final hammer strike (blue in Figures A-2 through A-4) change from horizontal straight lines to sinusoidal wave forms. These points are referred to as “first breaks”. First breaks may have a positive or negative polarity and exceed a minimum threshold. Often it is less ambiguous to pick the first peak of the wavelet from each receiver (R1 and R2). The point of the break or peak are represented by blue circles on the lower two wave traces in the Figures above. The first breaks need only cross a zero-amplitude threshold and be either paired as positive or negative polarity first breaks. An exception occurs in partially saturated to dry unconsolidated alluvium. With the tool string above the static water table, P-wave amplitudes may decrease significantly to a point where the first P-wave arrivals become undetectable. The pressure wave from the fluid is usually detected at the near hydrophone before the compressional wave from the formation in unsaturated sediments. The P-wave velocities measured above the water table may be an estimate due to the weak signal-to-noise ratio of the P-waves in unsaturated sediments and may not be representative of actual in situ P-wave velocities.

3.4 SEISMIC VELOCITY CALCULATIONS

Velocities are calculated by dividing the distance between the two receivers R1 and R2 by the difference in arrival times (AT in seconds) to those receivers. These are considered interval velocities. The general form of the equation is as follows:

$$V_{(R2-R1)} = (X_{R2}-X_{R1})/(AT_{R2}-AT_{R1})$$

Where $(X_{R2}-X_{R1}) = 1$ meter (3.28 feet); AT_{R2} = arrival time at **far** detector, AT_{R1} = arrival time at **near** detector.

The **PS Logger** program calculates two interval Vs velocities at each depth based on arrival time differences from the right strike polarity of cycle 1 (**Vs-right**) records and the left strike polarity of cycle 2 (**Vs-left**) records and one **Vp** interval velocity based on the arrival time differences selected from cycle 3 records. The average of Vs-right and Vs-left is the shear wave velocity reported for each depth.

3.5 INTERVAL SEISMIC VELOCITIES

Final output of velocities and arrival times were made with the reduction program *PS Log Analysis*. The output of these programs consists of two interval velocities at each depth, S-wave (Vs) and P-wave (Vp). The interval Vs were computed using an average of the lag times between the first peaks (both normal and reverse polarity) recorded with the near and far horizontal hydrophones. The interval Vp was computed using the lag time between the first arrivals recorded with the near and far vertical hydrophones.

3.6 POISSON'S RATIO

Poisson's ratio is a measure of the compressibility of soil and rock. Poisson's Ratio in rock ranges from 0.15 to 0.40. Poisson's Ratio in sediments is typically from 0.3 to 0.4 but it can be between 0.4 to 0.5 in saturated sediments. Poisson's Ratio (ν) can be determined from Vp and Vs velocities using the following relationship:

$$\nu = \frac{Vp^2 - 2Vs^2}{2(Vp^2 - Vs^2)}$$

Calculated Poisson's ratios are presented in Table A-1 with the P- and S-wave velocities.

4.0 DATA PRESENTATION

All P- and S-wave velocities interpreted from the receiver to receiver analysis for Borehole B-3 are presented in Table A-1 and are differentiated into both Metric and Imperial Units. The columns below indicating metric units are shown on the left. The columns indicating imperial units are shown on the right and present the Vs and Vp data as depths in feet and velocities in feet per second. These average or interval Vs and Vp velocities have columns shaded blue and are displayed graphically on the depth versus velocity profile on Plate 2 with the main body of the report. The depths of the measurements are based on a probe reference point that is half-way between the near and far receivers.

5.0 QUALITY ASSURANCE

For quality assurance purposes, a source to receiver analysis was conducted. Depth verses interval velocities are displayed below with velocities obtained from a source to near receiver (S-R1) analysis in Figure A-5. There is a 2.125 m separation between the source and near receiver. Therefore, the S-R1 velocities are an average velocity over 2.1 m rather than the average velocity over 1 m between the near and far receivers. The center point between the source and near

receiver is 1.56 m lower on the probe than the mid-point between the two receivers. The S-R1 velocity for the record acquired at 10 m, for example, is reported at a depth of 11.6 m. The source to receiver velocity is calculated with the following equation

$$V_{(S-R1)} = (X_S - X_{R1}) / (AT_{R1} - SD)$$

where the S-R1 separation is 2.125m, AT_{R1} = arrival time at **near** detector and SD is the source delay which was 0.24 milliseconds for B-3. The source delay is the time between the source trigger and the source impact and is influenced by the probe's internal electronics and the rigidity of the source springs. The results of this analysis show good agreement relative to the velocities obtained from the receiver to receiver (R1R2) analysis.

Oakland, CA 94612

Subject: Project No.: 750650005.700.004
Project Name: Lake Merritt BART Redevelopment
Corrosivity Analysis – ASTM Test Methods

Dear Mr. Wagstaffe:

Pursuant to your request, CERCO Analytical has analyzed the soil sample submitted on January 21, 2022. Based on the analytical results, a brief corrosivity evaluation is enclosed for your consideration.

Based upon the resistivity measurement, this sample is classified as “moderately corrosive”. All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron should be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines should be protected against corrosion.

The chloride ion concentration was none detected at a detection limit of 15 mg/kg.

The sulfate ion concentration was none detected at a detection limit of 15 mg/kg.

The pH of the soil is 7.21, which does not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures.

The redox potential is 330-mV and is indicative of potentially “slightly corrosive” soils resulting from anaerobic soil conditions.

This corrosivity evaluation is based on general corrosion engineering standards and is non-specific in nature. For specific long-term corrosion control design recommendations or consultation, please call JDH Corrosion Consultants, Inc. at (925) 927-6630.

We appreciate the opportunity of working with you on this project. If you have any questions, or if you require further information, please do not hesitate to contact us.

Very truly yours,
CERCO ANALYTICAL, INC.

J. Darby Howard, Jr., P.E.
President

 - 2.6. Existing Utilities
 - 2.7. Pile Foundation
 - 2.8. Construction Vibration
- 3. DESIGN AND CONSTRUCTION NEAR EXISTING AT-GRADE AND AERIAL BART STRUCTURES**
 - 3.1. Falsework near BART Tracks
 - 3.2. Construction Equipment
 - 3.3. Soil Cover over Foundation
- 4. DESIGN AND CONSTRUCTION NEAR EXISTING UNDERGROUND BART STRUCTURES**
 - 4.1. Surcharge Load for Existing Underground Structures
 - 4.2. Excavation close to Underground Structures
 - 4.3. Minimum Soil Cover
- 5. DOCUMENTATION**
 - 5.1. Design Documentation
 - 5.2. Construction Documentation

CRITERIA STRUCTURAL

DESIGN AND CONSTRUCTION NEAR EXISTING BART STRUCTURES

1. SCOPE

The purpose of the criteria herein is to establish minimum provisions for design and construction near existing BART structures.

2. GENERAL REQUIREMENTS

2.1. Policy

New structures near existing structures shall be designed and constructed so as not to impose temporary or permanent adverse effects on existing BART structures. Potential impacts to the existing BART structures by new design and construction shall be identified at the planning stage of design.

The Engineer Responsible for Design (ERD) shall coordinate the new design and construction with:

- BART design criteria
- Third-party design criteria
- District third-party interagency agreements, as applicable

Analyses of the existing structures are required when there are changes to the existing BART structures, or temporary or permanent changes to loading upon the existing BART structures due to the new design and construction.

2.2. Clearance

The minimum clearance between any parts of the adjacent BART structures to exterior face of substructures shall be 7 feet 6 inches. In addition, the substructures shall be located such that the loads from the foundations of the new structures shall not impact the BART structures.

2.3. Zone of Influence (ZOI)

2.3.1. Temporary Zone of Influence

For temporary effects on the existing BART's structures, the temporary ZOI is defined as the area above a positive line of influence which is a line from the critical point of substructure at a slope of 1-1/2 horizontal to positive 1 vertical (line sloping towards ground level) or the area below a negative line of influence which is a line

from the critical point of substructure at a slope of 1-1/2 horizontal to negative 1 vertical (line sloping away from ground level). Refer to Figure 1 for an underground rectangular structure.

The geotechnical engineer and ERD shall determine the critical points of the existing foundations and underground structures, subject to BART Engineering review and acceptance.

2.3.2. Permanent Zone of Influence

The geotechnical engineer for the proposed structure shall determine the permanent effects or influence on the existing BART's structures based upon the soil and groundwater conditions in the vicinity of the proposed structures and the existing BART's structures. Particular attention shall be paid to liquefiable soil, expansive soil, and lateral spreading. The slope of the permanent ZOI shall not be steeper than the slope of the temporary ZOI as defined above.

2.4. Shoring

Shoring is required for excavation in the ZOI. Refer to Design Criteria, Structural, Geo-Structures.

2.5. Groundwater Control and Dewatering

Where groundwater control is proposed, changes in groundwater elevation shall be evaluated together with the consequences to structures located in proximity to the dewatering. The groundwater drawdown zone shall be established based on a hydrogeologic study that includes, but is not limited to, soil types in proximity to the area of groundwater control, the duration of the work, the planned construction methods, and plans for recharge or other methods of groundwater control.

Dewatering shall be monitored for changes in groundwater level. Recharging back to its original elevation is required if existing groundwater level is expected to drop more than 2 feet.

2.6. Existing Utilities

Existing utilities shall be protected from damage. If relocation is necessary, it shall be accomplished in a manner that will not disrupt revenue service.

2.7. Pile Foundation

Piles shall be pre-drilled to a minimum of 10 feet below the line of influence. Piles shall be driven in a sequence away from BART structures.

BART structures shall be monitored for vibration during pile driving operations for all piles within 100 feet of the structures.

No pile shall be allowed between steel-lined tunnels. Steel-lined tunnels shall be monitored for movement and deformation.

2.8. Construction Vibration

Some construction methods may result in vibrations that lead to densification of loose, cohesionless soil, or architectural and structural damage. A vibration monitoring plan shall be prepared to document the potential for induced vibration and noise from construction equipment and procedures, with respect to their effect on adjacent structures, BART facilities and operations.

Procedures and control of vibration and settlement caused by the operations of construction equipment including, but not limited to, pile driving and soil compaction (vibro-compaction, etc.) shall be included in the plan. Plans shall include locations and details of monitoring instrumentation.

The peak particle velocity (PPV) in the vertical direction as measured from the closest BART structures to the construction equipment shall not exceed 1.0 in/sec (transient source) and 0.5 in/sec (continuous/frequent intermittent source). For vibration-sensitive structures, the vibration limits are subject to District for review and acceptance. For structures supporting BART tracks, BART track movement shall be limited to a maximum of 1/4 inch per 30 feet of length in both horizontal and vertical directions. For other structures, the settlement shall not exceed 0.3 inches. For historic or sensitive structures, the ERD shall provide a structure specific settlement analysis for BART Engineering's review and acceptance.

Where the PPV is predicted to exceed 0.5 in/sec, or where historic or vibration-sensitive structures are known to be located, as identified by District, a pre-condition survey shall be conducted before the start of construction. The purpose of the pre-condition survey shall be to provide comprehensive documentation of existing building conditions, such as the location and extent of structural damage, cosmetic cracks, signs of differential settlement, or other conditions that could be affected by construction vibrations.

Any existing structure located where the PPV is expected to exceed 0.5 in/sec shall be monitored for levels of vibration and the potential for vibration-induced settlement. Vibrations shall be monitored with a 3-component seismograph with geophones capable of recording 2 horizontal and 1 vertical ground motions. Settlement shall be monitored using survey targets and other remote settlement monitoring devices. The accuracy of the survey measurement shall be ± 0.01 inches or better. Results of the vibration and settlement monitoring shall be provided in daily reports.

Existing BART structures shall be monitored for vibration during pile driving operations for piles within 100 feet of said BART structures.

When construction requires monitoring, construction activity resulting in monitored measurements in excess of limits within submitted plans acceptance by District, shall be immediately halted, and reported to BART Engineering for further direction.

3. DESIGN AND CONSTRUCTION NEAR EXISTING AT-GRADE AND AERIAL BART STRUCTURES

3.1. Falsework near BART Tracks

Falsework near BART tracks shall be designed as follows:

- A. Falsework shall be designed to resist seismic loads. For construction durations of less than 5 years, the seismic loads may be reduced to values defined in Caltrans MTD 20-2. For construction durations over 5 years, falsework shall be designed for seismic loads in accordance with applicable codes for permanent structures.
- B. Falsework shall be designed to resist wind loads. For construction durations of less than 180 days, the wind loads may be reduced to values defined in ASCE 37. For construction durations over 180 days, falsework shall be designed for wind loads in accordance with applicable codes for permanent structures.
- C. Falsework crossing under BART tracks without pedestrian traffic shall be designed according to the Caltrans Falsework Manual.
- D. Falsework crossing under BART tracks with pedestrian traffic shall be designed per item C above, including compliance with pedestrian protection according to CBC Section 3306.

3.2. Construction Equipment

Construction equipment operating adjacent to BART's Operating Envelope shall be situated and restrained such that it will not damage BART facilities, nor violate BART's Operating Envelope. See Operating Envelop specified in Standard Specifications – Operating System Interface.

3.3. Soil Cover over Foundation

Existing soil cover over foundations shall be maintained.

4. DESIGN AND CONSTRUCTION NEAR EXISTING UNDERGROUND BART STRUCTURES

4.1. Surcharge Load for Existing Underground Structures

In general, cut-and-cover underground structures were designed with an area surcharge applied at the ground surface both over and adjacent to the structures. The area surcharge was considered static uniform load with the following value:

D (ft)	Average Vertical Surcharge Loading (psf)
D>20	0
5<D<20	800-40D
D<5	600

where D is the vertical distance from the top of the subway roof to the ground surface.

In general, steel-lined tunnels were designed to support the weight of 35 feet of earth above the roof of the tunnel. Whenever the actual depth of cover is less than this amount, construction may be added imposing an additional average vertical loading of 120 lbs per square foot for each foot of depth of reduced cover.

Where basements are excavated, the average vertical surcharge loading can be increased to the extent that it is balanced by the weight of the removed material. The effects of soil rebound in such cases shall be fully analyzed for each construction stage.

4.2. Excavation close to Underground Structures

Excavation shall be done with extreme care to prevent damage to the waterproofing membrane and the structure itself. Hand excavation shall be performed for the final 1 foot to the underground structures.

4.3. Minimum Soil Cover

Minimum soil cover of 8 feet on underground structures shall be maintained wherever possible.

5. DOCUMENTATION

5.1. Design Documentation

The following is a list of minimum documentation required for design of structures near existing BART structures, subject to District review and acceptance:

- Geotechnical Reports as required in Design Criteria, Structural, Geotechnical
- Foundation plan showing the location of new foundations relative to the existing BART structure and foundations, and ZOI

- Foundation design calculations showing magnitudes and directions of foundation loads, how they are resisted through soils, and any interaction with the existing BART structure
- Structural design calculations and drawings for foundation design loads
- Excavation plan showing the ZOI, sequence of work, excavation slope, temporary shoring system, and permanent earth retaining systems, as applicable
- Soil-structure interaction analysis report, if needed
- Basis of structural design
- Dewatering analysis and associated de-watering plans, if required
- As-built construction drawings, if applicable

5.2. Construction Documentation

The following is a partial list of the required construction documentation, subject to District review and acceptance:

- Pre-construction planning report
- Pre-conditions survey report
- Field construction reports
- Instrumentation plan
- Dewatering monitoring and recharging plans
- Dewatering monitoring report
- Vibration monitoring plan
- Vibration monitoring report
- Monitoring plan for confirming incremental loads from new construction
- Excavation plan for area within the ZOI showing the excavation slope or shoring system
- Procedures and control of soil compaction operations

CRITERIA STRUCTURAL

GEO-STRUCTURES

1. SCOPE

Criteria set forth in this section cover the structural design of foundations for structures, excluding tunnels and miscellaneous structures, which are addressed separately. These Criteria include structural design of earth retaining structure (ERS) walls, and supporting and underpinning of existing structures. The foundations, ERS walls, and underpinning support are collectively referred to as geo-structures.

2. DESIGN CODES

Geo-structures shall be designed in accordance with Caltrans Bridge Design (CBD) as amended by these Criteria for structures belonging to Transport Design Category, and with California Building Code (CBC) as amended by these Criteria for structures belonging to Building Design Category.

Geo-structures belonging to the Hybrid Design Category shall be designed according to the applicable Transport Design Category or the Building Design Category requirements herein. Requirements in Design Criteria, Structural, Passenger Stations and Buildings shall be used for determination of the applicable design basis for Hybrid Design Category Structures. If certain Geo-structure components involve both the Transport Design Category and the Building Design Category, then both sets of requirements shall apply.

Where inconsistencies are noted amongst code and design requirements, the more conservative or stringent of the requirements shall be used.

3. FOUNDATIONS SUPPORTING STRUCTURES

Acceptable foundations for structures include shallow and deep foundations, depending on geotechnical and groundwater conditions, types of loading, and site construction constraints at the development site. The foundation type and geotechnical design parameters shall be as recommended by the geotechnical engineer in the Geotechnical Engineering Report (GER).

Foundation design shall take into account the presence of potentially corrosive substances in soils, if any, such as chlorides and sulphates. This may be accomplished by providing appropriate protection for concrete, reinforcement, and metal embedments.

4. FOUNDATIONS SUPPORTING TRANSPORT DESIGN CATEGORY STRUCTURES

The design of foundations supporting Transport Design Category structures shall be as directed by the provisions of CBD with the exceptions noted within this Article.

Design Criteria, Structural, Geotechnical identifies limitations on differential settlements of foundations.

4.1. SHALLOW FOUNDATIONS

The design of foundations supporting Transport Design Category structures shall be as directed by the provisions of CBD.

4.2. DEEP FOUNDATIONS

Acceptable deep foundations include driven piles and drilled shafts, including cast-in-drilled-hole (CIDH) piles, and cast-in-steel-shell (CISS) piles. Other types of deep foundations, such as helical piles and auger-cast piles (ACP) shall not be used for support of transport structures.

In addition to CBD, the following provisions shall apply to the design of deep foundations supporting Transport Structures:

- A. Uplift shall not be allowed in any deep foundation where the uplift resistance is due to side friction, except for an intermittent uplift load from load combinations that include wind or extreme load combinations.
- B. Effects of downdrag loads (i.e., negative skin friction) shall be evaluated relative to the structural capacity of the deep foundation. Where methods are recommended for reducing effects of downdrag loads by means of a slip coating, consideration shall be given to the long-term value of residual negative skin friction that may develop.
- C. Batter piles shall not be farther out of plumb than 1 horizontal unit in 3 vertical units. Batter piles shall not encroach on property outside the right-of-way lines or interfere with existing structures or pile foundations.
- D. Batter piles shall not be used to resist extreme load combinations where reasonable alternatives are available. When foundations include batter piles which are not subject to extreme load combinations, the batter piles and any reacting vertical piles and their connections, shall be designed to remain elastic under factored demand forces, and factored pile axial forces are within permissible axial resistances per the GER. When foundations include batter piles and are reacting vertical piles subject to extreme load combinations, the piles and connections shall be capacity-protected, such that they remain elastic under the overstrength seismic forces that can be delivered by the structural system to the batter piles.
- E. The design shall consider nonlinear soil pressure-displacement relationships, soil-structure interaction (SSI), group action, and static and dynamic load conditions.

- F. Appropriate corrosion protection shall be provided for steel piles, if selected for use, such that the pile has full required design strength at the end of the specified design life.

5. FOUNDATIONS SUPPORTING BUILDING DESIGN CATEGORY STRUCTURES

The design of foundations supporting Building Design Category structures shall be as directed by the provisions of CBC with the exceptions noted within this Article.

5.1. SHALLOW FOUNDATIONS

Shallow foundations for building structures include spread footings for isolated columns, combined footings to support the load from more than one structural unit, strip footings for walls, and mats or rafts beneath an entire building area. Shallow foundations shall be sized and structurally designed in accordance with Section 1809 of CBC, to satisfy the allowable bearing pressures, settlement tolerances, and sliding resistances indicated in the GER.

Shallow foundations supporting at-grade buildings shall be interconnected with continuous footings or reinforced concrete grade beams with or without slab on-grade or reinforced beams. In addition to the other applicable loadings, the structural elements interconnecting the shallow foundations shall be capable of carrying, in tension or compression, a force equal to the lesser of: the product of the larger shallow foundation or column design gravity load times the seismic coefficient, SDS, divided by 10, and 25 percent of the smaller shallow foundation or column gravity load. Seismic ties between shallow foundations shall comply with Section 1809.13 of CBC for all soil conditions.

5.2. DEEP FOUNDATIONS

Deep foundations supporting Building Design Category structures shall be designed in accordance with Section 1810 of CBC.

Deep foundation design shall include following.

- A. Uplift shall not be allowed in any pile where the uplift resistance is provided by side friction, except for an intermittent uplift load from load combinations that include wind or seismic load.
- B. Effects of downdrag loads (i.e., negative skin friction) shall be evaluated relative to the structural capacity of the deep foundation. Where methods are recommended for reducing the effect of downdrag loads by means of a slip coating, then consideration shall be given to the long-term value of residual negative skin friction that may develop.
- C. Batter piles shall not be farther out of plumb than 1 horizontal unit in 3 vertical units. Consideration shall be given to the possibility of such batter piles encroaching on property outside the right-of-way lines or interfering with existing structures or pile foundations.

- D. Batter piles shall not be used where feasible alternatives are available. Where batter piles must be used, the batter pile and its connections, and any reacting vertical piles, shall meet requirements for batter piles in CBC Chapter 31F.
- E. The design shall account for nonlinear soil pressure-displacement relationships, SSI, group action, and static and dynamic load conditions.
- F. Appropriate corrosion protection shall be provided for steel piles, if selected for use, such that the pile has full required design strength at the end of the specified design life.

6. EARTH RETAINING STRUCTURES (ERS)

The criteria set forth in this Article govern the design of ERS including gravity and semi-gravity cantilever retaining walls, U-walls, mechanically stabilized earth (MSE) walls, abutments walls for bridges, wing walls for bridges, and basement walls for building structures.

Except as required in these Criteria, design shall be in accordance with CBD for ERS walls belonging to the Transport Design Category and with CBC for ERS walls belonging to the Building Design Category.

When designing ERS that directly support appurtenances such as equipment supports, sign supports, parapets, railings, fences, walls, or barriers, design shall account for all possible externally applied loading on the ERS from the appurtenance, including vehicular collision, and design shall be in accordance with specified codes. When designing ERS where adjacent structures are not physically supported by the ERS but may result in a surcharge or other force transmission acting on the ERS, design shall account for the force transmission to the ERS and design shall be in accordance with the specified codes and these Criteria.

When the ERS is potentially subjected to highway or BART or other train collision loading at the top of wall and a moment slab isolated from the ERS is proposed to provide the required crash protection, the moment slab shall be designed to appropriate standards. The ERS shall be designed for any incidental loading which may be transmitted either directly between the moment slab and the ERS or through the soil strata adjacent to the ERS. As a minimum, Article 11.10.10.2 in AASHTO/CA shall be used to determine vehicular collision loads. Refer to Illinois State Toll Highway Authority Design Bulletins for guidance on moment slab design.

ERS design shall take into account the presence of potentially corrosive substances in soils, if any, such as chlorides and sulphates. This may be accomplished by providing appropriate protection for concrete, reinforcement, and metal embedment.

6.1. WALL TYPE SELECTION

Wall type selection shall be based on siting, performance, and economic considerations as jointly recommended in the GER by the geotechnical engineer and agreed to by the Engineer Responsible for Design (ERD), with review and approval by BART Engineering.

- A. U-walls (retaining walls with integrated continuous base slab between walls) shall be used where the top of trackway subgrade is below the groundwater table or flood level or in other locations where the ERD identifies the U-wall as being appropriate. U-walls shall be designed to resist earth pressures, hydrostatic pressures, and surcharge loads such as highway or railway traffic. U-walls shall be designed to support BART train loads on the base slab.
- B. Independent gravity and semi-gravity retaining walls may be used for trackway subgrade above the ground-water level. Either shallow or deep foundations are permissible for supporting independent gravity and semi-gravity retaining walls. Independent retaining walls shall be designed to resist earth pressures, hydrostatic pressures, and surcharge loads such as highway, BART train, or railway traffic.
- C. MSE retaining structures are permissible at locations where acceptable ground conditions exist or where ground can be improved to provide bearing support during gravity and seismic loading. Transport structures bridge approaches shall not be supported by shallow foundations located on MSE abutment walls, except in the configuration MSE Type 2, Caltrans Memo-to-Designers 5-1. Use of MSE retaining structures shall be reviewed and approved by BART Engineering.
- D. For ERS wall taller than 25 feet, the type and design of ERS walls shall be reviewed and approved by BART Engineering.

6.2. ERS WALL DESIGN REQUIREMENTS

ERS walls and foundations for transport structures shall be proportioned to withstand the applicable loads and resistance factors as defined in provisions found in Sections 3 and 11 of AASHTO/CA. ERS walls and foundations for building structures shall be proportioned to withstand the applicable loads and factors as defined in Section 1807 of CBC. The following additional requirements apply for wall designs:

- A. For structures adjacent to operating railroads, both the vertical and lateral surcharge shall be based on Cooper's E-80 railroad surcharge loadings. Refer to AREMA and other standards of the subject railway.
- B. When design includes level backfill, or when vehicular or BART train traffic can be located on the backfill near the face of the wall or abutment, a minimum live load surcharge in accordance with AASHTO/CA article 3.11.6.4 but not less than 2 feet of equivalent weight of earth shall be used. The potential need to design for higher live load surcharge shall be evaluated where heavy train loads or other temporary loads occur within the 1.5 of wall height distance.
- C. Lateral Earth Pressures:
 - 1. Wall pressures shall be determined from values provided in the GER.
 - 2. Deformation required to develop passive earth pressure shall be considered in design of walls that rely on passive earth pressure. The upper 2 feet of passive earth pressure shall be ignored in the computation of soil reaction.

D. Base Pressure and Stability

ERS walls supported on shallow foundations shall be evaluated to confirm that bearing values are acceptable and that stability requirements are met, following provisions found in Sections 10 and 11 of AASHTO/CA for transport structures and in Sections 1809 and 1810 of CBC for Building Structures.

1. Soil-bearing pressures provided in the Design Criteria, Structural, Geotechnical shall be used.
2. The exposed face of the retaining walls supported on shallow foundations shall be initially offset towards the soil face. Refer to Standard Drawings, SS70, Structural Retaining Wall – Typical Elevation and Sections.

E. U-walls and Buoyancy Effects

1. The effects of hydrostatic uplift pressure shall be accounted for whenever ground water is present. Maximum design flood levels shall be assumed based on 500-year flood elevations and future sea level rise shall be assessed and accounted for in selecting the design flood elevations. For the permanent condition, buoyancy shall be calculated for all locations. Resistance to buoyancy calculations shall rely on the dead weight of structural components and soil backfill with no account to any equipment or other removable items. Shear strength or friction of overburden shall not be considered. Unless otherwise allowed by District, the use of tiedowns, tension piles or other elements specifically designed to resist uplift forces is not permitted.
2. A minimum factor of safety of 1.1 shall be maintained when applied to the structural dead weight. For the short term (temporary) construction conditions, buoyancy shall be calculated for all construction phases and a minimum factor of safety of 1.05 shall be maintained.

7. SUPPORT AND UNDERPINNING OF EXISTING STRUCTURES

The criteria set forth in this Article govern the design requirements for the support and underpinning of existing structures over or adjacent to existing or new BART facilities. Except as discussed herein, design shall be in accordance with CBD for support and underpinning of structures belonging to the Transport Design Category and with CBC for support and underpinning belonging to the Building Design Category.

7.1. PLANNING FOR SHORING AND UNDERPINNING

- A. The ERD, in coordination with BART Engineering shall investigate existing structures, that are to remain over, or adjacent to, the construction sites of existing or new BART facilities. Existing structures shall be protected and permanently supported and underpinned. When so stipulated by BART Engineering in the ERD's scope of work, the ERD shall prepare contract document provisions and site-specific design criteria requiring the construction contractor to prepare the necessary designs.

B. Types of Support Systems

The types of buildings and structures, that require support and underpinning include the following:

1. Buildings and structures extending over the BART structures to such an extent that they must be temporarily supported during construction and permanently underpinned.
2. Buildings and structures immediately adjacent to the BART structures that require temporary support during construction.
3. Building and structures that may be affected by groundwater lowering. In certain areas, uncontrolled lowering of the groundwater for BART construction may cause settlement of buildings either adjacent to or at some distance from BART excavations.
4. Other buildings, structures, and utilities, that BART Engineering deems appropriate, shall be included in the scope.

7.2. DESIGN REQUIREMENTS

- A. Underpinning walls or piers that support transport or buildings structures, and form a portion of the excavation support system shall extend to a minimum depth identified in the GER.
- B. Methods used to protect or underpin structure shall account for the site-specific soil and groundwater conditions and include the following:
 1. A bracing system shall be tight for the effectiveness of underpinning and for protection wall support. In addition to the general requirements for support of excavations, which are provided in the specifications, the ERD shall indicate requirements for the installation and removal of the temporary bracing systems that relate to the designs of underpinning and protection walls, such as the levels of bracing tiers, the maximum distances of excavation below an installed brace, and the amount of preloading. The ERD shall require through the contract documents that detailed design of the temporary bracing system be the responsibility of the construction contractor, based on overall criteria to be included in the contract documents.
 2. If soil and groundwater conditions, structure size, or proximity to an excavation dictate piers, piles, or caissons for underpinning of an existing structure, such piers, piles, or caissons shall extend at least 10 feet below the line of influence or into a competent soil or rock layer, whichever is deeper, as shown in Figure 1, unless the geotechnical engineer shows that vertical and horizontal support requirements can be developed at less than 10 feet below the line of influence. The minimum depth of underpinning below the line of influence shall be 2 feet.
 3. Other geotechnical considerations as outlined with Design Criteria, Structural, Geotechnical.

7.3. SHORING

Shoring is required for excavations in the temporary and permanent zone of influence, as defined in Design Criteria, Structural, Design and Construction Near Existing BART Structures.

- A. Seismic and wind loads shall be accounted for in the shoring design for temporary and permanent shoring. The seismic and wind loading shall be defined as follows:
1. Seismic earth pressures shall be determined by the geotechnical engineer based on the site-specific seismicity for permanent shoring systems.
 2. For temporary structures with an expected duration of less than 5 years, the site seismicity shall be based on a probabilistic ground motion with 10 percent probability of exceedance in 10 years. The seismic earth pressure coefficient (k_h) shall not be less than 0.1g.
 3. For temporary structures with an expected duration of over 5 years, the seismic loading for permanent retaining structures shall be used.
 4. For structures to be shored for 5 years or less, wind loading and design shall be in accordance with Section 6.2 of ASCE/SEI 37.
 5. For structures to be shored for over 5 years, wind loading and design shall be in accordance with applicable codes for permanent structures.
- B. Shoring shall maintain at-rest soil conditions and monitored for movement.
- C. Soil re-distribution caused by temporary shoring or existing foundation system shall be analyzed.
- D. Shoring support shall extend at least 10 feet below the base of the excavation or into a competent soil or rock layer, whichever is deeper, unless the geotechnical engineer shows that vertical and horizontal support requirements can be developed at less than 10 feet below the excavation depth. The minimum depth of shoring below the excavation depth shall be 2 feet.
