Temescal Produce Market, 4001 Broadway, Oakland – 0.6 miles. This is a very small market located at the northwest corner of 40th Street and Broadway, approximately 0.6 miles south of the Rockridge Safeway Project site in the Upper Broadway/Oakland Tech area of Oakland. The store features a limited amount of fresh produce, a small dairy section, ice cream, cookies, bulk items such as nuts and pasta, a small selection of specialty food items like black olive tapenade and organic tomato sauce, gluten-free products, organic products including organic cleaning products, and personal care products. The hours of operation are 9:00AM – 9:00PM, daily. The store is in good condition with street and off-street parking available. Customer volume appears light. Despite its close proximity to the Rockridge Safeway (0.6 miles), this store is not anticipated to experience negative sales impacts from the Safeway expansion due to its small size and limited, specialized product selection.

Trader Joe's, 5727 College Avenue, Oakland – 0.7 miles. This is a smaller niche-market type grocery store. This Trader Joe's is in a small center in Oakland's Rockridge area that also has a Pharmaca pharmacy. This store is larger than most Trader Joe's; it has wider aisles and a larger selection. The store is very well-maintained. While visiting the store ALH Economics observed the parking lot to be extremely busy and shopper volume was very high. The hours of operation are 8:00AM – 10:00PM, Monday-Sunday. Given its distance from the Rockridge Safeway (0.7 miles), and focus on some of the higher end packaged goods that are sold at Safeway Lifestyle stores, this store may potentially experience some negative sales impacts from the expansion.

Temescal Produce Market, 5121 Telegraph Avenue, Oakland – 0.7 miles. This is a small sister market to the Temescal Produce Market on Broadway, located at the northwest corner of 51st Street and Telegraph Avenue, at the north end of Oakland's Temescal/Koreatown area. Like the store on Broadway, this store features fresh produce, a small dairy section, ice cream, cookies, bulk items such as nuts and pasta, a small selection of specialty food items like black olive tapenade and organic tomato sauce, gluten-free products, and organic products including organic cleaning products. The hours of operation are 8:00AM – 9:00PM, daily. The store is in good condition with street parking available. Customer volume appears light. Despite its close proximity to the Rockridge Safeway (0.7 miles), this store is not anticipated to experience negative sales impacts from the expansion due to its small size and limited, specialized product selection.

Monte Vista Food Center, 4000 Piedmont Avenue - 1.0 miles. Monte Vista Food Center is a small neighborhood market. It is located just a few doors down from Piedmont Grocery on Piedmont Avenue. This store offers a small fresh produce section with a variety of organic fruits and vegetables. The store also includes packaged meats and other convenience food items. While visiting the store, ALH Urban & Regional Economics observed extremely low shopper volume. The hours of operation are 8:00AM – 7:00PM, Monday-Saturday, and 9:30AM – 7:00PM Sunday. Given this store's local market orientation, small size, and convenience orientation, it is not anticipated to be competitive with the Rockridge Safeway though it may experience some sales impacts due to the close distance. Most importantly, this store is located very close to the Piedmont Grocery (see above) and benefits from cross shopping from Piedmont Grocery shoppers. Therefore, if shoppers are diverted from the Piedmont Grocery due to enhanced shopping opportunities at the Rockridge Safeway then sales could accordingly be impacted at Monte Vista Food Center.

Yasai Produce Market, 6301 College Avenue – 1.1 miles. Yasai Produce Market is a very small produce market located directly across College Avenue from the Claremont & College Safeway store in Rockridge. This market is located in a strip of retail that also includes Ver Brugge Meat-Fish Poultry (see below), La Farine bakery, several fine dining restaurants, a candy shop, a clothing store, and a relatively new Peet's coffee shop. Yasai specializes in well-priced fresh, local produce, has a small Asian-themed section, and bread and dairy sections. The store has a strong local following and is open daily, with hours of operation including 9:00AM – 7:00PM Monday through Saturday, and 9:00AM – 6:00PM on Sundays. This store has no dedicated parking. This store has a local market orientation, is small, and has specialized product selection with a well-established and loyal customer base. Because this store is located adjacent to the College & Claremont Safeway, it is anticipated to experience some negative sales impacts if that store succeeds in its expansion plans. If that occurs, then ALH Economics does not anticipate that the Rockridge Safeway expansion will result in additional negative sales impacts for this market. However, if the College & Claremont Safeway store does not expand as planned, then it is possible that Yasai Produce Market might incur some negative sales impacts following completion of the Rockridge Safeway Project.

Ver Brugge Meat-Fish Poultry, 6321 College Avenue – 1.1 miles. Ver Brugge Meat-Fish Poultry is located a few storefronts to the north of Yasai Produce Market in Rockridge, also with no dedicated parking. Ver Brugge specializes in meat and seafood, including homemade sausages and poultry, and also features a good selection of cheeses. Like Yasai Produce Market, Ver Brugge is a very well-established local food business, with a strong customer base. Store hours are 10:00AM – 6:00 PM Monday – Friday, 9:00AM – 6:00PM Saturday, and 10:00AM – 5:00PM Sunday. Similar to Yasai Produce Market, this food store has a local market orientation, is small, has specialized product selection, and benefits from a well-established and loyal customer base. The sales impact findings for Ver Brugge Meat-Fish Poultry are similar to the findings for Yasai Produce Market, in that sales are not anticipated to be negatively impacted by the Rockridge Safeway Project unless plans do not proceed for expansion of the College & Claremont Safeway store.

Mulberry's Market, 335 Highland Avenue, Piedmont – 1.8 miles. Mulberry's Market is a very small local neighborhood market in Piedmont located 1.8 miles from the Rockridge Safeway site. This niche store is very upscale and offers a fresh bakery, deli counter with an espresso and coffee area, prepared foods, fresh and packaged meat and seafood, and organic/health goods. The quality of the store and small parking area are excellent. While visiting the store ALH Economics observed extremely high shopper volume. The store is located in the small downtown area of Piedmont. The hours of operation are Monday-Friday, 7:00AM – 8:00PM, Saturday, 8:00AM – 8:00PM, and Sunday, 8:00AM – 7:00PM. Given this store's local market- upscale orientation and small size, ALH Economics anticipates that this store will not be competitive with the Rockridge Safeway.

Lakeshore Natural Foods, 3321 Lakeshore Avenue, Oakland – 2.1 miles. This is a very small natural foods store located in Oakland's Lakeshore area, 2.1 miles from the Rockridge Safeway, but with no produce and limited fresh products. The store includes natural baby food, frozen food items, supplements, sugar replacements, gluten free options, crackers, beans, aromatherapy items, lotions and soaps, and beauty supplies. The hours of operation are Monday-Friday, 9:30AM – 7:00PM, Saturday, 9:30AM – 6:00PM, and Sunday, 10:00AM – 5:00PM. Shopper volume appeared light when visited by ALH Economics. Given the highly specialized nature of the products available at this store it is not anticipated to be competitive with the Rockridge Safeway.

Lakeshore Produce & Health Foods, 3260 Lakeshore Avenue, Oakland – 2.1 miles. This is also a very small store in Oakland's Lakeshore area located 2.1 miles from the Rockridge Safeway but with a heavy emphasis on fresh foods and produce. Store products include a wide variety of produce, including organic, bulk grains and beans, canned foods, a dairy section, ice cream, and healthy snacks. The hours of operation are Monday-Saturday, 9:00AM – 7:00PM and Sunday, 10:00AM – 6:00PM. Shopper volume appeared high when visited by ALH Economics and the store is in good condition. Given its proximity to Trader Joe's, a major food stores in the Lakeshore Business District that is anticipated to experience some sales impacts attributable to the Rockridge Safeway expansion (see following store), this store is also anticipated to incur some sales impacts following completion of the Rockridge Safeway Project.

Trader Joe's, 3250 Lakeshore Avenue, Oakland – 2.3 miles. This is a smaller, niche-market type grocery store located 2.3 miles from the Rockridge Safeway site. This Trader Joe's store is located in Oakland's Lakeshore area. Adjacent or nearby uses include CVS, Peet's Coffee, and other local retail stores. This is a standard-sized Trader Joe's store in excellent condition and is well-maintained, located in space formerly occupied by Lucky. While visiting the store ALH Economics observed the parking lot to be very busy and shopper volume was high. The hours of operation are 8:00AM – 10:00PM, Monday-Sunday. Given its focus on some of the higher end packaged goods that are sold at Safeway Lifestyle stores, this store may potentially experience some sales impacts from the expansion, but these impacts are anticipated to be less than impacts that might occur at the College Avenue Trader Joe's given the difference in store proximity to the Rockridge Safeway site.

Savemore Market, 4219 Park Boulevard, Oakland – 2.5 miles. This is a small neighborhood-oriented market located in Oakland's Glenview area, at the periphery of the Rockridge Safeway market area. This store is focused on serving the immediate neighborhood, and features many convenience items, a large selection of soups, canned fruit, liquor, extensive wine selection, some organic products, a very small produce section, and a strong ice cream section. This store has only metered street parking available. Daily hours of operation are 7:30AM – 11:00PM. Given its neighborhood focus, and 2.5-mile distance from the Rockridge Safeway store, this store is not anticipated to experience any sales impacts attributable to the Safeway expansion.

Gateway Supermarket, 5908 San Pablo Avenue, Oakland – 2.7 miles. This small market, located in Oakland's Golden Gate area, is very neighborhood-oriented. The space is not very well maintained and does not appear to be fully utilized, but it achieves high customer volume. The store sells a small amount of basic grocery store items, and includes a small fresh produce area. Where this market distinguishes itself is with its meat counter, which includes a wide variety of pork, beef, and poultry. Given the mix of products available the store has an emphasis on southern cooking. The meat counter extends most of the length of the store and appears to be the store's primary draw. Store hours are 9:00AM – 6:00PM Monday –Saturday and 10:00AM – 3:00 PM on Sundays. Given its neighborhood orientation, extensive meat counter, and 2.7-mile distance from the Rockridge Safeway store, the Gateway Market is not anticipated to experience any negative sales impacts upon the opening of the Rockridge Safeway store.

Discount Grocery and Food Stores within the Market Area

Discount stores are characterized by lower-than-average price points. Sometimes these are manifested by bulk sales, which allow the customer to get more for their dollar relative to most other grocery stores.

Grocery Outlet, 2900 Broadway, Oakland – 1.6 miles. Grocery Outlet is a national discount grocery store chain. This is an older, larger store located in Oakland's Broadway Auto Row/Broadway-Valdez area that is showing various signs of wear and tear, and did not appear to be very well-maintained when visited during fieldwork. While visiting the store ALH Economics observed moderate shopper volume. This store is located approximately 1.6 miles from the Rockridge Safeway store. Given this store's discount orientation it is not anticipated to be competitive with the Rockridge Safeway.

Ethnic Grocery and Food Stores within the Market Area

Ethnic food stores are stores that are distinguished from other stores by offering food products unique to a specific international culture or cuisine. These stores are often but not always smaller than conventional food stores. There are a number of small ethnic markets in the market area, but two of the more substantial stores are listed below.

Koreana Plaza Market, 2370 Telegraph Avenue, Oakland – 1.8 miles. This medium-sized ethnic grocery store caters to Korean customers and features a wide selection of produce, seafood, meat, and other products specific to Korean culture. Only a few packaged products are sold that overlap with conventional grocery stores, such as A-1 sauce and ketchup. This store is located in Oakland's Northgate/Koreatown area, and is exceedingly busy. Numerous unique products are available at the store, such as gallon jugs of Kimchee and live catfish, bass, and Korean halibut. This is a very unique store, located 1.8 miles from the Rockridge Safeway. Store hours are 7:00AM – 10:00PM daily. There is also a small, separate housewares store located adjacent to the grocery store. Because of its ethnic orientation and strong customer base, this store is not anticipated to incur any negative sales impacts associated with the Rockridge Safeway expansion.

Oasis Food Market, 3045 Telegraph Avenue, Oakland – 2.1 miles. This is a small-to-medium sized ethnic food store in Oakland's Northgate/Koreatown area focusing on Middle Eastern food products and cuisine. The store has a very limited produce section but features a meat counter and sells an extensive array of packaged and bulk products. The store includes a bakery and restaurant, also focused on Middle Eastern foods, such as a wide selection of baklava and prepared foods such as shawarma. Daily store hours are 9:30AM – 9:30 PM. Shopper volume appears moderate and the store is 2.1 miles from the Rockridge Safeway site. Because of its ethnic orientation and location, this store is not anticipated to incur any negative sales impacts associated with the Rockridge Safeway expansion.

OTHER FOOD STORES NEAR THE MARKET AREA

There are many other grocery stores located outside, but near the market area that were evaluated by ALH Economics. These stores were examined because, given their proximity to the Rockridge Safeway market area boundary, it is likely that they draw some of their shoppers from within the Rockridge Safeway market area, and may be vulnerable to negative sales impacts if some of these shoppers shift their grocery shopping to the expanded Safeway store. These stores are also relevant to the later discussion regarding cumulative impacts.

Conventional Grocery and Food Stores Near or Outside the Market Area

Andronico's (closed), 2655 Telegraph Avenue, Berkeley – 2.2 miles. Andronico's is a regional chain, conventional-style grocery store. This Andronico's store was a stand-alone store, the closure of which was announced on November 30, 2011 and completed by mid-December, 2011. The Andronico's ownership filed for bankruptcy during summer 2011. Shortly thereafter the chain was purchased, with the first underperforming store in Berkeley closed in October 2011.[16] Media reports indicated that this Telegraph Avenue store was perceived as the next weakest store in the chain, which ultimately led to its closure. Prior to bankruptcy of the Andronico's ownership, this Telegraph Avenue store underwent product and internal store layout changes, in an effort to freshen the store and enhance its customer appeal. However, these actions appeared insufficient to give the store a lift, and its closure leaves a gap in the conventional food market in the immediately surrounding neighborhood.

[16] "Breaking: Andronico's to Shutter University Avenue store," October 16, 2011, Berkeleyside.com.

***Lucky, 1963 Mountain Boulevard, Oakland – 3.0 miles*.** This Lucky store is located in the Montclair Village area of Oakland and is adjacent to a Rite-Aid and a Bank of America office building. This conventional grocery store has two-level parking with an automatic walkway between floors that allows grocery carts. Inside the store there is a fresh bakery, deli counter, fresh and packaged meat and seafood, organic/health goods, and a florist. There is also a bank and video rental kiosk inside the store. The quality of the store and parking area are good and appear to be on the newer side. While visiting the store ALH Economics observed high shopper volume. The hours of operation are 6:00AM – Midnight, Monday-Sunday. Even though this store is 3.0 miles from the Rockridge Safeway, it is anticipated to be competitive with the Rockridge Safeway expansion because of its proximity to Piedmont shoppers and other market area shoppers. Therefore, this store may experience some impacts following completion of the Rockridge Safeway Project.

***Safeway, 2096 Mountain Boulevard, Oakland 3.0 miles*.** This is a smaller, stand-alone grocery store located in Montclair Village 3.0 miles from the Rockridge Safeway. This Safeway store has a deli counter, fresh and packaged meat and seafood, a florist, and some organic/health foods. This Safeway also has a cafe, a Blockbuster Express, and a digital photo center located inside. The store offers parking in front and on top of the store. There is also an outdoor eating area on the rooftop. Both the store and parking lots are well maintained and appear to be on the newer side. The hours of operation are 6:00AM – Midnight, Monday-Sunday. While visiting the store ALH Economics observed high shopper volume. Similar to the Grand Avenue Safeway, this store is expected to compete with the Rockridge Safeway expansion and will likely experience some negative sales impacts, as shoppers seek out the expanded range of products that will be available at the Rockridge Safeway upon completion.

***Lucky, 247 E. 18th Street, Oakland – 3.1 miles*.** This large Lucky store is located in the Merritt commercial area of Oakland and is adjacent to the Merritt Restaurant and Bakery. This store offers a fresh bakery, deli counter, and fresh and packaged meat and seafood. There is also a pharmacy, bank, and video rental kiosk inside the store. The quality of the store and parking area are good, although the outside of the store needs some upkeep. While visiting the store ALH Economics observed moderate to high shopper volume. The hours of operation are 6:00AM – Midnight, Monday-Sunday. The pharmacy hours are 9:00AM – 7:00PM, Monday-Friday, 9:00AM – 5:00PM, Saturday, and closed on Sunday. Given its orientation, distance from the Rockridge Safeway (3.1 miles), and location within Oakland, this store is not likely to compete with the Rockridge Safeway expansion or experience negative impacts due to the expansion.

***Andronico's (closed), 1414 University Avenue, Berkeley – 3.7 miles*.** This former Andronico's was shuttered in October 2011. Andronico's declared Chapter 11 bankruptcy in August 2011 and was purchased by Renwood Opportunities Fund in October 2011.[17] The University Avenue Andronico's store was closed because it had the weakest sales of the chain.

***Andronico's, 1550 Shattuck Avenue, Berkeley – 4.2 miles*.** Andronico's is a regional chain of conventional-style grocery stores. This Andronico's store is a stand-alone store with a parking lot in the front and is located in the Gourmet Ghetto district of Berkeley. This store offers a fresh bakery, extensive deli counter, gourmet cheese options, an olive bar, a sushi bar, prepared foods, fresh and packaged meat and seafood, a large bulk foods sections, organic/health goods, an ATM, and a small floral selection. The quality of the store and parking area is a little worn, but well kept. While visiting the store ALH Economics observed moderate to high shopper volume. The hours of operation are

[17] Mercury News, "Andronico's sale to Renovo nears even as grocer decides to close a Berkeley store," October 26, 2011 (accessed November 9, 2011).

8:00AM – 10:00PM, Monday-Sunday. Given its conventional orientation and distance from the Rockridge Safeway (4.2 miles) this store is not anticipated to experience negative sales impacts from the Rockridge Safeway store expansion.

Safeway, 3550 Fruitvale Avenue, Oakland – 4.3 miles. This Safeway is located in a shopping center in Oakland's Dimond area that includes an Oakland Police Department substation. This store has a deli counter, fresh and packaged meat and seafood, and a floral section. This Safeway also has a Starbucks, a pharmacy, and a Blockbuster Express inside the store. The store's parking lot is in front. Both the store and parking lots are well maintained. The hours of operation are 6:00AM – Midnight, Monday-Sunday, the pharmacy hours are 9:00AM-8:00PM Monday – Friday and 9:00AM-5:30PM Saturday and Sunday. While visiting the store ALH Economics observed high shopper volume. Given the distance from the Rockridge Safeway (4.3 miles), this store is not expected to compete with the expansion and will likely not experience sales impacts.

Safeway, 1444 Shattuck Avenue, Berkeley – 4.3 miles. This stand-alone grocery store was recently expanded and renovated, with completion in October 2012. The expanded store offers a deli counter, fresh bakery, fresh and packaged meat and seafood, fresh coffee, a Signature Café, a florist, and some organic/health foods. Prior to closing this Safeway also had a video rental kiosk and a digital photo center located inside. The expanded store offers parking on two levels as well as expanded bicycle parking. There is an indoor eating area within the store. Store hours are 6:00AM – Midnight, Monday-Sunday. Given the similarity in store brand and products, as well as distance from the Rockridge Safeway store (4.3 miles), this store is not anticipated to experience sales impacts from the Rockridge Safeway expansion.

Andronico's, 1850 Solano Avenue, Berkeley – 5.1 miles. Andronico's is a local chain of conventional-style grocery stores. This Andronico's store is a stand-alone store with a parking lot in the rear and is located in along a major commercial node in North Berkeley. This store offers a fresh bakery, extensive deli counter with an olive bar, prepared foods, fresh and packaged meat and seafood, bulk foods, organic/health goods, an ATM, and a floral section. The quality of the store and parking area is excellent and well maintained. While visiting the store ALH Economics observed moderate to high shopper volume. The hours of operation are 9:00AM – 9:00PM, Monday-Sunday. Given its distance from the Rockridge Safeway (5.1 miles) this store is not likely to compete with the Safeway expansion or experience any negative sales impacts.

Lucky, 4055 MacArthur Boulevard Oakland – 5.5 miles. This smaller Lucky store is located in Oakland's Laurel commercial node. This store offers packaged meat and seafood, bulk foods, an ATM, and a Money Gram stand. The quality of the store and parking area are poor and in need of updating, the outside of the store also requires some upkeep. While visiting the store ALH Economics observed moderate to high shopper volume. The hours of operation are 6:00AM – 11:00PM, Monday-Sunday. Given its distance from the Rockridge Safeway (5.5 miles) this store is not likely to compete with expansion and will not experience negative sales impacts.

Safeway, 4100 Redwood Boulevard, Oakland – 5.8 miles. This Safeway is located in the Lincoln Square shopping center in Oakland's Lincoln Square commercial node. This Safeway is a small store that offers packaged meat and seafood, and a small floral selection. This is an older store that needs updating. The hours of operation are from 6:00AM – Midnight, Monday- Sunday. While visiting the store ALH Economics observed moderate shopper volume. Given its size and distance from the Rockridge Safeway (5.8 miles), this store is not expected to compete with the Safeway expansion or experience any sales impacts.

Upscale Grocery and Food Stores Near or Outside the Market Area

Whole Foods, 3000 Telegraph Avenue, Berkeley – 1.9 miles. Whole Foods is a natural and organic food store with locations in North America and the United Kingdom. This location is a large store with Ashby Flowers occupying a pad space. This store offers a fresh bakery, extensive deli counter, gourmet cheese options, an olive bar, prepared foods, fresh and packaged meat and seafood, a large bulk foods sections, ethnic foods, fresh coffee, organic/health goods, a florist, and Allegro Coffee. The quality of the store and parking area is excellent. While visiting the store ALH Economics observed that the store and parking lot had extremely high volume. The daily hours of operation are 8:00AM –10:00PM. Given its size, upscale orientation, and distance from the Rockridge Safeway (1.9 mile) this store might compete with the Rockridge Safeway expansion and may experience some negative impacts.

Berkeley Bowl, 2020 Oregon Street, Berkeley – 2.4 miles. Berkeley Bowl is an independent supermarket chain with two locations in Berkeley. This location, the main store, is a large stand-alone store, but is located across the street from a Walgreens pharmacy. This store is located in a former Safeway grocery store space, closed in the late 1990s/early 2000s timeframe. This store offers a fresh bakery, extensive deli counter, gourmet cheese options, an olive bar, prepared foods, fresh and packaged meat and seafood, a large bulk foods sections, ethnic foods, fresh coffee, organic/health goods, and a florist. The store appearance is modest, without high qualify fixtures. The quality of the store and parking area is excellent. While visiting the store ALH Economics observed that the store and parking lot had extremely high volume. The hours of operation are Monday-Saturday, 9:00AM – 8:00PM, and Sunday, 10:00AM – 6:00PM. Given the store's independent nature and somewhat upscale orientation (the store is hard to classify, and is thus considered a hybrid upscale/conventional store) and distance from the Rockridge Safeway (2.4 miles) this store might compete with the Rockridge Safeway expansion and may experience some negative impacts.

Berkeley Bowl West, 920 Heinz Avenue, Berkeley – 3.7 miles. Berkeley Bowl is an independent, local supermarket. This is a large, relatively new, stand-alone store. This store offers a fresh bakery, extensive deli counter with gourmet cheese options, an olive bar, sushi bar, taquería, prepared foods, fresh and packaged meat and seafood, a large bulk foods sections, ethnic foods, fresh coffee, organic/health goods, a florist, and a cafe. The quality of the store and parking area are excellent. While visiting the store ALH Economics observed the store and parking lot to have extremely high shopper volume. The hours of operation are Monday-Saturday, 9:00AM – 8:00PM, and Sunday, 10:00AM – 6:00PM. Given its upscale and independent orientation and distance from the Rockridge Safeway (3.7 miles) this store is not expected to compete with the Safeway expansion and is not likely to experience negative impacts.

Niche Grocery and Food Stores Near or Outside the Market Area

Star Grocery, 3068 Claremont Avenue, Berkeley - 1.4 miles. Star Grocery is a small neighborhood market. Founded in 1922, this market has a long history of serving the community. This market has a limited selection of fresh meat, seafood, and produce. The store also features a bulk foods section and many specialty food items, including a strong selection of cheeses, crackers, chocolates, vinegars, and beer. The store sells many household items and provides friendly customer service. Store hours are 8:00AM – 7:00PM Monday – Saturday and 10:00AM – 5:00PM on Sunday. This store, located 1.4 miles from the Rockridge Safeway, is not anticipated to incur any sales impacts from expansion of the Rockridge Safeway because of its strong neighborhood convenience function.

Ashby Marketplace, 2642 Ashby Avenue, Berkeley – 1.6 miles. Ashby Marketplace is a small neighborhood market focused primarily on non-perishable foodstuffs. The store has a very small fresh produce section and no fresh meat or seafood but offers many unique features, including a large gluten-free products section, a large spice section, grains, some bulk products, and an extensive and growing selection of teas and chocolates. Many products are organic or natural, including cleaning supplies. The store also features fresh sandwiches prepared daily. Store hours are Monday – Saturday, 10:00AM – 9:00PM and Sunday 11:00 AM – 8:00 PM. The store is staffed by the charismatic owner who is very focused on serving the neighborhood clientele. This store, located 1.6 miles from the Rockridge Safeway, is not anticipated to experience any sales impact upon expansion of the Rockridge Safeway store.

Rocky's Market, 1440 Leimert Boulevard, Oakland – 3.0 miles. This is a small neighborhood-oriented market, focusing on convenience items. Located near but not in the Glenview commercial node, the store sells many of the same kind of products one would expect to find in a 7-11 convenience store, plus a very small produce section. The space inside the store is underutilized, and many coolers are not fully stocked. Store hours are 8:00AM – 9:00PM, and shopper volume appears low. Given its 3.0-mile distance from the Rockridge Safeway, and neighborhood orientation, this store is not anticipated to experience any sales impact upon expansion of the Rockridge Safeway store.

Trader Joe's, 1885 University Avenue, Berkeley – 3.7 miles. This is a smaller, niche-market type grocery store. This Trader Joe's store is located in a mixed-use structure with condos above, on a major thoroughfare in a more urban area of the City of Berkeley. The parking lot is located in a garage which is accessed behind the store. The store is relatively new and is very well maintained. While visiting the store ALH Economics observed the parking lot to be extremely busy and shopper volume was very high. The hours of operation are 8:00AM – 10:00PM, Monday-Sunday. Given its orientation and distance from the Rockridge Safeway (3.7 miles), this store is not likely to experience sales impacts from the Rockridge Safeway expansion.

Trader Joe's, 5700 Christie Avenue, Emeryville – 4.1 miles. This is a smaller, niche-market type grocery store. This Trader Joe's store is a located in the Powell Street Plaza shopping center in Emeryville. Adjacent uses in the center include Ross, Marshall's, PetsMart, BevMo!, DB Shoes, Lane Bryant, Men's Warehouse, Sleeptrain, Starbucks, Burger King, Jamba Juice, and other local retail stores. This is an older, larger store that is showing some signs of wear-and-tear, though the store is well-maintained. While visiting the store ALH Economics observed moderate shopper volume. The hours of operation are 8:00AM – 10:00PM, Monday-Sunday. Given its niche orientation and distance from the Rockridge Safeway (4.1 miles), this store is not likely to experience negative sales impacts.

Farmer Joe's Marketplace, 3426 Fruitvale Avenue, Oakland – 4.2 miles. Farmer Joe's Marketplace in Oakland's Dimond commercial area is a local, family-run supermarket that specializes in organic and natural foods. This store offers a fresh bakery, extensive deli counter, gourmet cheese options, an olive bar, sushi bar, juice bar, prepared foods, fresh and packaged meat and seafood, bulk foods, organic/health goods, a florist, Joe's Grill, and an on-site massage area. The quality of the store and small parking area are excellent. While visiting the store ALH Economics observed extremely high shopper volume. The store is located adjacent to a CVS. The hours of operation are Monday-Sunday, 8:30AM – 8:30PM. Given its organic orientation and distance from the Rockridge Safeway (4.2 miles) this store is not expected to compete with the Safeway expansion and is not likely to experience negative sales impacts.

Monterey Market, 1550 Hopkins Street, Berkeley – 4.7 miles. Monterey Market is a small produce market that specializes in a wide variety of fresh and organic fruits and vegetables, many locally grown. Well regarded for its favorable pricing, this market also sells a variety of other items including dairy, bread, eggs, flowers, and fresh orange juice. There are bulk food options and many specialty items. Monterey Market also sells non-perishable items, such as a variety of vinegars, but it is most widely regarded for its produce options. Store hours are Monday – Friday, 9:00AM – 7:00PM, Saturday, 8:30AM – 6:00PM and Sunday, 10:00AM – 5:00PM. Monterey Market is a very popular market with high consumer volume. Because of its distance from the Rockridge Safeway store, and strong customer following, Monterey Market is not anticipated to experience any negative sales impacts from the Safeway expansion Project.

While not listed separately, there are other food vendors near the Monterey Market, also on Hopkins Street. These include Magnani's Poultry, Country Cheese and coffee, Monterey Fish Market, and Hopkins Street Bakery. Similar to Monterey Market, and because of their specialized nature, distance, and loyal clientele, these vendors are not anticipated to experience any negative sales impacts attributable to the Rockridge Safeway expansion.

Berkeley Natural Grocery Company, 1336 Gilman Street, Berkeley – 5.1 miles. The Berkeley Natural Grocery store is a small neighborhood-oriented grocery store with many natural, organic, and fair trade foods and personal products, including vitamins, soaps, and homeopathic products. The store features fresh produce and all natural products, including nuts for freshly ground nut butters. Prices can be on the high side at this store. There is a bulk foods section and strong dairy section. Store hours are daily 9:00AM – 8:00PM. Because of its distance from the Rockridge Safeway store and niche orientation, this store is not anticipated to experience any negative sales impacts due to the Rockridge Safeway expansion.

Farmer Joe's Marketplace, 3501 MacArthur Boulevard, Oakland – 5.2 miles. Farmer Joe's Marketplace in Oakland's Laurel commercial area is a local family-run supermarket that specializes in organic and natural foods. This store offers fresh and packaged meat and seafood, bulk foods, organic/health goods, and a small floral section. The quality of the store is decent, but well-kept and the parking area needs to be resurfaced. While visiting the store ALH Economics observed moderate shopper volume. The hours of operation are Monday-Friday, 9:00AM – 8:00PM and 9:00AM – 7:30PM Saturday and Sunday. Given its organic orientation and distance from the Rockridge Safeway (5.2 miles) this store is not expected to compete with Safeway expansion and is not likely to experience negative impacts.

Discount Grocery and Food Stores Near or Outside the Market Area

Pak 'N Save, 3889 San Pablo Avenue, Emeryville – 2.0 miles. Pak 'N Save is a discount-oriented grocery chain owned by Safeway. This store is located in the East Bay Bridge shopping center. Adjacent stores include Subway, Casual Male XL, Baskin Robbins, Little Caesar's, and Mattress Discounters. This large discount store offers a fresh bakery, deli counter, fresh and packaged meat, and packaged seafood. Inside the store is also an ACE Check Cashing stand and video rental kiosk. This store is showing signs of wear-and-tear. The needed renovation of this store has been approved by the City of Emeryville and will include a redesigned northern façade including additional entry, replacement of all signs and two new signs, and minor improvements to the parking lot including new landscaping. While visiting the store ALH Economics observed moderate shopper volume. The hours of operation are 6:00AM – Midnight, Monday – Sunday. Given the discount orientation of this store, it is not considered competitive with the Rockridge Safeway, but because of the distance from the Rockridge Safeway (2.0 miles), it may experience some sales impacts from the expansion project.

Grocery Outlet, 2001 4th Street, Berkeley – 5.7 miles. Grocery Outlet is a national discount grocery store chain. This store is a small, adequately maintained market located approximately 5.7 miles from the Rockridge Safeway store. While visiting the store ALH Economics observed moderate shopper volume. Store hours are 8:00AM – 9:00PM daily. Given this store's discount orientation and distance from Safeway, it is not likely to be competitive with the Rockridge Safeway expansion.

GROCERY AND FOOD STORES MOST SUSCEPTIBLE TO IMPACTS

Summary of Impacts

The Project impacts analysis in Exhibit 13 estimated $10.9 million in food & beverage sales impacts attributable to the Project. Exhibit B-1, which provides historical store sales trend data, suggests an average grocery store benchmark sales performance figure of about $500 per square foot. At this performance level, the estimated $10.9 million in sales impacts is equivalent to support for approximately 21,800 square feet. This amount is equivalent to a moderate-sized grocery store, larger than a Trader Joe's store, but smaller than Whole Foods.

However, many of the market area's larger grocery stores perform above this industry standard level. As cited earlier, the national average for Trader Joe's in 2011 was $1,790 per square foot, while the equivalent figure for Whole Foods was $854. All indications are that Berkeley Bowl also achieves higher than the $500 overall industry average. Therefore, the $10.9 million in sales impacts would translate into much lesser store impacts given consideration of the actual performance of the existing base of grocery stores.

Stores Likely to Experience Sales Impacts

Grocery Stores. ALH Economics believes that grocery stores with conventional and upscale orientations are most susceptible to sales impacts from the expanded Rockridge Safeway store given the store's repositioning as a Lifestyle brand store, which is more upscale than the standard Safeway stores. Among the larger stores referenced above, there are two conventional grocery stores, two upscale grocery stores, two niche grocery stores, and one discount grocery store in the market area, all of which are in the City of Oakland. The closest conventional store is the Safeway located at College & Claremont Avenues, 1.1 miles away, followed by the Safeway on Grand Avenue, approximately 1.6 miles away. The closest upscale store is Piedmont Grocery on Piedmont Avenue located approximately 1.0 mile away and the second upscale store is the Whole Foods on Bay Place, located approximately 2.1 miles away. The closest larger niche store is Trader Joe's on College Avenue, just 0.7 miles from the Rockridge Safeway store location, and the second larger niche store is the Trader Joe's on Lakeshore Avenue, approximately 2.3 miles away. The closest discount grocery store is the Grocery Outlet on Broadway, located 1.6 miles away from the Rockridge Safeway. All these stores with the exception of the Grocery Outlet are anticipated to experience some negative sales impacts following the expansion and repositioning of the Rockridge Safeway store;[18] however, the conventional- and upscale-oriented stores are anticipated to experience more impacts than the other store types.

[18] An exception is the Safeway at College & Claremont Avenues if the proposed expansion for this store is approved and comes to pass.

Several other larger grocery stores outside the market area are also anticipated to incur some sales impacts, mostly due to changed shopping patterns among shoppers who live in portions of the market area that overlap with the market areas for these other stores. As referenced in the individual store write-ups above, these larger stores near the market area include the Whole Foods on Telegraph Avenue located 1.9 miles away in Berkeley, the Pak 'n Save on San Palo Avenue located in Emeryville 2.0 miles away, the Berkeley Bowl located 2.4 miles away in Berkeley, and the Lucky and Safeway on Mountain Boulevard in Oakland's Montclair Village, both 3.0 miles away. It is possible that all of these stores might incur some degree of sales impacts following the redevelopment of the Rockridge Safeway store, as shoppers explore the broader options available at the expanded store while still continuing to shop at these other stores.

Many of the cited grocery stores are outperforming national averages. Because of their strong performance, the relatively low volume of sales impacts, and number and geographical dispersion of the potentially impacted stores, all of the identified large- to mid-sized conventional, upscale, niche, ethnic, and discount grocery stores are anticipated to be able to withstand the competition from the expanded Safeway store. Most of these stores are strong performers with a strong customer base. As experienced retailers, they are anticipated to be able to counterbalance product-based sales losses with new merchandising strategies, and thereby retain loyal customers.

Smaller Food Stores. It is possible that other, smaller food stores in and near the market area may also experience some sales impacts. As identified in the preceding store-by-store analysis, these stores could include the market area's Village Market located 1.0 miles from the Rockridge Safeway, Monte Vista Food Center located 1.0 miles away, Lakeshore Produce & Health Foods located 2.1 miles away, and Yasai Produce Market and Ver Brugge Meat-Fish Poultry, both 1.1 miles away. As opined above, Yasai and Ver Brugge are only anticipated to experience sales impacts if the planned College & Claremont Safeway expansion project is not approved. If this expansion occurs, then these stores are likely to experience some degree of sales impacts attributable to the College & Claremont Safeway. If that transpires, however, then the Rockridge Safeway expansion is not anticipated to result in additional negative sales impacts for these food stores. However, if the College & Claremont Safeway store does not expand as planned, then it is possible that Yasai Produce Market and Ver Brugge Meat-Fish Poultry might incur some negative sales impacts following completion of the Rockridge Safeway Project.

While these and the other small stores may experience sales losses, they are not anticipated to be severe enough to trigger closure. It is notable that these stores have coexisted with Safeway for many years. They therefore already offer products and services valued by customers that are not available at Safeway. Even with the greater volume of goods that will be available at the expanded Safeway these niche stores will continue to provide quality of service and products not available at Safeway. Customers might initially spend their shopping dollars at the expanded Rockridge Safeway while they explore the greater product offerings, but they are anticipated to continue to shop at their more convenient neighborhood shopping locations, which are sure to change their product offerings and service levels if warranted due to enhanced Safeway competition. However, shopping convenience and quality of service and products are anticipated to prevail over the long-run to the benefit of the smaller stores, especially since the larger size of the expanded Safeway will result in a more time intensive shopping trip for Safeway customers than the current store. Ultimately, the neighborhood convenience of these smaller stores will be reasserted and long-term customers will remain loyal to the store.

Overall Summary. Based upon the findings set forth in this study, ALH Economics concludes that no existing stores will experience sales impacts attributable to the Project so severe as to induce store closure. Impacts are anticipated to be spread widely, dispersed among a range of existing food stores. Moreover, the stores anticipated to experience the greatest impacts are the stores achieving among the highest sales performance, with these high sales buffering the potential impacts of any prospective sales losses.

OFFSETTING EFFECTS OF FUTURE GROWTH

The Safeway expansion is estimated to be completed in 2014, with completion of the center anticipated to follow in 2015. The year 2015 will also comprise the first full year of operations for the relocated and expanded Safeway store. There may be potential for new market area growth to generate yet additional demand for food sales in and near the market area by this timeframe.

Demographic projections suggest the potential for 1,845 new households in the market area between 2012 and 2015 (see Exhibit 5). This projection was prepared based on coupling ABAG market area census-tract level household growth projections prepared prior to the 2010 census with the actual 2010 household counts identified in the census. Although the amount of actual growth may prove less than that which is projected, it provides a sense of the potential demand that could be generated pursuant to residential development in the market area.

As Exhibit 14 indicates, the 1,845 new households are estimated to generate $54.8 million in retail demand. The largest component of this demand is $9.1 million for food stores, the great majority of which would likely be captured in the market area given the propensity for consumers to purchase groceries relatively close to home. This level of demand, therefore, if realized, could offset up to 84% of the maximum $10.9 million in food sales impacts. There is demand for yet additional retail categories, which would also help offset the estimated Project impacts in the home furnishings & appliances category and generally boost the market area's retail sales base.

This analysis indicates the potential for some increment of new household growth in the market area to be generated prior to the completion of the Project. This new demand will offset some of the Project's anticipated negative sales impacts on existing market area grocery and food stores.

VIII. CUMULATIVE PROJECT IMPACTS

This analysis seeks to quantify the impact of the Project taking into consideration other planned competitive retail projects within or very near the market area. The cumulative projects assessed for impacts include retail developments that are in various stages of entitlement or planning, or recently completed. Because specific development timelines are not available for many of the projects, the analysis carefully considers each project prior to determining the set of projects most likely to be operational during the Project's approximate timeframe.

IDENTIFIED RETAIL DEVELOPMENT PROJECTS

ALH Economics identified 16 potential cumulative retail development projects in the market area and surrounding areas. Information about these projects was primarily derived from interviews with local government sources, reviews of planning department information, and supplemental news articles. These 16 projects are described in Exhibit 15, which also identifies their distance from the Project site.

Only five of the cumulative projects are within the market area. These projects include the following:

- Civiq, located at 51st Street and Telegraph Avenue in Oakland - a mixed-use development with 19,500 square feet of retail, 100 residential units, and 60,000 square feet of office space, with unknown timing;
- BevMo! on Piedmont Avenue in Oakland – a retail beverage store seeking a conditional use permit to locate in space previously occupied by Blockbuster;
- MacArthur BART Transit Village in Oakland – an affordable housing and redevelopment project adjacent to the BART station comprising 624 residential units, 42,500 square feet of retail/commercial space, and surface parking;
- Valdez & 23rd Street Project in Oakland – a mixed use project with 281 residential units, 500-car parking structure, including 250 public spaces, and potential space for 12,000 square feet of retail; and
- College & Claremont Safeway expansion, located at College and Claremont avenues, 36,787 net new square feet of retail, including expansion and conversion of a Safeway store to a Lifestyle store, 1.1 miles from the Project site, EIR and public review in progress, potential completion date 2015.

These five projects vary in distance from the Project site, ranging from 0.6 miles for the 51st Street and Telegraph Avenue project and 2.0 miles for the Valdez & 23rd Street Project.

The 11 other projects are located in Oakland, Berkeley, and Emeryville, ranging 2.3 to 10.4 miles from the Project site. These projects are included because their market areas may overlap to some extent with the Project's market area, thus providing competition for market area resident retail expenditures.

These 11 additional projects and their net amount of planned retail space are as follows, by city:

City of Oakland

- Kaiser Center in Oakland, approved project with potentially 22,000 square feet of retail space 2.3 miles from the Project site, completion not anticipated for a number of years;

- Jack London Square redevelopment in Oakland, approved with 10,000 square feet of additional retail, 3.2 miles from the Project site;
- Oak to Ninth mixed use project in Oakland, approved, with up to 200,000 square feet of planned commercial space, located 4.1 miles from the Project site, with potential opening by 2015 (this project also includes planned residential development); and
- Foothill Square Redevelopment Project, 85,844 net new square feet of retail, 10.4 miles from the project site, approved with expected completion in 2013.

City of Berkeley

- Berkeley Iceland redevelopment in Berkeley into a Sports Basement store with 71,000 square feet of retail space, EIR in progress, located 2.5 miles from the Project site; and
- Shattuck Safeway expansion, located on Shattuck Avenue near Rose Street in Berkeley, recently completed construction of 17,250 net incremental square feet of retail space, 3.9 miles from the Project site.

City of Emeryville

- Pak 'n Save Foods, on San Pablo Avenue between Peralta Street and Yerba Buena Avenue, 2.2 miles from the Project site, a store update and minor parking lot and landscaping improvements, no increment in retail space, approved and anticipated to be completed in 2012;
- Parkside Project, bounded by Powell, Hollis, and Doyle streets and Stanford Avenue, residential project with 10,222 square feet of retail, 2.5 miles from the Project site, approved with opening anticipated fall 2013;
- Bay Street, Site A, proposed development at the northeast corner of Christie Avenue and Shellmound Street, 3.3 miles from the Project site, totaling 20,400 square feet of retail, development timing unknown;
- Bay Street, Suite B, a proposed 150,000-square-foot Macy's department store 3.3 miles from the Project site, development timing unknown; and
- Gateway@Emeryville, a proposed mixed-use project with 14,100 square feet of retail space along with residential and hotel uses, 3.3 miles from the Project site, development timing unknown.

Because of uncertainties in the entitlement and development process, compounded by the effects of the economy on development plans, ALH Economics does not assume that all these projects have the potential of being developed coincident with the Project's timeframe. Other projects are not considered in the cumulative process because they are not deemed likely to draw from the Project's market area, such as the small amount of retail associated with the Parkside Project in Emeryville.

Of the cited projects, 12 are assumed to comprise cumulative projects for analytical purposes. These projects are identified on Exhibit 18, with the numbering matching the numbering on Exhibit 15. The excluded projects include most of the Emeryville projects, including the Pak 'n Save update, Bay Street Sites A and B, and Gateway@Emeryville, due to lack of market area overlap and anticipated timing, i.e., unknown timing.

CUMULATIVE PROJECT SALES ESTIMATES AND SALES IMPACTS

Sales Estimates

Sales figures for the 12 cumulative projects are estimated in Exhibit 18. The estimates were developed with sensitivity to the size and nature of the prospective retail space, and range from $251 per square foot to $800 per square foot, as general sales estimations. These figures reflect estimates for neighborhood shopping centers, several types of food stores, generalized other retail sales, or other specific retail categories, depending upon the orientation of the cumulative project. For the full amount of planned retail development among the cumulative projects, which totals 522,925 square feet, these estimated sales total $216.1 million.

The cumulative retail projects will compete with the Project's market area only to the extent that their market areas overlap. Exhibit 18 also shows estimates of the share of each cumulative project sales anticipated to be sourced from the same market area as the Project. These estimates are the result of generalized assumptions, based on consideration of the location of the projects, their distance from the Rockridge Safeway expansion site, and the anticipated nature of their retail space and likely consumer. For example, Civiq at 51st and Telegraph Avenue project is located closest in proximity to the site, situated 0.6 miles from the Project. This project is anticipated to have a 100% overlap with the Project's market area because of the proximity to the project. The Macarthur BART transit project is also estimated to have a 100% overlap with the Project's market area. Another project located within the market area, 2.0 miles from the Project, is Valdez and 23rd, which is anticipated to have a 50% overlap with the Project's market area. A greater figure is not used because this is a relatively small project, unlikely to have a significant market draw, and thus is not anticipated to draw customers from the northern portion of the Project's market area. The other cumulative projects are assumed to have 5% to 80% market area overlap with the Project, with the cumulative projects located outside the Project's market area assumed to be at the low end of this range.

Of particular relevance to the cumulative analysis are the plans for the College & Claremont Safeway site. As referenced in Exhibits 16 and 17, an existing 24,260-square foot Safeway store with 1,120 square feet of pad space will be redeveloped featuring an expanded 51,510-square-foot Safeway store, more than doubling the size of the store, and an additional 9,537 square feet of restaurant and retail space. The result will comprise a net increase of 36,787 square feet of commercial space (see Exhibit 16).

As presented in Exhibit 17, this net increment of retail space is estimated to generate $26.1 million in net new retail sales, of which 28% are estimated to be generated by this project's market area residents, or $7.3 million. A retail space distribution for the 10,657 square feet of net new retail space for users other than Safeway includes 2,744 square feet of restaurant space and the remaining 7,913 square feet was developed by ALH Economics, based upon trends at other comparably-sized retail centers, and assumes tenants will comprise 2/3 in the Other Retail category, which includes gifts, books, jewelry, and florists, among others, and 1/3 in the Apparel category.

Only a portion of the market area for the College & Claremont Safeway project will be competitive with and overlap with the Rockridge Safeway expansion Project. In a separate urban decay analysis, completed for the College & Claremont Safeway store, ALH Economics developed an estimate of the market area for College & Claremont Safeway store. This market area includes a smaller portion of the City of Oakland than the Rockridge store and also includes portions of the City of Berkeley. Based on demographic estimates associated with the market are for this store, ALH Economics estimates that 28% of the College & Claremont Safeway store's market area households are in common with the

Rockridge Safeway project. Thus, the competitive stores analysis in Exhibit 17 indicates that $7.3 million of the sales at the College & Claremont Safeway project are anticipated to be generated by the market area for the Rockridge Safeway Project.

Pursuant to the market area overlap assumptions, $56.4 million of cumulative project estimated sales are assumed to be competitive with the Project and generated by residents within the Project's market area (see Exhibit 18). These retail sales are then distributed by retail category in Exhibit 19. The sales distributions are based upon industry averages identified by type of retail shopping center, as presented in Exhibit B-9. The results indicate that the largest portions of cumulative project market area sales will occur in two retail categories: food and beverage stores, with $19.4 million, or 36% the competitive total; and other retail, with $27.1 million, or 50% the competitive total (both percentages rounded). The remaining categories include food service and drinking places with $3.8 million in sales, general merchandise with $4.9 million in sales, clothing & clothing accessories with $0.7 million in sales, and building materials & garden equipment with a scant $0.4 million in sales.

Impact Analysis

In an analysis parallel to the Project impact analysis, the cumulative project impact analysis is documented in Exhibit 20. This exhibit takes into consideration the anticipated sales by retail category from the Rockridge Safeway expansion and the cumulative projects, focusing on the sales anticipated to originate from each project's market area. As with the Project's sales impact analysis, the cumulative projects analysis includes recapture of a portion of the estimated market area leakage for retail categories where leakage was identified. The assumptions underlying the share of sales recaptured for the cumulative projects are similar to the assumptions described for the Project's impact analysis.

The results in Exhibit 20 indicate maximum cumulative project impacts on market area retailers totaling $59.7 million. This compares to the Project's impact analysis of $14.2 million. Table 3 highlights the comparative sales impact findings for just the Project as well as the Project in combination with the competitive portion of the cumulative retail projects.

The figures in Table 3 indicate that three categories will experience incremental sales impacts on top of the sales impacts from the Project alone that are more than negligible, especially relative to the existing sales base. These include an incremental $19.4 million in food & beverage store impacts, an incremental $6.1 million in clothing & clothing accessories, and an incremental $20.0 in other retail impacts. The home furnishings & accessories category will experience sales impacts from the Project alone.

As with the Project impacts, extensive market area retail leakage will still remain following development of the cumulative projects. This remaining leakage provides an opportunity for other retailers to enter the marketplace focused on satisfying unmet retail demand.

Table 3
Comparative Sales Impacts
Rockridge Safeway Project and Cumulative Projects

Retail Category	Project	Cumulative Projects
Motor Vehicles & Parts	$0	$0
Home Furnishings	$3,274,508	$3,274,508
Bldg Mat'ls/Garden	$0	$0
Food & Beverage Stores	$10,904,320	$30,342,685
Gasoline Stations	$0	$0
Clothing & Accessories	$0	$6,131,920
General Merchandise	$0	$0
Food Services/Drinking	$0	$0
Other Retail	$0	$19,981,042
Total	$14,178,828	$59,730,154

Note: Figures may not total due to rounding.

Sources: Exhibits 13 and 20.

Clothing & Clothing Accessories Impacts. The incremental impact in this category is moderate, totaling $6.1 million in clothing & clothing accessories. As a share of market area sales for this sales category, this volume of sales impact is equal to 38.1% of the market area sales base. This high percentage of market area sales impact is primarily an indicator of the market area's low sales base in these categories, and not an indicator of strong market impacts. For this category, market area leakage is estimated to persist, even after absorption of the cumulative project sales. The analysis, however, conservatively assumed that not all the sales would be absorbed through leakage, and that some market area impacts could occur. However, the square footage equivalent of these impacts is fairly small, comprising 14,000 square feet of space (assuming $434 per square foot).[19] This increment of space is small, so the more likely scenario is that existing retailers will lose some increment of sales, but not so much as to induce store closure. Therefore, ALH Economics does not believe the clothing/clothing accessories impacts will result in any store closures and will therefore have no potential to contribute to or cause urban decay.

Other Retail Impacts. The nature of the other retail impacts will be dependent upon the type of retailers that locate in all of the cumulative projects. Almost every cumulative project is estimated to have some component of sales in this broad category, which can include sporting goods, office supplies, pet supplies, jewelry, toy stores, pharmacy, and gifts and hobbies, among other retailers. In all likelihood, each project will have a different mix of retailers comprising this category, such that one narrow type of retail will not experience all the estimated cumulative other retail impacts. This will serve to spread and thereby minimize the impacts. Moreover, the estimated $20.0 million in other retail impacts is equivalent to support for about 56,000 square feet of retail space based on the

[19] Ibid.

estimated $357 per square foot sales performance figure for the other retail category.[20] Because this increment of space is sizeable, the likely scenario is that some existing retailers will lose some increment of sales, but not so much as to induce store closure. Therefore, ALH Economics does not believe the other retail impacts will result in any store closures and will therefore have no potential to contribute to or cause urban decay.

Food Store Impacts. The cumulative food sales impact is estimated at $30.3 million, including the $19.4 million incremental impacts attributable to the cumulative projects. While Exhibit 20 represents these sales impacts as a share of the market area's food & beverage store retail sales base, these impacts are likely to be experienced in a more dispersed geography. This wider dispersion is attributable to the wide variety of food store shopping opportunities available throughout the region and the nature of the projects generating the incremental cumulative food sales impacts. For example, approximately $1.7 million of the estimated cumulative food sales is attributable to the planned Foods Co. discount grocery store at Foothill Square outside the market area (see Exhibit 19). Given its discount orientation this store will be most likely to divert sales from other discount food operators. The existing discount food retailer in the market area is Grocery Outlet and there is a Pak 'N Save nearby. These two stores and other discount shopping locations such as Smart & Final might be more likely to experience sales impacts attributable to the Foods Co. than the market area's predominantly upscale and niche groceries and food stores.

Another component of the estimated cumulative food sales impacts is the result of ALH Economics assumptions regarding cumulative project composition. For several of the projects, food sales were assumed because of the likely neighborhood orientation of their planned retail space, such as the 19,600 square feet planned at Civiq, located at 51st Street and Telegraph Avenue. While tenants have not yet been identified for this project, the analysis assumed 40% of the sales would be in the food & beverage category because this is generally consistent with the tenant composition of neighborhood shopping centers (See Exhibit B-9). Similar food & beverage tenant assumptions were made for other cumulative projects in the absence of identified tenant strategies. Thus, there is the potential that the cumulative food sales are overstated, contributing to overestimation of the potential food sales impacts. Future demand pursuant to household growth will also comprise a factor serving to minimize the cumulative food sales impacts.

As with the Project impacts, some smaller grocery and food stores within the market area and beyond might experience some short-term changes in demand as shoppers explore the expanded shopping opportunities presented by the cumulative projects. However, these shoppers are ultimately anticipated to restore some, if not all of their diverted shopping to these small grocery or food stores after an initial time period, especially if the cumulative projects do not comprise a substantially new food store offering, which is not anticipated. If, however, any existing stores do close as a result of food sales impacts, the extent to which such store closures become problematic for the retail market will also depend upon the market strength, regulatory controls, and actions pursued by property owners. These market area characteristics and the resulting likelihood of potential vacancies causing urban decay are discussed in the following chapter.

[20] See Exhibit B-1 for the sales per square foot estimate.

IX. URBAN DECAY DETERMINATION

The purpose of this chapter is to assess the degree to which development of the Rockridge Safeway expansion Project in Oakland will or will not contribute to or cause urban decay. This includes impacts associated with the Project combined with other cumulative planned retail development. This chapter discusses the definition of urban decay, the study's approach to determining urban decay potential, and ALH Economics' urban decay determination.

STUDY DEFINITION OF URBAN DECAY

For the purpose of this analysis, urban decay is defined as, among other characteristics, visible symptoms of physical deterioration that invite vandalism, loitering, and graffiti that is caused by a downward spiral of business closures and long term vacancies. The outward manifestations of urban decay include, but are not limited to, plywood-boarded doors and windows, parked trucks and long term unauthorized use of the properties and parking lots, extensive gang and other graffiti and offensive words painted on buildings, dumping of refuse on site, overturned dumpsters, broken parking barriers, broken glass littering the site, dead trees and shrubbery together with weeds, lack of building maintenance, homeless encampments, and unsightly and/or dilapidated fencing. A project's economic impacts on a community are only considered significant if they lead to adverse physical changes in the environment.

APPROACH TO DETERMINING URBAN DECAY POTENTIAL

ALH Economics engaged in several tasks to assess the probability of urban decay ensuing from Project development and the identified cumulative projects. These tasks revolved around assessing the potential for closed retail store spaces, if any, to either (a) remain vacant for a prolonged period of time such that they contribute to the multitude of causes that could eventually lead to urban decay, or (b) be leased to other retailers within a reasonable marketing period.

The purpose of this research was to determine if sufficient retailer demand exists to absorb vacated space in the event existing retailers close due to any negative economic impacts of the Project and the development of other planned retail. ALH Economics conducted field research and contacted real estate brokers and third party resources to determine the commercial health of the market area.

THE CURRENT ENVIRONMENT

ALH Economics conducted fieldwork throughout the Oakland portion of the market area and the City of Piedmont, which is fully encompassed within the market area. The purpose of this fieldwork was to perform reconnaissance of the Project site, identify and visit select competitive retailers, examine the physical condition of major shopping centers and commercial shopping corridors, and identify existing retail vacancies and assess their condition and appearance. Much of the findings from this field reconnaissance were presented earlier during the review of the market area's retail corridors and the individual grocery and food store descriptions. These personal observations are complemented by historical and current retail market performance data, demonstrating the underlying strength or weakness of the local commercial retail market.

Retail Market Statistics

Historically, the City of Oakland has generally maintained a relatively healthy retail market sector. Historical trend data in Exhibit 21 presents general vacancy, absorption, and new construction trends in Oakland by quarter beginning in 2006. Such trend data are not available exclusively for the Oakland portion of the market area. However, citywide trends in general are informative, and the fieldwork conducted in the Oakland portion of the market area suggested that the market area's market conditions area are likely as strong as the City's as a whole.

Exhibit 21 indicates that as of first quarter 2012, Oakland had an overall retail vacancy rate of 3.9%. This rate falls in the middle of noted rates during the 2006 to 2012 time period, with vacancy as high as 4.9% and as low as 2.7%. Throughout the course of the most recent recession and its aftermath retail vacancy has been low in Oakland, never exceeding 4.9% since the first quarter of 2011. This indicates a strong retail market in the City of Oakland, which has a base of approximately 22.3 million square feet of retail space. In general, retail markets are deemed most healthy when there is some increment of vacancy, at least 5.0%, which allows for market fluidity and growth of existing retailers. Thus, the first quarter 2012 Oakland retail vacancy rate of 3.9% is a low vacancy rate, indicative of a very strong and tight retail market.

In all likelihood the retail inventory tracked in Exhibit 21 does not comprise a full census of Oakland's commercial retail space. The data provide a strong indicator of overall market conditions, and thus is considered representative of Oakland's retail market performance.

Retail Lease Transactions

Exhibit 21 demonstrates that retail vacancies in Oakland are finding new tenants. This exhibit identified 115 retail leases executed over a one-year period, from April 2011 through the end of March 2012, totaling 214,158 square feet of leased space, with an average size of about 1,900 square feet. This volume of lease transactions, during a period of time still effected by the most recent national recession, is an indicator of strong interest in Oakland's commercial retail market.

Retail Vacancies

Exhibit 22 presents listings of retail vacancies as of June 2012 for Oakland. The list is extensive, and includes properties throughout the City, not just within the Project's market area. The list should therefore not be interpreted as a list of only market area vacancies, nor is the list a complete inventory of vacancies. However, it is an indicator of existing vacancies, and serves to demonstrate that the market area's vacancies are only a small portion of the City's retail vacancies. In reviewing this list of vacancies it is important to remember that despite the quantity of vacancies, Oakland's retail vacancy rate was measured at 3.9% during the timeframe represented.

Within the market area portion of the City of Oakland, the existing vacancies included in Exhibit 22 for which development plans are not in progress (excluding vacancies at Rockridge Plaza) total approximately 150,000 square feet, or 17% of the City's retail vacancies. There are about 22 such vacancies noted in the market area, located along major retail nodes and shopping districts, including Broadway, Lakeshore Avenue, Grand Avenue, Harrison Street, Piedmont Avenue, Telegraph Avenue, and San Pablo Avenue. Other retail vacancies exist in the market area, but the greatest majority appears to be referenced in Exhibit 22. The average market area vacancy noted is approximately 6,800 square feet, with several larger vacancies mostly comprising former auto dealerships, which can provide problematical reuse scenarios. The largest vacancy, totaling 17,000 square feet, is contiguous space located on Telegraph Avenue in Oakland's Northgate/Koreatown area. There are other market area vacancies in the Northgate/Koreatown area as well as numerous vacancies along the portion of Broadway to the south of the Rockridge Safeway site. These are the two market area commercial districts that are the most run down and are not characterized by cohesive commercial uses, with the existing commercial properties interspersed with a range of other uses such as medical- and auto-related. The southern portion of Temescal/Koreatown, which is a transitional commercial area, also appears to have a greater propensity for vacant commercial spaces than most other portions of the market area. In contrast, the market area's strongest shopping districts, such as a Piedmont Avenue, Rockridge, Lakeshore Avenue, and Grand Avenue/Grand Lake, typically have none or very few vacancies, with vacancies filling quickly when they become available. In general, most of the market area vacancies are well to reasonably well maintained, with only a few properties exhibiting select indicators of deterioration, such as boarded up windows or doors, including some appearing to be pursuant to fire damage.

The most notable market area vacancy is very near the Project site, comprising the former Poppy Fabrics store on Broadway just north of 51st Street. This long-term vacant property shows current evidence of graffiti, although in the past examples of graffiti were abated. Redevelopment of the Rockridge Safeway could prove beneficial to this property, enhancing the overall commercial draw and appeal of the immediate environs. Overall, the market area retail vacancies are well-maintained and the commercial real estate market appears relatively healthy.

POTENTIAL FOR URBAN DECAY RESULTING FROM THE PROJECT

Contributing Causes to Urban Decay

Before considering how the Project and cumulative projects might affect the market and environs, it is useful to focus on what constitutes the *environmental* impact known as urban decay. The leading court case on the subject, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1204, described the phenomenon as "a chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake." The court also discussed prior case law that addressed the potential for large retail projects to cause "physical deterioration of [a] downtown area" or "a general deterioration of [a] downtown area." (Id. at pp. 1206, 1207). When looking at the phenomenon of urban decay, it is also helpful to note economic impacts that do not constitute urban decay. For example, a vacant building is not urban decay, even if the building were to be vacant over a relatively long time. Similarly, even a number of empty storefronts will not constitute urban decay. Based on the preceding descriptions regarding urban decay, therefore, ALH Economics' analysis examined whether there was sufficient market demand to support the Project without affecting existing retailers so severely such as to lead to a downward spiral toward decay.

There are existing retail vacancies in the market area. Most of the vacant retail spaces observed during field reconnaissance of the market area are in good condition, with limited signs of deterioration or decay. These vacancies are occurring independent of Project or cumulative project development. The condition of the vacancies indicates that property owners are, in the most part, engaging in property maintenance efforts and providing upkeep even in the absence of tenants. The few exceptions to this observation are very limited.

The findings presented earlier regarding the Project's sales impacts indicate the potential for $14.2 million in market area sales diversions, in the categories of food & beverage stores and home furnishings & appliances. When the broader range of cumulative projects is considered, sales impacts were additionally identified in clothing & clothing accessories and other retail categories, with the cumulative total of all sales impacts increasing to $59.7 million. These are impacts remaining after sales leakage is captured by the Project as well as the cumulative projects. A portion of these impacts are anticipated to be absorbed through new growth, recaptured sales from the closed Andronico's on Telegraph Avenue, and some retailer repositioning. The level of impacts that may remain even after new demand and retailer repositioning are accounted for can lead to any one or more of the following consequences:

1. sales diversion from existing market area retailers;
2. slower than anticipated completion and opening of space at the Project and the cumulative retail developments;
3. lower initial sales volumes at the Project and the cumulative retail developments; and
4. a longer than estimated period of time to reach stabilized sales among the new retail developments.

In other words, the estimated sales impacts are likely to affect two types of businesses/retailers: existing retailers (#1 above); and the developers and future tenants of the other retail centers proposed for the market (#2-#4 above). With regard to the impact on existing retailers, some existing stores in the impact categories could sustain a short-term reduction in sales while others may sustain more long-term reductions. It is when stores close that concerns about urban decay come to the forefront. However, ALH Economics does not anticipate store closures relative to development of the Project and cumulative projects, thereby limiting the potential for urban decay to ensue as a result of Project development.

Urban Decay Conclusion

In developing a conclusion regarding the potential for urban decay, ALH Economics relied on the definition presented earlier in this chapter, which focused on determining whether or not physical deterioration would likely result from the opening of the Project and other cumulative retail developments. ALH Economics' conclusion is based on consideration of current market conditions, findings regarding diverted sales, and regulatory controls, as summarized below:

> ***Current Market Conditions***: The field research and market research indicated that retail market conditions are strong in the market area. The City of Oakland has a low retail vacancy rate, with few vacancies in the market area's major commercial shopping nodes. This indicates that while there are a few such properties, long-term retail vacancy is not a prevalent issue in the market area. There are limited retail properties in Piedmont and thus no appreciable retail vacancy in Piedmont. Existing retail vacancies generally appear well-maintained and retail vacancies in the market area are typically absorbed quickly, especially in the market area's major retail shopping districts. There are only limited instances of poorly maintained retail vacancies within the market area.
>
> ***Diverted Sales and Additional Retail Leakage***: ALH Economics anticipates that despite the Project's and cumulative projects' sales impacts, especially in the food & beverage category, existing retailers will not close as a result of the new project openings. The most competitive existing stores are high retail sales performers and are anticipated to be able to withstand the enhanced competition. However, if any stores do close, the market area is anticipated to be characterized by continued retail

leakage in almost all major retail categories. This remaining leakage provides an opportunity for other retailers to enter the marketplace focused on satisfying unmet retail demand. Given the size of Oakland's retail market, over 200,000 incremental square feet would need to become vacant to increase Oakland's retail vacancy rate by 1.0%. Even with this level of increment, the Oakland retail market would still be operating at a healthy overall vacancy rate.

Regulatory Controls: City ordinances, such as the City of Oakland Municipal Code of Ordinances Chapter 8.10 on Graffiti, Chapter 8.18.060 on Noxious Weeds, Chapter 8.24 on Property Blight, Chapter 8.38.170 on Dumping Garbage, Chapter 8.54 on Vacant Building Registration, Chapter 12.04 on Sidewalk, Driveway, and Curb Construction and Maintenance, require property owners to maintain their properties so as not to create a nuisance by creating a condition that reduces property values and promotes blight and neighborhood deterioration. Enforcement of these ordinances can help prevent physical deterioration due to any long-term closures of retail spaces. Code enforcement is managed by the City of Oakland's Building Services Division. They look into the accumulation of trash, debris, graffiti, and other blight on properties. The Building Services Division is responsible for enforcement and is allowed to take actions needed to enforce the ordinances. Also, according to Municipal Code Chapter 15.08.110, the owner in violation, "is liable for any costs, expenses, accruing interest, and disbursements paid for or incurred by the City of Oakland and any of its contractors in correction, abatement, and prosecution of the violation."[21] Citizens can report code violations through a telephone hotline or online form. Once a complaint is issued and determined valid, the owner has 16 days to pay the violation ticket or work with the City to fix the violation.

Similar codes also exist in the City of Piedmont, such as the City of Piedmont Municipal Code of Ordinances Chapter 6 on the Abatement of Nuisances including "Weeds, as defined in Government Code Section 39561.5 or successor statutes, growing in or on streets, sidewalks and private property in the City," "Rubbish, refuse, unsightly accumulations of dirt, sand, and gravel, and the like on parkways, sidewalks, streets or private property in the City", "Tangible personal property not intended for outdoor use (including but not limited to broken or discarded furniture, household equipment and furnishings, garbage cans, or shopping carts) which is stored on property so as to be visible from a public street or the vicinity of the property", "Overgrown vegetation visible from a public street and likely to harbor rats, vermin or other nuisances or which obstructs the view of drivers on public streets or private driveways and creates a safety hazard, or which impedes, obstructs or denies pedestrian or other lawful travel on sidewalks, walkways, or other public rights-of-way", "Vehicles which are wrecked, inoperable, or in a state of partial repair, whether or not located in a paved or graveled driveway, when visible from a public street or the vicinity of the property", "Buildings which appear to be abandoned, partially destroyed, left in an unreasonable state of partial construction or have been declared substandard or dangerous by the City's building official", "Buildings with windows and doors intended to be glazed which contain broken glass or no glass at all. Plywood or other material used to cover such window and door space for more than two weeks, if

permitted under this code, shall be painted in a color or colors compatible with the remainder of the building". Chapter 6 also covers the enforcement of these ordinances, all of which can help prevent physical deterioration due to any long-term closures of retail spaces. If properties require nuisance abatement there are controls in place to provide this abatement. The property owner will receive a written notice from the City, the owner has 14-18 calendar days to fix the nuisance or 10 calendar days to appeal, if neither of these actions are taken then the owner will be charged for the violation or a lien will be placed on the property.[22]

During the fieldwork conducted in October, 2011, and during periodic supplemental fieldwork in 2012, there have been only a few visible signs of litter, graffiti, weeds, or rubbish associated with existing commercial nodes in the Project's market area, most notably at the periphery of some of the nodes, such as along the southern portion of Temescal/Koreatown. Thus, ALH Economics concludes that existing measures to maintain private commercial property in good condition in the market area are generally effective and will serve to help preclude the potential for urban decay and deterioration in the event any existing retailers in the market area close following the operations of the Project and other cumulative retail projects.

Based upon these findings, ALH Economics concludes that the Rockridge Safeway expansion Project and the identified cumulative projects will not cause or contribute to urban decay.

ASSUMPTIONS AND GENERAL LIMITING CONDITIONS

ALH Urban & Regional Economics has made extensive efforts to confirm the accuracy and timeliness of the information contained in this study. Such information was compiled from a variety of sources, including interviews with government officials, review of City and County documents, and other third parties deemed to be reliable. Although ALH Urban & Regional Economics believes all information in this study is correct, it does not warrant the accuracy of such information and assumes no responsibility for inaccuracies in the information by third parties. We have no responsibility to update this report for events and circumstances occurring after the date of this report. Further, no guarantee is made as to the possible effect on development of present or future federal, state or local legislation, including any regarding environmental or ecological matters.

The accompanying projections and analyses are based on estimates and assumptions developed in connection with the study. In turn, these assumptions, and their relation to the projections, were developed using currently available economic data and other relevant information. It is the nature of forecasting, however, that some assumptions may not materialize, and unanticipated events and circumstances may occur. Therefore, actual results achieved during the projection period will likely vary from the projections, and some of the variations may be material to the conclusions of the analysis.

Contractual obligations do not include access to or ownership transfer of any electronic data processing files, programs or models completed directly for or as by-products of this research effort, unless explicitly so agreed as part of the contract.

Exhibit 2
Rockridge Safeway Store
Rockridge Safeway Shopping Center Distribution of Net Sales Estimates
in 2011 Dollars

---

(1) See Exhibit 1.
(2) ALH Urban & Regional Economics estimates that 80% of sales for this project will be attributed to consumers residing inside the market area.
(3) The analysis assumes that all of the incremental space will comprise grocery sales, as there is already a pharmacy located in this store.
(4) The sales per square foot estimates for Safeway were estimated by analyzing sales for representative Safeway stores in and near the market area provided by Nielson, Trade Dimensions.
(5) The sales per square foot estimate for the restaurant space is based on the average sales among major national restaurant chains. See the Retail Maxim summary data in Exhibit B-1, which provides a summary of average store sales among many stores and retail categories across the United States.
(6) CVS sales are categorized in the Other Retail category in the city level data reported by the State of California Board of Equalization. While this store serves the market primarily as a general merchandise store, its sales are retained in the category relevant to the BOE reported sales data.
(7) CVS nationally performs at approximately $800 per square foot according to Retail Maxim. However, when this store was fully utilized, it served more the function of a general merchandise store like Target than a pharmacy like most CVS or Walgreen stores. Moreover, the store has been contracting its sales area pending its potential demolition. Therefore, the analysis conservatively assumes sales performance of $158 per square foot comparable to an average of $315 per square foot spread across one-half the store area. The $315 per square foot rate is generally comparable to average Target store performance cited in Exhibit B-1.
(8) Retail tenants for the balance of the retail space have not yet been determined. ALH Urban & Regional Economics developed working assumptions for this space based upon professional judgment and experience in the retail industry. The assumptions include the following distributions by type of retail space: 15% each in home furnishings and appliances and general merchandise, 20% clothing and clothing accessories, and 50% other retail.
(9) The sales per square foot estimate for the home furnishings and appliances space is based on the domestics catgeory. See the Retail Maxim summary data in Exhibit B-1.
(10) The sales per square foot estimate for the clothing and clothing accessories stores space is based on the average for apparel. See the Retail Maxim summary data in Exhibit B-1.
(11) The sales per square foot estimate for the general merchandise space is based on the department stores catgeory. See the Retail Maxim summary data in Exhibit B-1.
(12) The sales per square foot estimate for the other retail space is based on the average of other retail categoeis. See the Retail Maxim summary data in Exhibit B-1.
(13) Presents total and weighted average sales for the net additional competitive retail space.
(14) There are no competitive retail sales associated with the Non-Retail service uses.

Total	**$559,618,000**	**$563,465,000**	**$519,816,000**	**$564,392,000**	**$2,207,291,000**		**$2,878,259,984**	**28.1%**	**$843,272,201**

Sources: California State Board of Equalization, "Taxable Sales in California" reports, for Third Quarter 2009, Fourth Quarter 2009, First Quarter 2010, and Second Quarter 2010; and ALH Urban & Regional Economics.

(1) See footnotes 3 through 5 regarding taxable sales adjustment.
(2) See Exhibits B-4, B-5, and B-6 for the analytical bridge between Claritas retail sales categories and BOE sales categories. The purpose of this exhibit is to estimate the share of Oakland retail sales occurring in the Oakland portion of the Rockridge store market area.
(3) Sales for Food and Beverage Stores have been adjusted to account for non-taxable sales; only 30.0% of all food store sales are estimated to be taxable.
(4) Sales for General Merchandise Stores have been adjusted to account for non-taxable food sales, since some General Merchandise Store sales include non-taxable food items. ALH Urban & Regional Economics estimates that at least 20% of General Merchandise sales are for grocery items that are also non-taxable. This estimate is based on analysis of the 2007 U.S. Economic Census, which attributes 21% of General Merchandise Stores sales to food.
(5) Sales for Other Retail Group have been adjusted to account for non-taxable drug store sales, since drug store sales are included in the Other Retail Group category. ALH Urban & Regional Economics estimates that 33.0% of drug store sales are taxable, based on discussions with the California BOE and examination of U.S. Census data. In Alameda County, drug store sales in Q3 2009, Q4 2009, Q1 2010 and Q2 2010 represented approximately 15.9% of all Other Retail Group sales. ALH Urban & Regional Economics applied that percentage and then adjusted upward for non-taxable sales.

Total	**100.0%**	**$2,705,000**	**$2,747,000**	**$2,583,000**	**$2,673,000**	**$10,708,000**	**$17,283,280**

Sources: California State Board of Equalization (BOE), "Taxable Sales in California" reports, for Third Quarter 2009, Fourth Quarter 2009, First Quarter 2010, and Second Quarter 2010; Claritas; and ALH Urban & Regional Economics.

(1) The BOE does not release category sales data for the City of Piedmont due to concerns about confidentiality. The BOE provides totals for all retail and food services combined. To best allocate the sales by retail category for the purpose of compiling a market area retail sales base estimate the sales distribution is benchmarked to Claritas sales estimates by retail category for the City of Piedmont.
(2) See Exhibit B-7 for a breakdown of the 2010 Claritas Retail Sales estimates into BOE categories for the City of Piedmont.
(3) Total sales are pursuant to reporting by the BOE. The quarterly category sales are estimated based on the category percentages derived from Claritas, such as the 26.3% figure in Food and Beverage Stores.
(4) Sales for Food and Beverage Stores have been adjusted to account for non-taxable sales; only 30.0% of all food store sales are estimated to be taxable. Because of the limited retail offerings in Piedmont, no other retail categories are adjusted for non-taxable sales.

Sources: U.S. Bureau of Labor Statistics; Hinderliter de Llamas via the City of Oakland; and ALH Urban & Regional Economics.

(1) See Exhibit 10.
(2) The sales base is adjusted pursuant to 2010 to 2011 taxable retail sales trends in the City of Oakland retail districts that are included in the market area. Quarterly sales tax data for the areaswere provided by category through 3rd quarter 2011. Since the City of Oakland dominates the market area sales base, the analysis applies similar increases to the entire sales base,
(3) Percent increase based upon CPI index from September 2010 to September 2011.

Total	**$29,685**	**$54,781,839**

Source: ALH Urban & Regional Economics.

(1) Household demand is equal to the demand per category presented in Exhibit 10, adjusted upward to 2011 dollars based on the 3.5% inflation rate presented in Exhibit 11, and multiplied by the estimated new household growth.
(2) See Exhibit 5 for projections of 1,845 new market area households between 2012 and 2015.

Exhibit 15
Rockridge Safeway Store
Cumulative Major Retail Developments (10,000+ Square Feet)
Within and Near the Market Area (1)
June/July 2012

Project	City	Description	Estimated Net New Retail Square Footage	Status	Location	Distance From Safeway	Expected Opening/ Completion
Market Area							
1. Civiq -51st and Telegraph (2)	Oakland	This project will retain the previously approved entitlements or increase ground floor retail to19,600 square feet, 100 residential units, and 60,000 square feet of office space.	19,600	Approved	5110 Telegraph Avenue at 51st Street	0.6	N/A
2. Bev Mo!	Oakland	This project has submitted a CUP application to the City of Oakland to locate in space formerly occupied by Blockbuster Video.	5,622	Proposed	3868 Piedmont Avenue	1.0	2,013
3. Macarthur BART Transit Village (2)	Oakland	This is an affordable housing and redevelopment project located on 6.84 acres adjacent to the BART station. The project comprises 624 residential units, 42,500 square feet of retail/commercial space, and surface parking.	42,500	Under Construction, Phased	W. MacArthur Boulevard, Telegraph Avenue, 40th Street, and Highway 24	1.3	2020
4. Valdez & 23rd Street Project	Oakland	This project includes 281 residential units, 500-car parking structure, including 250 public spaces, and potential space for 12,000 square feet of retail.	12,000	Extension granted January 2009	Valdez and 23rd Streets	2.0	N/A
5. College & Claremont Safeway	Oakland	Redevelopment of existing shopping center with new 62,167-square-foot shopping center. This center will replace an existing 25,380 square foot center, resulting in a 36,787 net square feet of retail developed (see Exhibit 15).	36,787	Proposed	6310 College Avenue	1.1	2014
Outside the Market Area							
6. Kaiser Center	Oakland	This project includes demolition of 280,000 square feet, construction of 2 new towers: one 42-stories with 780,000 square feet of office space and one 34-stories with 565,000 square feet of office space, and potentially 22,000 square feet of retail.	22,000	Approved	300 Lakeside Drive	2.1	N/A
7. Pak 'N Save Foods	Emeryville	Store update, featuring redesigned northern façade including additional entry, replacement of all signs and two new signs, minor improvements to parking lot including new landscaping. The building permit application was received in September 2011.	0	Approved	3889 San Pablo Avenue	2.2	2012
8. Berkeley Iceland	Berkeley	This project entails redevelopment of the Berkeley Iceland facility. Sports Basement is planning to redevelop the property with 61,100 square feet of retail, 1,325 square feet of office, and 476 square feet of storage.	61,100	EIR in progress	2727 Milvia Street; southeast corner of Milvia and Derby	2.5	2013
9. Parkside Project	Emeryville	Construction of a new rental project with 168 residential units, 5 live-work units, 3 flex space units, 10,222 square feet of retail space including space for one restaurant, and 299 parking spaces. Project includes new park along Stanford Avenue to replace City parking lot.	10,222	Approved	Block bounded by Powell, Hollis, and Doyle streets and Stanford Avenue	2.5	2013
10. Jack London Square Redevelopment (2)	Oakland	Master Plan of 1.2 million square feet of mixed-use retail, commercial, and office. The remaining phase of the project includes a 140,000-square-foot office building, 250-room hotel, an eight-story, 155,000-square-foot office building, and 10,000 square feet of retail.	10,000	Approved Site	Alice, 2nd, and Harrison streets, and Embarcadero	3.2	N/A
11. Bay Street – Site A	Emeryville	Completion of development of South Bayfront Retail/Mixed Use Project PUD with a hotel and retail north of Christie Avenue. The preliminary site plan offers three retail spaces of 4,400, 6,000, and 10,000 square feet. Tenant types are unknown.	20,400	Proposed	NE of Christie Avenue and Shellmound Street	3.3	N/A

Exhibit 15
Rockridge Safeway Store
Cumulative Major Retail Developments (10,000+ Square Feet)
Within and Near the Market Area (1)
June/July 2012

Project	City	Description	Estimated Net New Retail Square Footage	Status	Location	Distance From Safeway	Expected Opening/ Completion
12. Bay Street – Site B	Emeryville	This project comprises a 150,000-square-foot Macy's department store and public parking garage.	150,000	Proposed	Shellmound and Powell streets	3.3	N/A
13. Gateway @ Emeryville	Emeryville	This is a mixed use project that includes 265 residential rental units, 14,100 square feet of retail space, and a 142- room hotel.	14,100	Proposed	5801 - 5861 Christie Avenue	3.3	N/A
14. Shattuck Safeway	Berkeley	Remodel an existing 28,250-square-foot Safeway grocery store, construct 17,250 square feet of new floor area, and extend the hours of operation for the store.	17,250	Under Construction	1425 Shattuck Avenue	3.9	2012
15. Oak to Ninth Mixed Use	Oakland	The project is part of a new planned waterfront zoning district comprising 64.2 acres and has the potential for 3,100 residential units, 200,000 square feet of commercial space (which would include neighborhood serving retail), 3,950 structured parking spaces, 29.9 acres public open space, 2 renovated marinas, 170 boat slips, and a wetlands restoration area. In January 2012 the Port Commission extended the deadline for the close of escrow until January 31, 2013. This project is estimated to break ground in 2013.	200,000 (3)	Approved	Waterfront site bounded by Fallon Street, Embarcadero Road, 10th Ave., and the Oakland Estuary	4.1	2015
16. Foothill Square Redevelopment Project	Oakland	Redevelopment and expansion of a 157,642 square-foot commercial shopping center to 200,916 square feet. Tenants include a new 71,950-square foot Foods Co., a decrease of the Ross store to 24,000 square feet, and many of the smaller existing tenants will remain. The existing 29,380-square-foot grocery space has been vacant for approximately six years. The total net new space is 43,274 square feet. They are schedule to break ground in 2012.	85,844 (4)	Approved	10700 MacArthur Boulevard	10.4	2013

(1) Projects listed based on distance from the Project site.
(2) The project planner is not responding to queries. Information observed from other sources and may not be current.
(3) According to the project planner, the 200,000 square feet of commercial space would not likely consist of all retail; however, to be conservative, ALH Urban & Regional Economics is allocating all of the space to retail.
(4) Although the total net new square footage for Foothill Square is 43,724 square feet, ALH Urban & Regional Economics is including the entire Foods Co. in net new sales since the existing grocery space has been vacant for approximately six years.

Exhibit 16
College & Claremont Safeway Store
Project Description

Site Use		Net Change Square Feet Existing	Proposed	Net Change
Grocery		24,260	50,860	26,600
In-store Pharmacy (1)		0	650	650
	subtotal	**24,260**	**51,510**	**27,250**
Restaurant		0	2,744	2,744
Retail		1,120 (2)	7,913	6,793
	subtotal	**1,120**	**10,657**	**9,537**
Total		**25,380**	**62,167**	**36,787**

Sources: City of Oakland, "Safeway Shopping Center – College and Claremont Avenues Draft Environmental Impact Report," July 1, 2011; and ALH Urban & Regional Economics.

(1) The Safeway store upon completion will include a pharmacy. In July 2011, Safeway purchased the Chimes Pharmacy across College Avenue from the Safeway site. This site is now functioning as a Safeway facility, and the operation will be moved into the expanded Safeway upon completion.
(2) The existing space comprises shop space associated with the former 76 gasoline station and auto repair garage on the site. While this space will be replaced, the existing space is not currently generating any sales. Therefore, all of the proposed other retail space will comprise net new operational space.

College & Claremont Safeway Store
Distribution of Sales and Net Sales Estimates
in 2011 Dollars

				Net New Sales	
Store Characteristic	**California Board of Equalization Sales Category**	**Net New Square Feet (1)**	**Sales per Square Foot Estimates**	**Total**	**Generated by Shared Market Area Residents (2)**
Grocery	Food and Beverage Stores	26,600	$800 (3)	$21,280,000	$5,958,400
In-store Pharmacy	Other Retail	650	$800 (3)	$520,000	$145,600 (4)
subtotal		27,250		$21,800,000	$6,104,000
Restaurant	Food Services and Drinking Places	2,744	$449 (5)	$1,231,412	$344,795
Retail (6)	Other Retail	5,302	$357 (7)	$1,892,710	$529,959
	Apparel	2,611	$434 (8)	$1,133,300	$317,324
subtotal		7,913 (9)		$3,026,010	$847,283
Total/Weighted Average		**37,907**	**$687**	**$26,057,422.53**	**$7,296,078**

Source: ALH Urban & Regional Economics.

(1) See Exhibit 15.
(2) ALH Urban & Regional Economics estimates that 38 percent of the market area sales at the expanded College & Claremont Safeway will be attributed to consumers residing in the portion of this store's market area shared with the Rockridge Safeway. This is based on demographic data estimated by ALH Urban & Regional Economics and presented in a parallel urban decay analysis conducted for the College & Claremont Safeway Store, dated December 30, 2011.
(3) The sales per square foot estimates for Safeway were estimated by analyzing sales for representative Safeway stores in and near the market area provided by Nielson, Trade Dimensions.
(4) The pharmacy sales will not all be net new sales. To be conservative, however, the analysis treats these sales as net new to avoid underestimating the potential increment in new sales once the pharmacy operation is incorporated into the Safeway store space.
(5) The sales per square foot estimate for the restaurant space is based on the restaurant category, see Exhibit B-1.
(6) Tenants for this additional space have not yet been identified. Reflective of the general mix in the Project area, the analysis assumes tenants will comprise 2/3 in the Other Retail category, which includes gifts, books, jewelry, and florists, among others, and 1/3 in the Apparel category.
(7) The sales per square foot estimate for the Other Retail space is based on the average for Other Retail, see Exhibit B-1.
(8) The sales per square foot estimate for the Apparel space is based on the average for apparel, see Exhibit B-1.
(9) While only 6,793 square feet are net new per Exhibit 1, the existing space being replaced is currently vacant. Thus, all of the planned Other Retail space will generate net new sales.

Exhibit 18
Rockridge Safeway Store
Sales Estimates for Cumulative Projects (1)
in 2011 Dollars

Project Name	Miles From Safeway	Estimated Sq. Ft. (2)	Sales per Sq. Ft.	Total Sales	Estimated Sales Generated by Market Area Residents

subtotal		85,844		$39,333,242	$1,966,662
Total		**522,925**		**$216,124,786**	**$56,361,844**

Sources: The Kroger Co., "Form 10-K Report for the Fiscal Year ending January 29, 2011"; and ALH Urban & Regional Economics.

(1) Projects with an undetermined timeline are too speculative to include their sales in this analysis, as well as projects that are too far from the Rockridge store site and too small to be considered competitive. Project numbers match the numbers on Exhibit 15.

(2) See Exhibit 15.
(3) Average sales per square foot for the neighborhood center category. See Exhibit B-1.
(4) ALH Urban & Regional Economics estimates that 100% of sales for this project will be attributed to consumers residing inside the market area.
(5) Average sales per square foot estimate for the BevMo! chain, across all store sizes based on generalized data research.
(6) ALH Urban & Regional Economics estimates that 80% of sales for this project will be attributed to consumers residing inside the market Area.
(7) ALH Urban & Regional Economics estimates that 50% of sales for this project will be attributed to consumers residing inside the market Area.
(8) See Exhibit 17 for derivation of average sales per square foot.
(9) ALH Urban & Regional Economics estimates that 38% of sales for this project will be attributed to consumers residing in the market area based on market area demographic overlap, see Exhibit 17.
(10) ALH Urban & Regional Economics estimates that 10% of sales for this project will be attributed to consumers residing from inside the market area.
(11) Average sales per square foot for the average of the sporting goods category, see Exhibit B-1.
(12) See Exhibit 2 for estimated area Safeway stores sale per square foot.
(13) ALH Urban & Regional Economics estimates that 20% of sales for this project will be attributed to consumers residing from inside the market area.
(14) Average sales per square foot for the average of the other retail categories, see Exhibit B-1.
(15) Average sales per square foot for the Foods Co. was calculated based on the annual 10-K report from The Kroger Co.. The reported total supermarket sales without fuel was $67.882 million, the total supermarket square footage was 149,000,000. The 2010 sales per square foot figure was then inflated to 2011 dollars based on the CPI for 2010 to 2011 of 2.6%.

(16) ALH Urban & Regional Economics estimates that 5% of sales for this project will be attributed to consumers residing from inside the market area.

Source: ALH Urban & Regional Economics.

(1) See Exhibit 2.
(2) See Exhibit 19.
(3) See Exhibit 12.
(4) Potential Cumulative Project leakage recapture figures are based upon assumptions prepared by ALH Urban & Regional Economics. The assumptions vary by category, depending upon the nature of the prospective Project tenant, the type of existing market area retailers, and the likelihood that retailers outside the market area will continue to attract sales from the market area retailers due to their brand, national orientation, or regional prevalence.
(5) Includes the proposed Rockridge Safeway store. Calculations of negative dollar values are shown as $0, indicating that no related impacts are anticipated.

Building Notes:

Well maintained office building with attractive lobby and common areas, central East Bay location with great freeway access; close proximity to City Center, the Kaiser Center, Lake Merritt, and 1-block to the Nineteenth Street BART station. Excellent space for nonprofits, engineers, architects, attorneys or general office. Additional monthly parking is available directly across the street.

This building includes a remodeled lobby, a modernized elevator, on-site storage, air conditioning and limited on-site parking. It includes a 7,242-SF basement.

The property is near BART & AC transit lines.

(1) Safeway has two Oakland stores under environmental review, the Rockridge store and the College & Claremont store. Urban decay analysis was conducted for both stores. This area identifies the portion of each store's market area estimated in the urban decay analyses to overlap between the two stores.
(2) For data retrieval purposes it is necessary to identify both the 2000 and 2010 census tracts for the market areas.

FIRM HISTORY, SELECT QUALIFICATIONS, AND RESUME

FIRM INTRODUCTION

ALH Urban & Regional Economics (ALH Economics) is a recently formed sole proprietorship devoted to providing urban and regional economic consulting services to clients throughout California. Until early summer 2011, Amy L. Herman, Principal of ALH Economics, was a Senior Managing Director with CBRE Consulting in San Francisco, a division of the real estate services firm CB Richard Ellis. CBRE Consulting was the successor name of Sedway Group, a well established urban economic and real estate consulting firm acquired by CB Richard Ellis in the late 1990s. Ms. Herman's tenure with Sedway Group and then CBRE Consulting's land use and economics practice totaled more than 20 years. During that time Ms. Herman established a strong professional network and client base providing a range of services such as economic development and redevelopment, market feasibility analysis, fiscal and economic impact analysis, location analysis, strategic planning, and policy analysis. Ms. Herman's client base includes governmental clients, transportation agencies, corporations, environmental consultants, educational and health institutions, non-profits, and developers.

During spring 2011, CBRE chose to restructure the land use and economics practice area within CBRE Consulting. Ms. Herman took this opportunity to establish her own firm, through which she can continue to serve her existing client base and expand her practice in areas that suit her professional and personal interests. Examples of clients that have already retained the services of ALH Economics include the following: University of California at Berkeley; LSA Associates; Jack Faucett Associates; Hanna Novato, LLC; Terry Margerum & Associates; Raney Planning and Management, Inc.; Sedway Consulting; University of California at Riverside; During Associates; Lamphier-Gregory; Gresham Savage Nolan & Tilden, PC; California Gold Development Corporation; Environmental Science Associates (ESA); Arcadia Development Co.; PCR Services Corporation; Catellus Development Corporation; Sedgwick LLP; Michael Brandman Associates; the City of Concord; Victoria Ward, Limited, Hospital Council of Northern and Central California.

During her tenure with CBRE Consulting Ms. Herman developed a strong practice area involving the conduct of urban decay analyses as part of the environmental review process for projects with major retail components. A description of these services and recent projects follows. Also included are select examples of other economic impact studies conducted by Ms. Herman during her tenure with CBRE Consulting.

EXPERIENCE CONDUCTING RETAIL URBAN DECAY STUDIES

Description of Services

The Principal of ALH Economics, Amy L. Herman, has performed economic impact and urban decay studies for a number of retail development projects in California. These studies have generally been the direct outcome of the 2004 court ruling *Bakersfield Citizens for Local Control ("BCLC") v. City of Bakersfield* (December 2004) 124 Cal.App.4th 1184, requiring environmental impacts analyses to take into consideration the potential for a retail project as well as other cumulative retail projects to contribute to urban decay in the market area served by the project. Prior to the advent of the Bakersfield court decision, Ms. Herman managed these studies for project developers or retailers, typically at the request of the host city, or sometimes for the city itself. Following the Bakersfield decision, the studies have most commonly been directly commissioned by the host cities or environmental planning firms conducting Environmental Impact Reports (EIRs) for the projects. Studies are often conducted as part of the EIR process, but also in response to organized challenges to a city's project approval or to Court decisions ruling that additional analysis is required.

The types of high volume retail projects for which these studies have been conducted include single store developments, typically comprising a Walmart Store, The Home Depot, Lowe's Home Improvement Warehouse, or Target store (including SuperTarget). The studies have also been conducted for large retail shopping centers, typically anchored by one or more of the preceding stores, but also including as much as 300,000 to 400,000 square feet or more of additional retail space with smaller anchor stores and in-line tenants.

The scope of services for these studies includes numerous tasks. The basic tasks common to most studies include the following:

- defining the project and estimating sales for the first full year of operations
- identifying the market area
- identifying and touring existing competitive market area retailers
- evaluating existing retail market conditions at competitive shopping centers and along major commercial corridors in the market area
- conducting retail demand, sales attraction, and spending leakage analyses for the market area and other relevant areas
- forecasting future retail demand in the market area
- researching the retail market's history in backfilling vacated retail spaces
- assessing the extent to which project sales will occur to the detriment of existing retailers (i.e., diverted sales)
- determining the likelihood existing competitive and nearby stores will close due to sales diversions attributable to the project
- researching planned retail projects and assessing cumulative impacts
- identifying the likelihood the project's economic impacts and cumulative project impacts will trigger or cause urban decay.

Many studies include yet additional tasks, such as assessing the project's impact on downtown retailers; determining the extent to which development of the project corresponds with city public policy, redevelopment, and economic development goals; projecting the fiscal benefits relative to the host city's General Plan; forecasting job impacts; analyzing wages relative to the existing retail base; and assessing potential impacts on local social service providers.

Recent Projects, Past 3 Years

High volume retail projects for which Ms. Herman has prepared economic impact and urban decay studies during approximately the past three years are listed below. This includes studies for projects that have successfully navigated the public approvals process or are currently in progress. Projects are listed alphabetically by the California city in which they are located. These projects represent a range of entitlement success, from projects already completed to projects lacking certified EIRs.

- Alameda, Alameda Landing, totaling 285,000 square feet anchored by a Target, project approved
- Apple Valley, Walmart Superstore, 240,000 square feet plus 9,000 square feet of additional retail, replacing existing Walmart Discount Store, EIR certified, engaged in the legal process; superseded by local initiative
- Bakersfield, Bakersfield Commons, totaling 1.2 million square feet of lifestyle retail space and 400,000 square feet of community shopping center space, EIR Certified and project approved
- Bakersfield, Crossroads Shopping Center, totaling 786,370 square feet, anchored by a Target, EIR Certified and project approved
- Bakersfield, Silver Creek Plaza, anchored by a WinCo Foods, totaling 137,609 square feet, EIR Certified and project approved
- Concord, Lowe's Commercial Shopping Center, totaling 334,112 square feet, anchored by a Lowe's Home Improvement Warehouse and a national general merchandise store; EIR Certified December 2008 with no subsequent legal challenge; store opened January 2010
- Eureka, Eureka Balloon Track Development, totaling 327,500 square feet of retail space, anchored by Home Depot, EIR certified, engaged in the legal process
- Fairfield, Green Valley Plaza, totaling 465,000 square feet; EIR certified and project approved, not yet under construction
- Fresno, Fresno 40, totaling 209,650 square feet, project approved and beyond legal challenge, seeking Conditional Use Permit for increased grocery square footage
- Hesperia, Main Street Marketplace, totaling 465,000 square feet, anchored by a Walmart Superstore and a Home Depot, Walmart under construction, expected completion September 2012
- Kern County, Rosedale and Renfro, totaling 228,966 square feet, anchored by a Target, EIR Certified and project approved
- Livingston, Blueberry Crossing, totaling 273,225 square feet, anchored by a large general merchandise store, project environmental process on hold
- Menlo Park, Beverages & More, 8,788-square-foot store opened February 2011
- Milpitas, Walmart Superstore, 17,640-square-foot expansion to existing Walmart; EIR certified by the Planning Commission but not by the City Council; superseded by local initiative
- Novato, Hanna Ranch, Novato, Hanna Ranch, mixed-use project including 44,621 square feet of retail space, 21,190 square feet of office space, and a 116-room hotel; EIR certified and project approved
- Oroville, Walmart Superstore, 213,400 square feet, replacing existing Walmart Discount Store, EIR certified but engaged in the legal process
- Palo Alto, Stanford Shopping Center, 240,000-square-foot expansion; project withdrawn by applicant
- San Francisco, Candlestick Point, 635,000 square feet of regional retail and Hunters Point, with two, 125,000-square-foot neighborhood shopping centers; EIR certified
- San Jose, Almaden Ranch, up to 400,000 square feet; FEIR certified by the Planning Commission, legal appeal in progress
- Sonora, Lowe's Home Improvement Warehouse, 111,196 square feet; store opened December 2010
- Ukiah, Costco, 148,000-square-foot warehouse membership store; DEIR in progress
- Ukiah, Walmart Superstore, 47,621-square-foot expansion to existing Walmart, EIR approved but project denied by the City Council
- Vallejo, WinCo grocery store, 71,393 square feet; FEIR certified by the Planning Commission, legal appeal in progress

There have been yet numerous other comparable studies conducted by Ms. Herman in California locations prior to the past three years. These also include projects located in Adelanto, American Canyon, Carlsbad, Chico, Citrus Heights, Gilroy, Hercules, Madera, Rancho Cordova, Sacramento, San Jose, Victorville, West Sacramento, and Willows.

EXPERIENCE CONDUCTING OTHER ECONOMIC IMPACT STUDIES

Following are description of other economic impact studies managed by Ms. Herman. These studies have been performed under a range of circumstances, including for existing institutions seeking to demonstrate their local and regional impacts to new development projects seeking public approvals. These studies were all initiated during Ms. Herman's tenure with CBRE Consulting; however, Ms. Herman is continuing to provide services to some of these projects through ALH Economics.

- ***University of California at San Diego/Economic Impact Analysis***. Ms. Herman managed a study of the economic impacts of UC San Diego on the City of San Diego, San Diego County, and the State of California. Financial data gathered from the University and companies started by alumni and faculty were used to estimate economic benefits in terms of spending, employment, and personal income. A model was developed to analyze these impacts using IMPLAN input-output multipliers. The model was provided to UC San Diego for their use in analyzing these impacts going forward. Select qualitative economic impacts were also analyzed and include UC San Diego's extensive contribution to the regional workforce, cultural opportunities, and community development efforts. Specifically, the community benefits associated with the medical and health sectors include medical training, significant research spending on health issues, and healthcare for local residents.

- ***Kaiser Permanente/Lancaster Medical District Economic Impact Analysis***. Ms. Herman managed a study of the economic impacts of a planned Kaiser Medical District in Lancaster, California. The facility is planned as part of a larger development area and will serve the growing Antelope Valley. The economic impacts associated with the hospital and medical office buildings include both one-time benefits from construction and on-going operational benefits. The quantifiable benefits include new jobs and income, increased local spending by Kaiser, and spending by new Kaiser employees. The Kaiser Medical District will also likely result in significant economic development impacts such as an increase in the annual community contributions in the region, establishment of local medical training programs and job recruitment, and attraction of adjacent real estate development.

- ***Forest City Enterprises/Economic Impact Analysis***. Ms. Herman conducted an economic impact analysis for a planned mixed-use development project in downtown Fresno. Ms. Herman estimated the project's one-time benefits including the number of direct construction period jobs, indirect jobs associated with the development effort, and construction worker spending in the local community. Similarly, on-going benefits were estimated to include on-site project management jobs, retail sales generated by project residents, and direct and indirect jobs generated by on-site retail spending. These benefits were analyzed on a local and regional level. Some of the qualitative benefits associated with green construction and operation were also analyzed, such as increasing the local knowledge base and the creation of a green cluster.

- ***Lawrence Berkeley National Laboratory/Economic Impact Study.*** Ms. Herman has twice conducted an economic impact analysis demonstrating the benefits of Lawrence Berkeley National Laboratory ("Berkeley Lab") to the City of Berkeley, the Bay Area region, and the State of

California. The study was also intended to be useful to Berkeley Lab in the process of preparing its Long Range Development Plan. The study focused on job generation, wages, and local and regional spending. The analysis culminated in a brief memorandum of findings, as well as an Excel-based economic impact model for Berkeley Lab's future use that was designed to update itself automatically with annual inputs provided by LBL. Recent updates to this study have been used as a springboard to analysis of the Lab's planned second Bay Area campus, for which Ms. Herman participated in public meetings.

- ***Regents of the University of California at Berkeley/Berkeley Art Museum and Pacific Film Archive Economic Impact Analysis***. The Regents of the University of California at Berkeley is are planning to relocate the University's Berkeley Art Museum and Pacific Film Archive (BAM and PFA) to Downtown Berkeley near the gateway to the University campus. The project will be a focal point of Berkeley's evolving Arts District. The plan calls for 118,000 square feet, including 2,500 square feet for retail, an 88-space parking garage, two film screening rooms, 12 galleries, a café, and rooftop gardens. The Exhibition space is 32,760 square feet. Ms. Herman conducted an economic impact analysis of the new facility upon completion. The economic impacts analyzed construction period and on-going impacts on the City of Berkeley, Alameda and Contra Costa counties, and the Bay Area region. The on-going impacts were based upon visitorship projections prepared for the study, forecasted local visitor spending, and anticipated BAM and PFA local spending on payroll as well as goods and services pursuant to analysis of historic spending patterns. They study additionally included qualitative analysis of the spin-off benefits of the new facility, including revitalization of Downtown Berkeley, increasing exposure for local retailers and restaurants, and accelerating growth in residential development.

- ***Transbay Joint Powers Board/Economic Impact of Transbay Development Program.*** Ms. Herman conducted economic impact analysis of select components of the proposed new Transbay Terminal and the associated Transbay Terminal Redevelopment Project Area. This included analysis of the operations of the Terminal and the impacts of the new riders attracted into San Francisco due to expansion of the Terminal's capacity, the downtown extension of Caltrain, and the potential addition of High-Speed Rail service. In anticipation of this major redevelopment effort, the City of San Francisco Redevelopment Agency created a Transbay Redevelopment Project Area calling for an extensive commercial and residential development program. The analysis therefore also projected the economic impacts associated with the construction and operations of this program, which included 3,378 residential units, 765,000 square feet of office space, 40,516 square feet of retail space, and a 1,000-room hotel. The analysis was conducted for a static time period, representing estimated stabilization of the various operations, in the year 2020.

- ***University of California at Riverside/Economic Impact Analysis.*** Ms. Herman conducted an economic impact analysis of the UC Riverside campus and its research centers. The purpose of the study was for the University to demonstrate its impacts on the local Riverside community, the surrounding region, and beyond, as well demonstrate as its leadership role. These impacts include tangible benefits such as job generation, wages, and local and regional spending, as well as intangible benefits such as cultural opportunities, intellectual stimulation, and volunteer work. The study was especially relevant to the University's anticipated Long Range Development Plan (LRDP), both in terms of the University's economic benefits and potential negative impacts. The geographies reflected in the study included the City of Riverside, Riverside County, the Inland Empire, the State of California, and the nation. The study also included baseline analysis of a new Palm Desert campus, with the Heckman Center for Entrepreneurial Management, home of the University's MPB program. A model update to this analysis in process includes expansion of the University's impacts to the national level.

Amy L. Herman, Principal of ALH Urban & Regional Economics, has provided urban and regional consulting services for almost 30 years. During this time she has been responsible for directing assignments for corporate, institutional, non-profit, and governmental clients in key service areas, including fiscal and economic impact analysis, economic development and redevelopment, feasibility analysis, location analysis, strategic planning, policy analysis, and transit-oriented development. Her award-winning economic development work has been recognized by the American Planning Association, the California Redevelopment Association, and the League of California Cities.

Prior to forming ALH Urban & Regional Economics in mid-2011, Ms. Herman's professional tenure included 20 years with Sedway Group, inclusive of its acquisition by CB Richard Ellis and subsequent name change to CBRE Consulting. Her prior professional work experience includes 5 years in the Real Estate Consulting Group of the now defunct accounting firm Laventhol & Horwath (L&H), preceded by several years with the land use consulting firm Land Economics Group, which was acquired by L&H.

Following are descriptions of select consulting assignments managed by Ms. Herman during the course of her career.

ECONOMIC DEVELOPMENT AND REDEVELOPMENT

City of Morgan Hill. Reviewed the City's economic development practices and compared them with "best practices" to other competitive Bay Area cities.
Solano County Cities. Managed a regional labor market study for Solano County cities designed to enhance the recognition of Solano County's competitiveness as a business location to prospective businesses and corporate site selectors.
City of San Jose Redevelopment Agency. Prepared a study analyzing the costs and benefits associated with creating a bioscience incentive zone in the Edenvale industrial redevelopment area.
City of Lake Forest. Prepared a commercial revitalization plan for the El Toro Corridor, including strategies to attract retail tenants, improve design standards, and create a community focal point. Led a series of community workshops and assessed the existing retail market.
City of Palo Alto. Conducted a retail study targeting six of Palo Alto's retail business districts for revitalization, including the identification of barriers to revitalization and recommended strategies tailored to the priorities established for each of the individual target commercial areas.
East Bay Municipal Water District. Managed economic, demographic, and real estate data analysis in support of developing market-sensitive adjustments to long-term water demand forecasts.
Redwood City Redevelopment Agency. Conducted a business attraction, retention and expansion study designed to preserve and strengthen Redwood City's industrial and retail bases. Outlined a program of economic development incentives, formulated implementation strategies, and recommended an organizational structure for a new economic development department.

ECONOMIC IMPACT ANALYSIS

Hospital Council of Northern and Central California. Currently conducting a study to identify the economic impact of hospitals and long-term care facilities located in Santa Clara County.
University of California. Conducted economic impact studies for five University of California campuses: Berkeley, Davis, Riverside, San Francisco, and San Diego. Prepared models suitable for annual updates by campus personnel.
Various EIR Firms. Managed numerous assignments analyzing the potential for urban decay to result from development of major big box and other shopping center retailers. The analysis comprises a required Environmental Impact Report component pursuant to CEQA.
Bay Area Rapid Transit District. Conducted an economic impact study demonstrating BART's regional economic benefits, focusing on quality of life, regional competitiveness, smart growth, and development impacts.
Kaiser Permanente. Managed economic impact analysis for planned Kaiser facilities in Modesto (hospital) and Lancaster, California (medical office campus). The analyses included multiplier impacts for local and regional employment, wages, and vendor expenditures.

AMY L. HERMAN, AICP
Principal

FISCAL IMPACT ANALYSIS

Stanford Management Company and Stanford Hospitals. Managed numerous assignments involving fiscal impact analysis for planned facilities developed by Stanford Management Company or Stanford Hospitals, including a satellite medical campus in Redwood City, a hotel and office complex in Menlo Park, and expansion of the hospital complex and the Stanford School of Medicine in Palo Alto.

Google. As a subconsultant to an architectural firm, prepared a fiscal impact analysis of the master planning effort for Google's expanded headquarters presence in the City of Mountain View.

City of Concord. Structured and managed fiscal impact analysis designed to test the net fiscal impact of multiple land use alternatives pertaining to the reuse of the 5,170-acre former Concord Naval Weapons Station, leading to possible annexation into the City of Concord, California. Currently completing an update to this analysis.

General Electric Company. Conducted industrial market, retail demand, and comparative fiscal impact analysis to support changing 55.1 acres of heavy industrial land to commercial use in San Jose, California. The resulting regional shopping center met with strong market acceptance.

Exxon Mobil Corporation. Prepared a fiscal and economic impact report demonstrating the role of general industry, including Exxon Mobil, on the quality of life in Benicia, California. This was performed relative to the City's General Plan Update.

Catellus (now ProLogis). Demonstrated the fiscal and economic benefits of San Francisco's 303-acre planned multi-use Mission Bay development over the 30-year projected build-out period as a precondition of City/County and Redevelopment Agency plan approval.

CORPORATE LOCATION ANALYSIS

Toyota Motor Corporation. Conducted a location analysis study for a distribution facility in the San Francisco Bay Area, designed to minimize travel time distance to the majority of area dealerships.

Cisco Systems. Managed multiple corporate location studies for Cisco Systems, headquartered in San Jose, California. These studies focused on the formulation of both a regional and a North American location strategy.

Starbucks Coffee Company. Directed analysis examining alternative locations for a new coffee roasting plant in the Western United States. A variety of economic, business, and labor market data were collected. The roasting plant was successfully sited in Sparks, Nevada.

Sacramento Regional Transportation District (RTD). Managed a consultant team assisting the RTD in planning for its immediate and long-term administrative office space needs, and in developing a strategy for maximizing the value of the existing RTD complex.

Hines. Managed comparative analysis highlighting business and employee costs associated with business locations in three competitive Bay Area locations.

DEVELOPMENT FEASIBILITY

Catellus Development Corporation. Preparing a retail leasing strategy for Alameda Landing, a planned a 285,000-square-foot shopping center, identifying tenants suitable for the purpose of recapturing identified sales leakage.

ChevronTexaco. Conducted a regional market analysis of an 8,400-acre oil field retired from active oil production in the New Orleans, Louisiana metropolitan area.

City of San Jose. Managed alternative City Hall location analysis, focused on recommending a long-term occupation strategy for the City. Following relocation of City Hall conducted a study examining the feasibility of redeveloping the City's former City Hall location and nearby parking facilities for residential, retail, and civic land uses.

Ford Motor Land Corporation. Managed the market analysis component pertinent to the redevelopment of Ford's 157-acre Ford auto assembly plant site in Milpitas. Ford ultimately disposed of the property for the purpose of retail development through adaptive reuse.

General Motors Corporation. Managed reuse studies for closed manufacturing facilities in Indiana (250 acres, 14 sites) and New Jersey (80 acres). Studies focused on the long term reuse and redevelopment potential of the closed manufacturing sites.

Contents

1 Introduction

This report evaluates the greenhouse gas (GHG) emissions associated with the proposed Safeway Rockridge Center Shopping Project located at the intersection of 51st Street and Broadway in Oakland, California. The redevelopment includes the demolition of an existing shopping center (including an existing Safeway store) and the construction of a new Safeway store plus additional retail, restaurant, and office space at the same location. The GHG emissions are provided for both the baseline conditions existing at the time of the Notice of Preparation (NOP) as well as the conditions of the Project at build out.

This analysis includes the GHG emission inventories that are used to determine climate change impacts. The City of Oakland's California Environmental Quality Act (CEQA) Thresholds of Significance are based on the Bay Area Air Quality Management District's (BAAQMD's) CEQA thresholds updated in June 2010. On March 5, 2012 the Alameda County Superior Court issued a judgment, in California Building Industry Association v. Bay Area Air Quality Management District, finding that the BAAQMD had failed to comply with CEQA when it adopted its 2010 significance thresholds. The Court ruled that the adoption of the new significance thresholds (including new significance thresholds for GHGs) is considered a "project" under CEQA, and, thus, the BAAQMD should have prepared the required CEQA review and documentation. The court issued a writ of mandate ordering the BAAQMD to set aside the 2010 significance thresholds until the BAAQMD has complied with CEQA. However, the City of Oakland's CEQA thresholds are still in effect and are relied upon in this report. This report documents the methodologies used by ENVIRON in developing the GHG emission inventory and comparing them to the City's CEQA thresholds. The methodologies used in this analysis are consistent with the BAAQMD's May 2012 CEQA Guidelines which were not set aside by the Court and remain in effect.

1.1 Project Description

The project site is located at 51st Street and Broadway in Oakland, California and is currently occupied by an approximately 185,500-square-foot shopping center and surface parking lot. The project is proposed to consist of the following:

- Demolition of all 185,500 square feet of existing commercial buildings.
- Construction of approximately 323,000 square feet of new commercial buildings, including a Safeway grocery store (65,000 square feet), retail, office, and restaurant spaces.
- Construction of surface parking, rooftop parking, and a three-level above-ground parking garage totaling 967 parking spaces.

Because the new store would be a larger full service grocery store than the existing one, more local residents including those who currently shop groceries at other stores are expected to shop at the new store. Minor road construction will occur to reconfigure the medians on Pleasant Valley Avenue and Broadway.

1.2 GHG Emission Inventory

GHG emissions are estimated for the baseline operations and future operations. Project net GHG emissions are calculated as the difference between the two. The net emissions increase will be compared to the BAAQMD 'bright line' threshold.[1] The GHG emissions source categories include building energy use, water use, traffic, solid waste disposal, and refrigerant leaks. Emissions of carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and high global warming potential gas refrigerants from each of these sources were calculated and converted, using global warming potentials (GWP), to CO_2e for comparison to the BAAQMD threshold.

The emissions associated with solid waste disposal and refrigeration leaks are presented since BAAQMD's CEQA Guidelines indicate that these should be quantified, however inclusion of these categories is inconsistent with BAAQMD's justification for deriving the 1,100-metric ton (MT) threshold of significance and therefore the emission inventory is conservative by including these.[2] The reduction in refrigerant emission resulting from Safeway's efficiency programs is included as a net reduction in emissions. ENVIRON uses the solid waste methods utilized by the California Emission Estimator Model (CalEEMod) which is a comprehensive state-wide model used for estimation of GHG and air quality emissions for land use development projects, and which is further described below.

The one-time GHG emissions associated with demolition and building construction are also presented here using default construction assumptions contained in CalEEMod. These emissions are presented alone and then amortized to combine them with the annual operational emissions.

2 Methods

This section describes the methodology that was used to develop the GHG emissions inventories associated with the Baseline and Project. These inventories consider five categories of GHG emissions: energy use associated with non-residential buildings, mobile sources, solid waste, water and wastewater, and refrigeration leaks. Electrical power will be supplied to the Project Site by Pacific Gas & Electric Company (PG&E). Accordingly, indirect GHG emissions from electricity usage are calculated using the PG&E's carbon-intensity factors in CalEEMod based on the 2008 Power/Utility Reporting Protocol. Legislation and rules regarding climate change, as well as the scientific understanding of the extent to which different

[1] If a proposed project involves the removal of existing emission sources, BAAQMD recommends subtracting the existing emissions levels from the emissions levels estimated for the new proposed land use. This approach is consistent with the definition of baseline conditions pursuant to CEQA. See BAAQMD. 2011. California Environmental Quality Act Air Quality Guidelines. May. Page 4-5.

[2] The development and justification of the BAAQMD's 1,100 metric ton CO2e/year threshold is based on the California Air Resources Board's (ARB's) statewide GHG inventory of "land use-driven" sectors. While the sectors include transportation, electric power, commercial and residential fuel use, and wastewater treatment, it does not include emissions associated with solid waste disposal or with refrigeration leaks. Adding emissions associated with solid waste disposal and refrigeration would be conservative for a new project since these additional emissions would only increase the total emissions associated with the project, making it more likely that the threshold would be triggered. Since this new project replaces an existing commercial development, we subtract (or take the net difference) between the new project and the existing project. For consistency, we also include emissions associated with waste and refrigerants.

activities emit GHGs, continue to evolve; as such, the inventories in this report are a reflection of the guidance and knowledge currently available.

ENVIRON primarily utilized the CalEEMod version 2011.1.1[3] to assist in quantifying the GHG emissions in the inventories presented in this report for the Baseline and the Project. CalEEMod is a statewide program designed to calculate both criteria and GHG emissions from development projects in California. This model was developed under the auspices of the South Coast Air Quality Management District (SCAQMD) and received input from other California air districts including BAAQMD, and is currently supported by several lead agencies for use in quantifying the emissions associated with development projects undergoing environmental review. CalEEMod utilizes widely accepted models for emission estimates combined with appropriate default data that can be used if site-specific information is not available. These models and default estimates use sources such as the United States Environmental Protection Agency (USEPA) AP-42 emission factors,[4] CARB's on-road and off-road equipment emission models such as the EMission FACtor model (EMFAC) and the Offroad Emissions Inventory Program model (OFFROAD), and studies commissioned by California agencies such as the California Energy Commission (CEC) and CalRecycle. ENVIRON used Alameda County CalEEMod defaults in the model runs unless otherwise noted in the methodology descriptions below. Details regarding the specific methodologies used by CalEEMod can be found in the CalEEMod User's Guide and associated appendices.[5] The CalEEMod output files are provided for reference in Appendix A to this report.

2.1 Site-Specific Data

Safeway provided utility consumption data for electricity, natural gas, and water usage and also refrigerant leakage rates at the existing Safeway store.[6] Safeway also predicted electricity and natural gas data for the new Safeway based on the utility consumption of newer Safeway stores that were built with similar project design features as the Project.[7] Safeway provided the average trip length for existing store customers estimated based on the Safeway Club Card data.[8] The subsections below describe the methodology used in developing the GHG emission inventories.

2.2 Building Energy Use

Safeway provided the utility consumption data for both the existing and new stores. The CalEEMod default utility consumption data were used for other commercial buildings in the

shopping center. This category also includes natural gas combustion from the emergency generator. Emission factors were used to convert the consumption data in kilowatt-hours (kWh) and therms, for electricity and natural gas, respectively, to GHG emissions in MT CO_2e. As noted earlier, ENVIRON used carbon intensity emission factors for electricity collected from the Pacific Gas and Electric (PG&E) Power/Utility Reporting Protocol.[9,10] Natural gas emission factors used were from the California Climate Action Registry's General Reporting Protocol.[11]

Project operations result in a net annual increase of 225 and 40 MT CO_2e emissions related to electricity and natural gas usage, respectively, when compared to the baseline case. Table 1 presents the GHG emissions associated with electricity and natural gas usage for the baseline and Project with further details available in Appendix A.

2.3 Water and Wastewater

Emission factors were also used to convert from consumption data in millions of gallons (MG) water use, to equivalent electricity use, and then to GHG emissions in MT CO_2e. Water use was converted to equivalent electricity consumption using the default CalEEMod energy intensity values for Northern California water use which includes the supply, conveyance, treatment, and distribution. The electricity associated with transportation, treatment and disposal of wastewater was evaluated based on CEC's 2006 report. Electricity consumption was converted to CO_2e using the method described earlier. Consistent with BAAQMD draft guidance, ENVIRON only calculated GHG emissions from electricity associated with wastewater treatment, and ENVIRON did not calculate the direct biogenic GHG process emissions associated with wastewater treatment.

Water usage for the existing store was provided by Safeway and that for the proposed store was estimated using the water use intensity of the newer Safeway stores that were built with similar project design features as the Project. Water usage for non-Safeway commercial buildings in the existing and new shopping center was estimated using CalEEMod default parameters. The 29,000 square feet of "auxiliary space"[12] is not expected to generate demand for water so GHG emissions associated with water usage were not calculated for this land use.

Project operations result in a net annual increase of 22 MT CO_2e emissions related to water and wastewater when compared to the baseline case. Table 1 shows the baseline and Project GHG emissions associated with water and wastewater with further details by land use available in Appendix A.

[11] Emission factors for natural gas obtained from California Climate Action Registry. 2009. General Reporting Protocol 3.1, Tables C7 and C9.

[12] "Auxiliary space" is area that is not leasable floor space that includes stairs, aisle ways, corridors, plazas, and loading areas.

2.4 Mobile Sources

Greenhouse gas emissions from mobile sources were calculated using the predicted number of vehicle trips and trip lengths that are associated with the Project and baseline operations.

Consistent with the transportation study, for the Safeway store and other commercial buildings in the existing and new shopping center, the number of vehicle trips was estimated using Institute of Transportation Engineers (ITE) regression equations.[13] The same pass-by trip rate used in the transportation study was applied in the CalEEMod model.[14] The baseline trip rate for the existing CVS Pharmacy was also estimated using the ITE regression equations, but scaled by the ratio of peak trip counts from a Fehr & Peers study at the site to the peak trip counts derived from the ITE regression equations.[15] The total vehicle miles traveled (VMT) associated with Safeway store customers was calculated using the trip length provided by Safeway from Club Card data. VMT associated with all other trips was derived from CalEEMod default trip lengths. The “auxiliary space” is not expected to generate additional vehicle trips not already accounted for from the leasable area so GHG emissions associated with transportation were not calculated for this land use.

As discussed earlier, because the new store is much larger in terms of store size and grocery service, the current store customers are expected to continue shopping at the same location. The total VMT for these customers were calculated using the ITE regression equations, the size of the existing store, and average trip length estimated by Safeway based on the current store Club Card data. ENVIRON calculated the net VMT using the same methodology as for existing customers. The VMT for the employees and visitors other than customers were also calculated using the same methodology as that used for the existing store.

The CO_2 emissions from mobile sources were calculated with the vehicle miles traveled and emission factors from EMFAC2007 as provided in CalEEMod. Emission factors from 2014 were used with the baseline estimate.

Project operations result in a net annual increase of 1,650 MT CO_2e emissions related to mobile trips when compared to the baseline case. Table 1 shows the baseline and Project GHG emissions associated with mobile trips with further details available in Appendix A of this report.

2.5 Solid Waste Disposal

Greenhouse gas emissions from solid waste disposal were calculated using the predicted amount of waste disposed and sent to a landfill with landfill gas capture flaring. Defaults from CalEEMod were used in all instances, which is based on data from CalRecycle, the California Air Resources Board (ARB) Local Government Operations Protocol for degradation of solid waste material. The equations used have been modified from the Local Government Operations Protocol to capture all of the future GHG emissions resulting from the waste

[14] Email Communication from Sam Tabibnia of Fehr & Peers to S. Libicki of ENVIRON on August 16, 2012. Rockridge Trip Gen.pdf. Average weekday pass-by rate from ITE (2008) for a shopping center is 34%.

[15] Ibid. Table 4.3-12. The weekday PM peak hour trip counts from the Fehr & Peers study was 55% lower than that derived from the ITE regression equations.

degradation in the landfill and attribute it to the year it was placed into the landfill. This is more fully described in CalEEMod User's Guide Appendix A. The "auxiliary space" is not expected to generate additional waste not already accounted for from leasable space so GHG emissions associated with waste were not calculated for this land use.

Project operations result in a net annual increase of 9 MT CO_2e emissions related to solid waste when compared to the baseline case. Table 1 shows the baseline and Project GHG emissions associated with solid waste disposal with further details by land use available in Appendix A of this report.

2.6 Offsetting Reductions in Emissions - Refrigerant Leaks

The reduction in refrigerant emissions associated with Safeway's sustainability programs can be used as a source of offsetting emissions. The use of refrigerated systems results in leakage of some of the charged refrigerant. Refrigerants are usually classified as high global warming potential gases. Safeway provided records indicating the typical leakage rates of refrigerant from the refrigerated systems at the existing store. These data along with the amount and type of refrigerant used at the store was used to estimate the total amount of refrigerant leaks from the existing store. Safeway estimated the amount and leak rate for the new store based on information from similar newer stores. For each refrigerant type, the global warming potential (GWP) was calculated based on the values utilized in BAAQMD Guidelines and associated recommended models for specific refrigerants identified. The global warming potential indicates, on a pound for pound basis, the potency of the chemical compared to carbon dioxide. Multiplying the pounds of refrigerant by the GWP results in the GHG emissions from refrigeration leaks in terms of CO_2e. For new, non-Safeway commercial buildings in the shopping center, it is speculative as to whether there would be refrigeration; therefore, the GHG emissions for these buildings were not calculated.

Project operations result in a net annual decrease of 2,096 MT CO_2e emissions related to refrigeration leaks when compared to the baseline case. Table 2 illustrates the calculations for the net emissions associated with the net refrigeration leaks from the existing and new store. Table 1 summarizes this information.

2.7 Construction GHG Emissions

Greenhouse gas emissions from construction of the Project were calculated using default assumptions regarding the number of off-road construction equipment, worker commute trips, and vendor trips. ENVIRON calculated emissions from construction equipment using the CalEEMod defaults based on the 15-acre Project site,[16] and the amount of building demolition to be 185,500 square feet. Tables 3 through 5 detail the construction schedule, equipment list and construction related vehicle trips.[17]

[16] Construction emissions were quantified for two phases of construction separately. CalEEMod defaults for equipment and phase durations were based on a 5-acre Phase I construction site and a 10-acre Phase II construction site. Splitting the project site results in a higher conservative estimate of emissions.

[17] Roadway construction emissions were negligible compared to project site emissions (approximately 1%) and therefore detailed tables on construction schedule, equipment list, and construction related vehicle trips are not

CalEEMod is based upon ARB-approved Off-Road and On-Road Mobile-Source Emission Factor models (OFFROAD and EMFAC, respectively),[18] and is designed to estimate construction emissions for land use development projects and allows for the input of project-specific information. OFFROAD is an emissions factor model used to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). EMFAC is an emissions factor model used to calculate emissions rates from on-road vehicles (e.g., passenger vehicles, haul trucks). Where project-specific data were not available (e.g. equipment horsepower and load factors), default assumptions from CalEEMod were used to estimate construction emissions.[19] The off-road diesel emission factors used by CalEEMod are based on the Air Resources Board (ARB) OFFROAD2007 program. As such an adjustment to the load factors will be used. This will be based on a 33% reduction from the final mass emissions reported by CalEEMod as justified by Appendix B.

Table 6 shows total one-time GHG emissions for construction, including off-road equipment, worker commuting, vendor trips, and hauling for the Project. The GHG emissions from construction are 1,786 MT CO_2e for the Project. The construction emissions, annualized over a time period of 40 years, are 45 MT CO_2e.

2.8 Total Operational GHG Emissions

Table 1 shows the total GHG emissions from all source categories included in the baseline, Project and net emission inventory. The baseline GHG emissions are an average of 11,447 MT CO_2e per year. The Project GHG emissions are 11,298 MT CO_2e per year. Because GHGs are being reduced from the baseline, there is no impact from GHG emission as a result of this project, consistent with City thresholds.

ENVIRON annualized the construction emissions over 40 years pursuant to the City's thresholds. The annualized construction emissions using this method are 45 MT. This results in total net annualized emissions reductions for both construction and operational GHG emissions of 104 MT.

3 Summary

Table 1 shows the total operational GHG emissions from all sources included in the baseline, Project and net emission inventory. The baseline GHG emissions inventory is an average of 11,447 MT CO_2e per year. The Project GHG emissions are 11,298 MT CO_2e per year. This results in net GHG emissions reduction of 149 MT CO_2e per year. Table 6 shows the total construction GHG emissions for the Project of 1,786 MT which when amortized over 40 years is 45 MT. This results in net annualized GHG emissions reduction for the Project of 104 MT. Therefore, because this Project results in net GHG emissions reduction, it has a less than significant impact on climate change.

---

included in this report. Emissions modeling outputs can be found in the attachments to the Local Risk and Hazard Analysis technical memorandum.

[18] OFFROAD and EMFAC are also the basis for construction emission factors and estimation in the URBEMIS emissions estimation program; hence, the results will be similar using either software.

[19] CalEEMod model output files are provided as Appendix A.

								Net including ammortized construction			**-104**

Notes:
1. Electricity and Natural Gas use is provided by Safeway. Natural gas emergency generator emissions (4.9 MT CO2e/year, corresponding to 918 therms per year) included in project emissions.
2. Water and wastewater consumption for the existing store is provided by Safeway, and that for the proposed store is estimated using the water use intensity (gal/sqft) of a newer Safeway store with similar feature.
3. The average trip length for the Safeway customers is estimated based on the Safeway Club Card data, and those for the store employees and people other than customers and workers are the CalEEMod defaults. The trip rates are the CalEEMod default.
4. Electricity emission factors are based on the CalEEMod default values for PG&E.
5. Natural gas emission factors obtained from California Climate Action Registry Reporting Protocol, Table C6 and C9.
6. Energy intensity value for Northern California, the default in CalEEMod was used which includes the supply, conveyance, treatment, and distribution. Emission factor for electricity provided by Pacific Gas and Electric (PG&E). Wastewater was assumed to be an aerobic process.
7. Used 2014 vehicle emission factors for Alameda County.
8. Refrigeration leaks is provided by Safeway. This has then been converted to CO_2e based on global warming potentials for the different refrigerants.

	Architectural Coating	2015/10/15	2015/11/11	20

Notes:

1. The Project will be constructed in two phases. In Phase I, the existing CVS Pharmacy building and the adjacent retail building would be demolished and replaced by a new Safeway store. In Phase II, the existing Safeway and all of the other existing buildings on the site would be demolished and replaced with new 2- to 4-story buildings containing retail and restaurant uses on the ground floor and office and retail uses on the second floor.
2. The start date for each phase matches the start date given in the EIR Project Description.
3. CalEEMod defaults were used for the duration of each phase and sub-phase. These durations do not match information provided in the EIR Project Description. This does not affect the estimate of construction GHG emissions.

		Rollers	2	8	84	0.56
	Architectural Coating	Air Compressors	1	6	78	0.48

Notes:
1. The Project will be constructed in two phases.
2. These are the load factors used in CalEEMod. These factors, from OFFROAD, are 33% too high, according to the ARB (9/3/2010). This is corrected for by reducing the emissions by 33%.

Table 5
Construction On-Road Vehicle Trips and Trip Lengths
Safeway
51st Street, Oakland, California

Phase[1]	Sub-Phase	Worker Trips per Day (#)	Vendor Trips Per Day(#)	Total Hauling Trips (#)	Worker Trip Length (miles)	Vendor Trip Length (miles)	Hauling Trip Length (miles)

9.0 Vegetation

Construction Phase II

These model runs are only used to estimate construction emissions.
Operational emissions are calculated separately and should be ignored in these files

Safeway 51st - Construction "Phase II"

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
Parking Lot	667	Space
Regional Shopping Center	195.52	1000sqft
Supermarket	0	1000sqft
User Defined Retail	29	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	5	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics -

Land Use - User defined retail represents auxiliary space.

Demolition -

Vehicle Trips - Disregard operational emissions from this model (they were quantified in a separate model)

Construction Phase -

2.0 Emissions Summary

2.1 Overall Construction

Justification for OFFROAD Equipment Reductions

From: Dolney, Nicole@ARB
To: Kai Zhao;
cc: Sax, Todd@ARB;
Subject: RE: Workshop Follow Up Questions
Date: Wednesday, September 08, 2010 4:52:41 PM

Hello Kai,

I wanted to follow up on a workshop question regarding the off-road inventory. As Todd indicated you can directly apply a 33% reduction for the LF correction. With regards to the CO2 correction you won't be able to ratio the BSFCs. OFFROAD uses CO2 emission factors and then backcalculates fuel. For the updated inventory we're going to use the new BSFC values to calculate fuel. Also, at the workshop we said that we are using USEPA values for BSFC – this means that for the 50 HP bin the BSFC is 0.408 and for every other HP bin the BSFC is 0.367 lb/hr-hr.

Call or email if you have additional questions.

Subject: Workshop Follow Up Questions

Hi Todd,

It was good meeting to you today at the workshop in Oakland. Thank you and the other ARB/Cal EPA staff members for putting together this spirited discussion. I was hoping you could help me with one follow-up issue. As we discussed at the workshop, some of the updates regarding the offroad construction equipment presented during the workshop are important to our analysis and I would like to confirm the following to make sure I implement the changes properly.

I understand that ARB staff concluded that the load factor should be reduced by 33% for the updated inventory based on the collected engine load data from ARB testing programs and manufacturer provided data. I want to confirm that we can apply 33% reduction to the current default construction equipment load factors used by OFFROAD 2007 during our construction emissions calculation (i.e., updated emissions = 0.67 * emissions calculated using the current OFFROAD default equipment parameters).

In addition, for the CO2 emissions, we can further reduce the emissions multiplying the following fuel consumption ratio:

0.367lb/hp-hr (USEPA's NonROAD Model fuel consumption rate)

0.401 lb/hp-hr (OFFROAD fuel consumption rate)

Please let me know if the approaches above are correct. Lastly, are there any restrictions on applying these emissions reductions (e.g., specific equipment types, sizes)?

Thanks for your help with this matter.

Best,

-Kai

Re: Local Risk and Hazard Analysis for the Safeway Rockridge Center Shopping Project

Dear Mr. Henderson:

At the request of Property Development Centers (PDC), ENVIRON International Corporation (ENVIRON) conducted a health risk assessment (HRA) for the Draft Environmental Impact Report (DEIR) for the proposed Safeway Rockridge Center Shopping Project (herein referred to as the "Project"). The commercial development is located at the intersection of 51st Street and Broadway in Oakland, California. The Project location is depicted in Figure 1. The Project construction entails the commercial building construction (herein referred to as the "Site") as well as the roadway construction to the south and west of the Site. The Site construction is scheduled to occur for 20 months spanning two construction phases from July 2013 to March 2015[1] and is proposed to consist of the following:

- Demolition of all 185,500 square feet of existing commercial buildings.
- Construction of approximately 323,000 square feet of new commercial buildings, including a Safeway grocery store, retail, office, and restaurant spaces.
- Construction of surface parking, rooftop parking, and a three-level above-ground parking garage totaling 967 parking spaces.

The roadway construction to the south of the Site is expected to occur for 5 months from June 2014 to October 2014 and the roadway construction to the west of the Site is expected to occur for 3 months from June 2014 to August 2014. Roadway construction is proposed to consist of the following:

- Construction of a portion of the roadways to the south and west of the Site, which entails demolition, installing new traffic signals, paving and landscaping.

In addition, we understand that there will be one 60-kilowatt (kW) natural gas-fired emergency generator to serve Safeway in the event of a power outage.

This HRA evaluates local community risks and hazards associated with the emissions of toxic air contaminants (TACs) and fine particulate matter ($PM_{2.5}$) [2] from the construction and operation

---

[1] Conducting the construction in two phases will enable the shopping center to remain operational throughout construction to meet both current and expected future retail market demands. Phase I construction is scheduled to last for 10 months from July 2013 to April 2014 and Phase II is scheduled to last for 10 months from May 2014 to March 2015.

[2] PM_{10} and $PM_{2.5}$ refer to particulate matter with aerodynamic resistance diameters not exceeding 10 micrometers and 2.5 micrometers, respectively.

of the project. Health risk and $PM_{2.5}$ concentrations are evaluated at offsite receptors, which can include residences, schools and school yards, parks and playgrounds, daycare centers, nursing homes, and medical facilities. Specific impacts are estimated for cancer risk, chronic hazard index (long term health effects), acute hazard index (short term health effects), and $PM_{2.5}$ concentrations. A screening analysis indicates that due to the size of the proposed project and the proximity of nearby receptors, a refined HRA for construction-related emissions is required.[3] In this report, we evaluate the need to perform a refined health risk analysis for operational-related emissions from the emergency generator.

The City of Oakland's California Environmental Quality Act (CEQA) Thresholds of Significance are based on the Bay Area Air Quality Management District's (BAAQMD's) CEQA thresholds updated in June 2010. On March 5, 2012 the Alameda County Superior Court issued a judgment, in California Building Industry Association v. Bay Area Air Quality Management District, finding that the BAAQMD had failed to comply with CEQA when it adopted its 2010 significance thresholds. The Court ruled that the adoption of the new significance thresholds (including new significance thresholds for TACs and fine particulate matter or $PM_{2.5}$) is considered a "project" under CEQA, and, thus, the BAAQMD should have prepared the required CEQA review and documentation. The court issued a writ of mandate ordering the BAAQMD to set aside the 2010 significance thresholds until the BAAQMD has complied with CEQA. However, the City of Oakland's CEQA thresholds are still in effect and are relied upon in this report.

The City of Oakland's thresholds for risks and hazards for an individual project are:

- An increase in excess lifetime cancer risk level of more than 10 in one million;
- An increase in noncancer (both chronic or acute) HI greater than 1.0; and
- An incremental increase in the annual average concentration of $PM_{2.5}$ of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$)

In addition to individual project thresholds, there are cumulative thresholds that must account for all identified stationary and roadway sources within 1,000 feet of the Project. The City of Oakland's cumulative thresholds are:

- An excess lifetime cancer risk level of more than 100 in one million;
- A chronic noncancer HI greater than 10.0; and
- Annual average concentration of $PM_{2.5}$ of greater than 0.8 $\mu g/m^3$

ENVIRON followed updated May 2012 BAAQMD CEQA Guidelines[4] to calculate air pollution emissions and estimate health impacts of TACs.

Summary of Results

The Project's construction-related emissions were used in a risk analysis for the 20-month duration of construction and compared to a project threshold of a 10-in-one-million increase in cancer risk. Incremental cancer risk at the maximally exposed individual sensitive receptor

---

[3] BAAQMD. 2010. Screening Tables for Air Toxics Evaluation During Construction. May 2010.

For commercial projects between 300,000 – 500,000 square feet, the screening level offset distance required is 225 meters. The nearest receptors to the project are closer than this distance.

[4] BAAQMD. 2012. California Environmental Quality Act Air Quality Guidelines. May. Available online at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_Final_May%202012.ashx?la=en. Accessed September 21, 2012.

(MEISR) was calculated at 6-in-a-million which is below the individual project threshold of 10-in-one-million. Tables 1 and 2 provide a summary of the construction-related TAC emissions and local community risk and hazard impacts including $PM_{2.5}$ concentrations.

Risks and hazards were also considered for operational-related TAC emissions from the natural gas-fired emergency generator. Cancer risk and non-cancer health indices are not expected to exceed individual project thresholds based on a comparison of TAC emissions to the BAAQMD TAC trigger levels.[5] A conservative analysis also shows that concentrations of $PM_{2.5}$ are not expected to exceed the individual project concentration threshold.

A cumulative analysis was performed considering existing stationary sources and roadways within 1,000 feet of the Project. The cumulative analyses for construction-related emissions and operational-related emissions did not lead to cumulative risk at existing receptors of above 100-in-one million or chronic hazard indices above 1. The cumulative $PM_{2.5}$ concentration evaluated at the receptors was below the threshold of 0.8 $\mu g/m^3$. Tables 3a and 3b provide a summary of the cumulative local community risk and hazard impacts.

ENVIRON's health-protective analyses indicate that the Project does not exceed the thresholds of significance for construction and operational impacts on off-site receptors.

Discussion of Results

The following sections present the details and results for the:

- TAC and $PM_{2.5}$ emissions,
- Local Community Risks and Hazard Impacts, and
- Cumulative Impacts from Sources on Off-site receptors

Additional information about the methods used in this analysis, as well as detailed tables summarizing the analysis, can be found in Attachments A and B.

1. TAC and $PM_{2.5}$ Emissions

Construction-Related Emissions

Project construction-related TAC emissions are due to fuel-combusting construction equipment and mobile sources. Construction-related emissions of reactive organic gases (ROG), and particulate matter (PM_{10} and $PM_{2.5}$) from construction equipment and mobile sources were calculated from CalEEMod™ model results. Emissions of diesel particulate matter (DPM) are assumed to be equal to PM_{10} emissions.[6]

To estimate construction-related total particulate matter (PM_{10} and $PM_{2.5}$) emissions and maximum daily total organic gas (TOG) emissions, CalEEMod™ incorporated the Project's equipment list and usage information[7,8] and calendar year-specific emission factors for 2013-

[5] BAAQMD Regulation 2-5, Table 2-5-1.

[6] CARB and OEHHA. 1998. For the "Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant". April 22, 1998. Available at: http://oehha.ca.gov/air/toxic_contaminants/html/Diesel%20Exhaust.htm (Accessed November 7, 2012). The document states that "Almost all of the diesel exhaust particle mass is in the fine particle range of 10 microns or less in diameter. Approximately 98 percent of the mass of these particles are less than 10 microns in diameter."

[7] CalEEMod provided default phase duration, equipment list and activity was used to estimate emissions for Site construction. For roadway construction, Project sponsor provided phase duration, equipment list and activity was used to estimate emissions.

2015 from OFFROAD2007. Equipment load factors in CalEEMod™ are obtained from OFFROAD2007. Exhaust PM_{10} emissions from off-road equipment from Site and roadway construction were used to estimate annual average DPM concentrations. Exhaust and fugitive $PM_{2.5}$ emissions from Site construction and exhaust $PM_{2.5}$ emissions from roadway construction were used to estimate annual average $PM_{2.5}$ concentrations. CalEEMod™ daily maximum output of ROGs were converted to TOGs based on guidance from USEPA.[9] Emissions calculated by CalEEMod were reduced by 33% to account for errors in the load factors in the OFFROAD2007 database included in CalEEMod™, consistent with guidance from ARB.[10] PM_{10} and $PM_{2.5}$ emissions were reduced by 45% as per Oakland Standard Conditions of Approval (SCA)[11]. PM_{10} and $PM_{2.5}$ emissions were further reduced by 45% as per BAAQMD CEQA Guidelines to account for the 2-minute idling restriction in the Oakland SCA.[12,13] TAC emissions from construction are shown in Table 1. Detailed calculations and assumptions along with the CalEEMod™ outputs are provided in Attachment A.

Operational-Related Emissions

The one source of operational-related TAC and $PM_{2.5}$ emissions considered in this assessment is the 60-kW natural gas-fired emergency generator.[14] This emergency generator will support the Safeway supermarket in the unlikely event of a power outage. Emission factors from the California Air Toxics Emission Factors (CATEF)[15] and the USEPA's AP-42[16] were used to estimate TAC and $PM_{2.5}$ emissions for the natural gas internal combustion engine, in

---

[8] CalEEMod GHG and criteria pollutant construction emissions include on-site and off-site vehicle activity as well as non-mobile emissions such as those from architectural coatings.

[9] USEPA. 2010. Conversion Factors for Hydrocarbon Emission Components. July. Available online at: http://www.epa.gov/oms/models/nonrdmdl/nonrdmdl2010/420r10015.pdf. Accessed October 11, 2012

[10] In September 2010, the ARB announced that its methods used to estimate the load factor for off-road equipment were incorrect and led to an overestimate of emissions by a factor of at least 33%. ARB is currently revising their emissions model, OFFROAD, which has not yet been released. In the meantime, we have received direction from ARB to reduce the load factors by 33% to take into account this error. The slides from the ARB workshop discussing this change are available online at: http://www.arb.ca.gov/msprog/ordiesel/documents/emissions_inventory_presentation_full_10_09_03.pdf Accessed October 11, 2012

[12] BAAQMD. 2012. California Environmental Quality Act Air Quality Guidelines. May. Available online at: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_Final_May%202012.ashx?la=en. Accessed September 21, 2012. See Page B-11.

[13] Two separate requirements from the Oakland Standard Conditions of Approval (SCA) are for the i) limitation of idling time of diesel-powered equipment to two minutes, and ii) a fleetwide average reduction of PM emissions by 45%. The BAAQMD CEQA Guidelines recommend applying a 45-percent reduction for PM_{10} and $PM_{2.5}$ to account for the 2-minute idling limit (BAAQMD 2012). In addition, the Oakland SCA also requires a fleetwide average reduction of PM emissions by 45%. Therefore the PM emissions are further reduced by 45%. Implementing both measures requires accounting for both reductions.

[14] The increased number of cars and trucks associated with the project is not expected to exceed an average of 10,000 and 1,000 per day, respectively. According to BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (May 2012), roads that do not exceed this number of vehicles and trucks are considered minor, low-impact sources and can be excluded from the CEQA process.

accordance with BAAQMD permit evaluation guidance.[17] For emissions estimation purposes, it was assumed that the emergency generator would be permitted for 100 hours. Detailed emissions calculations can be shown in Attachment C. It can be seen that annual average emissions and maximum hourly emissions of TACs do not exceed any BAAQMD TAC Trigger Levels, the emission threshold levels below which the resulting health risks are not expected to cause, or contribute significantly to, adverse health effects.

2. Local Community Risk and Hazard Impacts

Construction-Related Risks

ENVIRON analyzed Project construction-related risks by estimating ambient air concentrations of DPM, $PM_{2.5}$, and TOG. To estimate air concentrations, ENVIRON used AERMOD, a Gaussian air dispersion model. Additional details on the air dispersion modeling are presented in Attachment B. AERMOD incorporates emission factors, source parameters and 5 years of meteorological data to estimate air concentrations of inert pollutants. As discussed above, emission rates were developed using data from CalEEMod. A 20-meter-by-20-meter array of volume sources was used to represent construction activity at the Site.[18] Roadway construction activity was represented by an array of 10-meter-by-10-meter volume sources as can be seen in Figure 2. As per information provided by the Project Sponsor, construction activities are assumed to occur only in the daytime between 7 a.m. and 5 p.m. Hence emissions were modeled for the hours of 7 a.m. to 5 p.m. only. The model was run with 5 years of upper air and surface data from year 2007 to 2011 obtained from the meteorological station at the Oakland Airport, the most representative station in the vicinity of the Project. The meteorological data meets BAAQMD's 90% completeness by quarter requirement since it has less than 10% of the hours missing when evaluated on a quarterly basis.

For modeling purposes, annual average emissions of PM_{10} and $PM_{2.5}$ (expressed in grams per second), were derived by taking the total emissions and dividing by the construction duration (days), number of working hours per day,[19] and 3,600 to convert from hours to seconds. Maximum hourly emissions of TOGs (expressed in grams per second) were derived by the maximum daily TOG emissions from Site and from roadway construction divided by the number of working hours per day, and 3,600 to convert from hours to seconds. We conservatively assume that the maximum daily emissions from Site construction occur concurrently with the maximum daily emissions from the roadway construction. Modeled construction-related emission rates for TOG, PM_{10} and $PM_{2.5}$ in grams per second are shown in Attachment B1b.

The calculation of concentrations for use in an HRA requires the selection of appropriate concentration averaging times. The annual average DPM and $PM_{2.5}$ dispersion factors were modeled for use in calculating the cancer risks and chronic non-cancer hazards associated with DPM emissions and annual average $PM_{2.5}$ concentration associated with $PM_{2.5}$ emissions. The maximum hourly dispersion factor was modeled to determine acute hazards associated with speciated emissions of TOG. The urban setting was used to reflect the characteristics of the surrounding area. An array of receptors with 10-meter spacing extending out to 1,000 feet from the Project boundary was used over all land uses as seen in Figure 1. Receptors were placed on four vertical levels to account for multi-story residences; at 1.8 meters to simulate adult

[17] BAAQMD Permit Handbook. Section 5.2.3.2. Stationary Natural Gas Engines. Available at: http://hank.baaqmd.gov/pmt/handbook/rev02/PH_00_05_02_03_02.pdf (Accessed 11/14/2012)

[18] There is no BAAQMD guidance on source selection for construction modeling. This source configuration is consistent with methodology used to develop the South Coast Air Quality Management District Localized Significance Thresholds. Available online at: http://www.aqmd.gov/ceqa/handbook/lst/Method_final.pdf). Accessed October 11, 2012.

[19] Construction was expected to take place between 7a.m. to 5p.m.based on information from the Project Sponsor.

breathing height on ground floor, in accordance with BAAQMD Guidance, and at 4.8, 7.8 and 10.8 meters to simulate a second, third and fourth story, respectively.

Cancer risk, chronic HI, and acute HI were calculated from ambient annual and hourly concentrations using intake factors, cancer potency factors, and chronic and acute reference exposure levels calculated consistent with Office of Environmental Health Hazard Assessment (OEHHA)[20] and BAAQMD[21] guidance. As shown in Table 2, the chronic HI, acute HI, and annual $PM_{2.5}$ concentration are substantially below the BAAQMD 2011 thresholds. Construction-related cancer risk is estimated to be 6-in-a-million at the off-site maximally exposed individual sensitive receptor (MEISR); this is less than the 10-in-a-million threshold. The location of the MEISR is shown in Figure 3. All receptor locations, including the MEISR, were conservatively evaluated with resident child exposure parameters since it would result in higher risks than any other sensitive population. Exposure parameters can be found in Attachment B2a. The MEISR is located at the California College of the Arts which is not a residential location, resulting in a conservative cancer risk. Since this is the highest offsite cancer risk, all other locations would necessarily have lower risks and fall under BAAQMD thresholds.

<u>Operational-Related Risks</u>

As discussed in the previous section, operational-related emissions of TACs were all below BAAQMD Trigger Levels. Therefore, TAC emissions from this source are not expected to lead to adverse health effects and an HRA is not required.

ENVIRON estimated concentrations of $PM_{2.5}$ from the natural gas emergency generator for evaluation against the operational-related $PM_{2.5}$ concentration threshold. Concentrations were estimated using the USEPA SCREEN3 model using worst-case meteorological conditions. The calculation of emissions using the SCREEN3 model with worst-case meteorological conditions is very conservative because it typically provides higher than expected concentrations. The model was conducted taking into account building downwash and both simple and complex terrain algorithms to account for elevated terrain immediately north of the Safeway building. Since the location of the emergency generator has not yet been identified, this analysis conservatively assumes that the highest concentration estimated by the SCREEN3 model to potentially occur at any receptor. The highest annual-average concentration of $PM_{2.5}$ estimated by SCREEN3 is 0.02 $\mu g/m^3$. This value is substantially lower than the individual project threshold of 0.3 $\mu g/m^3$. An operational-related MEIR for $PM_{2.5}$ was not identified.

3. Cumulative Impacts from Sources on Off-Site Receptors

BAAQMD CEQA Guidelines require an evaluation of cumulative risks from all offsite sources within 1,000 feet from the Project boundary as well as from onsite sources to evaluate the cumulative impact on off-site receptors.

<u>Off-site Stationary Sources</u>

BAAQMD has developed a Stationary Source and Risk Analysis Tool (“BAAQMD Risk Analysis Tool”)[22] for permitted sources to identify off-site stationary sources of TACs. ENVIRON utilized

the BAAQMD Risk Analysis Tool for Alameda County to compile a list of potential stationary sources to be evaluated within 1,000 feet of the Project boundary.

Four stationary sources, which included one diesel generator, one cogeneration plant and three gas dispensing facilities (GDF), were identified within 1,000 feet of the Project as seen in Figure 4.[23] The impacts of these sources were estimated using distance-based multipliers for diesel engines and GDFs.[24,25] For the Claremont Country Club GDF (BAAQMD ID G8633), where screening values were not available and the Claremont House cogeneration plant (BAAQMD ID 20198), which is comprised of a diesel engine and gas fired cogeneration unit, impacts were estimated using BAAQMD-provided emissions data[26] and the screening level risk calculator.[27] Table 4 shows the maximum estimated cancer risk, chronic HI, and $PM_{2.5}$ concentration from the stationary sources at the off-site construction MEIR.

Roadways

The impacts of these roadways were analyzed consistent with the BAAQMD CEQA Guidelines. As a supplement to the guidelines, BAAQMD provides screening tools to assess the impact of roadways on nearby receptors. The estimated cancer risk from the roadways obtained using the screening tool for surface streets depends on the distance between the receptor and the nearest travel lane of the roadway, the average number of vehicles that travel on the roadway in a day, and the orientation of the roadway. The distance between the receptor and the roadway was determined using geographical information software and the average daily traffic (ADT) was obtained from data reported by the California Environmental Health Tracking Program.[28] When the roadway ADT or distance between a receptor and a roadway is between two values in the screening tables, linear interpolation was performed to obtain the cancer risk at the reported distance and ADT, as per BAAQMD Guidelines.

ENVIRON identified four roadways within the 1,000-foot zone of influence with daily traffic greater than 10,000 vehicles as seen in Figure 4. Table 5 shows the cancer risk and annual $PM_{2.5}$ concentration from these four roadways at the off-site construction MEIR.

Cumulative Impacts on Off-Site Receptors (Construction)

The cumulative impacts evaluation was completed for the off-site construction MEIR by summing the impacts from Project construction, off-site stationary sources, and nearby roadways. There are no other projects planned for concurrent construction within 1,000 feet.[29] As shown in Table 3a, the sum of cancer risks is less than the CEQA threshold of 100 in a million. Similarly, the estimated chronic HI and the annual average $PM_{2.5}$ concentrations fall below the corresponding significance thresholds for cumulative impacts.

---

[23] Emil Villa's Hickery Pit Restaurant was not included in this analysis even though it was identified in the BAAQMD Stationary Source Screening Analysis Tool for Alameda County because it is no longer in operation.

<u>Cumulative Impacts on Off-Site Receptors (Operational)</u>

As discussed above, TAC emissions from the natural gas-fired emergency generator are not expected to lead to adverse health effects. Therefore cumulative cancer and noncancer impacts resulting from this operational source do not need to be evaluated. However, there is some incremental contribution to $PM_{2.5}$ concentrations as a result of the operation of the emergency generator. As an MEIR for $PM_{2.5}$ from operational-related emissions has not been identified, we take a very conservative approach as follows: The highest contribution to $PM_{2.5}$ concentration from offsite sources would be due to roadways, as shown in Tables 4 and 5. Specifically, a location near the proximity of College Avenue, Broadway Avenue, and Broadway Terrace would likely have the highest contribution to $PM_{2.5}$ concentration from offsite sources (Table 6). If we were to assume a hypothetical MEIR for $PM_{2.5}$ from project operational-related emissions at this location (i.e., the highest concentration of $PM_{2.5}$ from the emergency generator would hypothetically be at this location), the cumulative $PM_{2.5}$ concentration would be 0.69 µg/m^3 (Table 7). This concentration would not exceed the cumulative threshold of 0.8 µg/m^3. This approach is very conservative in that the actual operational $PM_{2.5}$ MEIR from the natural gas-fired emergency generator would likely be much closer to the location of the Safeway store, and therefore would have dramatically lower impacts from the roadways.

Closing

The conservative analysis described herein indicates that the proposed Project's construction-related and operational-related emissions do not result in the estimated cancer risk, chronic HI, acute HI and annual average $PM_{2.5}$ concentration to exceed the individual source and cumulative source significance thresholds.

If you have any questions about these analyses, please feel free to contact David at 415.796.1940 or dkim@environcorp.com. Thank you for the opportunity to assist you with this matter.

Sincerely,

David Kim, PhD
Senior Manager

Shari Libicki, PhD

Table 1
TAC Emissions from Construction[1,2,3]
51st and Broadway
Oakland, CA

Construction Phase	Construction Timeline	DPM[4,6]	$PM_{2.5}$ [4,5,6]	TOG[7,8]
		[tons]	[tons]	[max lbs/day]
Site	Jul 2013 - Mar 2015	0.16	0.35	10
Roadway - South	Jun 2014 - Oct 2014	0.0041	0.0041	1.6
Roadway - West	Jun 2014 - Aug 2014	0.0041	0.0041	0.83

Notes:
1. Emissions were calculated by California Emissions Estimator Model (CalEEModTM). Refer to Appendix A for CalEEMod™ runs.
2. Default construction schedule and offroad equipment information from CalEEMod was used for the Site construction. For roadway construction, the construction schedule and offroad equipment information was obtained from the Project Sponsor.
3. Default emissions from CalEEMod for diesel equipment were adjusted by the 33% load factor reduction recommended by the California Air Resources Board (ARB 2010) since this was not incorporated in CalEEMod™ which utilizes OFFROAD2007.
4. Two separate requirements from the Oakland Standard Conditions of Approval (SCA) are for the i) limitation of idling time of diesel-powered equipment to two minutes, and ii) a fleetwide average reduction of PM emissions by 45%. The BAAQMD CEQA Guidelines recommend applying a 45-percent reduction for PM10 and PM2.5 to account for the 2-minute idling limit (BAAQMD 2012). In addition, the Oakland SCA also requires a fleetwide average reduction of PM emissions by 45%. Therefore the PM emissions are further reduced by 45%. Implementing both measures requires accounting for both reductions.
5. To be conservative, $PM_{2.5}$ emissions from Site construction account for exhaust and fugitive emissions. whereas only exhaust $PM_{2.5}$ emissions from roadway construction were considered .
6. Exhaust $PM_{2.5}$ and PM_{10} emissions from roadway construction were too small to be displayed by CalEEMod™ (only displays two decimal digits), so these values were assumed to by 0.005.
7. CalEEMod™ output of reactive organic gases (ROG) were multiplied by a factor of 1.07/1.053 to convert to total organic gases (TOG) (USEPA 2010).
8. TOG emissions from the Site construction based on a default CalEEMod schedule occurs over a time frame of 25 months. Since the actual construction is expected to take 20 months only, daily TOG emissions are increased by a factor of 25/20 to account for the additional emissions that will take place in the shorter construction duration.

Notes:
1. Stationary source information was obtained from the BAAQMD Stationary Source Screening Analysis Tool for the Alameda County. (BAAQMD 2012)
2. All facilities within 1,000 feet of the MEISR as per the BAAQMD Stationary Source Screening Analysis Tool are included, consistent with BAAQMD Guidelines. The shortest distance between MEISR and the stationary source is reported. The distances were measured using Google Earth.
3. BAAQMD provides a *Cancer Risk and Chronic Hazard Index Distance Adjustment Multiplier for Diesel IC Engines* and a *Cancer Risk and Chronic Hazard Index Distance Adjustment Multiplier for Gasoline Dispensing Facilities* to be used on long term health effects from diesel generators and gasoline dispensing facilities. If the source is known to be a diesel engine or a gas station, the multiplier is applied to cancer risk and chronic HI reported in the BAAQMD Tool.
4. Screening levels for Claremont Country Club were estimated using emission data and screening-level risk calculator provided by BAAQMD. See Appendix B5.
5. Screening levels for Claremont House were estimated using emission data and screening-level risk calculator provided by BAAQMD. The source has a cogen engine and a diesel generator. The diesel generator distance multiplier was applied to the long term health effects from the diesel generator while the long term health effects from the cogen engine were not adjusted. See Appendix B5.

Table A4f: Summary of Roadway Construction Emissions

Table A1
Roadway Construction Equipment List
51st and Broadway
Oakland, CA

Phase[1]	Equipment Type[2]	Quantity[2]	Modeled Days of Operation[3]	Modeled Daily Usage [hours][4]	HorsePower[5]	Load Factor[6]
Roadway Construction - South						
Demolition	Concrete/Industrial Saws	2	8	4	81	0.73
	Tractors/Loaders/Backhoes	2		12	75	0.55
New Traffic Signals	Concrete/Industrial Saws	1	8	4	81	0.73
	Tractors/Loaders/Backhoes	1		2	75	0.55
New Concrete and Paving	Concrete/Industrial Saws	1	8	3	81	0.73
	Paving Equipment	2		5	82	0.53
	Tractors/Loaders/Backhoes	1		5	75	0.55
Landscaping	Tractors/Loaders/Backhoes	1	8	15	75	0.55
Roadway Construction - West						
Demolition	Concrete/Industrial Saws	1	8	4	81	0.73
	Tractors/Loaders/Backhoes	1		10	75	0.55
New Traffic Signals	Concrete/Industrial Saws	1	8	4	81	0.73
	Tractors/Loaders/Backhoes	1		2	75	0.55
New Concrete and Paving	Concrete/Industrial Saws	1	8	4	81	0.73
	Paving Equipment	1		5	82	0.53
	Tractors/Loaders/Backhoes	1		5	75	0.55
Landscaping	Tractors/Loaders/Backhoes	1	8	10	75	0.55

Notes:
1. Phase information for Roadway Construction - South and West is based on data provided by the Project Sponsor.
2. Equipment list and quantity is based on information provided by the from Project Sponsor.
3. Total days of operation for each construction phase were kept the same across all equipment type used within the particular phase.
4. Daily hours of operation were adjusted to conserve the total number of hours of operation and be consistent with Project Sponsor provided data.
5. Horsepower is based on CalEEMod™ defaults and has been approved by the client.
6. Default load factor from OFFROAD2007 are used.

Abbreviations:
ARB - California Air Resources Board
CalEEMod™ - CALifornia Emissions Estimator MODel
OFFROAD2007 - ARB Offroad Emissions Estimator Model

Table A2
Summary of Non-Default Construction Emission Assumptions
51st and Broadway
Oakland, CA

Construction Type	Reduction	Reasoning
Site and Roadway	33%	Reduction in load factor from OFFROAD applied to all off-road exhaust. Default emissions from CalEEMod for diesel equipment were adjusted by the 33% load factor reduction recommended by the California Air Resources Board (ARB 2010) since this was not incorporated in CalEEModTM which utilizes OFFROAD2007.
	45%	Reduction in PM10 and PM2.5 from off-road equipment from Oakland SCM
	45%	Reduction in PM10 and PM2.5 from 2-minute idling restriction in Oakland SCM. Percent reduction from BAAQMD CEQA Guidelines

Safeway 51st - Construction "Phase I"

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
Parking Lot	334	Space
Regional Shopping Center	32.7	1000sqft
Supermarket	65.01	1000sqft

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	5	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics -

Land Use -

Demolition -

Vehicle Trips - Disregard operational emissions from this model (they were quantified in a separate model)

9.0 Vegetation

Safeway 51st - Construction "Phase II"

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
Parking Lot	667	Space
Regional Shopping Center	195.52	1000sqft
Supermarket	0	1000sqft
User Defined Retail	29	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	5	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics -

Land Use - User defined retail represents auxiliary space.

Demolition -

Vehicle Trips - Disregard operational emissions from this model (they were quantified in a separate model)

Construction Phase -

9.0 Vegetation

RoadwayConst1 - Phase 2 and 3 (South)

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
User Defined Retail	1	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	4	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics - Phase 2 and 3 South

Land Use - Roadway Const to the south of project (1.21 acres = 52708 sq ft)

Construction Phase - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Trips and VMT - 16 vendor trips based on 245+75 cubic yards of material imported/exported

Demolition -

Grading - Using entire land use area for acres disturbed.

RoadwayConst1 - Phase 4 and 5 (West)

Alameda County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
User Defined Retail	1	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	4	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics - Phase 4 and 5 West

Land Use - Roadway Const to the west of project (0.36 acres = 15682 sq ft)

Construction Phase - Based on client info. Switched hours/day and total days values to maintain constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Trips and VMT - Based on soil imported/exported

Demolition -

Grading - Used entire land use area for acreage.

Safeway 51st - Construction "Phase II"

Alameda County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
Parking Lot	667	Space
Regional Shopping Center	195.52	1000sqft
Supermarket	0	1000sqft
User Defined Retail	29	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	5	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics -

Land Use - User defined retail represents auxiliary space.

Construction Phase -

Demolition -

Vehicle Trips - Disregard operational emissions from this model (they were quantified in a separate model)

7.1 Mitigation Measures Water

8.0 Waste Detail

8.1 Mitigation Measures Waste

9.0 Vegetation

RoadwayConst1 - Phase 2 and 3 (South)

Alameda County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
User Defined Retail	1	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	4	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics - Phase 2 and 3 South

Land Use - Roadway Const to the south of project (1.21 acres = 52708 sq ft)

Construction Phase - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Off-road Equipment - Based on client info. Switched hours/day and total days values to allow constant days in a phase and variable hours by equipment.

Trips and VMT - 16 vendor trips based on 245+75 cubic yards of material imported/exported

Demolition -

Grading - Using entire land use area for acres disturbed.

Urbanization Urban

Wind Speed (m/s) 2.2

Utility Company Pacific Gas & Electric Company

Climate Zone 4

Precipitation Freq (Days) 63

1.3 User Entered Comments

Project Characteristics - Phase 4 and 5 West

Land Use - Roadway Const to the west of project (0.36 acres = 15682 sq ft)

Construction Phase - Based on client info. Switched hours/day and total days values to maintain constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Trips and VMT - Based on soil imported/exported

Demolition -

Grading - Used entire land use area for acreage.

9.0 Vegetation

Safeway 51st - Construction "Phase II"
Alameda County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric
Parking Lot	667	Space
Regional Shopping Center	195.52	1000sqft
Supermarket	0	1000sqft
User Defined Retail	29	User Defined Unit

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	63
Climate Zone	5				
Utility Company	Pacific Gas & Electric Company				

1.3 User Entered Comments

Project Characteristics -

Land Use - User defined retail represents auxiliary space.

Construction Phase -

Demolition -

Vehicle Trips - Disregard operational emissions from this model (they were quantified in a separate model)

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Utility Company**	Pacific Gas & Electric Company
Climate Zone	4	**Precipitation Freq (Days)**	63		

1.3 User Entered Comments

Project Characteristics - Phase 4 and 5 West

Land Use - Roadway Const to the west of project (0.36 acres = 15682 sq ft)

Construction Phase - Based on client info. Switched hours/day and total days values to maintain constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Off-road Equipment - Client data. Switched hours/day and total days values to allow constant days in a phase and variable hours for equipment.

Trips and VMT - Based on soil imported/exported

Demolition -

Grading - Used entire land use area for acreage.

Oakland, CA

Construction Source	Source Type[1]	Source Dimension[2] [m]	Number of Sources[3]	Release Height[4] [m]	Initial Vertical Dimension[5] [m]	Initial Lateral Dimension[6] [m]
Site Equipment	Volume	20 x 20	146	5.0	1.2	4.7
Roadway Equipment - South	Volume	10 x 10	47	5.0	1.2	2.3
Roadway Equipment - West	Volume	10 x 10	13	5.0	1.2	2.3

Notes:
1. Due to lack of specific instructions on modeling of construction emissions from BAAQMD, ENVIRON used SCAQMD LST methodology when setting up the model. According to the LST methodology, construction sources were modeled as adjacent volume sources.
2. For volume sources, source dimensions were determined by size of construction zone. Size of construction zone was estimated based on a site map provided by Project Sponsor.
3. Number of sources were determined by size of construction zone and source dimensions.
4. According to the LST methodology, release height of the modeled volume sources representing construction equipment was set to 5 meters.
5. According to USEPA ISC3 User's Guide Volume II, initial vertical dimension of an elevated source not adjacent to a building is the vertical dimension of the source divided by 4.3.
6. According to USEPA ISC3 User's Guide Volume II, initial lateral dimension of single volume sources is length of side divided by 4.3.

Abbreviations:

Conversion Factors for Hydrocarbon Emission Components

NR-002a

Assessment and Standards Division
Office of Transportation and Air Quality
U.S. Environmental Protection Agency

Purpose

The purpose of this memorandum is to document the conversion factors for reporting hydrocarbon emissions in different forms. The general forms are total hydrocarbons (THC), total organic gas (TOG), nonmethane hydrocarbons (NMHC), nonmethane organic gas (NMOG), and volatile organic compounds (VOC), all defined in the introduction below. For reporting hydrocarbon emissions from nonroad equipment, it is helpful to provide an accepted means to estimate the hydrocarbons in the different forms. This is not a substitute for full speciation of hydrocarbons in the exhaust.

Introduction

Hydrocarbon emissions can be reported in a variety of styles depending on the end use of the emission estimates and the measurement technique used in the underlying data. Not all emissions are measured for all engines, so a conversion from the most common measurement type to others is needed to supply an estimate in terms required by the user.

Most hydrocarbon emissions data from mobile sources is measured as total hydrocarbon (THC). THC is the measured hydrocarbon emissions using a Flame Ionization Detector (FID) calibrated with propane. The FID is assumed to respond to all hydrocarbons identically as it responds to propane in determining the concentration of carbon atoms in a gas sample. Most hydrocarbons respond nearly identically as propane with notable exceptions being oxygenated hydrocarbons such as alcohols and aldehydes commonly found in engine exhaust.

Because alcohols and especially aldehydes are chemically reactive and therefore ozone-forming hydrocarbons, the California Air Resources Board defined a measurement that adds the THC and the oxygenated components into a new measurement called total organic gas (TOG). [1] The oxygenated components are measured by collecting aldehydes on dinitro- phenylhydrazine impregnated filter traps and alcohols in chilled water impingers. The aldehydes and alcohols are extracted and measured using chromatography to determine emission rates. Each mole of aldehydes and alcohols is added by weight as formaldehyde and methanol.

Methane is an organic gas that is orders of magnitude less reactive than other hydrocarbons, so it is often excluded from emission estimations. The methane is measured by chromatographically separating the methane from the THC and analyzing the concentrations using a FID calibrated specifically for methane. The methane emissions are subtracted from the THC and TOG emission estimations to produce a nonmethane hydrocarbon (NMHC) and a nonmethane organic gas (NMOG) emission estimate. Some newer instruments can measure the NMHC directly however leading to lower uncertainty.

Some hydrocarbons are less ozone-forming than other hydrocarbons, so EPA has officially excluded them from the definition of regulated hydrocarbons called volatile organic compounds (VOC). This definition excludes methane, ethane, and compounds not commonly found in large quantities in engine exhaust like chlorohydrocarbons from consideration as VOC. For this work the definition of VOC is the result of subtracting methane and ethane from the TOG emission estimates.

Conversion Factors

Because all studies to date have measured THC, all other hydrocarbon types will be given as a proportion of THC. The proportionalities given in the Table below were derived from those studies that measured methane, ethane, and aldehydes. Alcohols are only found if the fuel contains alcohols, so they would have been considered if data were available.

The hydrocarbon speciation data from nonroad engines is sparse. The 2-stroke engine conversions are derived from the study of only one moped engine while the 4-stroke engine results are an averaged result of 11 lawnmower engines studied. The diesel results are the average of two late 70s and early 80s vintage on-highway truck engines. The factors for compressed natural gas (CNG) and liquid petroleum gas (LPG) engines were estimated from data collected using on-highway light-duty vehicles equipped with catalysts. Nonroad equipment does not use this technology but no emissions data from nonroad CNG and LPG engines was available.

Table for Conversion Factors for Hydrocarbon Emission Results

Engine Type	TOG/THC	NMOG/THC	NMHC/THC	VOC/THC
2-Stroke Gasoline [2]	1.044	1.035	0.991	1.034
4-Stroke Gasoline [2, 3]	1.043	0.943	0.900	0.933
Diesel [4]	1.070	1.054	0.984	1.053
LPG [5]	1.099	1.019	0.920	0.995
CNG [5]	1.002	0.049	0.048	0.004

Bay Area Air Quality Management
Risk & Hazard Stationary Source Inquiry Form

This form is required when users request stationary source data from BAAQMD. This form is to be used with the BAAQMD's Google Earth stationary source screening tables.

For guidance on conducting a risk & hazard screening, including for roadways & freeways, refer to the District's Risk & Hazard Analysis flow chart.

Also see the District's Recommended Methods for Screening and Modeling Local Risks and Hazards document.

Table A: Requestor Contact Information	
Contact Name:	Shweta Mehta
Affiliation:	ENVIRON
Phone:	415-426-5008
Email:	smehta@environcorp.com
Date of Request	
Project Name:	51st and Broadway
Address:	51st and Broadway
City:	Oakland
County:	Alameda
Type (residential, commercial, mixed use, industrial, etc.):	commercial
Project size (# of units, or building square	323,000 building square feet
Comments:	

For Air District assistance, the following steps must be completed:

1. Complete all the contact and project information requested in Table A. Incomplete forms will not be processed. Please include a project site map.
2. Download and install the free program Google Earth, http://www.google.com/earth/download/ge/, and then download the county specific Google Earth stationary source application files from the District's website, http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx. The small points on the map represent stationary sources permitted by the District (Map A on right). These permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc. Click on a point to view the source's Information Table, including the name, location, and preliminary estimated cancer risk, hazard index, and PM2.5 concentration.
3. Find the project site in Google Earth by inputting the site's address in the Google Earth search box.
4. Identify stationary sources near the project. Verify that the location of the source on the map matches with the source's address in the Information Table, by using the Google Earth address search box to confirm the source's address location. Please report any mapping errors to the District.
5. List the stationary source information in Table B Section 1 below.
6. Note that a small percentage of the stationary sources have Health Risk Screening Assessment (HRSA) data INSTEAD of screening level data. These sources will be noted by an asterisk next to the Plant Name (Map B on right). If HRSA values are presented, these values have already been modeled and cannot be adjusted further.
7. Email this completed form to District staff. District staff will provide the most recent risk, hazard, and PM2.5 data that are available for the source(s). If this information or data are not available, source emissions data will be provided. Staff will respond to inquiries within three weeks.

Note that a public records request received for the same stationary source information will cancel the processing of your SSIF request.

Submit forms, maps, and questions to Alison Kirk at 415-749-5169, or akirk@baaqmd.gov .

Map B: Snapshot of Google Earth with Plant G8736 Information Table Selected Showing HRSA Values

Note the asterisk next to the plant name. This means that the values that appear below are from the HRSA. These values cannot be further adjusted using our screening tools, such as the diesel multiplier sheet. These values are based on modeling. If the Information Table says "Contact District Staff" include in Table B below.

Table B: Stationary Sources

Table B Section 1: Requestor fills out these columns based on Google Earth data | Table B Section 2: BAAQMD returns form with additional information in these columns as needed

Distance from Receptor (feet)	Plant # or Gas Dispensary #	Facility Name	Street Address	Corrected UTM_East	Corrected UTM_North	Screening Level Cancer Risk (1)	Screening Level Hazard Index (1)	Screening Level PM2.5 (1)	Permit #s (2)	Source #s (2)	Fuel Code (3)	Type of Source(s) (4)	HRSA Ap # (5)	HRSA Date (6)	HRSA Engineer (7)	HRSA Cancer Risk in a million	Age Sensitivity Factor (8)	HRSA Adjusted Cancer Risk	HRSA Chronic Health (9)	HRSA PM2.5 Risk	Status/Comments
520	G8633	Claremont Country Club	5295 Broadway Ter	566216.4803	4187975.491	na	na	na												0	Benzene emissions estimated at 0.029 #/yr.
750	G6254	Unocal SS# 251028	5300 Broadway Ave	565973.8352	4188034.233	11.032	0.016	na												0	Use gas station multiplier
250	14617	Claremont House	4500 GILBERT STREET	n/a	n/a	57.19	0.03	0.142	5707 = cogen, 17906 = ER gen	1, 2	1= 189, 2 = 98	1 Gas fired prepackaged cogen unit, 2 ER generator								0	new plant #20198; see attached spreadsheet. You can use the emissions calculator attached to determine the risk/concentration from each source and apply the diesel emissions distance multiplier to source 2.
5	1329	Emil Villa's Hickory Pit Restaurant	1982 PLEASANT VALLEY RD	566057.5317	4187584.081	9.7	0.119	0.067	27947 , 30376 = pit	1,2	175 "meat", 305 "wood"	1 Grill, 2 BBQ Pit								0	use screening levels; 9/20/12

																				0	
																				0	

Footnotes:

1. These Cancer Risk, Hazard Index, and PM2.5 columns represent the values in the Google Earth Plant Information Table.

2. Each plant may have multiple permits and sources.
3. Fuel codes: 98 = diesel, 189 = Natural Gas.
4. Permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc.
5. If a Health Risk Screening Assessment (HRSA) was completed for the source, the application number will be listed here.
6. The date that the HRSA was completed.
7. Engineer who completed the HRSA. For District purposes only.
8. All HRSA completed before 1/5/2010 need to be multiplied by an age sensitivity factor of 1.7.
9. The HRSA "Chronic Health" number represents the Hazard Index.
10. Further information about common sources:
    a. Sources that only include diesel internal combustion engines can be adjusted using the BAAQMD's Diesel Multiplier worksheet.
    b. The risk from natural gas boilers used for space heating when <25 MM BTU/hr would have an estimated cancer risk of one in a million or less, and a chronic hazard index of 0.003 or less. To be conservative, requestor should assume the cancer risk is 1 in a million and the hazard index is 0.003 for these sources.
    c. BAAQMD Reg 11 Rule 16 required that all co-residential (sharing a wall, floor, ceiling or is in the same building as a residential unit) dry cleaners cease use of perc on July 1, 2010. Therefore, there is no cancer risk, hazard or PM2.5 concentrations from co-residential dry cleaning businesses in the BAAQMD.
    d. Non co-residential dry cleaners must phase out use of perc by Jan. 1, 2023. Therefore, the risk from these dry cleaners does not need to be factored in over a 70-year period, but instead should reflect the number of years perc use will continue after the project's residents or other sensitive receptors (such as students, patients, etc) take occupancy.
    e. Gas stations can be adjusted using BAAQMD's Gas Station Distance Mulitplier worksheet.
    f. Unless otherwise noted, exempt sources are considered insignificant. See BAAQMD Reg 2 Rule 1 for a list of exempt sources.
    g. This spray booth is considered to be insignificant.

Operational Emission Estimates Supporting Information

Attachment C: Operational Emission Estimates Supporting Information

Table C1: CAP and GHG Emissions – Emergency Generator

Table C2: TAC Emissions – Emergency Generator

Table C1
CAP and GHG Emissions - Emergency Generator
Safeway Rockridge Center Shopping Project
Oakland, CA

Type	Pollutant Name	Source[1]	Emission Factor[2]	Unit[3]	Annual Emissions[4] [lb/yr]
Criteria Pollutant	NOx	AP-42	2.27E+00	lb/MMBtu	208
	CO		3.72E+00	lb/MMBtu	341
	SO_2		5.88E-04	lb/MMBtu	0.05
	VOC		2.96E-02	lb/MMBtu	2.7
	PM_{10}		9.50E-03	lb/MMBtu	0.87
	$PM_{2.5}$		9.50E-03	lb/MMBtu	0.87
GHG	CH_4	AP-42	2.30E-01	lb/MMBtu	21
	CO_2		1.10E+02	lb/MMBtu	10,098
	CO2,e	Calculated	--	--	10,541

Notes:
1. Uncontrolled emission factors for all the pollutants were obtained from AP-42 for a rich burn, natural gas-fired reciprocating engine. CO_2,e emissions were calculated by multiplying the CO_2 and CH_4 emissions by their GWP potential of 1 and 21, respectively.
2. To be conservative, the maximum emission factor was choosen for each pollutant from AP-42. PM_{10} and $PM_{2.5}$ are the filterable emission factors were selected.
3. Units consistent with AP-42.
4. Annual emissions were calculated assuming a default heating rate of 1020 BTU/scf as per AP-42 and a fuel consumption rate of 900 cubic feet per hour at 100% load from the generator specifications shown in Attachment E. Annual emissions were calculated assuming maximum operation of 100 hours per year.

Abbreviations:
CAP: criteria air pollutant
CH_4: methane
CO: carbon monoxide
CO_2: carbon dioxide
CO_2,e: carbon dioxide equivalent
GHG: greenhouse gas
GWP: global warming potential
lb: pound
MMBtu: million British thermal units
NOx: oxides of nitrogen
$PM_{2.5}$: particles in the atmosphere with a diameter of 2.5 micrometers or less
PM_{10}: particles in the atmosphere with a diameter of 10 micrometers or less
SO_2: sulfur dioxide
VOC: Volatile Organic Compounds
yr: year

Notes:

1. Only those TACs which have a trigger level as per BAAQMD Regulation 2, Rule 5 were evaluated in this analysis.
2. These substances are PAH-derivatives that have OEHHA-developed PEFs.
3. Total PAH was calculated by multiplying individual PAH-specific emission levels with their corresponding PEFs. THe sum of these products is the total PAH, which is the benzo(a)pyrene-equivalent. As per BAAQMD Regulation 2, Rule 5, PAH should be evaluated as benzo(a)pyrene-equivalents and should be copmared against the benzo(a)pyrene equivalent trigger level.
4. Emission factors were obtained either from AP-42 or from the Air Resource Board's CATEF, as listed.
5. PEFs for the PAH-derivative substances were obtained from BAAQMD Regulation 2, Rule 5.
6. Emission factor was obtained from AP-42 or from CATEF as mentioned above.
7. Units consistent with AP-42 or CATEF.
8. TAC emission factors which were obtained from CATEF are in units of lb/MMcf. These were converted to maximum hourly emissions by using a fuel consumption rate of 900 cubic feet per hour at 100% load from the generator specifications shown in Attachment E. TAC emission factors obtained from AP-42 are in units of lb/MMBtu. These were converted to maximum hourly emissions by using the fuel consumption rate mentioned above and a default heating rate of 1020 BTU/scf as per AP-42. Finally, the maximum hourly emissions were converte d to annual emissions assuming that the generator operates for a maximum of 100 hours per year.
9. Chronic and Acute trigger levels are obtained from BAAQMD Regulation 2, Rule 5 and are pollutant specific.
10. Annual emissions are compared against the chronic trigger levels and the maximum hourly emissions are compared against the acute trigger levels.

Abbreviations:

CATEF: California Air Toxics Emission Factor Database
lb: pound
MMBtu: million British thermal units
MMcf: million cubic feet
OEHHA: Office of Environmental Health Hazard Assessment
PAH: polycyclic aromatic hydrocarbon
PEF: Potency Equivalent Factors
scf: standard cubic feet
TAC: toxic air contaminants
yr: year

$PM_{2.5}$ Concentration (µg/m3)[12]	2.02E-02	2.02E-02	1.43E-04	3.06E-04	1.43E-04	3.06E-04

Notes:
1. Several cases were evaluated to determine the worst case scenario. Since the location of the emergency generator is not known, a couple building downwash scenarios were considered. Also, the terrain was varied to be either complex or simple to model the topography around the Project.
2. The emergency generator emissions stack was modeled as a point source.
3. Unit emission rate was assumed in the model to get dispersion factors.
4. Stack height, inner diameter and exit gas temperature was obtained from the generator specification sheet in Attachment E. Stack outlet diameter was used to calculate the area of the outlet. Stack exit gas velocity was calculated based on the calculate area of the stack outlet and the flow rate which was obtained from the generator specifications in Appendix E.
5. Building height for the proposed Safeway store was obtained from information provided by the Client.
6. Minimum and maximum building dimensions were calculated from site maps provided by the Client. For Case 1, 3a and 3b, the dimensions of the proposed Safeway store were considered. For Case 2, 4a and 4b, adjacent buildings in addition to the Safeway store were considered.
7. The complex terrain option in SCREEN3 accounts for elevation which is greater than the height of the stack. This option was selected in Case 3a, 3b, 4a and 4b to account for elevation north of the Project which is at a much higher elevation. The complex terrain option was not selected in Case 1 and 2 to model the terrain to the west, east and south of the Project.
8. Terrain height above the stack base and distance to the terrain were measured in Google Earth.
9. Results for each case are shown in Attachment D. Output for Case 1 and 2 are 1-hour maximum dispersion factors, whereas for the other cases which are modeled as complex terrain, it is the 24 -hour maximum dispersion factor.
10. The annual dispersion factor is calculated from the maximum 1-hourly or 24-hourly dispersion factor based on BAAQMDs permit modeling guidance.
11. Annual $PM_{2.5}$ emissions in lb/yr are shown in Attachment C. It is converted to g/s assuming uniform emissions over the entire course of the year.
12. $PM_{2.5}$ concentration is calculated by multiplying the annual dispersion factor with the annualized emission rate.

Abbreviations:
µg: microgram
g: gram
lb: pound
m: meter
$PM_{2.5}$: particles in the atmosphere with a diameter of 2.5 micrometers or less
s: second
yr: year

Appendix A

Peak Hour Selection

FEHR & PEERS

APPENDIX A – PEAK HOUR SELECTION

The Project impacts and mitigation measures identified in the DEIR are based on analysis of traffic impacts at study intersections during the weekday PM, Saturday midday, and Saturday PM peak hours. These time periods were selected because trips generated by the proposed Project, in combination with background traffic, would represent typical worst traffic conditions. This appendix describes why the DEIR did not analyze traffic impacts during the weekday AM peak hour.

WEEKDAY AM PEAK HOUR

Fehr & Peers conducted 24-hour tube counts on Broadway and Pleasant Valley Avenue adjacent to the Project site on during the weeks of October 10 and October 17, 2011. **Figure A-1** shows the average hourly traffic volume on both streets on weekdays.

Based on the October 2011 data, the weekday AM peak hour is between 8:00 and 9:00 AM and the weekday PM peak hour is between 5:00 and 6:00 PM. The PM peak hour traffic volumes on both Broadway and Pleasant Valley Avenue combined is about 28 percent higher than the AM peak hour.

Table A-1 summarizes the weekday AM peak hour trip generation for the proposed Project. Unlike the weekday PM peak hour trip generation, the trip generation is not reduced to account for the existing CVS Store that would be demolished, pass-by trips, or internalization between Safeway and other uses in the shopping center due to unavailability of data. Despite these conservative assumptions, the weekday AM peak hour trip generation is about 36 percent lower than the PM peak hour trip generation.

Figure A-1: Weekday Hourly Traffic Volumes

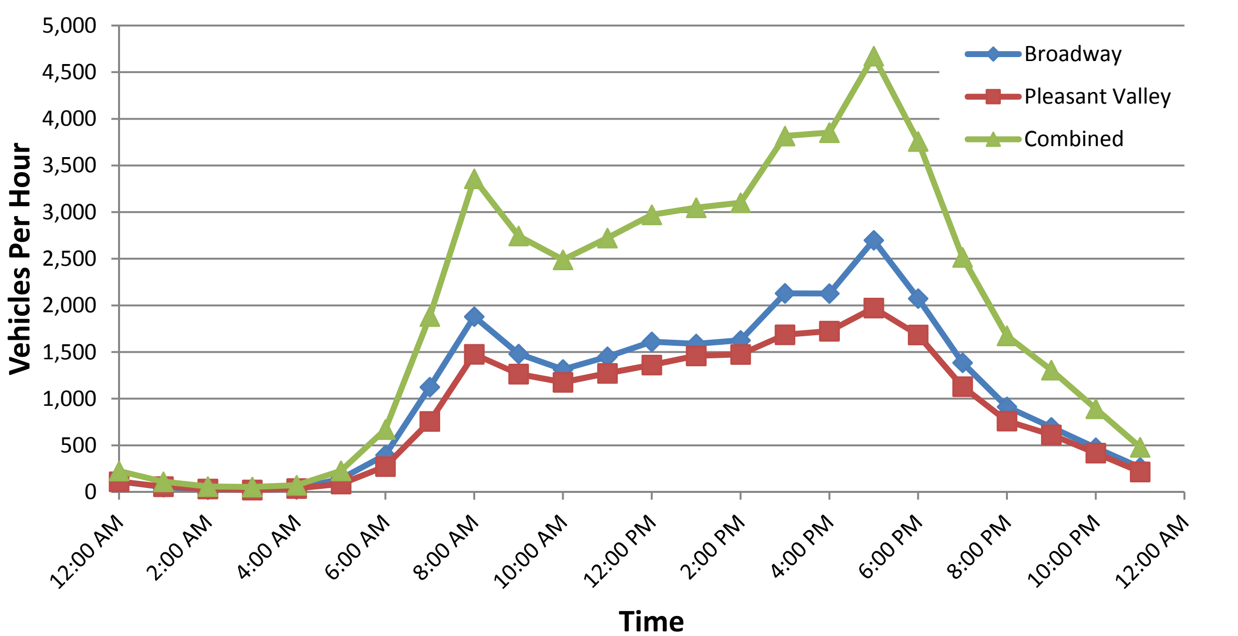

TABLE A-1
PROJECT TRIP GENERATION ESTIMATES – AM PEAK HOUR NET NEW VEHICLE TRIPS

Land Use	ITE Code	Units[1]	In	Out	Total
New Safeway Trips[2]	850	65.0 ksf	37	24	61
Proposed New Retail[3]	820	178.0 ksf	132	84	216
Existing CVS[4]	n/a	-87.2 ksf	n/a	n/a	n/a
New Project Trips			*169*	*108*	*277*
Pass-By Vehicles[5]			*0*	*0*	*0*
Internalized Trips[6]			*0*	*0*	*0*
Net AM Peak Hour New Project Trips			***169***	***108***	***277***
Net PM Peak Hour New Project Trips			***211***	***225***	***436***
Difference			***-42***	***-117***	***-159***

1. KSF = 1,000-square feet
2. Trip generation based on Institute of Transportation Engineers (ITE), *Trip Generation*, (8th Edition) average rate for supermarket (Land Use Code 850) applied to the net increase in Safeway size :

   Average Rate = 3.59 trips per KSF; Enter = 61%, Exit = 39%
3. Trip generation based on ITE *Trip Generation*, (8th Edition) regression equations for Shopping Center (Land Use Code 820) :

   Ln(T) = 0.59 Ln(X) + 2.32; Enter = 61%, Exit = 39%

   Where: T = trips generated, X = 1,000 square feet, Ln = natural log
4. AM peak hour data not available for the existing CVS store. This analysis conservatively assumes zero trip generation for the existing CVS store.
5. No AM peak hour pass-by data available. This analysis conservatively assumes zero pass-by trips.
6. No AM peak hour internalization data available. This analysis conservatively assumes zero internalization.

Source: Trip Generation (8th Edition), ITE, 2008; and Fehr & Peers, 2012.

The DEIR identifies a number of impacts and mitigation measures at the study intersections based on analysis of traffic operations during the weekday PM peak hour. Considering that both existing traffic volumes and Project trip generation are higher during the weekday PM peak hour, an analysis of Project impacts during the weekday AM peak hour is not expected to identify new impacts or mitigation measures.

Appendix E

Broadway Bicycle Lanes

APPENDIX E – BROADWAY BICYCLE LANES

City of Oakland is planning Class 2 bicycle lanes on Broadway between 38th Street and SR 24. The project would accommodate the bicycle lanes by generally eliminating one travel lane in each direction of Broadway. The segment between 38th Street and Broadway Terrace was approved by Oakland City Council in May 2012, is fully funded, and is currently under design.

The Broadway bicycle lane project was neither approved nor funded at the time that the Notice of Preparation (NOP) was published for the 51st & Broadway Safeway Redevelopment Project in 2009. Therefore, the DEIR did not include the Broadway bicycle lane project in the baseline future 2015 or 2035 analyses. Thus, this supplemental analysis has been conducted to address potential impacts of the proposed Project if bicycle lanes were installed on Broadway between 38th Street and Broadway Terrace by analyzing traffic operations at intersections along the affected segments of Broadway under No Project and Plus Project (i.e., the 51st & Broadway Safeway Redevelopment Project).

This analysis is based on the following assumptions:

- Under 2015 and 2035 with bicycle lanes and no Project conditions, the bicycle lane project would eliminate one through travel lane in each direction of Broadway except at the Broadway/College Avenue (intersection #3) and Broadway/51st Street/Pleasant Valley Ave (#7) intersections where the existing lane configurations would be maintained. No other roadway network modifications that would affect intersection operations, including signal timing optimization, are assumed.

- As described in the Project Roadway Modifications subsection of the DEIR Transportation, Circulation, and Parking chapter and shown on Figures 4.3-11A and 4.3-11B, the proposed Project, as part of Project improvements, would modify Broadway between just south of 51st Street/Pleasant Valley Avenue and College Avenue to provide Class 2 bicycle lanes on Broadway. Thus, this analysis assumes that these improvements would also be implemented under 2015 and 2035 with bicycle lanes plus Project conditions.

Tables E-1 and E-2 summarize intersection operations at the six study intersections along the affected segments of Broadway under 2015 and 2035 conditions with Broadway bicycle lanes under No Project and Plus Project conditions.

The DEIR identifies a significant and unavoidable impact at the Broadway/51st Street/Pleasant Valley Ave (#7) under both 2015 and 2035 conditions (Impacts Trans-4 and Trans-8, respectively). The DEIR did not identify any other significant impact at these six study intersections. In comparison as shown in Table E-1, the impact at this intersection under 2015 conditions would be eliminated with the installation of the bicycle lanes; however, the impact would continue to remain significant and unavoidable under 2035. The installation of the bicycle lanes on Broadway would not result in additional significant impacts that were not identified in the DEIR.

TABLE E-1
INTERSECTION LOS SUMMARY (BROADWAY BICYCLE LANES)
2015 CONDITIONS

#	Study Intersection	Traffic Control[1]	Peak Hour	2015 With Broadway Bicycle Lanes and No Project		2015 with Broadway Bicycle Lanes and Project		Significant Impact?
				Delay (Seconds)[2]	LOS	Delay (Seconds)[2]	LOS	
2	Broadway/Broadway Terrace	Signal	PM	18.3	B	19.1	B	No
			SAT	10.2	B	8.7	A	No
3	Broadway/College Avenue	Signal	PM	10.1	B	10.0	B	No
			SAT	12.9	B	12.1	B	No
4	Broadway/Coronado Avenue/ North Project Driveway	SSSC/ Signal[3]	PM	1.5 **(43.6)**	A **(E)**	26.6	C	No
			SAT	1.0 (18.1)	A (C)	17.0	B	No
7	Broadway/51st Street/ Pleasant Valley Avenue	Signal	PM	52.4	D	54.7	D	No
			SAT	46.3	D	39.4	D	No
8	Broadway/45th Street	Signal	PM	12.5	B	8.3	A	No
			SAT	8.5	A	5.2	A	No
9	Broadway/40th Street/ 40th Street Way	Signal	PM	20.8	C	18.3	B	No
			SAT	21.2	C	16.2	B	No

Notes: **Bold** indicates intersection operating at unacceptable LOS E or LOS F

1. Signal = signalized intersection, SSSC = side-street stop controlled intersection
2. For side-street stop controlled intersections, delay is reported as: intersection average (worst minor street approach); for signalized intersection, the average intersection delay is reported; for signalized intersections operating with high delay, volume-to-capacity (v/c) ratio is also reported. LOS for both unsignalized and signalized intersections based on 2000 HCM.
3. Intersection is side-street stop-controlled under No Project conditions and signalized under Plus Project conditions.
4. The proposed Project would cause an impact at this intersection because it would degrade intersection operations from LOS D to LOS E.

TABLE E-2
INTERSECTION LOS SUMMARY (BROADWAY BICYCLE LANES)
2035 CONDITIONS

#	Study Intersection	Traffic Control[1]	Peak Hour	2035 with Broadway Bicycle Lanes and No Project		2035 with Broadway Bicycle Lanes and Project		Significant Impact?
				Delay (Seconds)[2]	LOS	Delay (Seconds)[2]	LOS	
2	Broadway/Broadway Terrace	Signal	PM	**103.1 (v/c=1.13)**	**F**	**99.2 (v/c=1.12)**	**F**	No
			SAT	13.2	B	11.5	B	No
3	Broadway/College Avenue	Signal	PM	11.3	B	12.7	B	No
			SAT	13.6	B	11.9	B	No
4	Broadway/Coronado Avenue/ North Project Driveway	SSSC/ Signal[3]	PM	3.2 **(173.9)**	A **(F)**	43.9	D	No
			SAT	1.1 (25.9)	A (D)	15.7	B	No
7	Broadway/51st Street/ Pleasant Valley Avenue	Signal	PM	**131.6 (v/c=1.16)**	**F**	**136.4 (v/c=1.23)**	**F**	Yes[4, 5]
			SAT	**62.7**	**E**	47.1	D	No
8	Broadway/45th Street	Signal	PM	23.1	C	13.3	B	No
			SAT	9.5	A	6.5	A	No
9	Broadway/40th Street/ 40th Street Way	Signal	PM	31.1	C	30.0	C	No
			SAT	23.2	C	18.8	B	No

Notes: **Bold** indicates intersection operating at unacceptable LOS E or LOS F

1. Signal = signalized intersection, SSSC = side-street stop controlled intersection
2. For side-street stop controlled intersections, delay is reported as: intersection average (worst minor street approach); for signalized intersection, the average intersection delay is reported; for signalized intersections operating with high delay, volume-to-capacity (v/c) ratio is also reported. LOS for both unsignalized and signalized intersections based on 2000 HCM.
3. Intersection is side-street stop-controlled under No Project conditions and signalized under Plus Project conditions.
4. The proposed Project would cause an impact at this intersection because it would increase the intersection v/c ratio by more than 0.01 at an intersection already operating at LOS F.

MEMORANDUM

Date: June 15, 2010

To: Peterson Vollman, City of Oakland
Darin Ranelletti, City of Oakland

From: Sam Tabibnia and Ellen Robinson

Subject: ***Safeway on College Avenue and 51st and Broadway Center – ACCMA Travel Demand Model Land Use Assumptions***

WC07-2483 & WC10-2728

This memorandum summarizes Fehr & Peers' approach in developing land use assumptions for forecasting future traffic volumes in preparing the EIRs for the Safeway on College Avenue and 51st and Broadway Center projects. Previously, we used a similar methodology for the Alta Bates Summit Medical Center, Summit Campus Master Plan EIR. We have reviewed the land use database in the most recent Alameda County Congestion Management Authority's (ACCMA) Travel Demand Model, which was released in February 2009. The land use database is based on the Association of Bay Area Governments' *Projections 2007*. Our review methodology and recommendations for modifying the land use database are summarized below.

MODEL LAND USE REVIEW

The land use assumptions as modified for the Alta Bates Summit Medical Center Summit Campus Seismic Upgrade and Master Plan Project EIR were the starting point for development of land use assumptions for the EIRs for the Safeway on College Avenue and 51st Street and Broadway Center projects. The changes made from the original land uses for the Summit Campus project were documented in a memorandum by Fehr & Peers dated May 7, 2009 (see Appendix A).

Consistent with the methodology for the Summit Campus land use adjustments, Fehr & Peers reviewed the model land uses in the project area. The number and growth of households and employment by type in the project area from the year 2005 to 2035 are summarized in Table 1. The transportation analysis zones (TAZs) included in the project area are shown on Figure 1.

Fehr and Peers compared the projected growth in households and employment in each project-area TAZ to the development included in the City's Active Major Projects list. The most recent version of the Active Major Projects list, dated October – November 2009, was used for this comparison. The project square footage measurements from the list were converted to employment numbers by assuming one employee per 500 square feet for retail space and one employee per 300 square feet of office (service) space.

The Active Major Projects list identified pending, planned, proposed and recently completed development of households, retail employment and service employment in the project area. The total growth of these development types in the model and the Active Major Projects list are compared in Table 2.

TABLE 2
PROJECT VICINITY AREA[1] LAND USE GROWTH COMPARISON

Land Use Variable	ACCMA Model 2005-2035 [2]	Pending, Planned, Proposed and Completed Projects [3]	Difference
Households (HH)	3,858	1,325	2,533
Retail Employment (RET)	1,615	319	1,296
Service Employment (SVC)	6,663	2,191	4,472

1. See Figure 1 for a map of the project vicinity area.
2. Latest ACCMA model based on ABAG *Projection 2009*.
3. Includes projects from City of Oakland's Active Major Projects list, October – November 2009, and proposed Safeway projects

As shown in Table 2, the 2035 model assumes more total development in the project area than is identified in the Active Major Projects list. However, the model land use growth for many individual TAZs was not high enough to include specific projects in the Active Major Projects list. In these cases, Fehr & Peers shifted development growth to the project TAZ from other TAZs in the study area. In this way, the model land uses are modified to better match foreseeable development, while maintain the overall household and employment growth in the model. Appendix A documents the changes in 2035 land use assumptions by TAZ, and the resulting recommended modifications to 2035 model land uses.

Several development projects have been completed in the project area since 2005. Because the 2005 model will be used to represent existing traffic volumes for the purposes of forecasting traffic growth, projects identified as recently completed on the Active Major Projects list were added to the 2005 model land use assumptions. Appendix B documents the changes in 2005 land use assumptions by TAZ, and the resulting recommended modifications to 2005 model land uses.

Please contact us with questions or comments.

APPENDIX A

FINAL MEMORANDUM

Date: May 7, 2009

To: Scott Gregory, Lamphier-Gregory

From: Sam Tabibnia and Ellen Robinson

Subject: ***Alta Bates Summit Medical Center Summit Campus Master Plan EIR – ACCMA Travel Demand Model Land Use Assumptions***

WC08-2611

This memorandum summarizes Fehr & Peers proposed approach to developing land use assumptions for forecasting future traffic volumes. We have reviewed the land use database in the most recent Alameda County Congestion Management Authority's (ACCMA) Travel Demand Model, which was released in February 2009. The land use database is based on the Association of Bay Area Governments' *Projections 2007*. Our review methodology and recommendations for modifying the land use database are summarized below.

MODEL LAND USE REVIEW

The number of households and employment by type for City of Oakland assumed in the ACCMA model under 2005 and 2035 conditions are summarized in Table 1. The ACCMA model represents potential trip origins and destinations with transportation analysis zones, or TAZs. Each TAZ represents an area of several blocks, and is assigned land use characteristics, including the number of households and the number of jobs of varied types (agricultural, manufacturing, retail, service, trade and other) in the zone. Since the ACCMA model is a regional forecasting model, the distribution of future developments may not be very accurate at the TAZ level.

TABLE 1
ACCMA TRAVEL DEMAND MODEL
CITYWIDE LAND USE GROWTH ASSUMPTIONS

Land Use Variable	2005	2035	2005 – 2035 Growth
Households (HH)	154,570	207,249	52,679
Agricultural Employment (AFM)	289	383	94
Manufacturing Employment (MFG)	16,952	29,667	12,716
Retail Employment (RET)	24,161	40,753	16,592
Service Employment (SVC)	84,947	131,689	46,742
Trade Employment (TRD)	6,910	6,982	72
Other Employment (OTH)	68,457	75,702	7,245
Total Employment	201,715	285,176	83,461

Source: ACCMA model as summarized by Fehr & Peers, 2009

The land uses in the area surrounding the Alta Bates Summit Medical Center would most affect traffic patterns at the study intersections. Thus, we have reviewed in detail the land use growth assumptions for TAZs in the project vicinity area as presented on Figure 1. Fehr & Peers reviewed the years 2005 and 2035 model land use assumptions for the TAZs in the project vicinity area, and calculated the household and employment growth projected for each zone. Table 2 summarizes the growth in number of households and employment types in the project vicinity area.

TABLE 2
ACCMA TRAVEL DEMAND MODEL
PROJECT VICINITY AREA[1] LAND USE GROWTH ASSUMPTIONS

Land Use Variable	2005	2035	2005 – 2035 Growth
Households (HH)	35,669	51,314	15,647
Agricultural Employment (AFM)	0	0	0
Manufacturing Employment (MFG)	2,226	4,133	1,906
Retail Employment (RET)	5,867	10,275	4,410
Service Employment (SVC)	31,361	49,631	18,271
Trade Employment (TRD)	1,223	1,290	64
Other Employment (OTH)	17,062	18,645	1,585
Total Employment	57,739	83,973	26,235

1. See Figure 1 for a map of the project vicinity area.
Source: ACCMA model as summarized by Fehr & Peers, 2009

The land use growth assumptions in the project vicinity area were compared to planned, approved and pending projects, including those listed on the City of Oakland's Active Major Development Projects matrix (updated in November 2008), as well as the Summit Campus project and the Upper Broadway Retail Specific Plan. Appendix A presents the number of households and the number of retail and service jobs by TAZ in the project vicinity area. Appendix A also compares the land use growth assumed in the model with the expected land use growth. Since the model land use is based on employment numbers and information regarding specific development projects available in square footages, the project square footage measurements were converted to employment numbers by assuming one employee per 500 square feet for retail space and one employee per 300 square feet of office (service) space. Only service and retail employment were included in the comparison, as these employment types are the majority of employment growth in the project vicinity area, as shown in Table 2.

In addition to the project vicinity area, the model land use database was checked to assure that the following major projects in other parts of Oakland were also accounted for: Oak to Ninth Mixed Use Project, Wood Street Mixed Use Project and Jack London Square Redevelopment Project

As shown in Appendix A, the model land use assumptions for individual TAZs do not match the growth expected from pending, planned, and proposed projects. Table 3 compares the overall growth in the project vicinity areas as assumed in the model with the growth from pending, planned, and proposed projects. Overall, the model assumes more household, and retail and service employment growth in the project vicinity areas than is expected from pending, planned, and proposed projects, though growth in several individual TAZs is lower than expected. Note

FEHR & PEERS
TRANSPORTATION CONSULTANTS

that this comparison does not account for existing uses that are currently occupied by most of the pending, planned, and proposed projects. Although these existing uses would be eliminated, this comparison does not account for it to present a more conservative analysis.

TABLE 3
PROJECT VICINITY AREA[1] LAND USE GROWTH COMPARISON

Land Use Variable	ACCMA Model 2005-2035 [2]	Pending, Planned, and Proposed Projects [2]	Difference
Households (HH)	15,647	9,187	6,460
Retail Employment (RET)	4,410	4,066	344
Service Employment (SVC)	18,271	10,818	7,453

1. See Figure 1 for a map of the project vicinity area.
2. Latest ACCMA model based on ABAG *Projection 2009*.

RECOMMENDED MODIFICATIONS

Appendix A presents our recommended modifications to the land uses in TAZs in the project vicinity area based on the growth expected from pending, planned, and proposed projects. For household and retail and service employment growth in TAZs where pending, planned, and proposed projects include more growth than is assumed in the TAZ, we recommend increasing the corresponding land uses and then reducing the land use growth in the rest of the TAZs in the project vicinity area so that the overall growth in number of households and service jobs is consistent with the ACCMA for the project vicinity area.

Notes: **Bold** queues longer than available storage
1. NB = Northbound; SB = Southbound, EB = Eastbound, WB = Westbound.
2. Available storage for no project and plus project conditions.
3. 95th percentile queue as estimated by Synchro.
   #= 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
   m = Volume for 95th percentile queue is metered by upstream signal.

Notes: **Bold** queues longer than available storage
4. NB = Northbound; SB = Southbound, EB = Eastbound, WB = Westbound.
5. Available storage for no project and plus project conditions.
6. 95th percentile queue as estimated by Synchro.
#= 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
m = Volume for 95th percentile queue is metered by upstream signal.
