DESCRIPTION OF THE PROPOSED PROJECT [24 CFR 50.12 & 58.32; 40 CFR 1508.25]:

The Phoenix, 801 Pine Street (800 Cedar Street), Oakland, Alameda County, California 94607 (APN 006-0047-001-00):

The East Bay Asian Local Development Corporation (EBALDC) proposes to acquire and operate The Phoenix, a mixed-use affordable and supportive housing project on one lot that totals 0.90 acres (Parcel 1 of APN 006-0047-001-00) at the northwest corner of Pine Street and 8th Street in Oakland, California 94607 that would be constructed by Holliday Development (construction, acquisition, and operation is hereafter referred to as the "proposed project"). The project address is 801 Pine Street in Oakland, California 94607. The project will demolish at-grade concrete slabs currently covering the site.

The proposed project is phase 1 of a larger master-planned development that would consist of a total of 316 apartments and 12,000 square feet of ground floor retail and commercial makers spaces on the 4.65-acre site bound by 9th, Pine, and Shorey Streets and the frontage road to Interstate 880 (I-880).

The proposed project would include construction of a four-story and three-story, 101-unit residential building and a two-story community building. Approximately half of the units will be permanent supportive housing (PSH). Supportive housing combines permanent, independent rental apartments with services that help people who formerly experienced homelessness live more stable lives. The rest of the residential units will be reserved for low-income households, with incomes no greater than 60 percent of the area median income (AMI). Each apartment will have its own bathroom and kitchen area. The unit mix will be 82 studios, 3 one-bedroom units, and 16 two-bedroom units. One two-bedroom unit will be reserved for an onsite manager. Elevator lobby space and trash facilities will be located on each floor.[1]

Residents of the PSH units would be selected based on tenant selection criteria to be determined by the State, City, County, and applicant (landlord/owner). As noted, PSH pairs affordable rental apartments with on-site services. In addition to independent living, this component of the project will accommodate supportive service activities, including onsite workshops, group sessions, life skills, job training, informal gatherings, and one-on-one meetings The approximately 7,503-square foot community building will provide meeting space for these services and office space for the case workers, property managers and security guards who support the health of the residents. The community building also includes laundry facilities, mailboxes, and a bike room with 75 long-term bicycle parking spaces for residents. For aggregation purposes, the additional 16 street-parking spaces located along Shorey Street are part of the project as well as a 160-foot portion of the Shorey Lane extension that would include 21 parking spaces, which would provide a shared access fire lane for the larger master-planned project. The proposed project would only be responsible for construction and maintenance of the portion of Shorey Street that is on the project site (Figure 1), and all the required fire access needed by the proposed project would be located on-site (see Appendix K). The residential and community building surround a 3,582-square-foot courtyard which serves as outdoor common space for the buildings' residents.

---

[1] Lowney Architecture. 2019. The Phoenix, Oakland, CA – Site Built Permit Set. Oakland, CA. November 15.

A perspective of the proposed buildings from Pine Street and Shorey Street is shown in Figure 4. The conceptual site plan is shown in Figure 5, including improvements along Shorey Street, and floor plans for the ground floor through the roof are shown in Figures 6 through 10. The conceptual landscaping and open space plan is shown in Figure 11.

The total project cost is estimated to be $41,000,000.

STATEMENT OF PURPOSE AND NEED FOR THE PROPOSAL [40 CFR 1508.9(B)]:

The purpose of the proposal is to increase the number of affordable housing units in the city of Oakland and Alameda County as a whole. As described more thoroughly below, the region is facing a housing shortage and the need is particularly pronounced for housing that is affordable to households with incomes below 50 percent of AMI. An increase of 50 permanent supportive housing units and 50 affordable units (at 60 percent AMI) will be accomplished by implementing the project.

Regional Outlook

As of 2020, the San Francisco Bay Area (Bay Area) region had a population of approximately 7.61 million people. The Bay Area is the world's 19th-largest economy. The region's population is projected to swell to over 10 million people by 2050.

The Association of Bay Area Governments (ABAG), in conjunction with the Metropolitan Transportation Commission (MTC) and representatives from each of the nine Bay Area counties and cities, has drafted a strategy for a sustainable region named Plan Bay Area 2050. Plan Bay Area grew out of California Senate Bill (SB) 375 "The California Sustainable Communities and Climate Protection Act of 2008" which requires the Bay Area to reduce greenhouse gas (GHG) emissions from cars and light trucks. The law requires that the Sustainable Communities Strategy promote compact, mixed-use commercial and residential development. To meet the goals of SB 375, Plan Bay Area directs more future development in areas that are or will be walkable and bike-able and close to public transit, jobs, schools, parks, recreation and other amenities. The law synchronizes the regional housing needs allocation (RHNA) process with the regional transportation planning process and streamlines the California Environmental Quality Act (CEQA) process for housing and mixed-use projects that are consistent with the Sustainable Communities Strategy and in close proximity to public transportation. Local governments have identified Growth Geographies, including Priority Development Areas (PDAs), Priority Production Areas (PPAs), Transit-Rich Areas (TRAs) and High-Resources Areas (HRAs) to guide future growth in housing and jobs.

By 2050 the Bay Area is projected to add 2.39 million people, an increase of 31 percent or roughly 1 percent per year. The number of jobs is expected to grow by 1.4 million between 2015 and 2050, an increase of 35 percent, which is a faster rate of job growth than previous forecasts. During this same time period, the number of households is expected to increase by 51 percent to 4,043,000. Single-family homes represent the majority of housing production in recent decades, but recent trends suggest that cities once again are becoming centers of population growth. Demand for multi-family housing is projected to increase in developed areas near transit, shops, and services.

Environmental Assessment - The Phoenix

The COVID-19 pandemic eliminated approximately 150,000 jobs in the Bay Area in 2020. However, with a gross domestic product of over $900 billion, the Bay Area economy has ample opportunities to better serve historically marginalized communities as it recovers from the impacts of COVID-19. Factors such as high land and construction costs, minimum parking requirements, maximum unit densities, and other local policies combined with swiftly increasing demand for housing has led to higher rents and home prices. Bay Area communities face these challenges at a time when there are fewer public resources available than in past decades. Public funding to support affordable housing production or preservation has sharply declined since the 1980s, and today the region has among the smallest shares or deed-restricted affordable housing in the industrialized world.

Local Perspective

According to the 2020 American Community Survey, Alameda County had a population of 1,682,353. Alameda County's households are expected to grow 54 percent from 552,000 in 2015 to 847,000 in year 2050. Alameda County occupies most of the East Bay of the San Francisco Bay Area. The City of Oakland is the county seat and the largest city in Alameda County. According to ABAG's Housing Needs Allocation, 2023-2031, the city of Oakland should add 26,251 new units by 2031 in order to meet the needs for housing.[2,3] Of this total, Oakland's "fair share" housing goals for the 2023-2031 cycle included 6,511 units affordable to very low income households at 50 percent of the area median income (AMI), 3,750 units affordable to low income households (80 percent of AMI), 4,457 units affordable to moderate-income households (120 percent of AMI) and 11,533 units affordable to households of above moderate income.

Table 1: Alameda County Housing Needs Allocation, 2023-2031

City	Very Low <50%	Low <80%	Moderate, <120%	Above Moderate	Total
Alameda	1,421	818	868	2,246	5,353

[3] ABAG. 2021. *Final Regional Housing Needs Allocation (RHNA) Plan: San Francisco Bay Area, 2023 to 2031.* December.

Local housing elements must include an analysis of special housing needs. Under State law, special needs refer to those households that contain seniors, persons with disabilities, large households, female-headed households, homeless, veterans and farmworkers.

The City of Oakland, in its 2015-2023 Housing Element, outlines its goals, policies, and planned actions to address its housing needs.[4] The following goals and policies apply to this project and affordable housing in general.

- **Goal 2: Promote the development of adequate housing for low- and moderate-income households.**
    - *Policy 2.1 - Affordable housing development programs:* Provide financing for the development of affordable housing for low- and moderate-income households. The City's financing programs will promote a mix of housing types, including homeownership, multifamily rental housing and housing for seniors and persons with special needs.
    - *Policy 2.9 – PATH Plan for the homeless:* Expand the City's Permanent Access to Housing (PATH) Plan to prevent and end homelessness and increase housing opportunities to the homeless through acquisition, rehabilitation and construction of housing, master leasing and short-term financial assistance.
    - *Policy 2.10 - Promote an equitable distribution of affordable housing throughout the community:* The City will undertake a number of efforts to distribute assisted housing widely throughout the community and avoid the over-concentration of assisted housing in any particular neighborhood, in order to provide a more equitable distribution of households by income and by race and ethnicity.
- **Goal 7: Promote sustainable development and sustainable communities.**
    - *Policy 7.1 - Sustainable residential development programs:* In conjunction with the City's adopted Energy and Climate Action Plan (ECAP), develop and promote programs to foster the incorporation of sustainable design principals, energy efficiency and smart growth principles into residential developments. Offer education and technical assistance regarding sustainable development of project applicants.
    - *Policy 7.2 - Minimize energy consumption:* Encourage the incorporation of energy conservation design features in existing and future residential development beyond minimum standards required by State building code.
    - *Policy 7.3 - Encourage development that reduces carbon emissions:* Continue to direct development toward existing communities and encourage infill development at densities that are higher than – but compatible with – the surrounding communities. Encourage development in close proximity to transit, and with a mix of land uses in the same zoning district, or on the same site, so as to reduce the number and frequency of trips made by automobile.

---

[4] Oakland, City of. 2014. General Plan Housing Element 2015-2023. December 9.

The proposed project will help to achieve the stated goals by its consistency with the policies stated above. The project includes affordable housing for low-income households and permanent supportive housing for chronically homeless populations and will benefit special needs populations.

EXISTING CONDITIONS AND TRENDS [24 CFR 58.40(A)]:

Existing Conditions

As of 2020, the population of Oakland was 440,646. Oakland is a major West Coast port city in the U.S. State of California. The Port of Oakland is the busiest port for San Francisco Bay and all of Northern California. Oakland is the 3rd largest city in the San Francisco Bay Area, the 8th largest city in California, and the 45th largest city in the United States. Incorporated in 1852, Oakland is the county seat of Alameda County. It serves as a major transportation hub and trade center for the entire region and is also the principal city of the Bay Area Region known as the East Bay. The city is situated directly across the Bay, six miles east of San Francisco.

A steady influx of immigrants during the 20th century, along with thousands of African-American war-industry workers who relocated from the Deep South during the 1940s, have made Oakland one of the most ethnically diverse major cities in the country. Oakland is known for its history of political activism, as well as its professional sports franchises and major corporations, which include health care, dot-com companies and manufacturers of household products. The city is a transportation hub for the greater Bay Area, and its shipping port is the fifth busiest in the United States.

Oakland has a Mediterranean climate with an average of 260 sunny days per year. Lake Merritt, a large, centrally located estuary east of Downtown, was the United States' first officially designated wildlife refuge. Jack London Square, named for the author and former resident, is a tourist destination on the Oakland waterfront.

According to the U.S. Census Bureau, the City's total area is 78.0 square miles, including 55.8 square miles of land and 22.2 square miles (28.5 percent) of water. Oakland's highest point is near Grizzly Peak Blvd, east of Berkeley, just over 1,760 feet above sea level. Oakland has 19 miles of shoreline. Oakland residents refer to their city's terrain as “the flatlands” and “the hills,” which until recent waves of gentrification have also been a reference to Oakland's deep economic divide, with “the hills” being more affluent communities. About two-thirds of Oakland lies in the flat plain of the East Bay, with one-third rising into the foothills and hills of the East Bay range.

Sire Characteristics

The project site is at 801 Pine Street, northwest of the Shorey Street/Pine Street intersection in West Oakland. The 0.9-acre site is Parcel 1 out of the four parcels that make up Accessor Parcel Number (APN) 006-0047-001-00. It is approximately 0.5 miles northwest of the West Oakland Bay Area Rapid Transit (BART) station and approximately 200 feet east Interstate 880 (I-880). The site is approximately one mile east of San Francisco Bay.

The project site is currently vacant and undeveloped, although a concrete surface covers much of the lot. The project site is included in Opportunity Site #28 in the 7th Street Opportunity Area, Subarea 2c of the West Oakland Specific Plan. The site is predominately flat topographically and is not near any creeks or natural landmarks. There are four trees on the project site that would be removed and one near the site at the intersection of Shorey Street and Pine Street that would remain.[5]

Trends

The City of Oakland's Consolidated Plan 2015-2020 discusses the current housing conditions and expected trends.

There are 35,610 households that qualify as extremely low income (0 – 30 percent of area median income) under U.S. Department of Housing and Urban Development (HUD) guidelines, over 23 percent of all Oakland households. These are households living near or below the federal poverty level. This group is by far the most vulnerable to housing instability and at greatest risk of becoming homeless. The majority of these households are renters and have very high rates of housing instability.

There are 21,433 low-income households in Oakland (from 31-50 percent of median income) constituting over 14 percent of all Oakland households. Of these, 12,440 (58 percent) are renters. For low-income renters, affordability is clearly the most significant problem, affecting approximately 71 percent of these households. Overcrowding is reported for approximately 29 percent of low-income renters.[6]

Homelessness

While the City of Oakland does have an inventory of affordable housing, there are very long waiting lists for these units and most of the affordable housing projects do not have supportive services or are still not affordable to the homeless population. There is tremendous unmet need for housing for unsheltered homeless households and those at risk of being homeless.

According to a 2019 comprehensive report on homelessness, 8,022 people are experiencing homelessness in Alameda County, and 4,071 individuals experiencing homelessness were counted in the city of Oakland.[7] The total number of people experiencing homelessness in Alameda County increased from 5,629 in 2017, for a 43 percent increase between 2017 and 2019. The population of persons experiencing homelessness in Oakland represented over half of the total number of persons enumerated in Alameda County during the 2019 Point-in-Time Count. The total number of people experiencing homelessness in Alameda County increased from 1,310 persons in 2017, for a 47 percent increase between 2017 and 2019. This data confirms the analysis of EveryOne Home's Plan to End Homelessness: 2018 Strategic Update that says that, "for every two people becoming homeless, only one person returns to permanent housing." Other important data from these surveys indicate the following:

---

[5] Karnowski, Julia, BS. 2020. Site survey. Tom Origer & Associates. May 5.

[6] United States Census Bureau. Op. cit.

[7] Applied Survey Research (ASR), EveryOne Home, Aspire Consulting LLC and the Alameda County Housing and Community Development Department. 2019. *Alameda County and City of Oakland Homeless Count & Survey and Comprehensive Report.*

- While the number of individuals in Alameda County served by shelters remained stable (up by about 0.2 percent) between 2017 and 2019, there was an increase of 2,449 unsheltered individuals (or an increase of 63 percent). In 2019, 79 percent of the people experiencing homelessness in the City of Oakland were unsheltered, compared to 69 percent in 2017.

- Persons in families with at least one adult and one child under age 18 represented approximately 5 percent of the overall population experiencing homelessness in Oakland, slightly lower than Alameda County overall (7 percent). Most persons in families (99 percent) were enumerated in shelters and transitional housing programs.

- Ninety-five percent (95 percent) of the population experiencing homelessness were single individuals. Unaccompanied children and transition-age youth represented 12 percent of the population experiencing homelessness in Oakland, higher than the county overall (9 percent).

- Individuals identifying as Black/African American were over-represented in the population experiencing homelessness. An estimated 70 percent of persons experiencing homelessness in Oakland identified as Black/African American, compared to 47 percent of the overall county's population experiencing homelessness and 24 percent of the city's general population.

- Homelessness and incarceration are often correlative. Individuals without stable housing are at greater risk of criminal justice system involvement, particularly those with mental health issues, veterans and youth.

- Individuals with past incarceration face significant barriers to exiting homelessness due to stigmatization and policies affecting their ability to gain employment and access housing opportunities. Formerly incarcerated people are almost ten times more likely to experience homelessness than the general public. Ten percent of respondents in the City of Oakland homeless survey reported being on probation at the time of the survey, and 5 percent reported being on parole.

As also reported in EveryOne Home's 2018 Strategic Update report, Alameda County spent $106 million on the Housing Crisis Response System in fiscal year 2017/18 on homelessness prevention, shelter, outreach, navigation, rapid rehousing, subsidized permanent housing and permanent supportive housing. Service providers assisted approximately 1,500 people to return to permanent housing every year, yet there are 3,000 people becoming homeless for the first time, and the rate at which people are becoming homeless outpaces the ability to house them with existing resources.

The largest service and housing gaps are in homelessness prevention, subsidized housing for people with extremely low-incomes, and permanent supportive housing. The 2018 Strategic Update estimates that a total of $330 million per year would end unsheltered homelessness, calling for an increase of $228 million, the bulk of which should be spent in prevention, subsidized housing for people with extremely low-incomes, and permanent supportive housing.

These trends are likely to continue in the absence of the project. The project will help to stem the trends outlined above by providing affordable housing to special-needs populations.

COMPLIANCE WITH 24 CFR 50.4, 58.5, AND 58.6 LAWS AND AUTHORITIES

Record below the compliance or conformance determinations for each statute, executive order, or regulation. Provide credible, traceable, and supportive source documentation for each authority. Where applicable, complete the necessary reviews or consultations and obtain or note applicable permits of approvals. Clearly note citations, dates/names/titles of contacts, and page references. Attach additional documentation as appropriate.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
STATUTES, EXECUTIVE ORDERS, AND REGULATIONS LISTED AT 24 CFR 50.4 and 58.6		
Airport Hazards 24 CFR Part 51 Subpart D	Yes ☐ No ☒	There is one major airport and one minor airport within 15 miles of the project site. Oakland International Airport (OAK) is the nearest airport and is approximately 7.53 miles south of the project site. Minor airport Hayward Executive Airport is 14.22 miles south of the project site. The project is Runway Protection Zone/Clear Zone (RPZ/CZ) compliant. The proposed project is not within a potential hazard area subject to further mitigation. ***Source Documents:*** 10, 11, 12, Appendix A
Coastal Barrier Resources Coastal Barrier Resources Act, as amended by the Coastal Barrier Improvement Act of 1990 [16 USC 3501]	Yes ☐ No ☒	The Coastal Barrier Resources Act of the United States (CBRA, Public Law 97-348), enacted October 18, 1982, designated various undeveloped coastal barriers, depicted by a set of maps adopted by law, for inclusion in the John H. Chafee Coastal Barrier Resources System (CBRS). Areas so designated were made ineligible for direct or indirect Federal national security, navigability, and energy exploration. CBRS areas extend along the coasts of the Atlantic Ocean and the Gulf of Mexico, Puerto Rico, the U.S. Virgin Islands, and the Great Lakes, and consist of 857 units. There are no Coastal Barrier Resources in California. ***Source Documents:*** 13
Flood Insurance Flood Disaster Protection Act of 1973 and National Flood Insurance Reform Act of 1994 [42 USC 4001-4128 and 42 USC 5154a]	Yes ☐ No ☒	The project site is not located within a 100-year or 500-year flood hazard zone identified on a Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM). Flood hazard designation is depicted on FIRM Map Number 06001C0066H with an effective date of December 21, 2018. Therefore, flood insurance is not required. ***Source Documents:*** 14, 15, Appendix B

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
STATUTES, EXECUTIVE ORDERS, AND REGULATIONS LISTED AT 24 CFR 50.4 & 58.5		
Clean Air Clean Air Act, as amended, particularly section 176(c) & (d); 40 CFR Parts 6, 51, 93	Yes ☒ No ☐	**Criteria Air Pollutants** The Federal Clean Air Act (FCAA), as amended, is the primary federal law that governs air quality while the California Clean Air Act (CCAA) is its companion state law. The 1970 FCAA required the establishment of National Ambient Air Quality Standards (NAAQS) for criteria air pollutants. The FCAA and subsequent FCAA Amendments of 1977 and 1990 empowered the United States Environmental Protection Agency (USEPA) to designate areas as being in attainment or nonattainment for each criteria air pollutant standard. The FCAA, as amended, requires that states develop a State Implementation Plan (SIP) for areas that are in nonattainment of any of the NAAQS. The SIP present strategies for the attainment of the NAAQS and also include comprehensive attainment plans for each nonattainment area. California has established the California Ambient Air Quality Standards (CAAQS) for criteria air pollutants. The CAAQS and air basin designations are established by the California Air Resources Board (CARB). CARB is also responsible for implementing the strategies of the SIP, once it has been approved by the USEPA. The project site is in the San Francisco Bay Area Air Basin (SFBAAB). The state and federal attainment status for all regulated pollutants in the SFBAAB are summarized in Table 2. The SFBAAB is currently designated a marginal nonattainment area for the 2008 and 2015 federal 8-hour ozone standard, moderate nonattainment for the 2006 federal 24-hour fine particulate matter (PM2.5) standard, and nonattainment for the State ozone, coarse particulate matter (PM10), and PM2.5 standards. The SFBAAB is designated as a maintenance area with respect to the federal carbon monoxide standards. The SFBAAB is classified as attainment or unclassifiable for the remaining NAAQS and CAAQS. Unclassifiable generally indicates that there is a lack of representative data to classify a basin. The predominant regulation that guides the assessment of air quality impacts of federal actions is the General Conformity Rule, established under the Clean Air Act (Section 176(c)(4)). The General Conformity Rule ensures that the actions taken by federal agencies in nonattainment and maintenance areas do not interfere with implementation of the SIP to meet the NAAQS for air quality. In keeping with the General Conformity Rule process, this assessment applies the appropriate de minimis thresholds of the General Conformity Rule as they apply to the SFBAAB for ozone precursors, PM2.5, and carbon monoxide. The de minimis thresholds for these three

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		pollutants in the SFBAAB are 100 tons per year for each pollutant.

Table 2: State and Federal Attainment Status in the San Francisco Bay Area Air Basin

Pollutant	State Attainment Status	Federal Attainment Status
Ozone	Nonattainment	Nonattainment (Marginal)
Coarse Particulate Matter (PM10)	Nonattainment	Unclassifiable

NA = not applicable

The Bay Area Air Quality Management District (BAAQMD) has established thresholds in the CEQA Air Quality Guidelines at which project emissions of ozone precursors (reactive organic gases [ROG] and nitrogen oxides [NO_x]), PM_{10}, and $PM_{2.5}$ could cause or contribute to violations of the CAAQS. As shown in Table 3, the BAAQMD's thresholds are more stringent than the federal de minimis thresholds for conformity analysis. Therefore, any federal action that is consistent with the BAAQMD's thresholds for attaining the CAAQS would also conform with the goals and strategies of the SIP for attaining the NAAQS.

Table 3: BAAQMD Thresholds for Criteria Air Pollutants

Pollutant	BAAQMD Threshold
ROG	54 pounds/day (10 tons/year)
NO_x	54 pounds/day (10 tons/year)
Exhaust PM_{10}	82 pounds/day (10 tons/year)
Exhaust $PM_{2.5}$	54 pounds/day (10 tons/year)
Fugitive Dust PM^{10} and $PM_{2.5}$	Best Management Practices

The West Oakland Specific Plan EIR evaluated carbon monoxide emissions from new developments in the project vicinity and determined that project development would not generate emissions leading to significant concentrations of carbon monoxide that would violate any ambient air quality standard or contribute substantially to an existing or

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		projected air quality violation. Therefore, carbon monoxide emissions from the project would not interfere with implementation of the SIP. **Criteria Air Pollutant Analysis** *Construction Emissions* Construction activities associated the project would generate criteria air pollutant emissions that could potentially affect local and regional air quality. During construction, the primary pollutant emissions of concern would be ROG, NO_x, PM_{10}, and $PM_{2.5}$ from the exhaust of off-road construction equipment and on-road construction vehicles related to worker vehicles, vendor trucks, and haul trucks. In addition, fugitive dust emissions of PM_{10} and $PM_{2.5}$ would be generated by soil disturbance activities, and fugitive ROG emissions would result from the application of architectural coatings and paving. The BAAQMD has developed screening criteria for ROG, NO_x, PM_{10}, and $PM_{2.5}$ to conservatively evaluate if a project would exceed the BAAQMD's thresholds for criteria air pollutants during construction and operation (Table 3). The proposed project's affordable housing and community services were compared to the BAAQMD's screening criteria for low-rise apartments and general office buildings, respectively. As shown in Table 4, the total percentage of the project size compared to the BAAQMD's screening criteria would be less than 100 percent for construction, which means the project would not exceed the BAAQMD's thresholds for criteria air pollutants. As a result, emissions from project construction would also be below the federal de minimis thresholds for criteria air pollutants. In addition, the City of Oakland has a Standard Condition of Approval (SCA) that requires all construction projects to implement the BAAQMD's best management practices for controlling fugitive dust emissions during construction (see below). Compliance with City's SCA for dust control would ensure that the project satisfies the BAAQMD's threshold of significance and remains below the federal de minimis threshold for $PM_{2.5}$. In addition, the City of Oakland has a Standard Condition of Approval (SCA) that requires all construction projects to implement the BAAQMD's best management practices for controlling fugitive dust emissions during construction (see below). Compliance with City's SCA for dust control would ensure that the project satisfies the BAAQMD's threshold of significance and remains below the federal de minimis threshold for $PM_{2.5}$.

</table>
<p><i>Operational Emissions</i></p>
<p>Operational criteria air pollutants generated by residential uses are primary the result of mobile source emissions from vehicles. The proposed project's affordable housing and community services were compared to the BAAQMD's screening criteria for low-rise apartments and general office buildings, respectively.</p>
<p>Those projects that do not exceed the screening thresholds are presumed to result in less than significant air quality effects. For low-rise apartment projects, the operational screening threshold is 451 dwelling units. For ground-level office uses, the screening threshold is 346,000 square feet. At 101 dwelling units and approximately 7,500 square feet of commercial use, the project does not exceed either of the individual operational screening criteria and would not exceed the combined screening criteria. Therefore, emissions from operation of the project would conform with the goals and strategies of the SIP.</p>
<p>The City of Oakland has adopted Uniformly Applied Development Standards that are imposed as Standard Conditions of Approval (SCAs). These SCAs apply to all projects that meet applicable criteria. The City of Oakland has a SCA that requires all construction projects to implement the BAAQMD's best management practices for controlling fugitive dust emissions during construction (see below). Compliance with City's SCA for dust control would ensure that the project satisfies the BAAQMD's threshold of significance and remains below the federal de minimis threshold for $PM_{2.5}$.</p>
</td></tr>
</table>

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Health Risk Assessment Toxic air contaminants (TACs) include a diverse group of air pollutants that can adversely affect human health. Unlike criteria air pollutants, which generally affect regional air quality, TAC emissions are evaluated based on estimations of localized concentrations and risk assessments. The adverse health effects a person may experience following exposure to any chemical depend on several factors, including the amount (dose), duration, chemical form, and any simultaneous exposure to other chemicals. For risk assessment purposes, TACs are separated into carcinogens and non-carcinogens. Carcinogens are assumed to have no safe threshold below which health impacts would not occur. Non-carcinogenic substances are generally assumed to have a safe threshold below which health impacts would not occur. Acute and chronic exposure to non-carcinogens is expressed as a hazard index (HI), which is the sum of expected exposure levels divided by the corresponding acceptable exposure levels. In the SFBAAB, adverse air quality impacts on public health from TACs are predominantly from diesel particulate matter (DPM). The City of Oakland uses the BAAQMD CEQA Air Quality Guidelines to consider exposure of sensitive receptors to air pollutant levels that result in an unacceptable cancer risk or hazard. For cancer risk, which is a concern with DPM, the BAAQMD considers an excess risk at or above 10 in one million to be a significant risk for a single source. The BAAQMD CEQA Guidelines also consider single-source TAC exposure to be significant if the HI is greater than 1.0 for non-cancer risk hazards. Cumulative exposure is assessed by combining the risks and annual PM2.5 concentrations for all sources near a project site. The thresholds for cumulative exposure are an excess cancer risk of 100 in one million, annual PM2.5 concentrations of 0.8 micrograms per cubic meter (µg/m^3), and a HI greater than 10.0. These thresholds were used to address impacts from TAC sources that could affect future project residents. Project-related construction activities would generate construction-related emissions of TACs, specifically DPM from on-road haul trucks and off-road diesel equipment exhaust. Due to the variable nature of construction activity, the generation of TAC emissions would be temporary. Considering the short amount of time such equipment is typically within an influential distance that would result in the exposure of sensitive receptors to substantial concentrations, it is unlikely that construction-period TAC emissions during construction of the project would result in increased cancer risk or non-cancer health concerns for

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		nearby sensitive receptors. <u>Operational Health Risk Assessment</u> Residential and office uses are not generally considered substantial sources of operational TAC emissions. While, maker's space would be constructed in another phase of the larger Planned Unit Development (PUD) project, this building would be for custom low impact manufacturing which is generally not a source of substantial TAC emissions. The Project site is located is located near a freeway and an area characterized by large and complex industrial facilities across the freeway and extra cautions should be considered for sensitive land uses in these areas, including identifying additional measures that can be implemented to reduce health risks. Health risks from major sources of TAC emissions were estimated at the project site using results from the West Oakland Community Action Plan (WOCAP) Technical Assessment. As shown in Table 5, chronic HI at the project site would be below the BAAQMD's health risk screening threshold; however, cancer risk and PM2.5 concentrations at the project site would be above the BAAQMD's health risk screening thresholds. Therefore, the project is required to identify health risk reduction measures to reduce the health risk to acceptable levels. As described in the health risk assessment prepared for the project (Appendix C), CARB has identified high-efficiency filtration as the most effective method for residences to reduce incoming DPM from outdoor air. An air filtration device rated MERV-13 or higher can reduce levels of indoor DPM and PM2.5 by at least 85 percent, relative to the incoming outdoor air. Therefore, as shown in Table 5, implementation of MERV-13 or higher air filtration devices would reduce the cumulative excess cancer risk and PM2.5 concentrations at the project site below the BAAQMD's thresholds. The City has a SCA for controlling the exposure of future residents to TACs (see below). Installation and maintenance of a MERV-13 or higher air filtration on the project site would comply the City's SCA for TAC exposure. Therefore, compliance with City's SCA for TAC exposure would ensure that the project does not expose future residents to substantial air pollutant concentrations that could result in significant adverse health risks.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**

Total Health Risk with MERV-13	67	0.5	0.04
BAAQMD's Thresholds	100	0.8	10

Notes: $PM_{2.5}$ = fine particulate matter; HI = hazard index; $\mu g/m^3$ = micrograms per cubic meter; DPM = diesel particulate matter; MERV = minimum efficiency reporting value.
Bold indicates exceedance of the applicable BAAQMD thresholds.

Conclusions
With implementation of the City's Standard Conditions of Approval (SCAs), the project would not result in substantial increases in criteria air pollutant emissions or adverse health risks during construction or operation. The applicable SCAs for air quality are listed below.

SCAs Required:
AQ1. Dust Controls – Construction Related.
The project applicant shall implement all of the following applicable dust control measures during construction of the project:

a. Water all exposed surfaces of active construction areas at least twice daily. Watering should be sufficient to prevent airborne dust from leaving the site. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water should be used whenever feasible.
b. Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer).
c. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
d. Limit vehicle speeds on unpaved roads to 15 miles per hour.
e. All demolition activities (if any) shall be suspended when average wind speeds exceed 20 mph.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		f. All trucks and equipment, including tires, shall be washed off prior to leaving the site. g. Site accesses to a distance of 100 feet from the paved road shall be treated with a 6 to 12 inch compacted layer of wood chips, mulch, or gravel. **AQ2. Criteria Air Pollutant Controls – Construction Related.** The project applicant shall implement all of the following applicable basic control measures for criteria air pollutants during construction of the project as applicable: a. Idling times on all diesel-fueled commercial vehicles over 10,000 lbs. shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes (as required by the California airborne toxics control measure Title 13, Section 2485, of the California Code of Regulations). Clear signage to this effect shall be provided for construction workers at all access points. b. Idling times on all diesel-fueled off-road vehicles over 25 horsepower shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes and fleet operators must develop a written policy as required by Title 23, Section 2449, of the California Code of Regulations ("California Air Resources Board Off-Road Diesel Regulations"). c. All construction equipment shall be maintained and properly tuned in accordance with the manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. Equipment check documentation should be kept at the construction site and be available for review by the City and the Bay Area Air Quality District as needed. d. Portable equipment shall be powered by grid electricity if available. If electricity is not available, propane or natural gas generators shall be used if feasible. Diesel engines shall only be used if grid electricity is not available and propane or natural gas generators cannot meet the electrical demand. e. Low VOC (i.e., ROG) coatings shall be used that comply with BAAQMD Regulation 8, Rule 3: Architectural Coatings. f. All equipment to be used on the construction site shall comply with the requirements of Title 13, Section 2449, of the California Code of Regulations ("California Air Resources Board Off-Road Diesel Regulations") and upon request by the City (and the Air District if specifically requested), the project applicant shall provide written documentation that fleet requirements have been met.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		AQ3. Diesel Particulate Matter Controls – Construction Related The project applicant shall implement appropriate measures during construction to reduce potential health risks to sensitive receptors due to exposure to diesel particulate matter (DPM) from construction emissions. The project applicant shall choose one of the following methods: i. The project applicant shall retain a qualified air quality consultant to prepare a Health Risk Assessment (HRA) in accordance with current guidance from the California Air Resources Board (CARB) and Office of Environmental Health and Hazard Assessment to determine the health risk to sensitive receptors exposed to DPM from project construction emissions. The HRA shall be submitted to the City (and the Air District if specifically requested) for review and approval. If the HRA concludes that the health risk is at or below acceptable levels, then DPM reduction measures are not required. If the HRA concludes that the health risk exceeds acceptable levels, DPM reduction measures shall be identified to reduce the health risk to acceptable levels as set forth under subsection b below. Identified DPM reduction measures shall be submitted to the City for review and approval prior to the issuance of building permits and the approved DPM reduction measures shall be implemented during construction. -or- ii. All off-road diesel equipment shall be equipped with the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type (Tier 4 engines automatically meet this requirement) as certified by CARB. The equipment shall be properly maintained and tuned in accordance with manufacturer specifications. This shall be verified through an equipment inventory submittal and Certification Statement that the Contractor agrees to compliance and acknowledges that a significant violation of this requirement shall constitute a material breach of contract. **AQ4. Exposure to Air Pollution (Toxic Air Contaminants)** a. Health Risk Reduction Measures The project applicant shall incorporate appropriate measures into the project design in order to reduce the potential health risk due to exposure to toxic air contaminants. The project applicant shall choose one of the following methods: i. The project applicant shall retain a qualified air quality consultant to prepare a Health Risk Assessment (HRA) in accordance with California Air Resources Board (CARB) and Office of Environmental Health and Hazard Assessment requirements to determine the health risk

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		of exposure of project residents/occupants/users to air pollutants. The HRA shall be submitted to the City for review and approval. If the HRA concludes that the health risk is at or below acceptable levels, then health risk reduction measures are not required. If the HRA concludes that the health risk exceeds acceptable levels, health risk reduction measures shall be identified to reduce the health risk to acceptable levels. Identified risk reduction measures shall be submitted to the City for review and approval and be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the City. The approved risk reduction measures shall be implemented during construction and/or operations as applicable. - or - ii. The project applicant shall incorporate the following health risk reduction measures into the project. These features shall be submitted to the City for review and approval and be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the City: • Installation of air filtration to reduce cancer risks and Particulate Matter (PM) exposure for residents and other sensitive populations in the project that are in close proximity to sources of air pollution. Air filter devices shall be rated MERV-13 [insert MERV-16 for projects located in the West Oakland Specific Plan area] or higher. As part of implementing this measure, an ongoing maintenance plan for the building's HVAC air filtration system shall be required. • Where appropriate, install passive electrostatic filtering systems, especially those with low air velocities (i.e., 1 mph). • Phasing of residential developments when proposed within 500 feet of freeways such that homes nearest the freeway are built last, if feasible. • The project shall be designed to locate sensitive receptors as far away as feasible from the source(s) of air pollution. Operable windows, balconies, and building air intakes shall be located as far away from these sources as feasible. If near a distribution center, residents shall be located as far away as feasible from a loading dock or where trucks concentrate to deliver goods. • Sensitive receptors shall be located on the upper floors of buildings, if feasible. • Planting trees and/or vegetation between sensitive receptors and pollution source, if feasible. Trees that are best suited to trapping PM shall be planted, including one or more of the following: Pine (Pinus nigra var. maritima), Cypress (X Cupressocyparis

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		leylandii), Hybrid poplar (Populus deltoids X trichocarpa), and Redwood (Sequoia sempervirens). • Sensitive receptors shall be located as far away from truck activity areas, such as loading docks and delivery areas, as feasible. • Existing and new diesel generators shall meet CARB's Tier 4 emission standards, if feasible. • Emissions from diesel trucks shall be reduced through implementing the following measures, if feasible: o Installing electrical hook-ups for diesel trucks at loading docks. o Requiring trucks to use Transportation Refrigeration Units (TRU) that meet Tier 4 emission standards. o Requiring truck-intensive projects to use advanced exhaust technology (e.g., hybrid) or alternative fuels. o Prohibiting trucks from idling for more than two minutes. o Establishing truck routes to avoid sensitive receptors in the project. A truck route program, along with truck calming, parking, and delivery restrictions, shall be implemented. b. <u>Maintenance of Health Risk Reduction Measures</u> The project applicant shall maintain, repair, and/or replace installed health risk reduction measures, including but not limited to the HVAC system (if applicable), on an ongoing and as-needed basis. Prior to occupancy, the project applicant shall prepare and then distribute to the building manager/operator an operation and maintenance manual for the HVAC system and filter including the maintenance and replacement schedule for the filter. ***Source Documents:*** 16, Appendix C

Coastal Zone Management Coastal Zone Management Act, sections 307(c) & (d)	Yes ☐ No ☒	The project site is in an urban area of Oakland, a city in the East Bay of the San Francisco Bay Area. The project is subject to requirements of the San Francisco Bay Conservation and Development Commission, as the designated governing body over the Local Coastal Program in the greater Bay Area. Activities requiring permit approval include: • Filling: Placing solid material, building pile-supported or cantilevered structures, disposing of material or permanently mooring vessels in the Bay or in certain tributaries of the Bay. • Dredging: Extracting material from the tidal waters. • Shoreline Projects: Nearly all work, including grading, on the land within 100 feet of the Bay shoreline. • Suisun Marsh Projects: Nearly all work, including land divisions, in the portion of the Suisun Marsh below the ten-foot contour level. • Other Projects: Any filling, new construction, major remodeling, substantial change in use, and many land subdivisions in the Bay, along the shoreline, in salt ponds, duck hunting preserves or other managed wetlands adjacent to the Bay. The proposed project does not involve activities within 100 feet of the shoreline or any of the other activities described above that requires a permit. The project site is approximately 0.9 miles from the shoreline and therefore not immediately adjacent to the Bay. A Coastal Development Permit is not required. ***Source Documents:*** 10, 17, 18
Contamination and Toxic Substances 24 CFR Part 50.3(i) & 58.5(i)(2)	Yes ☒ No ☐	**Site History** Multiple site investigations and remedial activities have been performed at the project site since 1990 related to contamination and toxic substances, including the following: • Site Investigation Report for Highway 880, Cypress Reconstruction - Area 4 dated August 28, 1992 and prepared by Geo/Resource Consultants, Inc. • Preliminary Endangerment Assessment (PEA) Volume II for 800 Cedar Street dated November 1993 and prepared by On-Site Technologies, Inc. • Underground Storage Tank Closure Report for Cypress "B" Freeway Reconstruction Project - Phoenix 800 Area "T" dated November 27, 1995 and prepared by OGISO Environmental. • Site Investigation Report for 800 Cedar Street dated March 8, 2000 and prepared by IT Corporation. • Sampling and Analysis Plan Phase II Soil Investigation

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		for 800 Cedar Street dated July 14, 2011 and prepared by Northgate Environmental Management, Inc. • Phase II Soil Investigation Report for 800 Cedar Street dated November 9, 2011 and prepared by Northgate. • Soil Stockpile Sampling Report for 800 Cedar Street dated December 31, 2013 and prepared by Geocon Consultants, Inc. • Soil and Groundwater Management Plan (SGMP) dated December 1, 2017 and prepared by P&D Environmental, Inc. • Conditional Approval of Additional Site Investigation Activities dated November 13, 2018 and prepared Alameda County Health Care Services Agency. • Limited Subsurface Investigation Report dated February 14, 2019 and prepared by P&D Environmental, Inc. • Phase I Environmental Site Assessment, Site bounded by 9th Street (north), Pine Street (east), Shorey Street (south), Frontage Road (west) dated March 26, 2019 and prepared by AEI Consultants. • Limited Subsurface Investigation Report dated July 13, 2020 and prepared by P&D Environmental, Inc. • Corrective Action Plan, The Phoenix, dated February 4, 2020 and prepared by P&D Environmental, Inc. • The Alameda County Department of Environmental Health Fact Sheet for The Phoenix Redevelopment Corrective Action Plan dated February 24, 2022. • Remedial Soil Excavation Plan, Corrective Action Implementation Plan, The Phoenix, dated March 21, 2022 and prepared by P&D Environmental, Inc. Currently, the site is managed under Alameda County Department of Environmental Health (ACDEH) case RO0003269. A complete record of environmental site investigations may be obtained in the case files on the State Water Resources Control Board's GeoTracker database (https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=T10000011072) and the ACDEH website. The site is listed as 888 Cedar Street in some records, but reconfiguration of I-880 has actually removed Cedar Street at this location. A separate Local Oversight Program (LOP) Case No. RO0000417 was historically associated with the former underground storage tank (UST) release that was located near the project site and the site was formerly managed as a California Department of Toxic Substances Control (DTSC) case, Phoenix 800 Property, EnviroStor ID 01330037. On November 21, 2017, the property owner entered into a

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Voluntary Remedial Action Program Agreement with ACDEH, with concurrence from DTSC. Under the agreement, ACDEH will provide regulatory oversight for proposed redevelopment on APN 06-0047-001-00. Environmental Records Search In 2019, AEI Consultants prepared a Phase I Environmental Site Assessment (ESA) for the project site. The Phase I ESA included a review of regulatory database records in the project vicinity to identify nearby sites with known and suspected contamination and sites of potential environmental significance. A copy of the Phase I ESA is included in Appendix D, including the complete regulatory database search and radius map, and a summary of AEI's findings regarding potential environmental concerns associated with nearby sites is provided below. • Batavia Property (1832 Shorey Street): The site pertains to the adjacent property to the east, across 9th Street. A Preliminary Assessment/Site Inspection (PA/SI) was conducted by EPA in 1997; no contamination was found. DTSC certified the investigation as complete with no further action in 1998. Based on the lack of a documented release, the review of regulatory agency files for this site was not deemed necessary, and the site is not expected to represent a significant environmental concern. • Vacant Auto Repair (adjacent to the southwest): This site is assumed to pertain to the adjacent property to the southwest, across Shorey Street, which has since been redeveloped with the Nimitz Freeway and Frontage Road. A site screening was conducted in 1994; no contaminants were found. DTSC certified the investigation as complete with no further action in 1994. Based on the lack of a documented release, the inferred direction of groundwater flow, and redevelopment of the property, the site is not expected to represent a significant environmental concern. • Eds Automotive (1807 Shorey Street): This site pertains to a property adjacent to the southwest, across Shorey Street, which has since been redeveloped with the Nimitz Freeway and Frontage Road. According to this listing, this tenant occupied this location in 1967. Based on the lack of a documented release, the inferred direction of groundwater flow, and redevelopment of this property, the site is not expected to represent a significant environmental concern. • B & A Auto Dismantlers (1823 Shorey Street): The

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		site pertains to the adjacent property to the southwest, across Shorey Street. This area has since been used for construction of the Nimitz Freeway and Frontage Road. According to these listings, soil and groundwater investigations conducted in December 1992 found elevated concentrations of petroleum hydrocarbons and lead. Approximately 670 cubic yards of soil was excavated and transported for off-site disposal. This area was subsequently redeveloped with the existing frontage road. DTSC certified the remediation as complete with no further action in January 1997. Based on the case closure, the inferred direction of groundwater flow, and redevelopment of this property, the site is not expected to represent a significant environmental concern. Based on the review of regulatory database records, AEI Consultants determined that nearby sites do not pose a significant environmental concern to the proposed project. <u>Previous Uses</u> Historically, APN 006-0047-001-00, which includes the project site, was used for a variety of purposes between 1920 and the present, including auto parts manufacturing, steel and ironworks fabrication, and fireworks manufacturing. According to the 1993 PEA, the following company names and past activities have been located on the APN 006-0047-001-00: • The Dunn Cracker Co. from approximately 1889 to 1902 • California Bedding & Upholstery Co. from approximately 1902 to 1912 • A soap factory from some period of time between 1912 and 1931 • California Fireworks from approximately 1923 to 1927 • Independent Iron Works from 1924 to approximately 1960 • Pine Iron Works from some unknown time until 1990 • J&A Machine shop from 1985 through at least the date of the PEA (1993) • Phoenix Iron Works from approximately 1970 through at least the date of the PEA • Michael Bondi Metal Design from 1985 through at least November 1993 (the date of the PEA) • Cypress Auto Parts from 1970 through at least the November 1993 (the date of the PEA) • Ivan's Auto Body, Unknown Plastic Bag Co., Vennell Steel, and Terminal Manufacturing were located at

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		the subject site at unknown dates and for unknown durations The building covering APN 006-0047-001-00 was reportedly demolished in July 1995. Site Contamination History The project site is Parcel 1 (the southernmost parcel) of APN 006-0047-001-00. As previously mentioned, APN 006-0047-001-00 has been the subject of several site investigations. Previous investigations have identified the following contamination issues: • One 1,000-gallon diesel and one 2,600-gallon gasoline UST located northwest of the project site (where Frontage Road currently runs) were removed sometime between 1995 and 1997 and a total of 800 cubic yards of soil were excavated and disposed of as part of the UST removals. • Soil sampling performed during the tank removals indicated up to 17,000 parts per million (ppm) of lead and 44 ppm of arsenic in soil in the southwest corner of the former Phoenix Iron Works property, which is outside the current boundary of APN 006-0047-001-00. Soil excavation was initiated to remove these elevated metals concentrations, and during this excavation, two solvent-containing USTs (approximately 250 gallons and 25 gallons) and a settling sump were encountered west of the project site (where Frontage Road currently runs). A total of 3,300 cubic yards of soil were excavated and disposed of as part of this remedial action. • Soil sampling performed in 1999 indicated the western edge of APN 006-0047-001-00 has an area of total recoverable petroleum hydrocarbons (TRPH) in shallow soil in excess of 1,000 ppm, and this area was previously identified as containing "black-stained sand," indicative of soil impacted with petroleum hydrocarbons. • The 1999 soil sampling indicated two boring locations with elevated semi-volatile organic compound (SVOC) concentrations in shallow soil samples and the presence of elevated lead concentrations in shallow soil at multiple locations across APN 006-0047-001-00, including at locations on the project site. Based on recent subsurface investigation, the contaminants of concern at the project site include elevated lead in shallow soil and solvent vapors in soil gas (the air in between soil particles). The primary solvents of concern are tetrachloroethene (PCE) and trichloroethene (TCE). The Phase I Environmental Site Assessment prepared by AEI

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Consultants in 2019 did not identify any offsite sources of contamination potentially migrating beneath the project site. **Corrective Action Plan** In February 2020, P&D Environmental Inc. prepared a Corrective Action Plan (CAP) for the entire block that the project site is located on (APN 006-0047-001-00). The purpose of the CAP is to reduce exposure of workers, future building occupants, and nearby receptors to contaminated environmental media. Exposure pathways include inhalation of airborne dust and vapors during construction, direct exposure to soil or groundwater during construction, ingestion of soil or groundwater during construction, post-construction inhalation of vapors resulting from vapor intrusion, and inhalation of vapors resulting from vapor intrusion migrating along preferential pathways. ACDEH has reviewed the CAP and the environmental conditions that are specific to only the proposed project site (Parcel 1 on APN 006-0047-001-00). On February 24, 2022, ACDEH issued a fact sheet for the cleanup of only the project site under the proposed CAP (i.e., the fact sheet does not address the cleanup of the entire block). The fact sheet identifies the proposed actions to cleanup contamination at the project site and the engineering controls that will be used to protect the health of the community and workers during site development. The CAP includes the following measures to address contamination found at the project site: • Excavating shallow soils across the site to remove shallow lead impacts and prepare for redevelopment construction. • Placing lead-impacted soil into the bottom of an excavation adjacent to the Frontage Road sound wall and backfilling the remaining excavation with clean soil. • Capping the area of lead-impacted soil with asphalt/concrete roadways to act as a protective cover over the impacted soil. • Installing vapor intrusion mitigation and migration engineering controls including a sub-slab vapor barrier and venting system beneath the planned buildings to prevent petroleum products and solvents from entering indoor air. • Installing plugs in new utility trenches to prevent off-Site migration of impacted soil vapor. • Implementing administrative and institutional controls including long-term monitoring and management of the vapor barriers and the cover material for the lead-impacted soil.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		In March 2022, P&D Environmental Inc. prepared a draft Corrective Action Implementation Plan (CAIP) for the project, which is a plan set that describes construction activities and engineering techniques to protect the health of the community and workers from exposure to contaminated soil and dust during project site development. Measures that will be implemented for the project site include: • Implementation of a Soil and Groundwater Management Plan with protocols for handling and management of contaminated soil during site development. • Controlling dust during soil moving activities by using water and covering soil stockpiles. • Monitoring noise levels during site development activity and reducing equipment speeds or using noise mufflers, as needed. • Performing real-time perimeter air monitoring during soil disturbing work. • Cleaning truck tires and undercarriages to prevent track out of contaminated soil for any soil that is removed from the site. • Following the City of Oakland approved truck route for any soil that is removed from the site. • Using flaggers and traffic signage to safely manage construction-related traffic. • Installing signage that includes a phone number for more information on existing site fencing. Environmental work will not begin until ACDEH has approved the final CAIP. A copy of the ACDEH fact sheet, CAP, and draft CAIP for the cleanup of the project site is included in Appendix D. **Asbestos-Containing Materials** The subject property contains a concrete slab from previous warehouse buildings on the site. To be conservative, asbestos is assumed to be present in the concrete. **Conclusion** There is an open ACDEH case for the project site (Case #RO0003269), but the project site is currently part of a Voluntary Remedial Action Program Agreement with ACDEH. Site investigations and correspondence with ACDEH indicate that the project site can be remediated to achieve residential land use standards by implementing the cleanup measures identified in the final CAIP. The project will not introduce toxic, hazardous or radioactive materials to the neighborhood, nor does the project involve use of toxic chemicals or radioactive materials.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Mitigations Required: **CT1. Compliance with Corrective Action Implementation Plan (CAIP).** Ensure all measures identified in the final CAIP approved by Alameda County Department of Environmental Health for the project site are implemented during project construction. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to potential on-site hazards. Application of these standards would also ensure that new residences would not be exposed to hazardous materials. *SCAs Required:* **CT2. Asbestos in Structures.** The project applicant shall comply with all applicable laws and regulations regarding demolition and renovation of Asbestos Containing Materials (ACM), including but not limited to California Code of Regulations, Title 8; California Business and Professions Code, Division 3; California Health and Safety Code sections 25915-25919.7; and Bay Area Air Quality Management District, Regulation 11, Rule 2, as may be amended. Evidence of compliance shall be submitted to the City upon request. **CT3. Hazardous Materials Related to Construction.** The project applicant shall ensure that Best Management Practices (BMPs) are implemented by the contractor during construction to minimize potential negative effects on groundwater, soils, and human health. These shall include, at a minimum, the following: a. Follow manufacture's recommendations for use, storage, and disposal of chemical products used in construction; b. Avoid overtopping construction equipment fuel gas tanks; c. During routine maintenance of construction equipment, properly contain and remove grease and oils; d. Properly dispose of discarded containers of fuels and other chemicals; e. Implement lead-safe work practices and comply with all local, regional, state, and federal requirements concerning lead (for more information refer to the Alameda County Lead Poisoning Prevention Program); and f. If soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		underground storage tanks, abandoned drums or other hazardous materials or wastes are encountered), the project applicant shall cease work in the vicinity of the suspect material, the area shall be secured as necessary, and the applicant shall take all appropriate measures to protect human health and the environment. Appropriate measures shall include notifying the City and applicable regulatory agency(ies) and implementation of the actions described in the City's Standard Conditions of Approval, as necessary, to identify the nature and extent of contamination. Work shall not resume in the area(s) affected until the measures have been implemented under the oversight of the City or regulatory agency, as appropriate. **CT4. Hazardous Building Materials and Site Contamination.** a. <u>Hazardous Building Materials Assessment</u> The project applicant shall submit a comprehensive assessment report to the Bureau of Building, signed by a qualified environmental professional, documenting the presence or lack thereof of asbestos-containing materials (ACMs), lead-based paint, polychlorinated biphenyls (PCBs), and any other building materials or stored materials classified as hazardous materials by State or federal law. If lead-based paint, ACMs, PCBs, or any other building materials or stored materials classified as hazardous materials are present, the project applicant shall submit specifications prepared and signed by a qualified environmental professional, for the stabilization and/or removal of the identified hazardous materials in accordance with all applicable laws and regulations. The project applicant shall implement the approved recommendations and submit to the City evidence of approval for any proposed remedial action and required clearances by the applicable local, state, or federal regulatory agency. b. <u>Environmental Site Assessment Required</u> The project applicant shall submit a Phase I Environmental Site Assessment report, and Phase II Environmental Site Assessment report if warranted by the Phase I report, for the project site for review and approval by the City. The report(s) shall be prepared by a qualified environmental assessment professional and include recommendations for remedial action, as appropriate, for hazardous materials. The project applicant shall implement the approved recommendations and submit to the City evidence of approval for any proposed remedial action and required clearances by the applicable local, state, or federal regulatory agency. c. <u>Health and Safety Plan Required</u> The project applicant shall submit a Health and Safety Plan

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		for the review and approval by the City in order to protect project construction workers from risks associated with hazardous materials. The project applicant shall implement the approved Plan. d. <u>Best Management Practices (BMPs) Required for Contaminated Sites</u> The project applicant shall ensure that Best Management Practices (BMPs) are implemented by the contractor during construction to minimize potential soil and groundwater hazards. These shall include the following: i. Soil generated by construction activities shall be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Specific sampling and handling and transport procedures for reuse or disposal shall be in accordance with applicable local, state, and federal requirements. ii. Groundwater pumped from the subsurface shall be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Engineering controls shall be utilized, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building. **CT5. Regulatory Permits and Authorizations from Other Agencies** The project applicant shall obtain all necessary regulatory permits and authorizations from applicable resource /regulatory agencies including, but not limited to, the Regional Water Quality Control Board, Bay Area Air Quality Management District, Bay Conservation and Development Commission, California Department of Fish and Wildlife, U. S. Fish and Wildlife Service, and Army Corps of Engineers and shall comply with all requirements and conditions of the permits/authorizations. The project applicant shall submit evidence of the approved permits/authorizations to the City, along with evidence demonstrating compliance with any regulatory permit/authorization conditions of approval. ***Source Documents:*** 19, 20, 21, 22, 23, 24, 25, Appendix D
Endangered Species Endangered Species Act of 1973, particularly section 7; 50 CFR Part 402	Yes ☐ No ☒	The U.S. Fish and Wildlife was contacted for a list of Threatened and Endangered species that may occur within the boundary of the proposed project activities and/or may be affected by the proposed project. There are a number of Federal Endangered and Threatened species listed for the project site and vicinity, as listed

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		below. **Mammals:** • Salt Marsh Harvest mouse (*Reithrodontomys vaviventris*) **Birds** • California Clapper Rail (*Rallus longirostris obsoletus*) • California Least Tern (*Sterna antillarum browni*) • Western Snowy Plover (*Charadrius nivosus ssp. nivosus)* **Reptiles** • Alameda Whipsnake (*Masticophis lateralis euryxanthus)* • Green Sea Turtle (*Chelonia mydas*) • **Amphibians** • California red-legged frog *(Rana draytonii)* **Fish** • Tidewater goby *(Eucyclogobius newberryi)* • Delta smelt *(Hypomesus transpacificus)* **Plants** • Santa Cruz tarplant *(Holocarpha macradenia)* • California seablite *(Suaeda californica)* There is no aquatic habitat on the site for fish or crustaceans. There are no wetlands on the site. There is no riparian habitat on or near the site. There is no Critical Habitat on the site or vicinity. The project area is urban. There is very little exposed soil on the site or habitat for special-status species. The majority of the site is currently covered in concrete, and the site was previously developed with industrial uses. There are trees on and near the site, including two trees on the subject property, two street trees on Pine Street with canopies that extend over onto the site, and one street tree within 10 feet of proposed construction activities. These trees represent three species: *Robinia pseudoacacia, Acacia melanoxylon*, and *Quercus agrifolia var. agrifolia*. Four trees (two on the site and two with canopies overhanging the site) would be removed. Existing trees on and near the project site could provide suitable nesting habitat for some species of native birds. Tree removal and construction activities near active bird nests could result in the abandonment of the nesting effort and thus pose a potential significant impact on migratory birds. Active bird nests are protected by the federal Migratory Bird Treaty Act and the California Department of Fish and Wildlife. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to protection of birds during nesting

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		season for the trees which will be removed. Application of these standards would ensure the project would have a less than significant impact with respect to nesting birds, migratory birds and raptors. *SCAs Required:* **BR1. Tree Removal During Bird Breeding Season.** To the extent feasible, removal of any tree and/or other vegetation suitable for nesting of birds shall not occur during the bird breeding season of February 1 to August 15 (or during December 15 to August 15 for trees located in or near marsh, wetland, or aquatic habitats). If tree removal must occur during the bird breeding season, all trees to be removed shall be surveyed by a qualified biologist to verify the presence or absence of nesting raptors or other birds. Pre-removal surveys shall be conducted within 15 days prior to the start of work and shall be submitted to the City for review and approval. If the survey indicates the potential presence of nesting raptors or other birds, the biologist shall determine an appropriately sized buffer around the nest in which no work will be allowed until the young have successfully fledged. The size of the nest buffer will be determined by the biologist in consultation with the California Department of Fish and Wildlife, and will be based to a large extent on the nesting species and its sensitivity to disturbance. In general, buffer sizes of 200 feet for raptors and 50 feet for other birds should suffice to prevent disturbance to birds nesting in the urban environment, but these buffers may be increased or decreased, as appropriate, depending on the bird species and the level of disturbance anticipated near the nest. **BR2. Tree Permit.** a. <u>Tree Permit Required</u> Pursuant to the City's Tree Protection Ordinance (OMC chapter 12.36), the project applicant shall obtain a tree permit and abide by the conditions of that permit. b. <u>Tree Protection During Construction</u> Adequate protection shall be provided during the construction period for any trees which are to remain standing, including the following, plus any recommendations of an arborist: i. Before the start of any clearing, excavation, construction, or other work on the site, every protected tree deemed to be potentially endangered by said site work shall be securely fenced off at a distance from the base of the tree to be determined by the project's consulting arborist. Such fences shall remain in place for duration of all such work. All trees to be removed shall be clearly marked. A scheme shall be established for the

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		removal and disposal of logs, brush, earth and other debris which will avoid injury to any protected tree. ii. Where proposed development or other site work is to encroach upon the protected perimeter of any protected tree, special measures shall be incorporated to allow the roots to breathe and obtain water and nutrients. Any excavation, cutting, filling, or compaction of the existing ground surface within the protected perimeter shall be minimized. No change in existing ground level shall occur within a distance to be determined by the project's consulting arborist from the base of any protected tree at any time. No burning or use of equipment with an open flame shall occur near or within the protected perimeter of any protected tree. iii. No storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees shall occur within the distance to be determined by the project's consulting arborist from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. No heavy construction equipment or construction materials shall be operated or stored within a distance from the base of any protected trees to be determined by the project's consulting arborist. Wires, ropes, or other devices shall not be attached to any protected tree, except as needed for support of the tree. No sign, other than a tag showing the botanical classification, shall be attached to any protected tree. iv. Periodically during construction, the leaves of protected trees shall be thoroughly sprayed with water to prevent buildup of dust and other pollution that would inhibit leaf transpiration. v. If any damage to a protected tree should occur during or as a result of work on the site, the project applicant shall immediately notify the Public Works Department and the project's consulting arborist shall make a recommendation to the City Tree Reviewer as to whether the damaged tree can be preserved. If, in the professional opinion of the Tree Reviewer, such tree cannot be preserved in a healthy state, the Tree Reviewer shall require replacement of any tree removed with another tree or trees on the same site deemed adequate by the Tree Reviewer to compensate for the loss of the tree that is removed. vi. All debris created as a result of any tree removal work shall be removed by the project applicant from the property within two weeks of debris creation, and such debris shall be properly disposed of by the project applicant in accordance with all applicable laws, ordinances, and regulations. c. <u>Tree Replacement Plantings</u>

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Replacement plantings shall be required for tree removals for the purposes of erosion control, groundwater replenishment, visual screening, wildlife habitat, and preventing excessive loss of shade, in accordance with the following criteria: i. No tree replacement shall be required for the removal of nonnative species, for the removal of trees which is required for the benefit of remaining trees, or where insufficient planting area exists for a mature tree of the species being considered. ii. Replacement tree species shall consist of Sequoia sempervirens (Coast Redwood), Quercus agrifolia (Coast Live Oak), Arbutus menziesii (Madrone), Aesculus californica (California Buckeye), Umbellularia californica (California Bay Laurel), or other tree species acceptable to the Tree Division. iii. Replacement trees shall be at least twenty-four (24) inch box size, unless a smaller size is recommended by the arborist, except that three fifteen (15) gallon size trees may be substituted for each twenty-four (24) inch box size tree where appropriate. iv. Minimum planting areas must be available on-site as follows: • For Sequoia sempervirens, three hundred fifteen (315) square feet per tree; • For other species listed, seven hundred (700) square feet per tree. v. In the event that replacement trees are required but cannot be planted due to site constraints, an in lieu fee in accordance with the City's Master Fee Schedule may be substituted for required replacement plantings, with all such revenues applied toward tree planting in city parks, streets and medians. vi. The project applicant shall install the plantings and maintain the plantings until established. The Tree Reviewer of the Tree Division of the Public Works Department may require a landscape plan showing the replacement plantings and the method of irrigation. Any replacement plantings which fail to become established within one year of planting shall be replanted at the project applicant's expense. ***Source Documents:*** 8, 26, 27, Appendix E
Explosive and Flammable Hazards 24 CFR Part 51 Subpart C	Yes ☐ No ☒	The project is located in an area surrounded by residential and light industrial land uses and the project does not involve explosive or flammable materials or operations. Based on review of aerial photographs, there are two above-ground storage tanks (ASTs) west of the project site (see below).

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		 On February 1, 2022, a file request was submitted to the ACDEH, the Certified Unified Program Agency for the City of Oakland, to obtain information on the status of the ASTs. Based on the assessor parcel numbers and property addresses provided for each site, ACDEH reported that they could not find any records of the ASTs in their database. On February 3, 2022, the file request was expanded to search for ASTs on any nearby properties, including properties owned by Southern Pacific Railroad or Union Pacific Railroad. Based on the expanded search, ACDEH confirmed that they still could not find any records of the ASTs on the target properties. While information about the content of each tank is not readily available from ACDEH, the HUD's Acceptable Separation Distance (ASD) Electronic Assessment Tool can be used to conservatively estimate the ASD for potential explosion and fire hazards from each tank. Based on a review of aerial photographs and Google Street View images, both tanks have flat heads, which indicates they are not pressurized, and both tanks are surrounded by dikes. Pressurized tanks have rounded heads (e.g., propane tanks), because the seam along the edge of a flat top tank would be vulnerable to bursting. Therefore, the input parameters for the ASD Tool only requires the dimensions of each dike, which can be measured for aerial photographs, to conservatively estimate explosion and fire hazards for a worst-case scenario. Tank #1 is located about 1,500 feet west of the project site. Based on review of an Initial Site Assessment prepared for the Freight Intelligent Transportation System Project, historical Sanborn Fire Insurance Maps indicate that Tank #1 is an approximately 20,000-barrel (840,000-gallon) fuel AST that was constructed in the early 1960s and the tank currently appears to be connected to jet fuel pipelines owned by Kinder Morgan. In the event of an accidental release, the tank is surrounded by a dike. Assuming the tank is still active, the HUD's ASD Electronic Assessment Tool was used to conservatively estimate the ASD for potential explosion and fire hazards from the tank. As shown in

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		Appendix F, the maximum ASD from Tank #1 is about 615 feet based on thermal radiation hazards to people. The project is located well beyond the ASD for Tank #1; therefore, Tank #1 does not pose an explosion or fire hazard to the proposed project. Tank #2 is located about 1,900 feet southwest of the project site and appears to be located on the Pacific Rail Services property at 600 Maritime Street in Oakland. In the event of an accidental release, the tank is surrounded by a dike. According to the CalEPA Regulated Site Portal, chemicals commonly used at the Pacific Rail Services property include diesel exhaust fluid, gear oil, hydraulic oil, motor oil, cleaner solution, propane, transmission fluid, anti-freeze, and waste oil. Regardless of the type of chemical stored in Tank #2, the HUD's ASD Electronic Assessment Tool can be used to conservatively estimate the ASD for potential explosion and fire hazards from the tank based on the dimensions of the dike. As shown in Appendix F, the maximum ASD from Tank #2 is about 356 feet based on thermal radiation hazards to people. The project is located well beyond the ASD for Tank #2; therefore, Tank #2 does not pose an explosion or fire hazard to the proposed project. Based on the ASD calculations, the project site is located at an acceptable distance from the existing ASTs and would not be affected by potential explosion or fire hazards. ***Source Documents:*** 27, 28, 29, 75, Appendix F
Farmlands Protection Farmland Protection Policy Act of 1981, particularly sections 1504(b) and 1541; 7 CFR Part 658	Yes ☐ No ☒	The project is located in an area surrounded by residential and light industrial land uses; the project is located in an urban area and will not affect farmland. ***Source Documents:*** 30

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
Floodplain Management Executive Order 11988, particularly section 2(a); 24 CFR Part 55	Yes ☐ No ☒	The subject property is not located within a 100-year floodplain (Zones A or V) or 500-year floodplain (Zone B) identified on a Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM). The project involves acquisition and development of real property. The area is a Flood Hazard Area Designation Zone X: Areas of minimal flooding. No Base Flood Elevations or depths are shown within this zone. Insurance purchase is not required in these zones. Flood hazard designation is depicted on FIRM Map Number 06001C0059G, with an effective date of August 3, 2009. The project would have no effect on floodplains. ***Source Documents:*** 15, Appendix B
Historic Preservation National Historic Preservation Act of 1966, particularly sections 106 and 110; 36 CFR Part 800	Yes ☒ No ☐	**Undertaking** EBALDC proposes acquire and manage the mixed-use affordable housing project known as The Phoenix on one lot that totals 0.90 acres (Parcel 1 of APN 006-0047-001-00) at the northwest corner of Pine Street and 8th Street in Oakland, California 94607 that would be constructed by Holliday Development. The project address is 801 Pine Street in Oakland, California 94607. The project will demolish existing at-grade concrete slabs from former warehouse buildings on the project site, as well as any underground utilities or foundations found during project construction from previous site development. The proposal will construct a four-story, 101-unit residential building, and two-story community building. Approximately half of the units will be permanent supportive housing (PSH). The rest of the residential units will be reserved for low-income households, with incomes no greater than 60 percent of the AMI. The unit mix will be 82 studios, 3 one-bedroom units, and 16 two-bedroom units. **Area of Potential Effects** The area of potential effects (APE) for the proposed project consists of the entire block that contains the project site on its south half, and the first row of adjacent buildings to the north, east, and south; there are no buildings to the west. There are 29 parcels within the indirect architectural APE, of these, 19 contain at least one building and one contains a structure, while the remainder are vacant. The archaeological APE is limited to the south half of parcel APN 006-0047-001-00, which is the block bounded by 9th/Pine/Shorey streets, and the frontage road to I-880 as well as Shorey Street. The vertical archeological APE is 10

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		feet below the ground surface to accommodate utility installations/connections, and 56 feet above the ground surface to reflect the highest point of the new facilities. **Oakland Cultural Heritage Survey (OCHS)/Historical and Architectural Rating System** The Rating System, adopted in the Oakland General Plan, Historic Preservation Element, is shorthand for the relative importance of properties. The system uses letters A to E to rate individual properties and numbers 1 to 3 for district status. Individual properties can have dual ("existing" and "contingency") ratings if they have been remodeled, and if they are in districts, they can be contributors, non-contributors, or potential contributors. In general, A and B ratings indicate landmark-quality buildings. **Evaluation** Horizon Water and Environment, LLC, prepared a Cultural Resources Assessment Report for the project in April 2022, which is included in Appendix G. The following section summarizes the findings. Subject Property The subject parcel is vacant. It is not a local landmark and does not have an OCHS rating. Surrounding Buildings Parcels adjacent to the project site contain a mix of multi- and single-family residential, industrial, and special-purpose buildings dating from the 1870s through the present. Eight parcels surrounding the project site contain buildings within the Oakland Point Historic District, which was determined to be eligible for listing in the National Register of Historic Places (NRHP) in 1990. An additional building located at 1791 8th Street is located within the APE but outside of the Oakland Point Historic District, and appears to be eligible for listing in the NRHP. The remaining buildings within the APE are either not historic period buildings (i.e., generally built within the last 50 years), lack architectural significance, or have been altered substantially and lack integrity. The Secretary of the Interior's Standards for the Treatment of Historic Properties provides guidelines for the preservation and rehabilitation of historic properties. Most of these standards are directly related to the physical modification of individual buildings in some manner and are not pertinent to the proposed project. However, the following standards would be applicable to the proposed project: • *Standard 3: Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development,*

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		such as adding conjectural features or elements from other historic properties, will not be undertaken. The prohibition on conjectural features refers to application of "fantasy" architectural details to a historic-era building when such details have not been documented as original features. It therefore does not apply to the proposed project. Project design will allow the new buildings to be recognized as a physical record of their time, place, and use. The project will avoid creating a false sense of historical development, and repurposed elements of historic properties will not be utilized in the proposed project. Therefore, the proposed project conforms to this standard. • *Standard 8: Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.* As discussed below, no archaeological resources were identified during a pedestrian survey of the archaeological APE. However, construction of the proposed project has the potential to uncover buried archaeological remains that may be determined to be historic properties. As discussed below, should unanticipated discovery of archaeological resources occur, appropriate measures would be implemented if the archaeological resources cannot be avoided. Therefore, the proposed project conforms to this standard. • *Standard 9: New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.* The proposed project will not destroy historic materials, features, or spatial relationships that characterize adjacent historic properties or the historic district. The new buildings will be differentiated from adjacent buildings by using a contemporary rather than a historicist architectural style. The project design will avoid inappropriate application of historicist ornament onto the essentially contemporary design of the building. Features such as vertical window openings will be utilized to respond to the design vocabulary of the existing historic neighborhood without mimicking its architecture. Variation in color, texture, and materials will respond to the rhythm of historic single-family residences across the street. Utilization of board-form concrete and

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		horizontal board cladding will create compatibility of materials with the historic neighborhood. Size, scale, massing, and proportion will also be compatible with the nearby historic residential buildings, the closest of which are across the street. During the historic era, the subject property was the site of an industrial/warehouse facility similar in scale and massing to the proposed project. Furthermore, the proposed project has been designed to be stepped down in the areas closest to the historic district, with two-and three-story volumes nearest the historic residences and four-story volumes behind. For these reasons, the proposed project protects the integrity of individual historic buildings as well as the historic district and its environment. Therefore, the proposed project conforms to this standard. • *Standard 10: New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.* Future reversal of the proposed project would not impair the essential form and integrity of adjacent historic properties or historic districts. Therefore, the proposed project conforms to this standard. Therefore, the proposed project would conform to the applicable standards and would have no adverse effect on historic properties. **Archaeology** A records search of the project site was conducted on May 1, 2020, at the Northwest Information Center (NWIC) of the California Historical Resources Information System, Sonoma State University, Rohnert Park, California. The record search at NWIC revealed that four previous cultural resources field surveys have included the current direct APE, none of which identified archaeological cultural resources in the project site. **Native American Contacts** The proposed project involves significant ground disturbance during excavation for building foundation construction and other improvements. On November 19, 2021, the Native American Heritage Commission (NAHC) was contacted to request a search of that agency's Sacred Lands File for the project site and to obtain a list of local Native American tribes that are eligible to consult for the project. On February 14, 2022, the NAHC replied that a search of the Sacred Lands File indicated that cultural sites

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		are present, and that the Amah Mutsun Tribal Band of Mission San Juan Bautista and Northern Valley Yokut Tribe should be contacted. On January 27, 2022, 11 tribes, including the Amah Mutsun Tribal Band of Mission San Juan Bautista and Northern Valley Yokut Tribe, were contacted and invited to be a consulting party. On January 31, 2022, Corrina Gould, Chairperson, of the Confederated Villages of Lisjan, requested results of NAHC sacred lands search and a copy of the cultural resources report. A response was sent on behalf of the City on the same day, noting that the NAHC had not responded, and that the cultural report would be made available when it was completed. In a subsequent email on February 9, 2022, Ms. Gould noted that the project site is near a potentially significant site. Additional project locational information was provided via email on the same day. On April 27, 2022, Ms. Gould was provided the Cultural Resources Assessment Report. On May 25, 2022, Ms. Gould stated that “this area has been destroyed as far as our cultural resources.” However, Ms. Gould indicated concern related to the positive Sacred Lands File results, and requested consultation. On June 15, 2022, EBALDC met with Ms. Gould to discuss the potential impacts related to tribal cultural resources. On June 17, Ms. Gould indicated that consultation was complete and that no additional measures would be required. **Evaluation of Effects** No archaeological historic properties or historic properties of tribal importance were identified in the direct APE. The proposed project would have no adverse effect on historic properties within the indirect APE. **Recommended Determination** For purposes of Section 106 Review of this undertaking, LSA recommended that the Agency Official for HUD (City of Oakland) concur with the APE and determine that no historic properties would be affected by the undertaking. This finding is supported there are no historic properties within the APE, and that implementation of the proposed project would not result in any adverse effects to surrounding historic properties. **Consultation** On April 28, 2020, the Agency Official concurred with the description of the undertaking, the APE, the recommended determination of no effects to historic properties and initiated consultation with the California State Office of Historic Preservation (SHPO) with a letter and evaluation

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		materials. On June 6, 2022, the SHPO officer replied with a letter stating "Unfortunately, due to an extremely high workload, I was unable to review this project within the 30-day comment period allowed under the Section 106 regulations. Please proceed pursuant to 36 CFR Part 800.3(c)(4) Failure of the SHPO/THPO to respond. You can include this correspondence in the environmental record to demonstrate the City Oakland's efforts to consult under Section 106 of the National Historic Preservation Act." The City of Oakland has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCA) that apply to the potential discovery of archeological and paleontological resources as well as human remains on-site. *Standard Conditions of Approval Required* **CR1: Archaeological and Paleontological Resources – Discovery During Construction** Pursuant to CEQA Guidelines section 15064.5(f), in the event that any historic or prehistoric subsurface cultural resources are discovered during ground disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented. In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense. In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant. **CR2. Archaeologically Sensitive Areas – Pre-Construction Measures** The project applicant shall implement either Provision A (Intensive Pre-Construction Study) or Provision B (Construction ALERT Sheet) concerning archaeological resources. **Provision A: Intensive Pre-Construction Study** The project applicant shall retain a qualified archaeologist to conduct a site-specific, intensive archaeological resources study for review and approval by the City prior to soil-disturbing activities occurring on the project site. The purpose of the site-specific, intensive archaeological resources study is to identify early the potential presence of history-period archaeological resources on the project site. At a minimum, the study shall include: a. Subsurface presence/absence studies of the project site. Field studies may include, but are not limited to, auguring and other common methods used to identify the presence of archaeological resources. b. A report disseminating the results of this research. c. Recommendations for any additional measures that could be necessary to mitigate any adverse impacts to recorded and/or inadvertently discovered cultural resources. If the results of the study indicate a high potential presence of historic-period archaeological resources on the project

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		site, or a potential resource is discovered, the project applicant shall hire a qualified archaeologist to monitor any ground disturbing activities on the project site during construction and prepare an ALERT sheet pursuant to Provision B below that details what could potentially be found at the project site. Archaeological monitoring would include briefing construction personnel about the type of artifacts that may be present (as referenced in the ALERT sheet, required per Provision B below) and the procedures to follow if any artifacts are encountered, field recording and sampling in accordance with the Secretary of Interior's Standards and Guidelines for Archaeological Documentation, notifying the appropriate officials if human remains or cultural resources are discovered, and preparing a report to document negative findings after construction is completed if no archaeological resources are discovered during construction. **Provision B: Construction ALERT Sheet** The project applicant shall prepare a construction "ALERT" sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil-disturbing activities within the project site. The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones. Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		location at the project site. **CR3. Human Remains – Discovery During Construction** Pursuant to CEQA Guidelines section 15064.5(e)(1), in the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant. ***Source Documents:*** 34, 35, 36,37, 38, Appendix G
Noise Abatement and Control Noise Control Act of 1972, as amended by the Quiet Communities Act of 1978; 24 CFR Part 51 Subpart B	Yes ☒ No ☐	The project would include construction of a residential building with 101 affordable units and a community building consisting of office spaces, community room, and utility spaces that support the residential building. The primary noise generation from the long-term operation of the project would occur as a result of increased vehicular traffic on area roads and the use of mechanical heating, ventilation, and air conditioning (HVAC) systems. <u>Traffic Noise</u> The existing ambient noise levels along Pine Street are approximately 72 dBA L_{dn}. Generally, during the peak traffic hour under normal traffic conditions, Ldn is within plus or minus 2 dBA of the L_{eq}. Therefore, the existing AM and PM peak hour traffic noise levels range from approximately 70-74 dBA L_{eq}. A Transportation Assessment for a Preliminary Development Plan (PDP) to redevelop APN 006-0047-001-00 (including the proposed project and other components that would also generate vehicular traffic) found the PDP would generate 84 peak AM trips and 97 peak PM trips, and that the proposed project would generate approximately 23 AM peak hour trips and 27 PM peak hour trips. Using the FHWA TNM Version 2.5 model and conservatively assuming all the peak hour traffic (for the PDP) is generated on one roadway segment, these trips would generate noise levels of approximately 49.0 and 49.7 dBA Leq respectively, at 50 feet from the centerline of the road. Therefore, the ambient

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		noise levels are more than 10 dBA higher than the potential traffic noise generated by the project. When the difference between two co-located sources of noise is 10 dBA or more, the higher noise source dominates and the lower noise source makes no perceptible difference in what people can hear or measure. Therefore, the traffic noise generated by the project would not have a perceivable increase in the ambient noise levels (i.e., less than a 3 dBA increase). Consequently, the potential of the proposed project to result in a significant increase in ambient noise due to the increased vehicular traffic on area roads is not considerable. <u>HVAC Systems</u> During operation of the project, noise would be generated from HVAC systems. However, operations are not expected to generate noise levels that would be considered substantial in terms of existing or future noise levels in the area. Future noise levels in the project vicinity will continue to result from local transportation related noise sources. Occasional audible noises from the proposed residential land uses will not measurably contribute to daily average noise. <u>Construction Noise</u> The primary noise effects from construction of the project would occur from the noise generated by the operation of heavy construction equipment on the project site. The project would not involve pile driving, which, if included, could generate extreme levels of noise. The closest noise-sensitive receptors are residences located approximately 55 feet to the east of the project site across Pine Street. Baseline Environmental Consulting calculated that the two typical noisiest pieces of equipment[8] located at 55 feet away could generate noise levels of about 87 dBA. The existing ambient noise levels along Pine Street are approximately 72 dBA Ldn. Therefore, construction equipment could cause a substantial temporary increase in noise levels at surrounding land uses. However, construction noise will be subject to Section 17.120 of City of Oakland Planning Code and Section 8.18 of the Municipal Code. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to potential construction noise. Application of these standards would ensure that the project would have a less than significant impact with respect to construction noise impacts. *SCAs Required:*

---

[8] It is assumed that each noisiest piece of equipment would generate noise of 85 dBA at 50 feet.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		N1. Operational Noise Noise levels from the project site after completion of the project (i.e., during project operation) shall comply with the performance standards of chapter 17.120 of the Oakland Planning Code and chapter 8.18 of the Oakland Municipal Code. If noise levels exceed these standards, the activity causing the noise shall be abated until appropriate noise reduction measures have been installed and compliance verified by the City. **N2. Construction Days/Hours** The project applicant shall comply with the following restrictions concerning construction days and hours: a. Construction activities are limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday, except that pier drilling and/or other extreme noise generating activities greater than 90 dBA shall be limited to between 8:00 a.m. and 4:00 p.m. b. Construction activities are limited to between 9:00 a.m. and 5:00 p.m. on Saturday. In residential zones and within 300 feet of a residential zone, construction activities are allowed from 9:00 a.m. to 5:00 p.m. only within the interior of the building with the doors and windows closed. No pier drilling or other extreme noise generating activities greater than 90 dBA are allowed on Saturday. c. No construction is allowed on Sunday or federal holidays. Construction activities include, but are not limited to, truck idling, moving equipment (including trucks, elevators, etc.) or materials, deliveries, and construction meetings held on-site in a non-enclosed area. Any construction activity proposed outside of the above days and hours for special activities (such as concrete pouring which may require more continuous amounts of time) shall be evaluated on a case-by-case basis by the City, with criteria including the urgency/emergency nature of the work, the proximity of residential or other sensitive uses, and a consideration of nearby residents'/occupants' preferences. The project applicant shall notify property owners and occupants located within 300 feet at least 14 calendar days prior to construction activity proposed outside of the above days/hours. When submitting a request to the City to allow construction activity outside of the above days/hours, the project applicant shall submit information concerning the type and duration of proposed construction activity and the draft public notice for City review and approval prior to distribution of the public notice.

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		N3. Construction Noise The project applicant shall implement noise reduction measures to reduce noise impacts due to construction. Noise reduction measures include, but are not limited to, the following: a. Equipment and trucks used for project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or shrouds) wherever feasible. b. Except as provided herein, impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used, if such jackets are commercially available, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures. c. Applicant shall use temporary power poles instead of generators where feasible. d. Stationary noise sources shall be located as far from adjacent properties as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the City to provide equivalent noise reduction. e. The noisiest phases of construction shall be limited to less than 10 days at a time. Exceptions may be allowed if the City determines an extension is necessary and all available noise reduction controls are implemented. **N4. Construction Noise Complaints** The project applicant shall submit to the City for review and approval a set of procedures for responding to and tracking complaints received pertaining to construction noise, and shall implement the procedures during construction. At a minimum, the procedures shall include: a. Designation of an on-site construction complaint and enforcement manager for the project; b. A large on-site sign near the public right-of-way containing permitted construction days/hours, complaint procedures, and phone numbers for the project complaint manager and City Code Enforcement unit; c. Protocols for receiving, responding to, and tracking

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
		received complaints; and d. Maintenance of a complaint log that records received complaints and how complaints were addressed, which shall be submitted to the City for review upon the City's request. **N5. Extreme Construction Noise** a. Construction Noise Management Plan Required Prior to any extreme noise generating construction activities (e.g., pier drilling, pile driving and other activities generating greater than 90dBA), the project applicant shall submit a Construction Noise Management Plan prepared by a qualified acoustical consultant for City review and approval that contains a set of site-specific noise attenuation measures to further reduce construction impacts associated with extreme noise generating activities. The project applicant shall implement the approved Plan during construction. Potential attenuation measures include, but are not limited to, the following: i. Erect temporary plywood noise barriers around the construction site, particularly along on sites adjacent to residential buildings; ii. Implement "quiet" pile driving technology (such as pre-drilling of piles, the use of more than one pile driver to shorten the total pile driving duration), where feasible, in consideration of geotechnical and structural requirements and conditions; iii. Utilize noise control blankets on the building structure as the building is erected to reduce noise emission from the site; iv. Evaluate the feasibility of noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings by the use of sound blankets for example and implement such measure if such measures are feasible and would noticeably reduce noise impacts; and v. Monitor the effectiveness of noise attenuation measures by taking noise measurements. b. Public Notification Required The project applicant shall notify property owners and occupants located within 300 feet of the construction activities at least 14 calendar days prior to commencing extreme noise generating activities. Prior to providing the notice, the project applicant shall submit to the City for review and approval the proposed type and duration of extreme noise generating activities and the proposed public notice. The public notice shall provide the estimated start and end dates of the extreme noise generating activities and describe noise attenuation measures to be implemented. Source Document(s): 39, 40, 41

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
Sole Source Aquifers Safe Drinking Water Act of 1974, as amended, particularly section 1424(e); 40 CFR Part 149	Yes ☐ No ☒	The project activities do not affect a sole source aquifer, as there are no aquifers subject to a MOU between EPA and HUD in Alameda County. ***Source Documents:*** 42
Wetlands Protection Executive Order 11990, particularly sections 2 and 5	Yes ☐ No ☒	The site does not appear on the National Wetlands Inventory database. The site does not contain any on-site wetlands or jurisdictional waters. No further consultations are required. ***Source Documents:*** 43, Appendix B
Wild and Scenic Rivers Wild and Scenic Rivers Act of 1968, particularly section 7(b) and (c)	Yes ☐ No ☒	No wild and scenic rivers are located within Alameda County. ***Source Documents:*** 44, 45

Compliance Factors: Statutes, Executive Orders, and Regulations listed at 24 CFR §58.5 and §58.6	Are formal compliance steps or mitigation required?	**Compliance Determinations**
ENVIRONMENTAL JUSTICE		
Environmental Justice Executive Order 12898	Yes ☐ No ☒	According to EPA EJ Screen, the EPA's Environmental Justice Screening and Mapping Tool, the project site is in a low-income and minority neighborhood. Racial and/or ethnic minorities make up the majority of the area; the population of the project site and its surrounding area is 72 percent minority, which puts it in the 56th percentile in the State, 60th percentile in the region, and 79th percentile in the nation. The project site and surrounding area's population has a low-income population of 38 percent, which puts it in the 61st percentile in the state and region and the 63rd percentile in the nation. Because the project is in a low-income/minority neighborhood, it meets the definition of an Environmental Justice Community. Adverse environmental conditions in the area consist of air quality (including particulate matter, diesel particulate matter, cancer risk, and traffic proximity), and hazardous materials (lead paint, superfund site proximity, hazardous waste proximity, and underground storage tank). The project site is in the 75th percentile or higher for the nation (i.e., only 25 percent of the US population has a high block ground value than the average person on the project site). The analysis in this Environmental Assessment indicates that there are no unmitigated adverse environmental impacts. As described under the Clean Air Act compliance factors, the proposed project would include air filtration devices rated MERV-13 or higher, which would reduce the cumulative excess cancer risk and $PM_{2.5}$ concentrations at the project site below the BAAQMD's thresholds. As described under the Contamination and Toxic Substances compliance factors, the project site can be remediated to achieve residential land use standards by implementing the cleanup measures identified in the final CAIP. As described under the Explosive and Flammable Hazards compliance factors, the project site is located at an acceptable distance from the existing ASTs and would not be affected by potential explosion or fire hazards. All identified impacts can be reduced to less-than-significant levels with implementation of mitigation measures and/or Standard Conditions of Approval. Therefore, the project will not raise environmental justice issues and has no potential for new or continued disproportionately high and adverse human health and environmental effects on minority or low-income population. The project is suitable for it proposed use. ***Source Documents:*** 46, Appendix J

ENVIRONMENTAL ASSESSMENT FACTORS [24 CFR 58.40; REF. 40 CFR 1508.8 &1508.27]

Recorded below is the qualitative and quantitative significance of the effects of the proposal on the character, features and resources of the project area. Each factor has been evaluated and documented, as appropriate and in proportion to its relevance to the proposed action. Verifiable source documentation has been provided and described in support of each determination, as appropriate. Credible, traceable and supportive source documentation for each authority has been provided. Where applicable, the necessary reviews or consultations have been completed and applicable permits of approvals have been obtained or noted. Citations, dates/names/titles of contacts, and page references are clear. Additional documentation is attached, as appropriate. **All conditions, attenuation or mitigation measures have been clearly identified.**

Impact Codes: Use an impact code from the following list to make the determination of impact for each factor.

1. Minor beneficial impact
2. No impact anticipated
3. Minor Adverse Impact – May require mitigation
4. Significant or potentially significant impact requiring avoidance or modification which may require an Environmental Impact Statement

Environmental Assessment Factor	Impact Code	Impact Evaluation
CLIMATE AND ENERGY		
Climate Change Impacts	2	**Climate Change Impacts on the Project** The frequency and severity of natural hazards may be affected by climate changed, including: flooding; sea level rise; hurricanes and extreme storms; drought; extreme heat; wildfire; landslides; and extreme cold. Similarly, climate change may alter site suitability factors, such as: air quality; urban heat island effects; soil stability; and water resources. According to FEMA, the only natural hazard that has a moderate, high, or very high risk to impact the project site is earthquake hazards, which do not appear to be influenced by climate change. The proposed project is not anticipated to be subject to extreme weather of natural hazards that would require additional design measures beyond what is already required by the California Building Code (CBC). Similarly, compliance with the CBC and the provisions of C.3 of the NPDES permit would ensure that soil stability and water resources would not be affected by climate change. Finally, the proposed project would promote land use patterns and densities that help improve regional air quality emissions. **Project Contributions to Climate Change** According to the City of Oakland's thresholds of significance, a project would have a significant impact if it would produce more than 1,100 metric tons of carbon dioxide equivalents (CO_2e) annually and more than 4.6 metric tons of CO_2e per service population annually. The City's quantitative GHG thresholds were designed to ensure compliance with the State's AB 32 reduction goals, as set forth in CARB's Climate Change Scoping Plan. The proposed project estimated CO_2e emissions per service population would be 2.0 metric tons annually, and therefore the proposed project would not exceed the City's GHG thresholds. In addition, the project site is located within a Priority Development Area designated by Plan Bay Area, which is the Sustainable Communities Strategy adopted for the purpose of achieving the GHG reduction target established by CARB for the region's transportation and land use sector pursuant to the AB 32 scoping plan. As stated by Plan Bay Area, a Priority Development Area is a geographic area "where new development will support the day-to-day needs of residents and workers in a pedestrian-friendly environment served by transit." By focusing new development within a Priority Development Area, Plan Bay Area establishes a preferred development scenario, which will achieve the plan's GHG reduction targets. Since the proposed project would be constructed within a Priority Development Area with land uses at a density and intensity higher than the minimum recommendation included in Plan Bay Area (i.e., >20 dwelling units per acre; 0.75 FAR), the proposed project would further, and not conflict with, Plan Bay Area's GHG reduction targets. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that would also reduce GHG emissions. Application of these standards would ensure that the project would have a less than significant impact with respect to climate change impacts.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Waste1. Construction and Demolition Waste Reduction and Recycling The project applicant shall comply with the City of Oakland Construction and Demolition Waste Reduction and Recycling Ordinance (chapter 15.34 of the Oakland Municipal Code) by submitting a Construction and Demolition Waste Reduction and Recycling Plan (WRRP) for City review and approval, and shall implement the approved WRRP. Projects subject to these requirements include all new construction, renovations/alterations/modifications with construction values of $50,000 or more (except R-3 type construction), and all demolition (including soft demolition) except demolition of type R-3 construction. The WRRP must specify the methods by which the project will divert construction and demolition debris waste from landfill disposal in accordance with current City requirements. The WRRP may be submitted electronically at www.greenhalosystems.com or manually at the City's Green Building Resource Center. Current standards, FAQs, and forms are available on the City's website and in the Green Building Resource Center. **WS1. Recycled Water** Pursuant to section 16.08.030 of the Oakland Municipal Code, the project applicant shall provide for the use of recycled water in the project for feasible recycled water uses unless the City determines that there is a higher and better use for the recycled water, the use of recycled water is not economically justified for the project, or the use of recycled water is not financially or technically feasible for the project. Feasible recycled water uses may include, but are not limited to, landscape irrigation, commercial and industrial process use, and toilet and urinal flushing in non-residential buildings. The project applicant shall contact the New Business Office of the East Bay Municipal Utility District (EBMUD) for a recycled water feasibility assessment by the Office of Water Recycling. If recycled water is to be provided in the project, the project drawings submitted for construction-related permits shall include the proposed recycled water system and the project applicant shall install the recycled water system during construction. **EC1. Green Building Requirements** a. <u>Compliance with Green Building Requirements During Plan-Check</u> The project applicant shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures and the applicable requirements of the Green Building Ordinance (Chapter 18.02 of the Oakland Municipal Code). The following information shall be submitted to the City for review and approval with the application for a building permit: • Documentation showing compliance with Title 24 of the current version of the California Building Energy Efficiency Standards. • Completed copy of the final green building checklist approved during the review of the Planning and Zoning permit. • Copy of the Unreasonable Hardship Exemption, if granted, during the review of the Planning and Zoning permit. • Permit plans that show, in general notes, detailed design drawings, and specifications as necessary, compliance with the items listed in subsection (ii) below. • Copy of the signed statement by the Green Building Certifier approved during the review of the Planning and Zoning permit

Environmental Assessment Factor	Impact Code	Impact Evaluation
		that the project complied with the requirements of the Green Building Ordinance. • Signed statement by the Green Building Certifier that the project still complies with the requirements of the Green Building Ordinance, unless an Unreasonable Hardship Exemption was granted during the review of the Planning and Zoning permit. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. The set of plans in subsection (a) shall demonstrate compliance with the following: • CALGreen mandatory measures. • Green building point level/certification requirement per the appropriate checklist approved during the Planning entitlement process. • All green building points identified on the checklist approved during review of the Planning and Zoning permit, unless a Request for Revision Plan-check application is submitted and approved by the Bureau of Planning that shows the previously approved points that will be eliminated or substituted. • The required green building point minimums in the appropriate credit categories. b. <u>Compliance with Green Building Requirements During Construction</u> The project applicant shall comply with the applicable requirements of CALGreen and the Oakland Green Building Ordinance during construction of the project. The following information shall be submitted to the City for review and approval: • Planning and Zoning permit and during the review of the building permit. • Signed statement(s) by the Green Building Certifier during all relevant phases of construction that the project complies with the requirements of the Green Building Ordinance. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. c. Compliance with Green Building Requirements After Construction Prior to the finaling the Building Permit, the Green Building Certifier shall submit the appropriate documentation to City staff and attain the minimum required point level. **EC2. Plug-In Electric Vehicle (PEV) Charging Infrastructure** a. <u>PEV-Ready Parking Spaces</u> The applicant shall submit, for review and approval of the Building Official and the Zoning Manager, plans that show the location of parking spaces equipped with full electrical circuits designated for future PEV charging (i.e. "PEV-Ready) per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-Ready parking spaces. b. <u>PEV-Capable Parking Spaces</u> The applicant shall submit, for review and approval of the Building

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Official, plans that show the location of inaccessible conduit to supply PEV-capable parking spaces per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-capable parking spaces. c. <u>ADA-Accessible Spaces</u> The applicant shall submit, for review and approval of the Building Official, plans that show the location of future accessible EV parking spaces as required under Title 24 Chapter 11B Table 11B-228.3.2.1, and specify plans to construct all future accessible EV parking spaces with appropriate grade, vertical clearance, and accessible path of travel to allow installation of accessible EV charging station(s). ***Source Documents:*** 3, 27, 76

Environmental Assessment Factor	Impact Code	Impact Evaluation
Energy Efficiency	2	The proposed project is located within close proximity to transit, shopping and services, schools, and employment locations. The project is located approximately 0.5 miles northwest of the West Oakland BART Station at 1451 7th street. This site affords residents the opportunity to look for work outside the immediate area, as reliable, convenient and cost-effective public transportation is readily available. The project site is in an urbanized area where there are food markets, ATMs and banks, auto service facilities, pharmacies, and other commercial and retail establishments within a 3 mile radius. The additional residents would not constitute a significant impact on the demand for commercial facilities in the area. Additionally, the project would include a community building with space to host support services for residents. The City of Oakland has imposed Green Building conditions of approval on all projects pursuant to Oakland Municipal Code Chapter 18.02, the Green Building Ordinance. The applicant is required to comply with California Green Building Standards (CALGreen) and score a minimum of 50 points on the GreenPoint Rated checklist and be certified by Build It Green. Based on the size of the community Building (7,800 square feet total), the minimum required is a completed Green Building Checklist. No LEED certification is required based on the size and scope of work. As described above, the proposed project estimated CO_2e emissions per service population would be 2.0 metric tons annually, and therefore the proposed project would not exceed the City's GHG thresholds. The City has adopted Uniformly Applied Development Standards imposed as SCAs that apply to green building, energy efficiency and water conservation. Application of these standards and implementation of these measures would further ensure that impacts to sustainability are less than significant. *SCAs Required:* **EC1. Green Building Requirements** a. <u>Compliance with Green Building Requirements During Plan-Check</u> The project applicant shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures and the applicable requirements of the Green Building Ordinance (Chapter 18.02 of the Oakland Municipal Code). The following information shall be submitted to the City for review and approval with the application for a building permit: • Documentation showing compliance with Title 24 of the current version of the California Building Energy Efficiency Standards. • Completed copy of the final green building checklist approved during the review of the Planning and Zoning permit. • Copy of the Unreasonable Hardship Exemption, if granted, during the review of the Planning and Zoning permit. • Permit plans that show, in general notes, detailed design drawings, and specifications as necessary, compliance with the items listed in subsection (ii) below. • Copy of the signed statement by the Green Building Certifier

Environmental Assessment Factor	Impact Code	Impact Evaluation
		approved during the review of the Planning and Zoning permit that the project complied with the requirements of the Green Building Ordinance. • Signed statement by the Green Building Certifier that the project still complies with the requirements of the Green Building Ordinance, unless an Unreasonable Hardship Exemption was granted during the review of the Planning and Zoning permit. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. The set of plans in subsection (a) shall demonstrate compliance with the following: • CALGreen mandatory measures. • Green building point level/certification requirement per the appropriate checklist approved during the Planning entitlement process. • All green building points identified on the checklist approved during review of the Planning and Zoning permit, unless a Request for Revision Plan-check application is submitted and approved by the Bureau of Planning that shows the previously approved points that will be eliminated or substituted. • The required green building point minimums in the appropriate credit categories. b. <u>Compliance with Green Building Requirements During Construction</u> The project applicant shall comply with the applicable requirements of CALGreen and the Oakland Green Building Ordinance during construction of the project. The following information shall be submitted to the City for review and approval: • Planning and Zoning permit and during the review of the building permit. • Signed statement(s) by the Green Building Certifier during all relevant phases of construction that the project complies with the requirements of the Green Building Ordinance. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. c. Compliance with Green Building Requirements After Construction Prior to the finaling the Building Permit, the Green Building Certifier shall submit the appropriate documentation to City staff and attain the minimum required point level. **EC2. Plug-In Electric Vehicle (PEV) Charging Infrastructure** a. <u>PEV-Ready Parking Spaces</u> The applicant shall submit, for review and approval of the Building Official and the Zoning Manager, plans that show the location of parking spaces equipped with full electrical circuits designated for future PEV charging (i.e. "PEV-Ready) per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-Ready parking spaces. b. <u>PEV-Capable Parking Spaces</u>

Environmental Assessment Factor	Impact Code	Impact Evaluation
		The applicant shall submit, for review and approval of the Building Official, plans that show the location of inaccessible conduit to supply PEV-capable parking spaces per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-capable parking spaces. c. <u>ADA-Accessible Spaces</u> The applicant shall submit, for review and approval of the Building Official, plans that show the location of future accessible EV parking spaces as required under Title 24 Chapter 11B Table 11B-228.3.2.1, and specify plans to construct all future accessible EV parking spaces with appropriate grade, vertical clearance, and accessible path of travel to allow installation of accessible EV charging station(s).

Environmental Assessment Factor	Impact Code	Impact Evaluation
LAND DEVELOPMENT		
Conformance with Plans / Compatible Land Use and Zoning / Scale and Urban Design	2	The City of Oakland approved the project's planning application in December 2018. A summary of the findings that support the planning application approval that pertain to plans, land use, zoning and design are cited below. **Oakland General Plan** The project site is split between two General Plan land use designations: Housing and Business Mix and Business Mix. The Housing and Business portion is located adjacent to Pine Street with the Business Mix designation behind and closer to the frontage road and I-880. The intent of the Housing and Business Mix designation is to guide a transition from heavy industry to low impact light industrial and other businesses that can co-exist compatibly with residential development. The Business Mix designation is intended to create, preserve, and enhance areas of the city that are appropriate for a wide variety of business and related commercial and industrial establishments. The project, which would redevelop a now-vacant lot previously used for industrial uses, was found to be consistent with these land uses designations, especially since the General Plan designations are not meant to be parcel specific and the proposal is not required to be an exact match to applicable general plan. The project only need to be compatible with the objectives, policies, general land uses, and programs specified in' the applicable plan. Furthermore, the project site is located at the southern end of the parcel closer to residential uses across Pine and civic uses across Shorey Street. The project would help facilitate a transition from heavy industrial and transportation land uses to land uses more compatible with the existing neighborhood by adding a mid-rise residential building and small community building with office and gathering spaces. The project is also consistent with the following General Plan Land Use and Transportation Element (LUTE) objectives and policies: • *Objective N3: Encourage the construction, conservation, and enhancement of housing resources in order to meet the current and future housing needs of the Oakland community.* The project will provide the community with 101 new affordable housing units. • *Policy N3.1, Facilitating Housing Construction: Facilitating the construction of housing units should be considered a high priority for the City of Oakland.* The City of Oakland's Bureau of Planning has streamlined its systems to facilitate the construction of new homes and assist developers with navigating the permitting process smoothly and in a timely manner. • *Policy N3.2, Encouraging Infill Development: In order to facilitate the construction of needed housing units, infill development that is consistent with the General Plan should take place throughout the City Oakland.* The project is proposed as an urban infill replacement of existing vacant site. By creating more continuity and connection between residential and industrial uses in this area and improving the range of housing opportunities, the project also fulfills the policy strategies for this portion of the West Oakland Specific Plan, as discussed below.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		West Oakland Specific Plan (WOSP) The project site is also located within the WOSP which was adopted by the City in 2014 to provide a framework focusing on land use, job generation, traffic, infrastructure, urban design and a number of other topics that shape a ‘‘vision’’ for the future physical development of West Oakland. The project site is within the 7th Street Opportunity Area of the WOSP and is part of WOSP Opportunity Site #28. The project is consistent with the plan policies for the 7th Street Opportunity Area, which contemplate higher-density housing, commercial office, and government/institutional office space around the core of the BART Station and neighborhood-serving retail as well as custom manufacturing/industrial arts/artist exhibition space on the ground floor. The WOSP envisions redevelopment of the site with uses that “transform the surrounding areas” yet “maintain and enhance the residential edge along Pine Street.” The proposed project’s scale and massing has been carefully designed to respect the homes across Pine Street. The proposed mix of housing types and income levels accommodated make it a compatible development that will add activity to the area while maintaining consistency with the City’s Policy-Based Strategies of the WOSP. The project is consistent with the City’s Policy-Based Strategies of the WOSP and the following policies, strategies, and objectives: • *Low Dens. Res.-1: Encourage infill residential development within the West Oakland Residential Areas that is compatible in scale and character with the surrounding neighborhood.* The project is on a vacant, infill site and complies with the Pine Street Design Guidelines. The project has been designed to be compatible with the existing neighborhood. • *Ind. Conv.-1: Phoenix Iron Works Site: This site is located on the west side of Pine Street between Shorey Street and 9th Street. It is a long-vacant property remaining from a prior industrial use, with ongoing surface storage of large steel pipes. Change this site to enable residential and live/work uses along the Pine Street frontage (approximately 1.5 acres), resulting in similar densities and massing as the surrounding residential area, and better defining the residential/industrial edge along this portion of the neighborhood.* The project site makes up a portion of the Phoenix Iron Works site. The project would realize this policy by redeveloping a portion of the site with residential and commercial uses that respect and enhance the existing neighborhood. The project helps facilitate a transition from industrial land uses. • *AH (Affordable Housing)-3: In addition to providing market-rate new units, expand, stabilize, and improve affordable housing opportunities for extremely low to moderate income renters and homebuyers.* Half of the project’s 101 residential units will be affordable to low-income households and the other half will be permanent supportive housing (PSH) for people who formerly experienced homelessness. **Zoning Analysis and Entitlements** The project is located in two zoning districts: Housing and Business Mix 4 (HBX-4) and West Oakland Plan Area Commercial Industrial Mix-1B (CIX-

Environmental Assessment Factor	Impact Code	Impact Evaluation
		1B). The HBX-4 zone provides development standards for Live/Work, Work/Live, and housing in areas with industrial and commercial activities. The CIX-1B zoning district is intended to support industrial areas in the WOSP Area that are appropriate for light manufacturing, light industrial, warehouse, research and development, and service commercial uses. The project uses, which include multi-family residential and commercial office uses for supportive housing services, would meet the intentions of the two zones. Furthermore, a Conditional Use Permit and Density Bonus concessions and waivers allowed by state law were used to extend residential land uses permitted in the HBX-4 zone 150 feet into the CIX-1B zone per OMC Section 17.102.110-Expansion of Use into Adjacent Zones. The 150-foot Expansion of Use zone would cover the entirety of structures and uses proposed for Phase I. The project is also consistent with the approved Planned Unit Development (PUD) permit issued for APN 006-0047-001-00 on December 19, 2018. The preliminary development plan (PDP) for the PUD covers 4.65 acres, including the project site, and envisions a mix of market-rate, affordable, and supportive housing with artist/maker space on the 9th Street edge. On the project site, the PDP includes two- to four-story buildings with supportive housing and common amenities. The project's 101 affordable housing units (approximately half of which are supportive housing) and community building are consistent with the PUD vision and the illustrative PDP. The project proposes to redevelop a vacant site with a four-story residential building and two-story community building. Adoption/approval of the CEQA Findings, Design Review, and Major and Minor Conditional Use Permits were required. The City of Oakland approved the project's planning application and issued the required entitlements. **Design** The project site falls within the WOSP, which requires compliance with Design Guidelines (see below). The project was approved December 19, 2018 with a project-specific condition of approval (COA) for a subsequent Design Review Committee (DRC) approval. Per this COA and in order to meet the guidelines of the WOSP, the project made adjustments and further changes to comply. These changes included creating further building articulation, the addition of a triple track door, and pushing a primary pedestrian entrance closer to the street line. The project received DRC approval on August 28th, 2019. Additionally, the project will work with the Public Arts Advisory Committee to incorporate public art on a portion of the project where further articulation is not feasible. All the changes made further compliance with the specific guidelines referenced below: • Pine 1- Site Planning: Create entries facing Pine Street that are compatible with the porches and entrances on historic houses on the opposite side of the street. • Pine 2- Massing: Articulate facades on the west side of the Pine Street into segments that are generally 25 to 35 feet wide to roughly match the scale of historic housing on the opposite side of the street. Bay windows and porches are encouraged. • Pine 3- Height: Buildings directly facing Pine Street should relate

Environmental Assessment Factor	Impact Code	Impact Evaluation
		to the scale of historic housing on the opposite side of the street. - Pine 4- Fenestration and Materials: Employ, clear, logical, and high-quality building openings appropriate detail around entries and primary windows. - Pine 5- Landscape: Establish landscaped yards between the sidewalk and the face of the building. **Finding** The project is consistent with the applicable General Plan land use designations and zoning districts, which encourage a transition from industrial land use to land uses more compatible with the existing neighborhood. The project has been approved and the design has been deemed appropriate and compliant with City standards. ***Source Documents:*** 1, 47, 48, 49

Environmental Assessment Factor	Impact Code	Impact Evaluation
Soil Suitability/ Slope/ Erosion/ Drainage/ Storm Water Runoff	3	**Soil Suitability** A Geotechnical Investigation was prepared for the project by Rockridge Geotechnical in December 2019. A summary from the report follows. The objective of the investigation was to evaluate subsurface conditions at the site and develop conclusions and recommendations regarding the geotechnical aspects of the proposed project. Scope of work consisted of evaluating subsurface conditions at the site by drilling two exploratory borings, advancing four cone penetration tests (CPTs) and performing engineering analyses to develop conclusions and recommendations regarding: • Site seismicity and seismic hazards, including the potential for liquefaction and liquefaction-induced ground failure • The most appropriate foundation type(s) for the proposed structure • Design criteria for the recommended foundation type(s) • Estimates of foundation settlement • Rigid and flexible pavement design • Design groundwater level • Subgrade preparation for floor slabs, pavements, and exterior concrete flatwork • Site preparation and grading, including criteria for fill quality and compaction • 2019 California Building Code (CBC) site class and design spectral response acceleration parameters • Soil corrosivity • Construction considerations **Exploratory Borings** Subsurface conditions at the site were investigated by performing Cone Penetration Tests (CPTs) and hand-auger borings. Nineteen CPTs (designated CPT-1 though CPT-19) were advanced to depths between 30 and 100 feet below the existing ground surface (bgs). The CPTs were performed during two mobilizations with the first 7 CPTs advanced on December 4, 2017 and the remaining 12 on November 19-20, 2019. Four borings (HA-8, HA-9, HA-13, and HA-17) were hand-augered to a depth of about 5 feet bgs. The borings were advanced using a three-inch-diameter hand auger. **Subsurface Conditions** The site is generally underlain by a layer of loose to medium dense sand, which is typically 4 to 7 feet thick. This layer could represent geologically young material, reworked native material, or fill. The layer is underlain by Merritt sand. Merritt sand consists of sand, silty sand, and clayey sand, which are typically dense to very dense with occasional medium dense layer. At CPT-16, the Merritt sand extends to a depth of about 63 feet bgs and is underlain by the San Antonio formation. The San Antonio formation typically consists of very stiff to hard clays with occasional interbeds of dense to very dense sand. Groundwater was measured in CPTs at approximately 9.5 to 10 feet bgs at the time of testing. Review of previous environmental borings indicates that the groundwater level at the site is expected to fluctuate

Environmental Assessment Factor	Impact Code	Impact Evaluation
		several feet seasonally with potentially larger fluctuations annually, depending on the amount of rainfall. As described below in Hazards and Nuisances, the site can be developed as planned, provided the recommendations presented in the Geotechnical report are incorporated into the project plans and specifications and implemented during construction, as required by Mitigation Measure G1. **G1. Adherence to Geotechnical Recommendations.** Follow all recommendations laid forth in the Geotechnical Investigation prepared for the PUD, including this project, by Rockridge Geotechnical and dated December 29, 2017 (see Appendix H) including site preparation and grading subgrade preparation, fill material and compaction criteria, utility trench backfill, drainage and landscaping, foundation design, deepened footings, rapid impact compaction, floor slabs, site retaining walls, pavement design and seismic design. **Slope** The site and vicinity are relatively flat. The site does not contain any slopes. **Erosion** The site as it exists now is not subject to erosion. However, if not properly managed, erosion could occur during construction of the project. Plans demonstrating the Best Management Practices for erosion control, sedimentation, and water quality impacts to the maximum extent practicable must be submitted for review and approval by the City. At a minimum, appropriate filter materials shall be provided at nearby catch basins to prevent debris and dirt from flowing into the City's storm drain system and creeks. **Drainage/Storm Water Runoff** Redevelopment of the site could affect drainage patterns and increase the overall amount of impervious surfaces, thus creating changes to stormwater flows and water quality. Increasing the total area of impervious surfaces can result in a greater potential to introduce pollutants to receiving waters. Urban runoff can carry a variety of pollutants, such as oil and grease, metals, sediments, and pesticide residues from roadways, parking lots, rooftops, and landscaped areas and deposit them into an adjacent waterway via the storm drain system. New construction could also result in the degradation of water quality with the clearing and grading of sites, releasing sediment, oil and greases, and other chemicals to nearby water bodies. The site is already covered in impervious surfaces. There will be no significant increase in impervious surfaces over current conditions as a result of the project. The City of Oakland requires Best Management Practices to minimize the generation, discharge, and runoff of stormwater pollution during construction of projects in the City. Post-construction stormwater management on the site will be required

Environmental Assessment Factor	Impact Code	Impact Evaluation
		to comply with the requirements of Provision C.3 of the National Pollutant Discharge Elimination System (NPDES) permit issued to the Alameda Countywide Clean Water Program. A stormwater management plan will be developed to manage stormwater run-off and limit discharge of pollutants in stormwater after construction of the project. The plan will include hydromodification measures, if required, and stormwater treatment measures to remove pollutants and hydraulic sizing for treatment measures proposed. The project will be required to fund any repairs or infrastructure improvements to the surrounding stormwater system. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAS) that apply to stormwater control, runoff, the storm-drain system and water quality. Application of these standards and implementation of these measures and plans would ensure that impacts to stormwater and water quality are less than significant. *SCAs Required:* **SW1. Erosion and Sedimentation Control Measures for Construction** The project applicant shall implement Best Management Practices (BMPs) to reduce erosion, sedimentation, and water quality impacts during construction to the maximum extent practicable. At a minimum, the project applicant shall provide filter materials deemed acceptable to the City at nearby catch basins to prevent any debris and dirt from flowing into the City's storm drain system and creeks. **SW2. NPDES c.3 Stormwater Requirements for Regulated Projects** a. Post-Construction Stormwater Management Plan Required The project applicant shall comply with the requirements of Provision C.3 of the Municipal Regional Stormwater Permit issued under the National Pollutant Discharge Elimination System (NPDES). The project applicant shall submit a Post-Construction Stormwater Management Plan to the City for review and approval with the project drawings submitted for site improvements, and shall implement the approved Plan during construction. The Post-Construction Stormwater Management Plan shall include and identify the following: i. Location and size of new and replaced impervious surface; ii. Directional surface flow of stormwater runoff; iii. Location of proposed on-site storm drain lines; iv. Site design measures to reduce the amount of impervious surface area; v. Source control measures to limit stormwater pollution; vi. Stormwater treatment measures to remove pollutants from stormwater runoff, including the method used to hydraulically size the treatment measures; and vii. Hydromodification management measures, if required by Provision C.3, so that post-project stormwater runoff flow and duration match pre-project runoff. b. Maintenance Agreement Required The project applicant shall enter into a maintenance agreement with the City, based on the Standard City of Oakland Stormwater Treatment

<tbody>
<tr><td></td><td></td><td>Measures Maintenance Agreement, in accordance with Provision C.3, which provides, in part, for the following:
i. The project applicant accepting responsibility for the adequate installation/construction, operation, maintenance, inspection, and reporting of any on-site stormwater treatment measures being incorporated into the project until the responsibility is legally transferred to another entity; and
ii. Legal access to the on-site stormwater treatment measures for representatives of the City, the local vector control district, and staff of the Regional Water Quality Control Board, San Francisco Region, for the purpose of verifying the implementation, operation, and maintenance of the on-site stormwater treatment measures and to take corrective action if necessary.

The maintenance agreement shall be recorded at the County Recorder’s Office at the applicant’s expense.

<tr><td>Hazards and Nuisances including Site Safety and Noise</td><td>3</td><td>Site Safety
The project will not create a risk of explosion, release of hazardous substances or other dangers to public health. The project is not located near any hazardous operations. The project will provide a safe place for residents.

A Geotechnical Investigation was prepared for the project by Rockridge Geotechnical on December 18, 2019. A summary from the report about geologic hazards follows.

Regional Seismicity
The project site is located within the seismically active San Francisco Bay region. The major active faults in the area are the Hayward, San Andreas, and Calaveras faults. Table 6 shows these and other active faults within a 50-kilometer radius of the site.

The U.S. Geological Survey's 2014 Working Group on California Earthquake Probabilities has compiled the earthquake fault research for</td></tr>
</tbody>
</table>

Environmental Assessment Factor	Impact Code	Impact Evaluation
		the San Francisco Bay area in order to estimate the probability of fault segment rupture. They have determined that the overall probability of moment magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Region during the next 30 years (starting from 2014) is 72 percent. The highest probabilities are assigned to the Hayward Fault, Calaveras Fault, and the northern segment of the San Andreas Fault. These probabilities are 14.3, 7.4, and 6.4 percent, respectively. **Seismic Hazards** During a major earthquake on a segment of one of the nearby faults, strong to very strong shaking is expected to occur at the project site. Strong shaking during an earthquake can result in ground failure such as that associated with soil liquefaction, lateral spreading and cyclic densification. The results of borings and CPTs were used to evaluate the potential of these phenomena occurring at the project site. **Ground Shaking** The ground shaking intensity felt at the project site will depend on: 1) the size of the earthquake (magnitude), 2) the distance from the site to the fault source, 3) the directivity (focusing of earthquake energy along the fault in the direction of the rupture), and 4) subsurface conditions. The site is approximately 8 kilometers from the Hayward Fault. Therefore, the potential exists for a large earthquake to induce strong to violent ground shaking at the site during the life of the project. **Fault Rupture** Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. The risk of fault offset at the site from a known active fault is very low. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, the Geotechnical Report states that the risk of surface faulting and consequent secondary ground failure from previously unknown faults is also very low. **Liquefaction** Liquefaction analyses indicate there are layers of potentially liquefiable material at a depth of approximately 26 feet below ground surface (bgs) where the upper loose/medium dense sand layer extends below the assumed groundwater table. The potentially liquefiable layers of sand on the project site are generally about 2 feet think. The estimated total free-field ground settlement associated with liquefaction (referred to as post-liquefaction reconsolidation) within these layers after a major event on a nearby fault will be less than 1/2-inch, with differential settlement of about 1/4 inch over a horizontal distance of 30 feet. Considering the depth and plasticity of the potentially liquefiable soil layers, analysis indicates the risk of lateral spreading is low. **Cyclic Densification** Cyclic densification (also referred to as differential compaction) of non-saturated sand (sand above groundwater table) can occur during an earthquake, resulting in settlement of the ground surface and overlying improvements. The soil in the upper 5 to 6 feet of the site consists of

Environmental Assessment Factor	Impact Code	Impact Evaluation
		loose to medium dense undocumented fill material, which is potentially susceptible to cyclic densification. Analysis indicates that the site could experience as much as 2 inches of ground surface settlement due to cyclic densification during a major earthquake, if the density of the sand fill is not improved. **Conclusions** From a geotechnical standpoint, Rockridge Geotechnical concludes the site can be developed as planned, provided the recommendations presented in the Geotechnical report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concerns affecting the proposed development include: • The presence of 5 to 6 feet of undocumented fill blanketing the site; • The potential for as much as 1/2 inch of liquefaction-induced free-field ground settlement following a major earthquake; and • The potential for as much as 2 inches of ground surface settlement due to cyclic densification of the loose to medium dense sands in the upper 5 to 6 feet following a major earthquake. *Mitigations Required:* **G1. Adherence to Geotechnical Recommendations.** Follow all recommendations laid forth in the Geotechnical Investigation prepared for the PUD, including this project, by Rockridge Geotechnical and dated December 29, 2017 (see Appendix G) including site preparation an grading subgrade preparation, fill material and compaction criteria, utility trench backfill, drainage and landscaping, foundation design, deepened footings, rapid impact compaction, floor slabs, site retaining walls, pavement design and seismic design.. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to geology and soils. Application of these standards and implementation of these measures, reports, and recommendations, would ensure that impacts to geology and soils are less than significant. *SCAs Required:* **G2. Construction-Related Permit** The project applicant shall obtain all required construction-related permits/approvals from the City. The project shall comply with all standards, requirements and conditions contained in construction-related codes, including but not limited to the Oakland Building Code and the Oakland Grading Regulations, to ensure structural integrity and safe construction. **G3.Soils Report** The project applicant shall submit a soils report prepared by a registered geotechnical engineer for City review and approval. The soils report shall contain, at a minimum, field test results and observations regarding the nature, distribution and strength of existing soils, and recommendations

Environmental Assessment Factor	Impact Code	Impact Evaluation
		for appropriate grading practices and project design. The project applicant shall implement the recommendations contained in the approved report during project design and construction. **G4. Seismic Hazards Zone (Landslide/Liquefaction)** The project applicant shall submit a site-specific geotechnical report, consistent with California Geological Survey Special Publication 117 (as amended), prepared by a registered geotechnical engineer for City review and approval containing at a minimum a description of the geological and geotechnical conditions at the site, an evaluation of site-specific seismic hazards based on geological and geotechnical conditions, and recommended measures to reduce potential impacts related to liquefaction and/or slope stability hazards. The project applicant shall implement the recommendations contained in the approved report during project design and construction. **Noise** A Noise Study was conducted for the project by Charles M. Salter Associates Inc. (Salter) in September 2022, which is included in Appendix I. *Regulatory Setting* U.S. Department of Housing and Urban Development The U.S. Department of Housing and Urban Development (HUD) environmental noise regulations are set forth in 24CFR Part 51B (Code of Federal Regulations). Section 51.103.(c) includes the following exterior noise standards for new housing construction that would be applicable to this project: • 65 dBA L_{dn} or less – acceptable. • Exceeding 65 dBA Ldn but not exceeding 75 dBA L_{dn} – normally unacceptable (appropriate sound attenuation measures must provide an additional 5 decibels of attenuation over that typically provided by standard construction in the 65 dBA L_{dn} to 70 dBA L_{dn} zone; 10 decibels additional attenuation in the 70 dBA L_{dn} to 75 dBA L_{dn} zone). • Exceeding 75 dBA DNL – unacceptable. According to Section 51.103.(c), these noise standards also apply to "a location 2 meters from the building housing noise sensitive activities in the direction of the predominant noise source" and to "other locations where it is determined that quiet outdoor space is required in an area ancillary to the principal use on the site." Section 51.101 specifies the interior noise goal of 45 dBA Ldn. *City of Oakland General Plan* The Oakland General Plan contains guidelines for determining the compatibility of various land uses with different outdoor noise environments. According to the City's land use compatibility matrix for residential uses, noise levels between 60 to 70 dBA Ldn are considered "conditionally acceptable" and noise levels between 70 to 75 dBA Ldn are considered "normally unacceptable" for residential land uses. Both conditionally acceptable and normally unacceptable noise levels require detailed noise analysis and additional noise reduction requirements for

Environmental Assessment Factor	Impact Code	Impact Evaluation

new development. However, it is also noted that conventional construction will usually suffice as long as it incorporates air conditioning or forced-air-supply systems for areas characterized as having "conditionally acceptable" noise levels.

Existing Noise Environment

The project site is located along Interstate 880 in West Oakland. The site is bordered by vacant land and 9th Street to the north, Shorey Street to the south, Pine Street to the east, and Frontage Road to the west. The Bay Area Rapid Transit (BART) tracks are located two blocks to the south of the project site. The main sources of noise at the project site are traffic from I-880/Frontage Road, vehicular traffic on 7th Street, and BART trains.

A noise monitoring survey was conducted to quantify existing ambient noise levels at the project site. The noise monitoring survey included two long-term noise measurements and three short-term noise measurements. The calculated day-night average noise level within the project site range from 59 to 74 dBA Ldn. Ambient noise levels near 7th Street are approximately 83 dBA Ldn while noise levels near Pine Street are approximately 72 dBA Ldn.

Table 7: Existing Noise Calculation Summary and Effect of Noise Barrier

Identifier[a]	DNL without Barrier[b]	Barrier Effect	Actual DNL	DNL with Future Traffic Increase
NAL1	77	0	77	78
NAL2	74	-3	72	73
NAL3	73	-17	58	59
NAL4	74	-17	59	60
NAL5	75	-15	61	62
NAL6	76	-3	74	75
NAL7	74	-11	64	65

a: Refer to Appendix I for noise measurement locations.
b: All DNL values in this table are the combined DNL, which includes the following sources: I-880/Frontage Road, 7th Street, and BART. Some values may not add up due to rounding.

Acceptable Noise Levels

An adverse effect would result if noise levels at the project site would exceed HUD Guidelines for acceptability. Exterior noise levels exceeding 65 dBA Ldn or interior noise levels exceeding 45 dBA Ldn would exceed HUD's noise compatibility criteria.

Future Exterior Noise Environment

Pursuant to the HUD Guidelines, the noise exposure at least 10 years in the future must be considered in addition to the existing noise exposure. A future traffic analysis was not provided for this project. However, the Noise Study has accounted for the potential future increase in traffic volumes (and associated increased noise levels) using the published 2017 traffic volumes (AADT), from the California Department of Transportation (DOT) for I-880/Frontage Road, the 2018 AADT for 7th Street from the Transportation Study, and BART train schedules. For I-

Environmental Assessment Factor	Impact Code	Impact Evaluation
		880/Frontage Road 7th Street, 1 dB was added to the measured existing ambient noise levels to account for these traffic volumes. The traffic volume increase along I-880 and Frontage Road is based on the California DOT's historical average of a three-percent increase per year, which accounts for a 1 dB noise level increase over 10 years. The West Oakland Specific Plan Environmental Impact Report assumed a 3.95 percent increase in total traffic volume on local roads (such as 7th Street) by 2035, which would equate to an approximately 0.2 dB increase in noise. Therefore, a 3.95 percent increase was assumed for 7th Street. The recommendations for noise control measures also have accounted for future traffic increases. Based on the noise monitoring survey, existing noise levels at the exterior of the building at NAL1 would reach 78 dBA DNL with Future Traffic Increase and would be considered unacceptable (exceeding 75 dBA DNL). Existing noise levels at the exterior of the building at NAL2 and NAL6 would also reach 72 and 74 dB and would be considered normally unacceptable (65 to 75 dB DNL). Therefore, a noise waiver would be required. Based on the noise monitoring survey existing noise levels at the outdoor open space location are about 69 dBA Ldn, which exceeds the exterior noise compatibility criterion of 65 dBA. However, the outdoor open space would be shielded by the proposed residential building to the west and to the north, as well as the proposed community building to the east and to the south. Salter calculated the exterior noise levels using the HUD DNL Calculator and Barrier Performance Module, the worksheets for which are included as appendices to the Noise Study in Appendix I. At the central courtyard, the noise level was calculated to be less than DNL 65 dB, which is considered "Acceptable" under the HUD guidelines described above. <u>Future Interior Noise Environment</u> Based on the drawings dated 15 November 2019, Salter calculated noise levels at the various building facades using the Sound Transmission Classification Assessment Tool (STraCAT). Based on these calculations, the Noise Study provides recommendations for window Sound Transmission Class (STC) ratings and exterior wall STC ratings that are needed to meet the interior noise levels of 45 dBA Ldn in residences. STC is a single-number rating defined in ASTM E90 that quantifies the airborne sound insulating performance of a partition under laboratory conditions. Increasing STC ratings correspond to improved airborne sound insulation. The Salter recommendations are based on the following assumptions: • Bedrooms will have carpet. • All other rooms will have hard-surface flooring. • Ceilings are 9 feet high. • Window sizes and locations are as shown on the drawings dated 15 November 2019. • The typical exterior wall assembly (e.g. Type WE1) achieves minimum STC 45. • The recommended STC ratings are for full window assemblies (glass and frame) rather than just the glass itself. Tested sound-rated assemblies should be used.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		The proposed project would include STC 53 walls and STC 40 windows. The Noise Study concludes that noise can be reduced to DNL 45 dB with the planned exterior wall and window assemblies and planned upgraded exterior wall and STC 40 windows that would be included in the proposed project. Mitigation Measure N1 would be required in order to ensure that residential units are dependent on not opening doors and windows. *Mitigation Required:* **N6. Comply with Noise Reduction Recommendations**. The project shall implement STC 53 walls and STC 40 windows on at least the the north facade and the south facade closest to Shorey Street and the west façade. as set forth in the Noise Study prepared by Charles Salter Associates, June 16, 2022 and the Noise Waiver (see Appendix I) based on the following assumptions: • Bedrooms will have carpet. • All other rooms will have hard-surface flooring. • Ceilings are 9 feet high. • Window sizes and locations are as shown on the drawings dated 15 November 2019. • The typical exterior wall assembly (e.g. Type WE1) achieves minimum STC 45. • The recommended STC ratings are for full window assemblies (glass and frame) rather than just the glass itself. Tested sound-rated assemblies should be used. If the assumptions change, the applicant shall retain a noise consultant to prepare a revised STraCAT analysis to ensure suitable STC wall and window assemblies. **N7. Ventilation, and Operations and Maintenance Plan.** The Project shall provide mechanically ventilated residential units that are not dependent on opening doors or windows, and shall develop and implement an Operations and Maintenance Plan that provides for periodic inspection of seals, and repair or replacement of building components at private decks or balconies when their noise attenuation performance diminishes The City has Uniformly Applied Development Standards imposed as SCAs that apply to noise. Application of these standards and implementation of these measures would ensure that impacts related to noise are less than significant. *SCAs Required:* **N8. Exposure to Community Noise** The project applicant shall submit a Noise Reduction Plan prepared by a qualified acoustical engineer for City review and approval that contains noise reduction measures (e.g., sound-rated window, wall, and door assemblies) to achieve an acceptable interior noise level in accordance with the land use compatibility guidelines of the Noise Element of the Oakland General Plan. The applicant shall implement the approved Plan during construction. To the maximum extent practicable, interior noise levels shall not exceed the following:

Environmental Assessment Factor	Impact Code	Impact Evaluation
		a. 45 dBA: Residential activities, civic activities, hotels b. 50 dBA: Administrative offices; group assembly activities c. 55 dBA: Commercial activities d. 65 dBA: Industrial activities Implementation of the project with the Salter recommendations would ensure that impacts to noise are less than significant. ***Source Documents:*** 39, 50, Appendix H and I

Environmental Assessment Factor	Impact Code	Impact Evaluation
Energy Consumption	3	The City of Oakland has imposed Green Building conditions of approval on all projects pursuant to Oakland Municipal Code Chapter 18.02, the Green Building Ordinance. The applicant is required to comply with California Green Building Standards (CALGreen) and score a minimum of 50 points on the GreenPoint Rated checklist and be certified by Build It Green. Based on the size of the community Building (7,800 square feet total), the minimum required is a completed Green Building Checklist. No LEED certification is required based on the size and scope of work. The City has adopted Uniformly Applied Development Standards imposed as SCAs that apply to green building, energy efficiency and water conservation. Application of these standards and implementation of these measures would further ensure that impacts to sustainability are less than significant. *SCAs Required:* **EC1. Green Building Requirements** e. Compliance with Green Building Requirements During Plan-Check The project applicant shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures and the applicable requirements of the Green Building Ordinance (Chapter 18.02 of the Oakland Municipal Code). The following information shall be submitted to the City for review and approval with the application for a building permit: • Documentation showing compliance with Title 24 of the current version of the California Building Energy Efficiency Standards. • Completed copy of the final green building checklist approved during the review of the Planning and Zoning permit. • Copy of the Unreasonable Hardship Exemption, if granted, during the review of the Planning and Zoning permit. • Permit plans that show, in general notes, detailed design drawings, and specifications as necessary, compliance with the items listed in subsection (ii) below. • Copy of the signed statement by the Green Building Certifier approved during the review of the Planning and Zoning permit that the project complied with the requirements of the Green Building Ordinance. • Signed statement by the Green Building Certifier that the project still complies with the requirements of the Green Building Ordinance, unless an Unreasonable Hardship Exemption was granted during the review of the Planning and Zoning permit. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. The set of plans in subsection (a) shall demonstrate compliance with the following: • CALGreen mandatory measures. • Green building point level/certification requirement per the appropriate checklist approved during the Planning entitlement process. • All green building points identified on the checklist approved

Environmental Assessment Factor	Impact Code	Impact Evaluation
		during review of the Planning and Zoning permit, unless a Request for Revision Plan-check application is submitted and approved by the Bureau of Planning that shows the previously approved points that will be eliminated or substituted. • The required green building point minimums in the appropriate credit categories. f. <u>Compliance with Green Building Requirements During Construction</u> The project applicant shall comply with the applicable requirements of CALGreen and the Oakland Green Building Ordinance during construction of the project. The following information shall be submitted to the City for review and approval: • Planning and Zoning permit and during the review of the building permit. • Signed statement(s) by the Green Building Certifier during all relevant phases of construction that the project complies with the requirements of the Green Building Ordinance. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. g. Compliance with Green Building Requirements After Construction Prior to the finaling the Building Permit, the Green Building Certifier shall submit the appropriate documentation to City staff and attain the minimum required point level. **EC2. Plug-In Electric Vehicle (PEV) Charging Infrastructure** h. <u>PEV-Ready Parking Spaces</u> The applicant shall submit, for review and approval of the Building Official and the Zoning Manager, plans that show the location of parking spaces equipped with full electrical circuits designated for future PEV charging (i.e. “PEV-Ready) per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-Ready parking spaces. i. <u>PEV-Capable Parking Spaces</u> The applicant shall submit, for review and approval of the Building Official, plans that show the location of inaccessible conduit to supply PEV-capable parking spaces per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-capable parking spaces. j. <u>ADA-Accessible Spaces</u> The applicant shall submit, for review and approval of the Building Official, plans that show the location of future accessible EV parking spaces as required under Title 24 Chapter 11B Table 11B-228.3.2.1, and specify plans to construct all future accessible EV parking spaces with appropriate grade, vertical clearance, and accessible path of travel to allow installation of accessible EV charging station(s). ***Source Documents:*** 47, 48, 53

<tr><th>Environmental Assessment Factor</th><th>Impact Code</th><th>Impact Evaluation</th></tr>
<tr><td colspan="3">SOCIOECONOMIC</td></tr>
<tr><td>Employment and Income Patterns</td><td>2</td><td>
<p>The project by its definition is to provide affordable and supportive housing for low-income individuals. The project will provide 82 studios, 3 one-bedroom units, and 16 two-bedroom units (with 1 two-bedroom unit reserved for the property manager). The target demographic will be provided with affordable rental apartments and on-site services.</p>
<p>Using HUD guidelines for the maximum number of residents, the project will house 253 persons (see calculation in the Demographic Character Changes, Displacement Section below). According to 2019 Census data, the city of Oakland has 429,082 residents. The project represents 0.06 percent of the population.</p>
<p>In addition to independent living, the project will accommodate supportive service activities, including on-site workshops, group sessions, life skills, job training, informal gatherings and one-on-one meetings. The project itself will generate temporary construction jobs and permanent jobs, including property managers, case managers, and front desk attendants which include a range of skill sets.</p>
<p>It is estimated that approximately 9 persons would be permanently employed on the project site. Construction jobs would be temporary and permanent jobs would not significantly alter employment opportunities in the area. Therefore, the impact to employment and income patterns is less than significant.</p>
<p><i>Source Documents:</i> 1, 54</p>
</td></tr>
<tr><td>Demographic Character Changes, Displacement</td><td>2</td><td>
<p>Demographic Character Changes
As a 101-unit affordable and supportive housing project in an urbanized area, the project is not anticipated to induce substantial population growth in the neighborhood. The project will help to address the need for housing projected in the Regional Housing Needs Allocation.
Based on guidelines provided by HUD, the maximum number of residents appropriate to multi-family unit dwellings is two persons per bedroom, plus one per unit. Thus, at most there would be seven persons in a three-bedroom apartment, and five persons in a two-bedroom unit. The proposed project would provide 82 studios, 3 one-bedroom units, and 16 two-bedroom units. As shown in Table 7 below, the maximum number of persons the project could accommodate per HUD guidelines, is 253. However, it is not expected that two people will occupy a studio.</p>
<p>Table 8: Unit Mix and Number of Residents</p>
<table>
<tr><th>Unit Mix</th><th>Number of Units</th><th>Number of Allowed Residents</th><th>Total</th></tr>
<tr><td>Studio</td><td>82</td><td>2</td><td>164</td></tr>

<tr><td>2-BR</td><td>16</td><td>5</td><td>80</td></tr>
<tr><td>Total</td><td>101</td><td>--</td><td>253</td></tr>
</table>
<p>According to Census data, Oakland’s population was 429,082 in 2019, so the additional 253 people housed by the project would represent 0.06</p>
</td></tr>
</table>

Environmental Assessment Factor	Impact Code	Impact Evaluation
		percent of that population. A less-than-significant impact is expected to result from the proposed project, as it would not create a significant change to the demographics of the area. **Displacement** The Uniform Relocation Act (URA), passed by Congress in 1970, establishes minimum standards for federally funded programs and projects that require the acquisition of real property (real estate) or displace persons from their homes, businesses, or farms. The Uniform Act's protections and assistance apply to the acquisition, rehabilitation, or demolition of real property for federal or federally funded projects. Section 205 of the URA requires that, "Programs or projects undertaken by a federal agency or with federal financial assistance shall be planned in a manner that (1) recognizes, at an early stage in the planning of such programs or projects and before the commencement of any actions which will cause displacements, the problems associated with the displacement of individuals, families, businesses, and farm operations, and (2) provides for the resolution of such problems in order to minimize adverse impacts on displaced persons and to expedite program or project advancement and completion." The developer/project proponent owns the site and it is currently vacant. No tenants lease the space that would require relocation prior to construction. A relocation plan is not required. ***Source Documents:*** 55, 56, 57
Environmental Justice	2	As previously discussed, the project site is located in a low-income/minority neighborhood and meets the definition of an Environmental Justice Community. The analysis in this Environmental Assessment indicates that there are no unmitigated adverse environmental impacts. As described under the Clean Air Act compliance factors, the proposed project would include air filtration devices rated MERV-13 or higher, which would reduce the cumulative excess cancer risk and PM2.5 concentrations at the project site below the BAAQMD's thresholds. As described under the Contamination and Toxic Substances compliance factors, the project site can be remediated to achieve residential land use standards by implementing the cleanup measures identified in the final CAIP. As described under the Explosive and Flammable Hazards compliance factors, the project site is located at an acceptable distance from the existing ASTs and would not be affected by potential explosion or fire hazards. All identified impacts can be reduced to less-than-significant levels with implementation of mitigation measures and/or Standard Conditions of Approval. Therefore, the project will not raise environmental justice issues and has no potential for new or continued disproportionately high and adverse human health and environmental effects on minority or low-income population. The project is suitable for it proposed use. ***Source Documents:*** 46, Appendix J

Environmental Assessment Factor	Impact Code	Impact Evaluation
COMMUNITY FACILITIES AND SERVICES		
Educational and Cultural Facilities	2	**Educational Facilities** The project by its definition is to provide supportive housing for individuals, with at most a population of 253 people. Families are not the primary demographic target of the project, but school-aged children may reside at the project. School-age children would likely attend the nearest schools, which include Prescott Elementary School at 920 Campbell St, approximately 0.4 miles east or a 4-minute drive. For middle school children, West Oakland Middle is located at 991 14th St, approximately 1.4 miles east of the site or a 6-minute drive. Ralph J. Bunche Academy (high school) is located 1.2 miles northeast of the project site, or a 5-minute drive. The project is required to pay Capital Improvement Impact and School Fees which reduce impacts to public schools to less than significant. Impacts to educational facilities are considered less than significant. **Cultural Facilities** The City of Oakland and the San Francisco Bay Area is rich in culture and opportunities for cultural experiences. Several cultural facilities are within five miles of the project site, including cinemas, theaters and music venues, galleries, libraries, and museums. The project's location near high-quality transit also offers opportunities for cultural enrichment outside the immediate area. The project represents an incremental demand for cultural facilities; impacts are considered less than significant. ***Source Documents:*** 8, 10, 27
Commercial Facilities	1	The project site is in an urbanized area where there are food markets, ATMs and banks, auto service facilities, pharmacies, and other commercial and retail establishments within a 3 mile radius. The additional residents would not constitute a significant impact on the demand for commercial facilities in the area. Additionally, the project would include a community building with space to host support services for residents. ***Source Documents:*** 8, 10

Environmental Assessment Factor	Impact Code	Impact Evaluation
Health Care and Social Services	2	**Health Care** Hospitals with full-service emergency rooms near the project site include Alta Bates Medical Center located at 350 Hawthorne Avenue, approximately 2.4 miles northeast; Kaiser Permanente Oakland Medical Center at 3600 Broadway, approximately 2.7 miles northeast; and Highland Hospital located at 1411 E 31st Street, approximately 4.0 miles east. There are numerous smaller health care facilities including clinics, urgent care, and specialty services in the area. There are no significant impacts to healthcare facilities or delivery systems anticipated as a result of the proposed project. **Supportive Services for Residents** The project itself will provide supportive services to residents, tailored to their needs. Services include on-site workshops, group sessions, life skills, job training, informal gatherings and one-on-one meetings. Case managers will work with permanent residents to develop an individualized housing and service plan with the goal of accessing the range of services they need to ensure long term stability. **Social Services** Alameda County Social Services Agency is located at 200 San Pablo Avenue in Oakland, approximately 2.7 miles east of the project site. The Agency provides services for children and families, the elderly, disabled adults, and veterans. Services include food assistance, medical and health, employment, training, housing services, and financial assistance. Supportive services provided include childcare, transportation, mental health, alcohol and drug addiction treatment and Social Security Insurance advocacy. There are numerous social service providers in the Oakland area, including Mental Health Association of Alameda County, St. Vincent de Paul Society, Oakland Family Resource Center, and the American Red Cross, to name a few. The project does not represent a significant change to the demographics of the area or on area social services as it serves the existing population. Implementation of the project represents a less than significant impact to social services. ***Source Documents:*** 58, 59, 60, 61
Solid Waste Disposal / Recycling	3	**Operational Waste** Franchise waste hauler Waste Management, Inc. (Waste Management) provides solid waste services to the site and vicinity. Waste Management is the largest garbage company in North American with nearly 20 million customers and over 5,000 municipal contracts. Waste Management has been moving operations into green services that extract value from waste rather than the traditional model of isolating waste in disposal sites. Since 2018, Waste Management has had a sustainability team dedicated to tracking and reporting progress on sustainability goals and as well as advocating on sustainability issues.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		The City of Oakland has been a partner in these efforts. Chapter 17.118 of the Oakland Municipal Code defines the Recycling Space Allocation Ordinance in an effort to divert solid waste generated by operation of the project from landfills. An Operational Diversion Plan (ODP) must be submitted to the Environmental Services Division of the Public Works Agency for review and approval. The adjacent properties are already served with solid waste disposal service, and the site would gain access to this service. The project does represent a net increase in demand, but this incremental increase would not exceed the capacity of or reduce the capability of services in the City of Oakland and would not require the construction of additional solid waste management facilities. As described in the WOSP EIR, all development in the WOSP Area would be designed in accordance with State and local solid waste regulations and therefore impacts associated with solid waste would be less than significant. Nonhazardous solid waste in the WOSP Area is ultimately hauled to the Altamont Landfill and Resource Facility. The Altamont Landfill would have sufficient capacity to accept waste generated by development under the WOSP. Impacts are considered less than significant. **Construction Waste** To reduce landfill waste and divert debris from construction to recycling facilities, the City of Oakland established section 15.34 of the Oakland Municipal Code with the goal to divert debris waste from landfill disposal. The project proponent is required to submit a Construction & Demolition Waste Reduction and Recycling Plan (WRRP) for review and approval by the Oakland Public Works Agency. In addition, waste generated by demolition and construction will be required to be diverted from landfills to reduce impacts to landfills and encourage the reuse of such materials. Impacts after adherence to the Oakland Municipal Code are less than significant. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to waste disposal and recycling. Application of these standards and implementation of these measures would further ensure that impacts to waste facilities are less than significant. *SCAs Required:* **Waste1. Construction and Demolition Waste Reduction and Recycling** The project applicant shall comply with the City of Oakland Construction and Demolition Waste Reduction and Recycling Ordinance (chapter 15.34 of the Oakland Municipal Code) by submitting a Construction and Demolition Waste Reduction and Recycling Plan (WRRP) for City review and approval, and shall implement the approved WRRP. Projects subject to these requirements include all new construction, renovations/ alterations/modifications with construction values of $50,000 or more (except R-3 type construction), and all demolition (including soft demolition) except demolition of type R-3 construction. The WRRP must specify the methods by which the project will divert construction and demolition debris waste from landfill disposal in accordance with current City requirements. The WRRP may be submitted electronically at www.greenhalosystems.com or manually at the City's Green Building

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Resource Center. Current standards, FAQs, and forms are available on the City's website and in the Green Building Resource Center. **Waste2. Recycling Collection and Storage Space** The project applicant shall comply with the City of Oakland Recycling Space Allocation Ordinance (chapter 17.118 of the Oakland Planning Code). The project drawings submitted for construction-related permits shall contain recycling collection and storage areas in compliance with the Ordinance. For residential projects, at least two (2) cubic feet of storage and collection space per residential unit is required, with a minimum of ten (10) cubic feet. For nonresidential projects, at least two (2) cubic feet of storage and collection space per 1,000 square feet of building floor area is required, with a minimum of ten (10) cubic feet. ***Source Documents:*** 62, 63, 64
Waste Water / Sanitary Sewers	3	Waste water (sewage) is collected and treated by the East Bay Municipal Utility District or EBMUD. EBMUD has been operating in the East Bay of the San Francisco Bay Area for over 50 years and services approximately 650,000 people. Waste water is collected from homes and businesses through privately-owned sewer laterals that feed into a network of city sewers. EBMUD's interceptors carry the wastewater to a treatment plant in Oakland. EBMUD treats the waste water, removing solids and cleaning it before it is discharged into San Francisco Bay. Stormwater is collected through a separate community-owned system. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to utility and service systems, including the sanitary sewer system. Application of these standards and implementation of these measures would further ensure that impacts related to waste water and sanitary sewers are less than significant. *SCAs Required:* **WW1. Sanitary Sewer System** The project applicant shall prepare and submit a Sanitary Sewer Impact Analysis to the City for review and approval in accordance with the City of Oakland Sanitary Sewer Design Guidelines. The Impact Analysis shall include an estimate of pre-project and post-project wastewater flow from the project site. In the event that the Impact Analysis indicates that the net increase in project wastewater flow exceeds City-projected increases in wastewater flow in the sanitary sewer system, the project applicant shall pay the Sanitary Sewer Impact Fee in accordance with the City's Master Fee Schedule for funding improvements to the sanitary sewer system. ***Source Documents:*** 65, 66
Water Supply	3	**Water Supplier** Potable water at the project site will be supplied by the East Bay Municipal Utility District (EBMUD). Ninety percent of EBMUD's water comes from the 577-square mile watershed of the Mokelumne River on the western slope of the Sierra Nevada. This area is mostly national

Environmental Assessment Factor	Impact Code	Impact Evaluation
		forest, EBMUD-owned lands and other undeveloped lands little affected by human activity. The Mokelumne watershed collects snowmelt from Alpine, Amador and Calaveras counties. The snowmelt flows into Pardee Reservoir near the town of Valley Springs. Three aqueducts carry water more than 90 miles from Pardee Reservoir to the East Bay and protect it from pesticides, agricultural and urban runoff, municipal sewage and industrial discharges. When water demand is high or during times of operational need, EBMUD also draws water from protected local watersheds. EBMUD has prepared a Water Supply Management Plan 2040 to estimate water supply needs over a 30-year planning period and proposes a diverse portfolio of policy initiatives and potential projects to ensure that needs are being met in dry years. The portfolio of solutions includes increased conservation and provision of recycled water, as well as rationing and a mix of possible supplemental supply projects that can be adjusted and implemented in a step-wise manner over the next 30 years as necessary to respond to changes in demand, changes in supplies, and future uncertainties, including the potential for climate change effects on both supply and demand. In addition to including aggressive conservation goals and an increase in the provision of recycled water, a mix of possible supplemental supply projects intended to be pursued in progressive stages is included, with the projects involving the fewest regulatory and institutional challenges undergoing study in order to respond to water need in the short-term, while the other more complex, regional projects to be pursued in the longer-term, beyond 2025, if the demand arises and other short-term projects do not provide sufficient yield to meet dry year needs. In addition, the Water Supply Assessment prepared by the East Bay Municipal Utility District (EBMUD) for the West Oakland Specific Plan (WOSP) EIR concluded that EBMUD has sufficient water supplies to meet current demand and future water demand through 2035, including the increased water demand associated with the WOSP, during normal, single dry, and multiple dry years. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to utility and service systems and water conservation measures. Application of these standards and implementation of these measures would further ensure that impacts related to water supply are less than significant. *SCAs Required:* **WS1. Recycled Water** Pursuant to section 16.08.030 of the Oakland Municipal Code, the project applicant shall provide for the use of recycled water in the project for feasible recycled water uses unless the City determines that there is a higher and better use for the recycled water, the use of recycled water is not economically justified for the project, or the use of recycled water is not financially or technically feasible for the project. Feasible recycled water uses may include, but are not limited to, landscape irrigation, commercial and industrial process use, and toilet

Environmental Assessment Factor	Impact Code	Impact Evaluation
		and urinal flushing in non-residential buildings. The project applicant shall contact the New Business Office of the East Bay Municipal Utility District (EBMUD) for a recycled water feasibility assessment by the Office of Water Recycling. If recycled water is to be provided in the project, the project drawings submitted for construction-related permits shall include the proposed recycled water system and the project applicant shall install the recycled water system during construction. **WS2. Water Efficient Landscape Ordinance (WELO)** The project applicant shall comply with California's Water Efficient Landscape Ordinance (WELO) in order to reduce landscape water usage. For the specific ordinance requirements, see the link below: http://www.water.ca.gov/wateruseefficiency/ landscapeordinance/docs/Title%2023%20extract%20-%20Official%20CCR%20pages.pdf For any landscape project with an aggregate (total noncontiguous) landscape area equal to 2,500 sq. ft. or less, the project applicant may implement either the Prescriptive Measures or the Performance Measures, of, and in accordance with the California's Model Water Efficient Landscape Ordinance. For any landscape project with an aggregate (total noncontiguous) landscape area over 2,500 sq. ft., the project applicant shall implement the Performance Measures in accordance with the WELO. Prescriptive Measures: Prior to construction, the project applicant shall submit the Project Information (detailed below) and documentation showing compliance with Appendix D of California's Model Water Efficient Landscape Ordinance (see page 38.14(g) in the link above): Performance Measures: Prior to construction, the project applicant shall prepare and submit a Landscape Documentation Package for review and approval, which includes the following: a. Project Information • Date • Applicant and property owner name • Project address • Total landscape area • Project type (new, rehabilitated, cemetery, or home owner installed) • Water supply type and water purveyor • Checklist of documents in the package • Project contacts • Applicant signature and date with the statement: "I agree to comply with the requirements of the water efficient landscape ordinance and submit a complete Landscape Documentation Package." b. Water Efficient Landscape Worksheet: • Hydrozone Information Table • Water Budget Calculations with Maximum Applied Water Allowance (MAWA) and Estimated Total Water Use c. Soil Management Report d. Landscape Design Plan e. Irrigation Design Plan

Environmental Assessment Factor	Impact Code	Impact Evaluation
		f. Grading Plan Upon installation of the landscaping and irrigation systems, and prior to the final of a construction-related permit, the Project applicant shall submit a Certificate of Completion (see page 38.6 in the link above) and landscape and irrigation maintenance schedule for review and approval by the City. The Certificate of Completion shall also be submitted to the local water purveyor and property owner or his or her designee. ***Source Documents:*** 3, 62, 65, 66
Public Safety - Police, Fire and Emergency Medical	2	**Police** The Oakland Police Department (OPD) provides police services to the area. The site is located in Beat 02Y within Area 1. The nearest station is located at 455 7th St, 1.8 miles east. Area 1 comprises ten community policing beats. Although the demand for police services would incrementally increase, it is not expected that the project would require construction or expansion of law enforcement facilities or the number of sworn officers; therefore the impact is considered less than significant. **Fire and Emergency Medical** The Oakland Fire Department provides emergency services to the site and vicinity. The nearest fire station is Fire Station No. 3 located at 1445 14th Street, approximately 0.8 miles east. Emergency response starts with the 9-1-1 Dispatch Center. This Accredited Center of Excellence provides the highest level of emergency dispatch; the Fire Prevention Bureau is knowledgeable of the fire code and the vegetation management system; the Public Education Division has built strong partnerships with local schools, libraries, head start programs, and senior and community centers. Emergency preparedness is a core function of the Oakland Fire Department. Communities of Oakland Responding to Emergencies (CORE) teaches self-reliance skills and helps establish response teams to take care of neighborhoods until professional emergency response personnel arrive. Because first responders will be overwhelmed during a catastrophic event such as a major earthquake on the Hayward fault, it is critical that community members are prepared to be self-sufficient for the first 72 hours or longer during an emergency. The Oakland Fire Department is comprised of eight divisions including the Operations Division. The Operations Division responds out of 25 Fire Stations, located throughout the City and the International Airport, operating a fleet of 24 Engines, 7 Trucks, and numerous other special operations, support, and reserve units throughout 3 Battalions. The OFD responds to approximately 60,000 emergency calls annually, with over 80% being emergency medical services calls. The project would only have a significant impact if it were to exceed the ability of fire and emergency medical providers to adequately serve the existing and future residents and require new or expanded facilities. However, planned projects such as this one would incrementally increase service needs but the impact would be less than significant.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Although the demand for fire and emergency medical services would increase, it would not require the new construction or expansion of Fire or Emergency Medical facilities; therefore the impact is considered less than significant. ***Source Documents:*** 67, 68, 69
Parks, Open Space and Recreation	2	The project site has numerous parks and recreational opportunities nearby. A smaller pocket park, Bertha Port Park, is located 0.1 mile south of the project site. Cypress Freeway Memorial Park is located approximately 1 mile east which offers a copious network of running and walking trails along Mandela Parkway. Raimondi Park is 1 mile north of the project site and offers recreational amenities such as a multisport field, playground, putting green, and baseball diamond. Martin Luther King Jr. Regional Shoreline, Damon Slough Staging Area is part of the East Bay Regional Park District and is located at Doolittle Drive and Swan Way, approximately 7.5 miles southeast of the project site. The area is next to Oakland International Airport and is 741-acres that include marshland, trails and the Tidewater Boating Center. Activities at the park include picnicking, birdwatching, hiking, biking, fishing and boating. The City of Oakland's Parks and Recreation Department is over 105 years old. They have 140 parks maintained by Public Works, 66 ball fields, 44 tennis courts, 28 recreation centers, 14 rental venues, 5 swimming pools, 17 community gardens, 3 golf courses, a digital arts and culinary center, 2 boating centers, an inclusionary center, and a host of programs designed for tiny tots to seniors, collectively serving over 95,000 enrolled participants and over a million drop-in users annually. The project represents an incremental demand for recreational facilities therefore impacts are considered less than significant. ***Source Documents:*** 10, 70, 71
Transportation and Accessibility	3	**Transportation** Transportation impacts caused by the proposed project to traffic vary depending upon the number of vehicle miles traveled the project will generate, the availability of public transit, the bicycle network, and the completeness of the nearby pedestrian network. Close amenities serve to further reduce the impacts to traffic. <u>Pedestrian and Bicycle</u> The project is consistent with both the City's Pedestrian Master Plan and Bicycle Master Plan as it would not make major modifications to existing pedestrian or bicycle facilities in the surrounding areas and would not adversely affect installation of future facilities. The project site and vicinity are walkable and the sidewalk network is complete. The City of Oakland is bicycle-friendly and has an extensive bicycle network for access throughout the city. The site is adjacent to 8th Street, a Class II bikeway. Three blocks north, Peralta Street is also a Class II bikeway. The City also requires that projects comply with the City of Oakland Bicycle

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Parking Requirements (chapter 17.118 of the Oakland Planning Code). <u>Public Transit</u> Bay Area Rapid Transit (BART) is a heavy-rail and subway system that connects San Francisco with cities in the East Bay and suburbs in Northern San Mateo County. BART's rapid transit system operates 7 routes on 121 miles of line with 48 stations in multiple counties. The project is located approximately 0.5 miles northwest of the West Oakland BART Station at 1451 7th street. This site affords residents the opportunity to look for work outside the immediate area, as reliable, convenient and cost-effective public transportation is readily available. AmTrak and Capitol Corridor trains can be caught at the Oakland Coliseum/Airport Station (OAC) accessible from the BART Station. AmTrak provides state-wide and country-wide train services between Auburn, Sacramento, Emeryville, Oakland, and San Jose. Alameda County-Contra Coast Transit (AC Transit) The site's location will afford residents with many options to meet their transportation needs. The project is located approximately 0.1 miles from frequent bus service along Wood street (AC Transit Route 14, with 15-minute peak headways). <u>Personal Vehicles</u> According to the Institute of Transportation Engineers (ITE) Trip Generation, 10th Edition for land use code 221 (Mid-Rise Apartment, General Urban/Suburban) the project would generate 23 AM peak hour trips and 27 PM peak hour trips. The additional 7,503 square feet of office and gathering space in the community building will serve the neighboring residents in the supportive housing and would also generate a minimal amount of additional peak trips. The proposed project is estimated to add fewer than 100 peak hour trips to any intersection and fewer than 50 peak hour trips to any minor-street movements. In addition, the proposed project would not add 50 or more peak hour trips to any intersections operate at Level of Service D or lower. The proposed project would provide new on-street parking on Shorey Street, in addition to off-street surface parking lots on the west side of the project, which would be accessed through driveways on Shorey Street. Motorists would travel to and from the site using Shorey, 9th, and/or Pine Streets. Shorey Street would be re-opened to provide perpendicular parking spaces on the north side of the street adjacent to the proposed project and the west end of the cul-de-sac adjacent to the sound wall, as well as parallel parking spaces on the south side of the street. The proposed on-street and off-street parking areas would provide adequate circulation for passenger vehicles. Vehicles would have adequate space to wait and maneuver into and out of spaces with minimal conflict. Once the rest of the phases are constructed and the access driveway is completed, vehicles would exit the off-street parking area onto 9th or Shorey Streets, both of which would connect with

Environmental Assessment Factor	Impact Code	Impact Evaluation
		intersections at Pine Street. The driveway on Shorey Street would have minimal conflicts with pedestrians because it is located at the end of a cul-de-sac and would have few pedestrians crossing. Additionally, the driveway would provide adequate sight distance between vehicles entering and exiting and pedestrians on the adjacent sidewalks. Adequate sight distance is defined as a continuous line-of-sight between an exiting motorist ten feet back from the sidewalk and a pedestrian ten feet away on the adjacent sidewalk on either side of the driveway. The internal driveways providing access to the parking courts would cross internal pedestrian walkways, but these driveways provide adequate sight distance, as presented in the most recent site plan. The project would increase vehicle traffic and pedestrian crossings at the Shorey Street-8th Street/ Pine Street intersection. Pedestrians would likely cross the Shorey Street approach of this intersection to travel between the project site and BART station or other destinations. The project would provide curb extensions and a directional curb-ramp across the west approach of the intersection, improving sight distance between vehicles and pedestrians at that crossing. The intersection would continue to be all-way stop-controlled. <u>Parking</u> The subject site is located at the corner of Pine Street and Shorey Street, two local access roads. The project would encourage the use of non-automobile transportation modes by providing residential and commercial uses in a dense, walkable urban environment approximately 0.5 miles from the West Oakland BART Station and 0.1 miles from frequent bus service along Wood Street (Route 14, with 15-minute peak headways). The proximity to public transit stations and bus lines makes the project an excellent candidate to encourage use of multi-modal forms of transportation that supports reduced parking. Hence, the project provides 24 parking spaces, including 2 accessible stalls and 1 EV-ready stall. The proposed project would be consistent Section 15.04 of the Oakland Municipal Code, which includes requirement for plug-in electric vehicle (PEV) infrastructure. The project's 24 parking spaces are approximately 50 percent of the 51 spaces required spaces for a 100 percent affordable housing project within a half mile of BART (0.5 spaces per unit). The project utilized concessions under the State Density Bonus Law to reduce the parking. An additional 12 street-parking spaces are located along Shorey Street. <u>Conclusion</u> Pedestrian, bicycle and transit facilities are expected to adequately serve the project. The project is transit-oriented by nature of its proximity to public rail and bus transit services and its reduced parking supply. Project impacts to traffic are considered less than significant. **Accessibility** The project will comply with all HUD and local requirements for accessibility at the site. The proposed project would re-open Shorey

Environmental Assessment Factor	Impact Code	Impact Evaluation
		Street and would install curbs and sidewalks along the project frontage on Shorey Street. The sidewalks provided on Shorey Street would be at least five feet wide, according to the site plan. A six-foot wide pedestrian walkway would also be provided along Shorey Lane. As discussed above, the project would provide curb extensions and a directional curb-ramp across the west approach of the Shorey Street-8th Street/Pine Street intersection, improving sight distance between vehicles and pedestrians at that crossing. The City has adopted Uniformly Applied Development Standards imposed as Standard Conditions of Approval (SCAs) that apply to transportation. Application of these standards and implementation of these measures would further ensure that impacts related to transportation are less than significant. *SCAs Required:* **TA1. Bicycle Parking** The project applicant shall comply with the City of Oakland Bicycle Parking Requirements (chapter 17.118 of the Oakland Planning Code). The project drawings submitted for construction-related permits shall demonstrate compliance with the requirements. **TA2. Public Improvements** The project applicant shall obtain all necessary permits/approvals, such as encroachment permits, obstruction permits, curb/gutter/sidewalk permits, and public improvement ("p-job") permits from the City for work in the public right-of-way, including but not limited to, streets, curbs, gutters, sidewalks, utilities, and fire hydrants. Prior to any work in the public right-of-way, the applicant shall submit plans for review and approval by the Bureau of Planning, the Bureau of Building, Engineering Services, Department of Transportation, and other City departments as required. Public improvements shall be designed and installed to the satisfaction of the City. ***Source Documents:*** 1, 72, 73, 74
NATURAL FEATURES		
Unique Natural Features, Water Resources	2	There are no unique natural features or water resources on the site. The site is predominately flat topographically with a concrete surface covering much of the lot and is not near any creeks, streams, water courses, seasonal wetlands or other water resources. There is no impact in this regard. ***Source Documents:*** 9, 10, 40
Vegetation, Wildlife	2	Neither the City of Oakland's LUTE or Open Space, Conservation, and Recreation Element (OSCAR) identify the site as hosting protected habitat, special status plant or animal species, or the four native plant communities of conservation value identified by the OSCAR. Additionally, no protected, candidate, or special status plant or animal species has its habitat in the type of landscape that exists at the project site. There are no habitat conservation plans or natural community conservation plans applicable to the site.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		There are four trees on the project site that would be removed and one near the site at the intersection of Shorey Street and Pine Street that would remain. Compliance with the City of Oakland Standard Conditions of Approval (SCAs) would ensure proper tree protections and replacement plantings are implemented to reduce impacts to a less-than-significant level. See Endangered Species section for full SCA language. *SCAs Required:* **BR1. Tree Removal During Bird Breeding Season.** To the extent feasible, removal of any tree and/or other vegetation suitable for nesting of birds shall not occur during the bird breeding season of February 1 to August 15 (or during December 15 to August 15 for trees located in or near marsh, wetland, or aquatic habitats). If tree removal must occur during the bird breeding season, all trees to be removed shall be surveyed by a qualified biologist to verify the presence or absence of nesting raptors or other birds. Pre-removal surveys shall be conducted within 15 days prior to the start of work and shall be submitted to the City for review and approval. If the survey indicates the potential presence of nesting raptors or other birds, the biologist shall determine an appropriately sized buffer around the nest in which no work will be allowed until the young have successfully fledged. The size of the nest buffer will be determined by the biologist in consultation with the California Department of Fish and Wildlife, and will be based to a large extent on the nesting species and its sensitivity to disturbance. In general, buffer sizes of 200 feet for raptors and 50 feet for other birds should suffice to prevent disturbance to birds nesting in the urban environment, but these buffers may be increased or decreased, as appropriate, depending on the bird species and the level of disturbance anticipated near the nest. **BR2. Tree Permit.** a. <u>Tree Permit Required</u> Pursuant to the City's Tree Protection Ordinance (OMC chapter 12.36), the project applicant shall obtain a tree permit and abide by the conditions of that permit. b. <u>Tree Protection During Construction</u> Adequate protection shall be provided during the construction period for any trees which are to remain standing, including the following, plus any recommendations of an arborist: i. Before the start of any clearing, excavation, construction, or other work on the site, every protected tree deemed to be potentially endangered by said site work shall be securely fenced off at a distance from the base of the tree to be determined by the project's consulting arborist. Such fences shall remain in place for duration of all such work. All trees to be removed shall be clearly marked. A scheme shall be established for the removal and disposal of logs, brush, earth and other debris which will avoid injury to any protected tree. ii. Where proposed development or other site work is to encroach upon the protected perimeter of any protected tree, special measures shall be incorporated to allow the roots to breathe and

Environmental Assessment Factor	Impact Code	Impact Evaluation
		obtain water and nutrients. Any excavation, cutting, filling, or compaction of the existing ground surface within the protected perimeter shall be minimized. No change in existing ground level shall occur within a distance to be determined by the project's consulting arborist from the base of any protected tree at any time. No burning or use of equipment with an open flame shall occur near or within the protected perimeter of any protected tree. iii. No storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees shall occur within the distance to be determined by the project's consulting arborist from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. No heavy construction equipment or construction materials shall be operated or stored within a distance from the base of any protected trees to be determined by the project's consulting arborist. Wires, ropes, or other devices shall not be attached to any protected tree, except as needed for support of the tree. No sign, other than a tag showing the botanical classification, shall be attached to any protected tree. iv. Periodically during construction, the leaves of protected trees shall be thoroughly sprayed with water to prevent buildup of dust and other pollution that would inhibit leaf transpiration. v. If any damage to a protected tree should occur during or as a result of work on the site, the project applicant shall immediately notify the Public Works Department and the project's consulting arborist shall make a recommendation to the City Tree Reviewer as to whether the damaged tree can be preserved. If, in the professional opinion of the Tree Reviewer, such tree cannot be preserved in a healthy state, the Tree Reviewer shall require replacement of any tree removed with another tree or trees on the same site deemed adequate by the Tree Reviewer to compensate for the loss of the tree that is removed. vi. All debris created as a result of any tree removal work shall be removed by the project applicant from the property within two weeks of debris creation, and such debris shall be properly disposed of by the project applicant in accordance with all applicable laws, ordinances, and regulations. c. <u>Tree Replacement Plantings</u> Replacement plantings shall be required for tree removals for the purposes of erosion control, groundwater replenishment, visual screening, wildlife habitat, and preventing excessive loss of shade, in accordance with the following criteria: i. No tree replacement shall be required for the removal of nonnative species, for the removal of trees which is required for the benefit of remaining trees, or where insufficient planting area exists for a mature tree of the species being considered. ii. Replacement tree species shall consist of Sequoia sempervirens (Coast Redwood), Quercus agrifolia (Coast Live Oak), Arbutus menziesii (Madrone), Aesculus californica (California Buckeye), Umbellularia californica (California Bay Laurel), or other tree species acceptable to the Tree Division. iii. Replacement trees shall be at least twenty-four (24) inch box size, unless a smaller size is recommended by the arborist, except that three fifteen (15) gallon size trees may be substituted for each twenty-four (24) inch box size tree where appropriate.

Environmental Assessment Factor	Impact Code	Impact Evaluation
		iv. Minimum planting areas must be available on-site as follows: • For Sequoia sempervirens, three hundred fifteen (315) square feet per tree; • For other species listed, seven hundred (700) square feet per tree. v. In the event that replacement trees are required but cannot be planted due to site constraints, an in lieu fee in accordance with the City's Master Fee Schedule may be substituted for required replacement plantings, with all such revenues applied toward tree planting in city parks, streets and medians. The project applicant shall install the plantings and maintain the plantings until established. The Tree Reviewer of the Tree Division of the Public Works Department may require a landscape plan showing the replacement plantings and the method of irrigation. Any replacement plantings which fail to become established within one year of planting shall be replanted at the project applicant's expense. ***Source Documents:*** 8, 10
Other Factors	2	The project will provide much needed affordable housing with a supportive service environment on-site for residents. The project will provide a safe, clean, and sanitary place for mixed-income residents, including permanent supportive housing for families experiencing homelessness. The project is beneficial to both residents and the community.

Additional Studies Performed

See Source Documentation List

Field Inspection (Date and completed by)

May 5, 2020, by Julia Karnowski

List of Sources, Agencies and Persons Consulted [40 CFR 1508.9(b)]

See Source Documentation List

List of Permits Obtained

The City of Oakland's Planning Commission has approved the project's planning application (December 19, 2018; PLN18-252 with further design changes approved August 28th, 2019) which includes design review approval, subdivision, and CEQA findings. No other permits have been obtained yet, as the moment the use of federal funds was contemplated, all project actions were halted to conduct this environmental review.

Public Outreach [24 CFR 50.23 & 58.43]

The project results in a Finding of No Significant Impact (FONSI) which will be published in the newspaper and circulated to public agencies, interested parties, and landowners/occupants of parcels located within the project's Area of Potential Effects (APE). Information about where the public may find the Environmental Review Record pertinent to the project will be included in the FONSI Notice.

The City of Oakland Planning Commission approved the project on December 19, 2018 at a public hearing where seven community members made public comments on the project. Six speakers openly supported the project and one speaker had a mixed opinion and concern regarding the project. The project was also presented to the Prescott Neighborhood Council. The Design Review Committee approved further design changes on August 28th, 2019.

The proposed project is part of the West Oakland Specific Plan, for which the Oakland Planning Department conducted five public workshops over 10 months in addition to multiple community meetings and public hearings to provide opportunities to gather feedback.

Presentations and regular updates will be provided to the community as the project progresses.

Cumulative Impact Analysis [24 CFR 58.32]

This project has been approved by the City of Oakland as to design, use, and variances as of December 2018 and thus has been considered as an “approved project” in subsequent cumulative impacts analysis of later projects. No negative cumulative impact is anticipated.

Alternatives [24 CFR 58.40(e); 40 CFR 1508.9]

A reduced-density alternative to the project site was considered but deemed infeasible. The project would be inconsistent with the planning application approvals already achieved and not meet the goal of providing as many supportive housing units as possible.

No Action Alternative [24 CFR 58.40(e)]

No change to the site would occur. The impacts discussed in the Environmental Assessment would not occur. The site would continue in its current state. Additional affordable housing units would not be created. The site may be sold for residential housing, commercial, light industrial, or other uses. The approvals achieved so far would not be utilized.

Summary of Findings and Conclusions

The project is suitable from an environmental standpoint. As long as the SCAs and mitigation measures are adhered to, there is no anticipated significant impact from the project. The project will provide a safe, sanitary, and affordable place for residents.

MITIGATION MEASURES AND CONDITIONS [40 CFR 1505.2(C)]

Summarize below all mitigation measures adopted by the Responsible Entity to reduce, avoid, or eliminate adverse environmental impacts and to avoid non-compliance or non-conformance with the above-listed authorities and factors. These measures/conditions must be incorporated into project contracts, development agreements, and other relevant documents. The staff responsible for implementing and monitoring mitigation measures should be clearly identified in the mitigation plan.

The Standard Conditions of Approval were initially and formally adopted by the Oakland City Council on November 3, 2008 (Ordinance No. 12899 C.M.S.), pursuant to Public Resources Code section 21083.3 and CEQA Guidelines section 15183 (and now section 15183.3), and incorporate development policies and standards from various adopted plans, policies, and ordinances (such as the Oakland Planning and Municipal Codes, Oakland Creek Protection, Stormwater Management and Discharge Control Ordinance, Oakland Tree Protection Ordinance, Oakland Grading Regulations, National Pollutant Discharge Elimination System (NPDES) requirements, Housing Element and other General Plan Element-related mitigation measures, California Building Code, Uniform Fire Code, Energy and Climate Action Plan, Complete Streets Policy, and Green Building Ordinance, among others), which have been found to substantially mitigate environmental effects.

Where there are peculiar circumstances associated with a project or project site that will result in significant environmental impacts despite implementation of the Standard Conditions of Approval, mitigation measures have been identified to reduce the impact to less than significant levels. A Standard Conditions of Approval/Mitigation Monitoring and Reporting Program is attached as a separate document.

** A Standard Condition of Approval /Mitigation Monitoring and Reporting Program is attached as a separate document.

Law, Authority, or Factor	Mitigation Measure
Clean Air	**AQ1. Dust Controls – Construction Related.** The project applicant shall implement all of the following applicable dust control measures during construction of the project: a. Water all exposed surfaces of active construction areas at least twice daily. Watering should be sufficient to prevent airborne dust from leaving the site. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water should be used whenever feasible. b. Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard (i.e., the minimum required space between the top of the load and the top of the trailer). c. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. d. Limit vehicle speeds on unpaved roads to 15 miles per hour. e. All demolition activities (if any) shall be suspended when average wind speeds exceed 20 mph. f. All trucks and equipment, including tires, shall be washed off prior to leaving the site. g. Site accesses to a distance of 100 feet from the paved road shall be treated

Law, Authority, or Factor	Mitigation Measure
	with a 6 to 12 inch compacted layer of wood chips, mulch, or gravel. **AQ2. Criteria Air Pollutant Controls – Construction Related.** The project applicant shall implement all of the following applicable basic control measures for criteria air pollutants during construction of the project as applicable: a. Idling times on all diesel-fueled commercial vehicles over 10,000 lbs. shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes (as required by the California airborne toxics control measure Title 13, Section 2485, of the California Code of Regulations). Clear signage to this effect shall be provided for construction workers at all access points. b. Idling times on all diesel-fueled off-road vehicles over 25 horsepower shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes and fleet operators must develop a written policy as required by Title 23, Section 2449, of the California Code of Regulations ("California Air Resources Board Off-Road Diesel Regulations"). c. All construction equipment shall be maintained and properly tuned in accordance with the manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. Equipment check documentation should be kept at the construction site and be available for review by the City and the Bay Area Air Quality District as needed. d. Portable equipment shall be powered by grid electricity if available. If electricity is not available, propane or natural gas generators shall be used if feasible. Diesel engines shall only be used if grid electricity is not available and propane or natural gas generators cannot meet the electrical demand. e. Low VOC (i.e., ROG) coatings shall be used that comply with BAAQMD Regulation 8, Rule 3: Architectural Coatings. f. All equipment to be used on the construction site shall comply with the requirements of Title 13, Section 2449, of the California Code of Regulations ("California Air Resources Board Off-Road Diesel Regulations") and upon request by the City (and the Air District if specifically requested), the project applicant shall provide written documentation that fleet requirements have been met. **AQ3. Diesel Particulate Matter Controls – Construction Related** The project applicant shall implement appropriate measures during construction to reduce potential health risks to sensitive receptors due to exposure to diesel particulate matter (DPM) from construction emissions. The project applicant shall choose one of the following methods: i. The project applicant shall retain a qualified air quality consultant to prepare a Health Risk Assessment (HRA) in accordance with current guidance from the California Air Resources Board (CARB) and Office of Environmental Health and Hazard Assessment to determine the health risk to sensitive receptors exposed to DPM from project construction emissions. The HRA shall be submitted to the City (and the Air District if specifically requested) for review and approval. If the HRA concludes that the health risk is at or below acceptable levels, then DPM reduction measures are not required. If the HRA concludes that the health risk exceeds acceptable levels, DPM reduction measures shall be identified to reduce the health risk to acceptable levels as set forth under subsection b below. Identified DPM reduction measures shall be submitted to the City for review and approval prior to the issuance of building permits and the approved DPM reduction measures shall be implemented during construction. -or- ii. All off-road diesel equipment shall be equipped with the most effective Verified Diesel Emission Control Strategies (VDECS) available for the engine type (Tier 4

Law, Authority, or Factor	Mitigation Measure
	engines automatically meet this requirement) as certified by CARB. The equipment shall be properly maintained and tuned in accordance with manufacturer specifications. This shall be verified through an equipment inventory submittal and Certification Statement that the Contractor agrees to compliance and acknowledges that a significant violation of this requirement shall constitute a material breach of contract. **AQ4. Exposure to Air Pollution (Toxic Air Contaminants)** a. <u>Health Risk Reduction Measures</u> The project applicant shall incorporate appropriate measures into the project design in order to reduce the potential health risk due to exposure to toxic air contaminants. The project applicant shall choose one of the following methods: i. The project applicant shall retain a qualified air quality consultant to prepare a Health Risk Assessment (HRA) in accordance with California Air Resources Board (CARB) and Office of Environmental Health and Hazard Assessment requirements to determine the health risk of exposure of project residents/occupants/users to air pollutants. The HRA shall be submitted to the City for review and approval. If the HRA concludes that the health risk is at or below acceptable levels, then health risk reduction measures are not required. If the HRA concludes that the health risk exceeds acceptable levels, health risk reduction measures shall be identified to reduce the health risk to acceptable levels. Identified risk reduction measures shall be submitted to the City for review and approval and be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the City. The approved risk reduction measures shall be implemented during construction and/or operations as applicable. - or - ii. The project applicant shall incorporate the following health risk reduction measures into the project. These features shall be submitted to the City for review and approval and be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the City: • Installation of air filtration to reduce cancer risks and Particulate Matter (PM) exposure for residents and other sensitive populations in the project that are in close proximity to sources of air pollution. Air filter devices shall be rated MERV-13 [insert MERV-16 for projects located in the West Oakland Specific Plan area] or higher. As part of implementing this measure, an ongoing maintenance plan for the building's HVAC air filtration system shall be required. • Where appropriate, install passive electrostatic filtering systems, especially those with low air velocities (i.e., 1 mph). • Phasing of residential developments when proposed within 500 feet of freeways such that homes nearest the freeway are built last, if feasible. • The project shall be designed to locate sensitive receptors as far away as feasible from the source(s) of air pollution. Operable windows, balconies, and building air intakes shall be located as far away from these sources as feasible. If near a distribution center, residents shall be located as far away as feasible from a loading dock or where trucks concentrate to deliver goods. • Sensitive receptors shall be located on the upper floors of buildings, if feasible. • Planting trees and/or vegetation between sensitive receptors and pollution source, if feasible. Trees that are best suited to trapping PM shall be planted, including one or more of the following: Pine (Pinus nigra var. maritima), Cypress (X Cupressocyparis leylandii), Hybrid poplar (Populus deltoids X trichocarpa), and Redwood (Sequoia sempervirens). • Sensitive receptors shall be located as far away from truck activity areas, such as loading docks and delivery areas, as feasible. • Existing and new diesel generators shall meet CARB's Tier 4 emission

Law, Authority, or Factor	Mitigation Measure
	standards, if feasible. • Emissions from diesel trucks shall be reduced through implementing the following measures, if feasible: o Installing electrical hook-ups for diesel trucks at loading docks. o Requiring trucks to use Transportation Refrigeration Units (TRU) that meet Tier 4 emission standards. o Requiring truck-intensive projects to use advanced exhaust technology (e.g., hybrid) or alternative fuels. o Prohibiting trucks from idling for more than two minutes. o Establishing truck routes to avoid sensitive receptors in the project. A truck route program, along with truck calming, parking, and delivery restrictions, shall be implemented. b. <u>Maintenance of Health Risk Reduction Measures</u> The project applicant shall maintain, repair, and/or replace installed health risk reduction measures, including but not limited to the HVAC system (if applicable), on an ongoing and as-needed basis. Prior to occupancy, the project applicant shall prepare and then distribute to the building manager/operator an operation and maintenance manual for the HVAC system and filter including the maintenance and replacement schedule for the filter.
Contamination and Toxic Substances	**CT1. Compliance with Corrective Action Implementation Plan (CAIP).** Ensure all measures identified in the final CAIP approved by Alameda County Department of Environmental Health for the project site are implemented during project construction. **CT2. Asbestos in Structures.** The project applicant shall comply with all applicable laws and regulations regarding demolition and renovation of Asbestos Containing Materials (ACM), including but not limited to California Code of Regulations, Title 8; California Business and Professions Code, Division 3; California Health and Safety Code sections 25915-25919.7; and Bay Area Air Quality Management District, Regulation 11, Rule 2, as may be amended. Evidence of compliance shall be submitted to the City upon request. **CT3. Hazardous Materials Related to Construction.** The project applicant shall ensure that Best Management Practices (BMPs) are implemented by the contractor during construction to minimize potential negative effects on groundwater, soils, and human health. These shall include, at a minimum, the following: a. Follow manufacture's recommendations for use, storage, and disposal of chemical products used in construction; b. Avoid overtopping construction equipment fuel gas tanks; c. During routine maintenance of construction equipment, properly contain and remove grease and oils; d. Properly dispose of discarded containers of fuels and other chemicals; e. Implement lead-safe work practices and comply with all local, regional, state, and federal requirements concerning lead (for more information refer to the Alameda County Lead Poisoning Prevention Program); and f. If soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any underground storage tanks, abandoned drums or other hazardous materials or wastes are encountered), the project applicant shall cease work in the vicinity of the suspect material, the area shall be secured as necessary, and the applicant shall take all appropriate measures to protect human health and the environment. Appropriate measures shall include notifying the City and applicable regulatory agency(ies) and

Law, Authority, or Factor	Mitigation Measure
	implementation of the actions described in the City's Standard Conditions of Approval, as necessary, to identify the nature and extent of contamination. Work shall not resume in the area(s) affected until the measures have been implemented under the oversight of the City or regulatory agency, as appropriate. **CT4. Hazardous Building Materials and Site Contamination.** a. <u>Hazardous Building Materials Assessment</u> The project applicant shall submit a comprehensive assessment report to the Bureau of Building, signed by a qualified environmental professional, documenting the presence or lack thereof of asbestos-containing materials (ACMs), lead-based paint, polychlorinated biphenyls (PCBs), and any other building materials or stored materials classified as hazardous materials by State or federal law. If lead-based paint, ACMs, PCBs, or any other building materials or stored materials classified as hazardous materials are present, the project applicant shall submit specifications prepared and signed by a qualified environmental professional, for the stabilization and/or removal of the identified hazardous materials in accordance with all applicable laws and regulations. The project applicant shall implement the approved recommendations and submit to the City evidence of approval for any proposed remedial action and required clearances by the applicable local, state, or federal regulatory agency. b. <u>Environmental Site Assessment Required</u> The project applicant shall submit a Phase I Environmental Site Assessment report, and Phase II Environmental Site Assessment report if warranted by the Phase I report, for the project site for review and approval by the City. The report(s) shall be prepared by a qualified environmental assessment professional and include recommendations for remedial action, as appropriate, for hazardous materials. The project applicant shall implement the approved recommendations and submit to the City evidence of approval for any proposed remedial action and required clearances by the applicable local, state, or federal regulatory agency. c. <u>Health and Safety Plan Required</u> The project applicant shall submit a Health and Safety Plan for the review and approval by the City in order to protect project construction workers from risks associated with hazardous materials. The project applicant shall implement the approved Plan. d. <u>Best Management Practices (BMPs) Required for Contaminated Sites</u> The project applicant shall ensure that Best Management Practices (BMPs) are implemented by the contractor during construction to minimize potential soil and groundwater hazards. These shall include the following: i. Soil generated by construction activities shall be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Specific sampling and handling and transport procedures for reuse or disposal shall be in accordance with applicable local, state, and federal requirements. ii. Groundwater pumped from the subsurface shall be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Engineering controls shall be utilized, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building. **CT5. Regulatory Permits and Authorizations from Other Agencies** The project applicant shall obtain all necessary regulatory permits and authorizations from applicable resource /regulatory agencies including, but not limited to, the

Law, Authority, or Factor	Mitigation Measure
	Regional Water Quality Control Board, Bay Area Air Quality Management District, Bay Conservation and Development Commission, California Department of Fish and Wildlife, U. S. Fish and Wildlife Service, and Army Corps of Engineers and shall comply with all requirements and conditions of the permits/authorizations. The project applicant shall submit evidence of the approved permits/authorizations to the City, along with evidence demonstrating compliance with any regulatory permit/authorization conditions of approval.
Historic Preservation	**CR1: Archaeological and Paleontological Resources – Discovery During Construction** Pursuant to CEQA Guidelines section 15064.5(f), in the event that any historic or prehistoric subsurface cultural resources are discovered during ground disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented. In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense. In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant. **CR2. Archaeologically Sensitive Areas – Pre-Construction Measures** The project applicant shall implement either Provision A (Intensive Pre-Construction Study) or Provision B (Construction ALERT Sheet) concerning archaeological resources. **Provision A: Intensive Pre-Construction Study** The project applicant shall retain a qualified archaeologist to conduct a site-specific, intensive archaeological resources study for review and approval by the City prior to soil-disturbing activities occurring on the project site. The purpose of the site-specific,

Law, Authority, or Factor	Mitigation Measure
	intensive archaeological resources study is to identify early the potential presence of history-period archaeological resources on the project site. At a minimum, the study shall include: a. Subsurface presence/absence studies of the project site. Field studies may include, but are not limited to, auguring and other common methods used to identify the presence of archaeological resources. b. A report disseminating the results of this research. c. Recommendations for any additional measures that could be necessary to mitigate any adverse impacts to recorded and/or inadvertently discovered cultural resources. If the results of the study indicate a high potential presence of historic-period archaeological resources on the project site, or a potential resource is discovered, the project applicant shall hire a qualified archaeologist to monitor any ground disturbing activities on the project site during construction and prepare an ALERT sheet pursuant to Provision B below that details what could potentially be found at the project site. Archaeological monitoring would include briefing construction personnel about the type of artifacts that may be present (as referenced in the ALERT sheet, required per Provision B below) and the procedures to follow if any artifacts are encountered, field recording and sampling in accordance with the Secretary of Interior's Standards and Guidelines for Archaeological Documentation, notifying the appropriate officials if human remains or cultural resources are discovered, and preparing a report to document negative findings after construction is completed if no archaeological resources are discovered during construction. **Provision B: Construction ALERT Sheet** The project applicant shall prepare a construction "ALERT" sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil-disturbing activities within the project site. The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire-cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones. Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible location at the project site. **CR3. Human Remains – Discovery During Construction** Pursuant to CEQA Guidelines section 15064.5(e)(1), in the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda

Law, Authority, or Factor	Mitigation Measure
	County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant.
Noise Abatement and Control	**N1. Operational Noise** Noise levels from the project site after completion of the project (i.e., during project operation) shall comply with the performance standards of chapter 17.120 of the Oakland Planning Code and chapter 8.18 of the Oakland Municipal Code. If noise levels exceed these standards, the activity causing the noise shall be abated until appropriate noise reduction measures have been installed and compliance verified by the City. **N2. Construction Days/Hours** The project applicant shall comply with the following restrictions concerning construction days and hours: a. Construction activities are limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday, except that pier drilling and/or other extreme noise generating activities greater than 90 dBA shall be limited to between 8:00 a.m. and 4:00 p.m. b. Construction activities are limited to between 9:00 a.m. and 5:00 p.m. on Saturday. In residential zones and within 300 feet of a residential zone, construction activities are allowed from 9:00 a.m. to 5:00 p.m. only within the interior of the building with the doors and windows closed. No pier drilling or other extreme noise generating activities greater than 90 dBA are allowed on Saturday. c. No construction is allowed on Sunday or federal holidays. Construction activities include, but are not limited to, truck idling, moving equipment (including trucks, elevators, etc.) or materials, deliveries, and construction meetings held on-site in a non-enclosed area. Any construction activity proposed outside of the above days and hours for special activities (such as concrete pouring which may require more continuous amounts of time) shall be evaluated on a case-by-case basis by the City, with criteria including the urgency/emergency nature of the work, the proximity of residential or other sensitive uses, and a consideration of nearby residents'/occupants' preferences. The project applicant shall notify property owners and occupants located within 300 feet at least 14 calendar days prior to construction activity proposed outside of the above days/hours. When submitting a request to the City to allow construction activity outside of the above days/hours, the project applicant shall submit information concerning the type and duration of proposed construction activity and the draft public notice for City review and approval prior to distribution of the public notice. **N3. Construction Noise** The project applicant shall implement noise reduction measures to reduce noise impacts due to construction. Noise reduction measures include, but are not limited to, the following: a. Equipment and trucks used for project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or

Law, Authority, or Factor	Mitigation Measure
	shrouds) wherever feasible. b. Except as provided herein, impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used, if such jackets are commercially available, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures. c. Applicant shall use temporary power poles instead of generators where feasible. d. Stationary noise sources shall be located as far from adjacent properties as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the City to provide equivalent noise reduction. e. The noisiest phases of construction shall be limited to less than 10 days at a time. Exceptions may be allowed if the City determines an extension is necessary and all available noise reduction controls are implemented. **N4. Construction Noise Complaints** The project applicant shall submit to the City for review and approval a set of procedures for responding to and tracking complaints received pertaining to construction noise, and shall implement the procedures during construction. At a minimum, the procedures shall include: a. Designation of an on-site construction complaint and enforcement manager for the project; b. A large on-site sign near the public right-of-way containing permitted construction days/hours, complaint procedures, and phone numbers for the project complaint manager and City Code Enforcement unit; c. Protocols for receiving, responding to, and tracking received complaints; and d. Maintenance of a complaint log that records received complaints and how complaints were addressed, which shall be submitted to the City for review upon the City's request. **N5. Extreme Construction Noise** a. <u>Construction Noise Management Plan Required</u> Prior to any extreme noise generating construction activities (e.g., pier drilling, pile driving and other activities generating greater than 90dBA), the project applicant shall submit a Construction Noise Management Plan prepared by a qualified acoustical consultant for City review and approval that contains a set of site-specific noise attenuation measures to further reduce construction impacts associated with extreme noise generating activities. The project applicant shall implement the approved Plan during construction. Potential attenuation measures include, but are not limited to, the following: i. Erect temporary plywood noise barriers around the construction site, particularly along on sites adjacent to residential buildings; ii. Implement "quiet" pile driving technology (such as pre-drilling of piles, the use of more than one pile driver to shorten the total pile driving duration), where feasible, in consideration of geotechnical and structural requirements and conditions; iii. Utilize noise control blankets on the building structure as the building is erected to reduce noise emission from the site; iv. Evaluate the feasibility of noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings by the use of sound blankets

Law, Authority, or Factor	Mitigation Measure
	for example and implement such measure if such measures are feasible and would noticeably reduce noise impacts; and v. Monitor the effectiveness of noise attenuation measures by taking noise measurements. b. <u>Public Notification Required</u> The project applicant shall notify property owners and occupants located within 300 feet of the construction activities at least 14 calendar days prior to commencing extreme noise generating activities. Prior to providing the notice, the project applicant shall submit to the City for review and approval the proposed type and duration of extreme noise generating activities and the proposed public notice. The public notice shall provide the estimated start and end dates of the extreme noise generating activities and describe noise attenuation measures to be implemented.
Soil Suitability/ Slope/ Erosion/ Drainage/ Storm Water Runoff	**SW1. Erosion and Sedimentation Control Measures for Construction** The project applicant shall implement Best Management Practices (BMPs) to reduce erosion, sedimentation, and water quality impacts during construction to the maximum extent practicable. At a minimum, the project applicant shall provide filter materials deemed acceptable to the City at nearby catch basins to prevent any debris and dirt from flowing into the City's storm drain system and creeks. **SW2. NPDES c.3 Stormwater Requirements for Regulated Projects** a. <u>Post-Construction Stormwater Management Plan Required</u> The project applicant shall comply with the requirements of Provision C.3 of the Municipal Regional Stormwater Permit issued under the National Pollutant Discharge Elimination System (NPDES). The project applicant shall submit a Post-Construction Stormwater Management Plan to the City for review and approval with the project drawings submitted for site improvements, and shall implement the approved Plan during construction. The Post-Construction Stormwater Management Plan shall include and identify the following: i. Location and size of new and replaced impervious surface; ii. Directional surface flow of stormwater runoff; iii. Location of proposed on-site storm drain lines; iv. Site design measures to reduce the amount of impervious surface area; v. Source control measures to limit stormwater pollution; vi. Stormwater treatment measures to remove pollutants from stormwater runoff, including the method used to hydraulically size the treatment measures; and vii. Hydromodification management measures, if required by Provision C.3, so that post-project stormwater runoff flow and duration match pre-project runoff. b. <u>Maintenance Agreement Required</u> The project applicant shall enter into a maintenance agreement with the City, based on the Standard City of Oakland Stormwater Treatment Measures Maintenance Agreement, in accordance with Provision C.3, which provides, in part, for the following: i. The project applicant accepting responsibility for the adequate installation/construction, operation, maintenance, inspection, and reporting of any on-site stormwater treatment measures being incorporated into the project until the responsibility is legally transferred to another entity; and Legal access to the on-site stormwater treatment measures for representatives of the City, the local vector control district, and staff of the Regional Water Quality Control Board, San Francisco Region, for the purpose of verifying the implementation, operation, and maintenance of the on-site stormwater treatment measures and to take corrective action if necessary.
Hazards and Nuisances including Site Safety and	**G1. Adherence to Geotechnical Recommendations.** Follow all recommendations laid forth in the Geotechnical Investigation prepared for

Law, Authority, or Factor	Mitigation Measure
Noise	the PUD, including this project, by Rockridge Geotechnical and dated December 29, 2017 (see Appendix H) including site preparation an grading subgrade preparation, fill material and compaction criteria, utility trench backfill, drainage and landscaping, foundation design, deepened footings, rapid impact compaction, floor slabs, site retaining walls, pavement design and seismic design. **G2. Construction-Related Permit** The project applicant shall obtain all required construction-related permits/approvals from the City. The project shall comply with all standards, requirements and conditions contained in construction-related codes, including but not limited to the Oakland Building Code and the Oakland Grading Regulations, to ensure structural integrity and safe construction. **G3.Soils Report** The project applicant shall submit a soils report prepared by a registered geotechnical engineer for City review and approval. The soils report shall contain, at a minimum, field test results and observations regarding the nature, distribution and strength of existing soils, and recommendations for appropriate grading practices and project design. The project applicant shall implement the recommendations contained in the approved report during project design and construction. **G4. Seismic Hazards Zone (Landslide/Liquefaction)** The project applicant shall submit a site-specific geotechnical report, consistent with California Geological Survey Special Publication 117 (as amended), prepared by a registered geotechnical engineer for City review and approval containing at a minimum a description of the geological and geotechnical conditions at the site, an evaluation of site-specific seismic hazards based on geological and geotechnical conditions, and recommended measures to reduce potential impacts related to liquefaction and/or slope stability hazards. The project applicant shall implement the recommendations contained in the approved report during project design and construction. **N6**. **Comply with Noise Reduction Recommendations**. The project shall implement STC 53 walls and STC 40 windows on at least the the north facade and the south facade closest to Shorey Street and the west façade. as set forth in the Noise Study prepared by Charles Salter Associates, June 16, 2022 and the Noise Waiver (see Appendix I) based on the following assumptions: • Bedrooms will have carpet. • All other rooms will have hard-surface flooring. • Ceilings are 9 feet high. • Window sizes and locations are as shown on the drawings dated 15 November 2019. • The typical exterior wall assembly (e.g. Type WE1) achieves minimum STC 45. • The recommended STC ratings are for full window assemblies (glass and frame) rather than just the glass itself. Tested sound-rated assemblies should be used. If the assumptions change, the applicant shall retain a noise consultant to prepare a revised STraCAT analysis to ensure suitable STC wall and window assemblies. **N7. Ventilation, and Operations and Maintenance Plan.** The Project shall provide mechanically ventilated residential units that are not dependent on opening doors or windows, and shall develop and implement an Operations and Maintenance Plan that provides for periodic inspection of seals, and repair or replacement of building components at private decks or balconies when their noise attenuation performance diminishes.

Law, Authority, or Factor	Mitigation Measure
	N8. Exposure to Community Noise The project applicant shall submit a Noise Reduction Plan prepared by a qualified acoustical engineer for City review and approval that contains noise reduction measures (e.g., sound-rated window, wall, and door assemblies) to achieve an acceptable interior noise level in accordance with the land use compatibility guidelines of the Noise Element of the Oakland General Plan. The applicant shall implement the approved Plan during construction. To the maximum extent practicable, interior noise levels shall not exceed the following: a. 45 dBA: Residential activities, civic activities, hotels b. 50 dBA: Administrative offices; group assembly activities c. 55 dBA: Commercial activities d. 65 dBA: Industrial activities
Energy Consumption	**EC1. Green Building Requirements** e. <u>Compliance with Green Building Requirements During Plan-Check</u> The project applicant shall comply with the requirements of the California Green Building Standards (CALGreen) mandatory measures and the applicable requirements of the Green Building Ordinance (Chapter 18.02 of the Oakland Municipal Code). The following information shall be submitted to the City for review and approval with the application for a building permit: • Documentation showing compliance with Title 24 of the current version of the California Building Energy Efficiency Standards. • Completed copy of the final green building checklist approved during the review of the Planning and Zoning permit. • Copy of the Unreasonable Hardship Exemption, if granted, during the review of the Planning and Zoning permit. • Permit plans that show, in general notes, detailed design drawings, and specifications as necessary, compliance with the items listed in subsection (ii) below. • Copy of the signed statement by the Green Building Certifier approved during the review of the Planning and Zoning permit that the project complied with the requirements of the Green Building Ordinance. • Signed statement by the Green Building Certifier that the project still complies with the requirements of the Green Building Ordinance, unless an Unreasonable Hardship Exemption was granted during the review of the Planning and Zoning permit. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. The set of plans in subsection (a) shall demonstrate compliance with the following: • CALGreen mandatory measures. • Green building point level/certification requirement per the appropriate checklist approved during the Planning entitlement process. • All green building points identified on the checklist approved during review of the Planning and Zoning permit, unless a Request for Revision Plan-check application is submitted and approved by the Bureau of Planning that shows the previously approved points that will be eliminated or substituted. • The required green building point minimums in the appropriate credit categories. f. <u>Compliance with Green Building Requirements During Construction</u> The project applicant shall comply with the applicable requirements of CALGreen and the Oakland Green Building Ordinance during construction of the project.

Law, Authority, or Factor	Mitigation Measure
	The following information shall be submitted to the City for review and approval: • Planning and Zoning permit and during the review of the building permit. • Signed statement(s) by the Green Building Certifier during all relevant phases of construction that the project complies with the requirements of the Green Building Ordinance. • Other documentation as deemed necessary by the City to demonstrate compliance with the Green Building Ordinance. g. Compliance with Green Building Requirements After Construction Prior to the finaling the Building Permit, the Green Building Certifier shall submit the appropriate documentation to City staff and attain the minimum required point level. **EC2. Plug-In Electric Vehicle (PEV) Charging Infrastructure** h. PEV-Ready Parking Spaces The applicant shall submit, for review and approval of the Building Official and the Zoning Manager, plans that show the location of parking spaces equipped with full electrical circuits designated for future PEV charging (i.e. "PEV-Ready) per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-Ready parking spaces. i. PEV-Capable Parking Spaces The applicant shall submit, for review and approval of the Building Official, plans that show the location of inaccessible conduit to supply PEV-capable parking spaces per the requirements of Chapter 15.04 of the Oakland Municipal Code. Building electrical plans shall indicate sufficient electrical capacity to supply the required PEV-capable parking spaces. j. ADA-Accessible Spaces The applicant shall submit, for review and approval of the Building Official, plans that show the location of future accessible EV parking spaces as required under Title 24 Chapter 11B Table 11B-228.3.2.1, and specify plans to construct all future accessible EV parking spaces with appropriate grade, vertical clearance, and accessible path of travel to allow installation of accessible EV charging station(s).
Solid Waste Disposal / Recycling	**Waste1. Construction and Demolition Waste Reduction and Recycling** The project applicant shall comply with the City of Oakland Construction and Demolition Waste Reduction and Recycling Ordinance (chapter 15.34 of the Oakland Municipal Code) by submitting a Construction and Demolition Waste Reduction and Recycling Plan (WRRP) for City review and approval, and shall implement the approved WRRP. Projects subject to these requirements include all new construction, renovations/ alterations/modifications with construction values of $50,000 or more (except R-3 type construction), and all demolition (including soft demolition) except demolition of type R-3 construction. The WRRP must specify the methods by which the project will divert construction and demolition debris waste from landfill disposal in accordance with current City requirements. The WRRP may be submitted electronically at www.greenhalosystems.com or manually at the City's Green Building Resource Center. Current standards, FAQs, and forms are available on the City's website and in the Green Building Resource Center. **Waste2. Recycling Collection and Storage Space** The project applicant shall comply with the City of Oakland Recycling Space Allocation Ordinance (chapter 17.118 of the Oakland Planning Code). The project drawings submitted for construction-related permits shall contain recycling collection and storage areas in compliance with the Ordinance. For residential projects, at least two (2) cubic feet of storage and collection space per residential unit is required, with a

Law, Authority, or Factor	Mitigation Measure
	minimum of ten (10) cubic feet. For nonresidential projects, at least two (2) cubic feet of storage and collection space per 1,000 square feet of building floor area is required, with a minimum of ten (10) cubic feet.
Waste Water/Sanitary Sewers	**WW1. Sanitary Sewer System** The project applicant shall prepare and submit a Sanitary Sewer Impact Analysis to the City for review and approval in accordance with the City of Oakland Sanitary Sewer Design Guidelines. The Impact Analysis shall include an estimate of pre-project and post-project wastewater flow from the project site. In the event that the Impact Analysis indicates that the net increase in project wastewater flow exceeds City-projected increases in wastewater flow in the sanitary sewer system, the project applicant shall pay the Sanitary Sewer Impact Fee in accordance with the City's Master Fee Schedule for funding improvements to the sanitary sewer system.
Water Supply	**WS1. Recycled Water** Pursuant to section 16.08.030 of the Oakland Municipal Code, the project applicant shall provide for the use of recycled water in the project for feasible recycled water uses unless the City determines that there is a higher and better use for the recycled water, the use of recycled water is not economically justified for the project, or the use of recycled water is not financially or technically feasible for the project. Feasible recycled water uses may include, but are not limited to, landscape irrigation, commercial and industrial process use, and toilet and urinal flushing in non-residential buildings. The project applicant shall contact the New Business Office of the East Bay Municipal Utility District (EBMUD) for a recycled water feasibility assessment by the Office of Water Recycling. If recycled water is to be provided in the project, the project drawings submitted for construction-related permits shall include the proposed recycled water system and the project applicant shall install the recycled water system during construction. **WS2. Water Efficient Landscape Ordinance (WELO)** The project applicant shall comply with California's Water Efficient Landscape Ordinance (WELO) in order to reduce landscape water usage. For the specific ordinance requirements, see the link below: http://www.water.ca.gov/wateruseefficiency/ landscapeordinance/docs/Title%2023%20extract%20- %20Official%20CCR%20pages.pdf For any landscape project with an aggregate (total noncontiguous) landscape area equal to 2,500 sq. ft. or less, the project applicant may implement either the Prescriptive Measures or the Performance Measures, of, and in accordance with the California's Model Water Efficient Landscape Ordinance. For any landscape project with an aggregate (total noncontiguous) landscape area over 2,500 sq. ft., the project applicant shall implement the Performance Measures in accordance with the WELO. Prescriptive Measures: Prior to construction, the project applicant shall submit the Project Information (detailed below) and documentation showing compliance with Appendix D of California's Model Water Efficient Landscape Ordinance (see page 38.14(g) in the link above): Performance Measures: Prior to construction, the project applicant shall prepare and submit a Landscape Documentation Package for review and approval, which includes the following: a. Project Information • Date • Applicant and property owner name • Project address • Total landscape area

Law, Authority, or Factor	Mitigation Measure
	• Project type (new, rehabilitated, cemetery, or home owner installed) • Water supply type and water purveyor • Checklist of documents in the package • Project contacts • Applicant signature and date with the statement: "I agree to comply with the requirements of the water efficient landscape ordinance and submit a complete Landscape Documentation Package." b. Water Efficient Landscape Worksheet: • Hydrozone Information Table • Water Budget Calculations with Maximum Applied Water Allowance (MAWA) and Estimated Total Water Use c. Soil Management Report d. Landscape Design Plan e. Irrigation Design Plan f. Grading Plan Upon installation of the landscaping and irrigation systems, and prior to the final of a construction-related permit, the Project applicant shall submit a Certificate of Completion (see page 38.6 in the link above) and landscape and irrigation maintenance schedule for review and approval by the City. The Certificate of Completion shall also be submitted to the local water purveyor and property owner or his or her designee.
Transportation and Accessibility	**TA1. Bicycle Parking** The project applicant shall comply with the City of Oakland Bicycle Parking Requirements (chapter 17.118 of the Oakland Planning Code). The project drawings submitted for construction-related permits shall demonstrate compliance with the requirements. **TA2. Public Improvements** The project applicant shall obtain all necessary permits/approvals, such as encroachment permits, obstruction permits, curb/gutter/sidewalk permits, and public improvement ("p-job") permits from the City for work in the public right-of-way, including but not limited to, streets, curbs, gutters, sidewalks, utilities, and fire hydrants. Prior to any work in the public right-of-way, the applicant shall submit plans for review and approval by the Bureau of Planning, the Bureau of Building, Engineering Services, Department of Transportation, and other City departments as required. Public improvements shall be designed and installed to the satisfaction of the City.
Vegetation, Wildlife	**BR1. Tree Removal During Bird Breeding Season.** To the extent feasible, removal of any tree and/or other vegetation suitable for nesting of birds shall not occur during the bird breeding season of February 1 to August 15 (or during December 15 to August 15 for trees located in or near marsh, wetland, or aquatic habitats). If tree removal must occur during the bird breeding season, all trees to be removed shall be surveyed by a qualified biologist to verify the presence or absence of nesting raptors or other birds. Pre-removal surveys shall be conducted within 15 days prior to the start of work and shall be submitted to the City for review and approval. If the survey indicates the potential presence of nesting raptors or other birds, the biologist shall determine an appropriately sized buffer around the nest in which no work will be allowed until the young have successfully fledged. The size of the nest buffer will be determined by the biologist in consultation with the California Department of Fish and Wildlife, and will be based to a large extent on the nesting species and its sensitivity to disturbance. In general, buffer sizes of 200 feet for raptors and 50 feet for other birds should suffice to prevent disturbance to

Law, Authority, or Factor	Mitigation Measure
	birds nesting in the urban environment, but these buffers may be increased or decreased, as appropriate, depending on the bird species and the level of disturbance anticipated near the nest. **BR2. Tree Permit.** a. <u>Tree Permit Required</u> Pursuant to the City's Tree Protection Ordinance (OMC chapter 12.36), the project applicant shall obtain a tree permit and abide by the conditions of that permit. b. <u>Tree Protection During Construction</u> Adequate protection shall be provided during the construction period for any trees which are to remain standing, including the following, plus any recommendations of an arborist: i. Before the start of any clearing, excavation, construction, or other work on the site, every protected tree deemed to be potentially endangered by said site work shall be securely fenced off at a distance from the base of the tree to be determined by the project's consulting arborist. Such fences shall remain in place for duration of all such work. All trees to be removed shall be clearly marked. A scheme shall be established for the removal and disposal of logs, brush, earth and other debris which will avoid injury to any protected tree. ii. Where proposed development or other site work is to encroach upon the protected perimeter of any protected tree, special measures shall be incorporated to allow the roots to breathe and obtain water and nutrients. Any excavation, cutting, filling, or compaction of the existing ground surface within the protected perimeter shall be minimized. No change in existing ground level shall occur within a distance to be determined by the project's consulting arborist from the base of any protected tree at any time. No burning or use of equipment with an open flame shall occur near or within the protected perimeter of any protected tree. iii. No storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees shall occur within the distance to be determined by the project's consulting arborist from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. No heavy construction equipment or construction materials shall be operated or stored within a distance from the base of any protected trees to be determined by the project's consulting arborist. Wires, ropes, or other devices shall not be attached to any protected tree, except as needed for support of the tree. No sign, other than a tag showing the botanical classification, shall be attached to any protected tree. iv. Periodically during construction, the leaves of protected trees shall be thoroughly sprayed with water to prevent buildup of dust and other pollution that would inhibit leaf transpiration. v. If any damage to a protected tree should occur during or as a result of work on the site, the project applicant shall immediately notify the Public Works Department and the project's consulting arborist shall make a recommendation to the City Tree Reviewer as to whether the damaged tree can be preserved. If, in the professional opinion of the Tree Reviewer, such tree cannot be preserved in a healthy state, the Tree Reviewer shall require replacement of any tree removed with another tree or trees on the same site deemed adequate by the Tree Reviewer to compensate for the loss of the tree that is removed. vi. All debris created as a result of any tree removal work shall be removed by the project applicant from the property within two weeks of debris creation, and such debris shall be properly disposed of by the project applicant in accordance with all applicable laws, ordinances, and regulations. c. <u>Tree Replacement Plantings</u>

Law, Authority, or Factor	Mitigation Measure
	Replacement plantings shall be required for tree removals for the purposes of erosion control, groundwater replenishment, visual screening, wildlife habitat, and preventing excessive loss of shade, in accordance with the following criteria: vii. No tree replacement shall be required for the removal of nonnative species, for the removal of trees which is required for the benefit of remaining trees, or where insufficient planting area exists for a mature tree of the species being considered. viii. Replacement tree species shall consist of Sequoia sempervirens (Coast Redwood), Quercus agrifolia (Coast Live Oak), Arbutus menziesii (Madrone), Aesculus californica (California Buckeye), Umbellularia californica (California Bay Laurel), or other tree species acceptable to the Tree Division. ix. Replacement trees shall be at least twenty-four (24) inch box size, unless a smaller size is recommended by the arborist, except that three fifteen (15) gallon size trees may be substituted for each twenty-four (24) inch box size tree where appropriate. x. Minimum planting areas must be available on-site as follows: • For Sequoia sempervirens, three hundred fifteen (315) square feet per tree; • For other species listed, seven hundred (700) square feet per tree. xi. In the event that replacement trees are required but cannot be planted due to site constraints, an in lieu fee in accordance with the City's Master Fee Schedule may be substituted for required replacement plantings, with all such revenues applied toward tree planting in city parks, streets and medians. xii. The project applicant shall install the plantings and maintain the plantings until established. The Tree Reviewer of the Tree Division of the Public Works Department may require a landscape plan showing the replacement plantings and the method of irrigation. Any replacement plantings which fail to become established within one year of planting shall be replanted at the project applicant's expense.

Determination:

☒ **Finding of No Significant Impact** [24 CFR 58.40(g)(1); 40 CFR 1508.27]
The project will not result in a significant impact on the quality of the human environment.

☐ **Finding of Significant Impact** [24 CFR 58.40(g)(2); 40 CFR 1508.27]
The project may significantly affect the quality of the human environment.

APPENDIX C

AIR QUALITY

BASELINE
ENVIRONMENTAL CONSULTING

MEMORANDUM

Date: 28 February 2020

To: Meredith Rupp, Planner, Urban Planning Partners Inc.

From: Ivy Tao, Baseline Environmental Consulting

Subject: **The Phoenix, 801 Pine Street, Oakland, California**
Draft Air Quality Health Risk Memorandum

The project proposes to construct supportive housing and commercial buildings on a 0.9-acre site at 801 Pine Street in the West Oakland neighborhood of the City of Oakland, located within the West Oakland Specific Plan area. The proposed mixed-use project would construct:

1) A four-story building consisting of 101 supportive and affordable residential units;

2) A two-story building of approximately 7,500 square feet consisting of office space and community room and utility spaces that support the residential building.[1]

This air quality health risk memorandum evaluates the potential health risk impacts associated with implementation of the proposed project to support environmental review of the project in accordance with the National Environmental Policy Act and the Department of Housing and Urban Development (HUD) environmental standards. The primary health risk concerns associated with the project are related to toxic air contaminant (TAC) emissions during construction and the exposure of future residential receptors on the project site to emissions of TACs from existing and reasonably foreseeable future sources.

PROJECT ANALYSIS

Health Risk Screening Thresholds

For risk assessment purposes, TACs are separated into carcinogens and non-carcinogens. Carcinogens are assumed to have no safe threshold below which health impacts would not occur, and cancer risk is expressed as excess cancer cases per 1 million exposed individuals over a lifetime of exposure. Non-carcinogenic substances are generally assumed to have a safe threshold below which health impacts would not occur. Acute and chronic exposure to non-carcinogens is expressed as a hazard index (HI), which is the sum of expected exposure levels divided by the corresponding acceptable exposure levels.

The Bay Area Air Quality Management District (BAAQMD) has established health risk screening thresholds to evaluate significant adverse health effects from exposure to TACs.[2] The health risk

---

[1] Lowney Arch, 2019. Site Built Permit Set; The Phoenix, Oakland, California. November 15.

[2] Bay Area Air Quality Management District (BAAQMD), 2017. California Environmental Quality Act Air Quality Guidelines, May.

screening thresholds, presented below, are supported by substantial evidence presented in the BAAQMD's Revised Draft Options and Justification Reports.[3]

Table 1: BAAQMD Health Risk Screening Thresholds

Impact Analysis	Pollutant	Screening Thresholds
Project	TACs	Cancer risk increase > 10 in one million Chronic HI > 1.0
Cumulative Sources	TACs	Cancer risk increase > 100 in one million Chronic HI > 10.0
	Exhaust $PM_{2.5}$	0.8 μg/m^3 (annual average)

Note: TACs = Toxic air contaminants; HI = Hazard index; $PM_{2.5}$ = Fine particulate matter; μg/m^3 = micrograms per cubic meter.
Source: BAAQMD, 2017.

Construction Health Risk Impacts

Construction emissions of diesel particulate matter (DPM) and fine particulate matter ($PM_{2.5}$) from off-road diesel construction equipment and on-road heavy-duty diesel trucks can contribute to a range of health problems. In 1998, the California Air Resources Board (CARB) identified DPM from diesel-powered engines as a TAC based on its potential to cause cancer and other adverse health effects.[4] However, project construction would not involve substantial uses of diesel equipment and vehicles because the project would assemble modular housing units that have been built off-site. Therefore, the use of diesel construction equipment would be substantially less than a non-modular construction project and construction would not be expected to result in substantially elevated levels of TACs near the project site. Furthermore, the project applicant is committed to the use of the most effective Verified Diesel Emission Control Strategies (VDECS) on all off-road diesel construction equipment in accordance with the City of Oakland's SCA 22: *Diesel Particulate Matter Controls-Construction Related*. Implementation of SCA 22 would further reduce DPM and $PM_{2.5}$ emissions from construction activity to the maximum extent technologically feasible. Therefore, project construction will not result in substantial health risk impacts to nearby sensitive receptors.

Operational Health Risk Impacts

Operation of the proposed project could expose future residents to TAC emissions from nearby stationary sources, major roadways, freeways, railroads, and a seaport. In accordance with the City of Oakland's SCA 22: *Exposure to Air Pollution (Toxic Air Contaminants)*, the following analysis estimates the cumulative health risk impact on future project residents exposed to TACs from existing sources.

---

[3] Bay Area Air Quality Management District (BAAQMD), 2009. Revised Draft Options and Justification Report; California Environmental Quality Act Thresholds of Significance, October.

[4] California Air Resources Board (CARB), 1998. Initial Statement of Reasons for Rulemaking; Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, June.

The BAAQMD recommends that projects within the West Oakland Specific Plan area use the West Oakland Community Action Plan (WOCAP) Technical Assessment[5] as a part of the air quality assessment.[6] The WOCAP Technical Assessment spatially mapped the contribution of air pollutants emissions from major emissions sources to pollutant concentrations and estimated cancer risks within the West Oakland community that may potentially impact current and future residents. The supporting data package from the WOCAP Technical Assessment for year 2018 was used in this analysis.[7] A detailed summary of cumulative health risks at the project site from the WOCAP Technical Assessment data package is included in Attachment A.

Health risks and major source contributions estimated at the project site by the WOCAP Technical Assessment are summarized in Table 2, below. There is one stationary source of TAC emissions within 1,000 feet of the project site (California Waste Solutions – 10th Street, Facility 15739).[8] There are also major roadways, freeways, railroads, and other non-stationary sources of TAC emissions within 1,000 feet of the project site. The WOCAP Technical Assessment used community-scale air dispersion modelling for TACs to quantify source contributions within and beyond 1,000 feet of receptors. There are no foreseeable future projects within 1,000 feet of the proposed project that could contain new stationary sources of TAC emissions.

Sources	**Cancer Risk**		**$PM_{2.5}$**		**Chronic HI from DPM**	
	Per million	**Percent contribution**	**$\mu g/m^3$**	**Percent contribution**	**Unitless**	**Percent contribution**
Highways	130	30	1.4	43	0.031	27
Streets	23	5	1.1	34	0.005	4
Port	167	37	0.3	9	0.045	38
Railroads	114	26	0.1	4	0.153	26
Permitted Stationary Sources						
- California Waste Solutions	<1	<1	0.1	4	<0.001	<1
- Other Stationary Sources	6	1	0.3	7	<0.001	<1
Other Non-Stationary Sources	7	1	<0.1	<1	0.002	1
Total Health Risk	**447**		**3.3**		0.24	
Total Health Risk with MERV-13	67.0		0.5		0.04	
Total Health Risk with MERV-16	4.5		<0.1		<0.01	
BAAQMD's Health Risk Screening Thresholds	100		0.8		10	

Note: PM = Particulate matter; HI = Hazard index; $\mu g/m^3$ = micrograms per cubic meter; DPM = Diesel particulate matter; MERV = minimum efficiency reporting value.
Bold and shaded indicates exceedance of the applicable BAAQMD's screening level.

Source: BAAQMD, 2019.
Appendix A.

As shown in Table 2, chronic HI at the proposed project site would be below the BAAQMD's health risk screening threshold; however, cancer risk and $PM_{2.5}$ concentrations at the proposed project site would be above the BAAQMD's health risk screening thresholds. Therefore, the project is required to identify health risk reduction measures to reduce the health risk to acceptable levels under SCA 22: *Exposure to Air Pollution (Toxic Air Contaminants)*. To reduce the potential excess cancer risk and $PM_{2.5}$ concentrations at the proposed project site, the project could install air filtration devices with minimum efficiency reporting value (MERV) equal to or higher than 13 (MERV-13). MERV rating system provides a scale showing the effectiveness of air filtration devices at removing particles at different sizes. CARB has identified high-efficiency filtration as the most effective method for residences to reduce incoming DPM from outdoor air.[9] An air filtration device rated MERV-13 or MERV-16 can reduce levels of indoor DPM and $PM_{2.5}$ by at least 85 and 99 percent, respectively, relative to the incoming outdoor air.[10] Therefore, as shown in Table 2, implementation of MERV-13 or MERV-16 devices would reduce the cumulative excess cancer risk and $PM_{2.5}$ concentrations at the project site to acceptable levels.

[10] South Coast Air Quality Management District, 2009. Pilot Study of High Performance Air Filtration for Classrooms Applications. October.

CONCLUSION

With the implementation of the applicable SCAs, described above, the proposed project would not result in substantial increases in health risks during construction or operation.

1.0 INTRODUCTION

Geo/Resource Consultants, Inc. (GRC) was contracted under Contract Number 53P614 and Task Order Number 04-192201-01 by the State of California Department of Transportation (Caltrans) to complete a subsurface investigation for three parcels owned by the Phoenix Project; (See Figure 1). The purpose of this investigation was to determine if contamination is present, to estimate the potential areal and vertical extent of contamination, and to provide cost estimates for remedial actions, if deemed necessary.

The investigations described in this report are consistent with investigations proposed in the Workplan prepared by GRC and approved by Caltrans (dated June 17, 1992).

1.1 TASK ORDER MEETINGS

The Phoenix Properties were visited by GRC and Caltrans personnel on May 21 and May 28, 1992. These facilities were also visited by GRC and Bruce Waenas of West Hazmat (the drilling subcontractor) on June 19 to verify site access conditions.

1.2 SITE BACKGROUND

The three Phoenix Properties are located within proximity to each other on Cedar Street in Oakland. A brief discussion regarding facility operations and prior investigative activities (if known) was provided in the Caltrans Task Order (May 4, 1992) and is summarized below. These descriptions provided the basis for the subsurface investigations conducted at each site.

Three of the four parcels owned by the Phoenix Properties were part of the historical Independent Iron Works operation from the 1950's. Soil sampling and laboratory analyses were performed by others for the properties listed below in September, 1990. The results of these analyses are summarized below.

Phoenix Properties
800 Cedar Street
Oakland, California 94607

One gasoline and one diesel underground storage tank (UST) are maintained on this parcel. One sample taken at 2.0 to 2.5 feet below the ground surface, contained lead at 52 milligram/kilogram (mg/kg). A Waste Extraction Test (WET) test of the sample showed a Soluble Threshold Limit Concentration (STLC) of 2.26 mg/L.

Phoenix Properties
766 Cedar Street
Oakland, California 94607

Soils on this parcel were previously sampled within the vadose zone and tested for hydrocarbons (gasoline, diesel and benzene, toluene, xylenes and ethyl benzene). Laboratory results apparently did not indicate detectable levels of the compounds analyzed for.

Phoenix Properties
524 Cedar Street
Oakland, California 94607

Soil samples were collected at 1.5 to 2.2 feet and 2.5 to 3.0 feet below the ground surface. Test results indicated lead concentrations of 180 mg/kg and 750 mg/kg, respectively. WET tests performed on the soil samples reported STLC levels of 1.47 mg/L and 2.89 mg/L, for the above respective sample depth intervals. Additional soil samples collected within the vadose zone were tested for hydrocarbons. These laboratory results were not available for inclusion in this report.

2.0 FIELD METHODOLOGY

Soil boring drilling, monitoring well construction and sampling was conducted in general accordance with the California Site Mitigation Decision Tree (December, 1986), the Environmental Protection Agency (EPA) Ground-Water Monitoring Technical Enforcement Guidance Document (TEGD, September, 1986), and Geo/Resource Consultants Field Procedure Manual (September, 1989). Descriptions of standard methodologies are included in Appendix A. Specific field activities and methodologies are described below.

2.1. PHOENIX PROPERTIES-800 CEDAR

On June 23, 1992, one soil boring (PP800/B-1) was drilled using a rig equipped with 8-inch-diameter, hollow-stem augers. On June 24, 1992, two more borings (PP800/H-1 and PP800/W-1) were drilled. The borings were drilled in the area of the USTs. The location of the borings are shown in Figure 2. Borings PP800/B-1, PP800/H-1, and PP800/W-1 were drilled to 8 feet, 13 feet and 27 feet below ground surface (bgs), respectively. Soil samples were collected in PP880/B-1 at 0.5 feet, 3.0 feet, and 6.5 feet bgs; in PP880/H-1 at 0.5 feet, 1.5 feet, 4.0 feet, and 6.5 feet bgs; and in well boring PP880/W-1 at approximately 1 foot, 5 feet, and 8 feet bgs (See Appendix B).

One ground-water sample was collected by the "Hydropunch" sampling technique from a depth of approximately 13 feet bgs in PP800/H-1.

Upon completion of soil sampling, the borings PP800/B-1 and PP800/H-1 were backfilled with cement grout, and the cuttings were disposed of in 55-gallon United States Department of Transportation (U.S. DOT) approved drums.

A 2-inch-diameter monitoring well was constructed at boring PP800/W-1. The well was screened between 5 feet and 25 feet bgs and was constructed of 0.020-inch slotted schedule 40 Poly Vinyl Chloride (PVC) pipe. The annular space was filled with No. 3 RMC Lonestar sand to a depth of 4 feet bgs and bentonite pellets were placed to a depth of approximately 3 feet bgs. The remainder of the annular space was filled with cement grout and an underground locking monument well box was cemented into place.

The monitoring well was developed on June 26, 1992 using the surge and bail technique. Approximately 37 gallons of water were purged from the well during development. Well development logs are included in Appendix C.

The monitoring well was sampled on July 1, 1992. Prior to sampling, the water level was measured and the well was subsequently purged of 16 gallons of water. The ground-water parameters, pH, electrical conductivity, and temperature, were measured during purging. Water sampling logs are included in Appendix C.

Soil cuttings, development water and purge water were disposed of in 55-gallon U.S. DOT approved drums.

2.2 PHOENIX PROPERTIES-766 CEDAR

On June 22, 1991, six soil borings (PP766/B-1, PP766/B-2, PP766/B-3, PP766/B-4, PP766/B-5, and PP766/B-6) were drilled using a drill rig equipped with 8-inch-diameter, hollow-stem augers. The borings were located within a random grid pattern across the site. The locations of the borings are shown in Figure 2. Borings PP766/B-1, PP766/B-2, PP766/B-3, PP766/B-4, PP766/B-5, and PP766/B-6 were all terminated at 3.0 feet bgs. A continuous soil sample was collected from all six borings from the ground surface to the bottom of the hole at 3 feet bgs.

Upon completion of the soil sampling, the borings were backfilled with cement grout and the cuttings were disposed of in 55-gallon U.S. DOT approved drums.

2.3 PHOENIX PROPERTIES-524 CEDAR

On June 22, 1992 five soil borings (PP524/B-1, PP524/B-2, PP524/B-3, PP524/B-4, and PP524/B-5) were drilled using a drill rig equipped with 8-inch-diameter, hollow-stem augers. The locations of the borings are shown in Figure 2. Borings PP524/B-1, PP524/B-2, PP524/B-3, PP524/B-4, and PP524/B-5 were all terminated at 6.5 feet bgs. Soil samples were collected at 0.5, and 5 feet bgs in all the borings.

Upon completion of the soil sampling the borings were backfilled with cement grout and the cuttings were disposed of in 55-gallon U.S. DOT approved drums.

3.0 FINDINGS

This section describes subsurface conditions encountered during the field investigation and includes analytical findings.

3.1 SUBSURFACE CONDITIONS

Subsurface conditions at each site were evaluated from lithologic logs, water level measurements and photoionization (PID) readings from the on-site HnU meter. These data are included in Appendices B and C.

3.1.1 Phoenix Properties 800 Cedar

The area investigated at 800 Cedar is underlain by silty sands and sands (See Appendix B). The silty sand was observed to be light brown to dark gray/black in color, and medium to very dense, based on blow counts during sampling. The silty sand was present from the ground surface to a depth of approximately 3.5 feet bgs (in PP800/B-1) to 15 feet bgs (in PP800/W-1). The silty sand was underlain by medium to very dense, gray and brown sand to a depth of at least 27 feet bgs. Soil moisture content generally ranged from moist in the upper 6 feet and very moist to wet with increasing depth. Strong odors (suspected hydrocarbons) were noted in the silty sands of borings PP800/B-1 and PP800/H-1 at respective depths of 3.5 and 6.5 feet bgs. Based on debris noted in soils from the borings, the site area is interpreted to be underlain by fill to approximately 3.5 to 6.5 feet bgs.

Ground water was measured at approximately 7 feet bgs on July 1, 1992 in well PP800/W-1.

HnU readings were obtained from each of the soil samples collected. Hydrocarbons were present above detection limits in boring PP800/B-1 at a maximum of 50 parts per million (ppm) at a depth of 1 foot bgs and in boring PP800/H-1 at 2 ppm at 7 feet bgs. In general, higher HnU readings occur near the ground surface and decrease with depth.

3.1.2 Phoenix Properties 766 Cedar

The area investigated at 766 Cedar is underlain by silty sand (See Appendix B). The silty sand was observed to be dark brown in color to a depth of 3 feet bgs, the bottom of the exploration borings. Relative soil density ranged from loose to dense and moisture content was dry to damp. Rock fragments were encountered in several of the borings suggesting that the soil within the area of investigation is fill in origin to depths explored. HnU readings were very low (0 to 3 ppm) in all of the borings.

3.1.3 Phoenix Properties 524 Cedar

The area investigated at the 524 Cedar site is underlain by light to predominantly dark brown, medium to fine-grained silty sand to the maximum depth of exploration of 6.5 feet bgs in all the borings. (See Appendix B). Soils encountered in the borings were observed to be moist, ranging from medium dense to dense. The soils encountered to the depths explored were interpreted to be fill in origin as construction debris was commonly observed. HnU readings showed no detection of hydrocarbons in any of the soil samples tested.

3.2 ANALYTICAL FINDINGS

Soil and ground-water samples were submitted to CKY, Inc. (CKY) for chemical analyses based on site background and suspected contaminants. The analytical results are summarized on Tables 1, 2 and 3. and are included in Appendix D. The findings are briefly described below.

3.2.1 Phoenix Properties 800 Cedar

Three soil samples were collected from the unsaturated zone at each boring location (for a total of nine samples) and one "Hydropunch" sample and one ground-water sample were collected from PP800/H-1 and PP800/W-1. All of the samples were chemically analyzed for total petroleum hydrocarbons as gasoline (TPH-G) and diesel (TPH-D) by EPA Method 8015.

Soil

TPH-G was detected in boring PP800/H-1 at relatively low concentrations of 10 to 17 milligrams per kilogram (mg/kg), at 1.5 and 4 feet bgs, respectively. TPH-D was detected at high concentration levels in soil samples from borings PP800/B-1 and PP800/H-1. In boring PP800/B-1, TPH-D was detected at a concentration of 1,600 mg/kg in a soil sample at a depth of 1.5 feet bgs. In boring PP800/H-1, TPH-D was detected in soil samples at concentration levels of 1,600 and 2,400 ppm at depths of 1.5 and 4 feet bgs, respectively. These data suggest that leakage may have occurred primarily from associated pipelines.

Ground Water

Neither the "Hydropunch" ground-water sample collected from PP800/B-1 or the ground-water sample collected from PP800/W-1 contained detectable concentrations of either TPH-G or TPH-D.

3.2.2 Phoenix Properties 766 Cedar

Soil borings PP766/B-1 through PP766/B-6 were all drilled to depth of 3.0 feet bgs. Two soil samples were collected from the unsaturated zone at each boring location (for a total of 12 samples). These samples were analyzed for heavy metals by EPA Method 6010.

Soil

Most of the heavy metals analyzed for were detected in the soil samples tested with the exception of the metals selenium and silver. Metal concentrations were highest near the ground surface and decreased with depth. The highest lead concentrations were detected at 3,600 mg/kg in boring PP766/B-1 at a sample depth of 1 foot bgs. In addition, lead exceeded ten times the STLC requirements for soil samples collected from PP766/B-3 (at 1 foot), PP766/B-4 (at 1 foot), and PP766/B-5 (at 1 foot and 3 feet). These samples were re-submitted for STLC testing by the WET method. The test results indicated lead exceeded STLC limits at all the above listed sample locations and that soluble lead concentrations ranged from 8 mg/l to 31 mg/l.

Ground Water

Ground water was not encountered at this location and, therefore, ground-water samples were not collected.

3.2.3 Phoenix Properties 524 Cedar

Soil borings PP524/B-1 through PP524/B-5 were all drilled to depth of 6.5 feet bgs. Two soil samples were collected from the unsaturated zone from each of the wells (for a total of ten samples). The samples were chemically analyzed for total recoverable petroleum hydrocarbons (TRPH) by EPA Method 418.1 and for heavy metals by EPA Method 6010.

Soils

TRPH was detected in all the soil samples analyzed. Elevated TRPH levels above 100 mg/kg were detected in borings PP524/B-4 and PP524/B-5. In boring PP524/B-4, TRPH was detected at a concentration levels of 210 mg/kg (at 1.5 feet) and at 1,200 mg/kg (at 6 feet). In boring PP524/B-5 (at 1.5 feet) TRPH was detected at a concentration of 250 mg/kg. Most of the heavy metals analyzed for were detected in the soil samples tested with the exception of the metals selenium and silver. Lead was detected in soil samples up to 1,100 mg/kg, 3,500 mg/kg, and 23,000 mg/kg, respectively, in borings PP524/B-4 (at 1.5 feet), PP524/B-4 (at 6 feet), and PP524/B-5 (at 1.5 feet). Copper was identified at ten times STLC in PP524/B-4 (at 6 feet). This sample was re-submitted for testing by the WET method. The test result showed the level for copper well below the STLC limit.

Ground Water

Ground water was not encountered at this location, therefore, ground-water samples were not collected.

4.0 REGULATORY FRAMEWORK

The regulatory framework as it pertains to this site investigation is described in Appendix E. Regulatory agencies that set forth guidelines and statutes that may impact these sites include the California Environmental Protection Agency (CalEPA), the California Regional Water Quality Control Board (RWQCB), the Alameda County Water District (ACWD), and the Alameda County Department of Environmental Health (ACDEH). This section the potential applicability of various waste characterization regulations and criteria of each of the sites in Area 4.

4.1 PHOENIX PROPERTIES 800 CEDAR

Soil

Concentrations of TPH-D were found in several samples collected from the 800 Cedar site that may be considered hazardous waste by the RWQCB (greater than 1,000 mg/kg). Hazardous waste levels of TPH-D were found in soil boring PP800/B-1 to a depth of 1.5 feet bgs and in soil boring PP800/H-1 to a depth of 4 feet bgs. The remaining samples did not contain hydrocarbons above laboratory detection limits.

Ground Water

No detectable levels of either TPH-G or TPH-D were found in the groundwater samples tested.

4.2 PHOENIX PROPERTIES 766 CEDAR

Soil

At the 766 Cedar site, concentrations of lead exceeding hazardous waste criteria Total Threshold Limit Concentration (TTLC) were detected in one soil boring (PP766/B-1). Lead concentrations exceeding ten times STLC were detected in borings PP766/B-3, PP766/B-4, PP766/B-5, and PP766/B-6. Depth of contamination was found to of 3 feet bgs, the maximum depth of exploration.

4.3 PHOENIX PROPERTIES 524 CEDAR

Soil

An elevated concentration level of TRPH was found in one soil sample collected from the 524 Cedar site, that may be considered hazardous waste by the RWQCB (greater than 1,000 mg/kg). TRPH was found in soil boring PP524/B-4 at 1,200 mg/kg at a depth of 6 feet bgs. In addition, concentrations of TRPH were found in soil samples that may be considered designated waste (between 100 and 1,000 mg/kg). The designated waste levels were found in soil samples in borings PP524/B-4 and PP524/B-5 at depths of 1.5 feet bgs.

Lead was detected above TTLC at PP524/B-4 and PP524/B-5. One sample collected from PP524/B-4 had been re-submitted for the WET for copper and was shown to be well below minimum STLC limit.

5.0 REMEDIAL ACTIONS

Very limited data points were obtained at the sites investigated for this Task Order. Therefore, potential contaminant plume boundaries cannot be determined. However, for the purposes of providing very generalized estimates remedial volumes of potentially contaminated soil have been derived from the limited data available regarding soil conditions, and types and concentrations of contaminants. These very preliminary estimates should not be construed as final, and at all of the sites where contamination was detected, further investigation is recommended to define its lateral and vertical extent. Only from subsequent investigations can accurate contaminated soil volume estimates for remedial actions be provided.

5.1 PHOENIX PROPERTIES-800 CEDAR

Soils at 800 Cedar were found to be contaminated with elevated levels of TPH-D.

Soil

TPH was detected in soil samples at concentrations above hazardous waste levels from borings PP800/B-1 and PP800/H-1 located just north of the former underground diesel fuel storage tank. In borings PP800/B-1 and PP800/H-1 elevated levels of TPH-D were detected soil at a depths of 1.5 to a maximum of 4 feet bgs and TPH-D was not present above laboratory detection limits in samples collected from 7.5 feet bgs.

Based on these data, it appears that soil contamination could be related to potential pipeline leakage or spillage during tank filling activities. Information regarding the orientation of the fill pipe and associated piping was unavailable for this report. These data suggest that soil contamination may be relatively localized. To determine the extent of contamination, additional borings would be required. However, for purposes of preparing a cost estimate, it is assumed that potential soil contamination within the vadose zone could encompass a 20-foot area near the north end of the diesel tank to a depth of 7 feet bgs. Based on this assumption, an estimated 104 cubic yards (135 tons) may require disposal at either a Class II landfill or recycling facility.

Ground Water

No contaminants were detected in ground water at the 800 Cedar site and thus no remediation measures are warranted at this time.

5.2 PHOENIX PROPERTIES-766 CEDAR

At the 766 Cedar site hazardous waste level concentrations (TTLC and/or STLC) of lead were detected in soil samples collected from 1 foot at borings PP766/B-1, PP766/B-3, PP766/B-4 and PP766/B-5. Samples collected from the two remaining borings, PP766/B-2 and PP766/B-6 contained relatively low metal concentrations.

Soil

Since the majority of shallow soil samples tested contained hazardous waste levels of lead, it is assumed that the majority of shallow soils across the site is hazardous. Based on currently available data, potential soil contamination within the subsurface soil is suspected to extend across the site to a depth of 3 feet. Thus, an estimated 2,200 cubic yards (2,900 tons) could require disposal at either a Class I landfill or recycling facility.

5.3 PHOENIX PROPERTIES-524 CEDAR

Hazardous waste levels of TRPH was found in a soil one sample collected at the 524 Cedar site. Hazardous waste levels of lead (TTLC and STLC) were detected in samples collected from PP524/B-4 at 1.5 feet and from PP524/B-5 at 1.5 feet.

Soil

Elevated levels of TRPH and lead were detected in borings PP524/B-4 and PP524/B-5. Due to limited number of sampling points and the lack of information regarding previous site activities, estimates of soil contamination cannot be made. It is recommended that previous site activities be identified as best as possible and that additional drilling be conducted to determine the extent of contamination. Unit costs per ton for disposal at Class I and Class II facilities are presented in discussions for the 800 and 766 Cedar properties.

6.0 CONCLUSIONS

Three soil borings, including one "hydropunch" and one monitoring well, were drilled at 800 Cedar to investigate potential leakage from two existing USTs. Leakage from pipelines associated with the diesel tank appears to have occurred. Hazardous waste levels of TPH-D were detected in two soil samples and a volume of contaminated soil requiring remediation was estimated. Groundwater samples did not contain either TPH-D or TPH-G over laboratory detection limits.

Six soil borings were drilled at the 766 Cedar site to investigate shallow soil contamination from metals. One sample contained lead over TTLC and several samples contained lead in excess of 10 times the STLC. When these samples were resubmitted for testing by the WET method results indicated all the soil samples contained lead levels the exceeded regulatory STLC requirements to be classified as hazardous waste. Based on consistent high lead concentrations across the site, it was assumed that the upper 3 feet of soil may require disposal as a hazardous waste.

Five soil borings were drilled at the 524 Cedar site to investigate potential contamination from hydrocarbons or metals. One soil sample was found to contain hazardous levels of TRPH and several soil samples contained lead in excess of TTLC. Based on these limited data, volumes of soil requiring remediation have been estimated.

APPENDIX A

FIELD METHODOLOGY

Area 4

APPENDIX A - FIELD METHODOLOGY

The Highway 880, Cypress Structure Reconstruction Site Investigation performed by GRC in June, 1992 included drilling and sampling of both drill rig borings and hand auger borings. Ground-water samples were collected at some boring locations, using "hydropunch" sampling techniques or by the installation and sampling of ground-water monitoring wells.

General boring locations and field methodologies were determined during several pre-work site visits conducted by GRC and Caltrans personnel prior to initiating the field investigation. Pre-work site visits were conducted May 21, May 28, and June 5, 1992. Subsequent to the site visits, a Workplan was prepared and approved by Caltrans in June, 1992. Variations from the Workplan, such as well construction materials and re-locations of boring locations, were communicated to Caltrans during the field investigation.

A.1 PRELIMINARY ACTIVITIES

Prior to beginning field activities, GRC performed the following tasks at drilling locations as appropriate.

Utility Clearance

Underground Service Alert (USA) was notified by GRC 48-hours in advance of field work of our intent to drill. USA notified the utility companies of our proposed work locations. GRC met with utility company representatives to clear each boring location of buried utilities. GRC also met with site owners and tenants during pre-work site visits to discuss the location of potential underground utility lines.

Above Ground Utility Clearance

Above ground utilities were visually examined by GRC to assure that the drill rig boom would not be within 15 feet of overhead power lines. Boring locations were confirmed with the subcontracted drilling company on June 19 prior to initiating the field investigation.

Permits

This investigation required monitoring well installation permits and right-to-enter permits. As part of the monitoring well permitting process, an application for well permits were submitted to the Alameda County Flood Control District. The well permits were granted as a group and is included at the end of this Appendix. Permits to enter each of the project sites were obtained by Caltrans personnel prior to beginning field work and right-to-enter permits are maintained within Caltran's files. All appropriate permits were kept on-site during field work.

A.2 DRILLING AND SAMPLING METHODOLOGY

This section describes the field methodology used to drill and sample both hand auger borings and drill rig borings, and to collect "hydropunch" ground-water samples from drill rig soil borings and "grab" ground-water samples from hand auger soil borings.

Drill Rig Borings - Drilling and Soil Sample Collection

Soil borings were drilled by a three-man crew from West Hazmat Drilling Company of Hayward California. West Hazmat maintained two drill rigs operating at the project site which included a truck-mounted Mobile B-57 and a truck-mounted CME 75. Soil borings were drilled using hollow stem auger methods with 8-inch augers. A GRC hydrogeologist was present during all field activities to make detailed observations of field conditions and maintain a continuous log of each soil boring. Soil boring logs are contained in Appendix B and soil boring locations are illustrated within the text.

Generally, soil borings were drilled through the unsaturated zone to the water table and soil samples collected from the unsaturated zone were submitted for chemical analysis. The sampling interval in the unsaturated zone was dependant on the number of samples to be analyzed as outlined in the Workplan. Soil borings converted to monitoring wells were further advanced into the saturated zone.

Soil samples were collected at each boring location using a California Modified split spoon sampler. Soil samples were collected in three, clean 6-inch stainless steel sleeves. At each sampling interval, the split spoon sampler was driven with a 140-pound hammer dropping 30-inches. Upon retrieval, the sampler was placed on a relatively clean surface and carefully opened. One of the sample sleeves was immediately covered on both ends with aluminum foil, capped, labeled, and placed a plastic bag and then in a cooled ice chest prior to transport to the chemical laboratory. The two remaining sleeves were used for sample description and field screening using an photoionization meter (HnU).

Field screening was conducted by placing a portion of the remaining soil sample in a zip-lock bag. The head space of the zip-lock bag was then screened for organic vapors using a HnU. and the readings were recorded on the boring log. Soil sample descriptions were maintained on a continuous soil boring log. Soil samples were described according to color, texture, moisture, density, any other appropriate observations, and classified using the Unified Soil Classification System.

Hand Auger - Drilling and Soil Sample Collection

Selected soil boring locations were drilled and sampled by a GRC hydrogeologist using a hand auger. Generally, hand augered soil borings were drilled through the unsaturated zone to the water table. Soil samples collected from the unsaturated zone were submitted for chemical analysis. The sampling interval in the unsaturated zone was dependant on the number of samples to be analyzed as outlined in the Workplan.

Soil samples were collected at each hand auger boring location using two six-inch stainless sleeves attached to a hand held sampler and slide hammer. The slide hammer was used to advance the stainless steel sleeve containing sampler into the soil in advance of the augered hole. Upon retrieval the sampler was placed on a relatively clean surface and carefully opened. One of the sample sleeves was immediately covered on the ends with aluminum foil, capped, labeled, and placed a plastic bag and then in a cooled ice chest for possible chemical analysis. The remaining sleeve was used for sample description and field screening. A portion of the remaining soil sample was placed in a zip-lock bag. The head space of the zip-lock bag was then screened for organic vapors using a HnU and the readings were recorded on the boring log. Soil sample descriptions were maintained on a continuous soil boring log. Soil samples were described according to color, texture, moisture, density, any other appropriate observations, and classified using the Unified Soil Classification System.

"Hydropunch" Ground-Water Sampling

Discrete ground-water samples were collected at selected soil boring locations using a "hydropunch". A "hydropunch" is a hollow rod-shaped device constructed of stainless steel and Teflon. The "hydropunch" was lowered down through the hollow stem augers, hydraulically pushed into the saturated soil, and retracted approximately 1.5 feet to expose the perforated intake pipe. The "hydropunch" was then allowed to fill with ground water. A clean Teflon bailer was lowered down the "hydropunch" to collect the ground-water sample.

Upon retrieval of the bailer, the ground-water sample was carefully transferred into laboratory provided sample containers and placed in a cooled ice chest.

"Grab" Ground-Water Sample Collection

As described in the Workplan, ground-water samples were collected at selected hand auger soil borings. Following soil sample collection, these borings were continued into the saturated zone for approximately two feet. Ground-water samples were collected using a disposable bailer in the open borehole. Upon collection, the ground water was carefully transferred into laboratory-provided containers, labeled, and placed in a cooled ice chest.

A.3 MONITORING WELL INSTALLATION, DEVELOPMENT, AND SAMPLING

Some soil borings within the project site area were converted to ground-water monitoring wells. The locations of monitoring wells are presented within the text. Monitoring well construction diagrams are presented in Appendix B.

Monitoring Well Installation

All monitoring wells are constructed of 2-inch diameter, threaded schedule 40 PVC. Blank casing was flesh mounted on machine slotted 0.010-inch or 0.020-inch slot size well casing. The wells were installed by lowering the casing down the hollow stem auger. As the augers were removed, a filter pack consisting of No. 2/12 or No. 3 Monterey sand was carefully poured down the augers around the well screen to a depth of approximately 1 to 2 feet above the top of the screen. During pouring, the sand depth was measured continuously to prevent bridging.

The width of the slots and sand depended on the formation materials encountered during drilling. Generally, silty sands were encountered and the slot width and sand size used consisted of 0.020-inch and No. 3 sand, respectively. When the formation consisted predominantly of clayey materials, the slot width and sand size used was 0.010-inch and No. 2/12 sand, respectively.

Following sand pack installation, bentonite pellets were placed to a minimum thickness of 1-foot above the filter pack. An annular seal of a cement bentonite slurry was then placed above the bentonite seal to an approximately depth of 1 foot. A locking cap was placed on top of well casing and a water-tight, flush-mounted well cover was cemented into place approximately 2-inches above grade, sloping away from the well head to prevent the ponding of surface water.

Monitoring Well Development

Monitoring wells were developed by West Hazmat under the supervision of a GRC hydrogeologist utilizing the "surge and bail" technique. Each monitoring well was initially surged by attaching a 1.5-inch O.D. surge block to the drive rods. The surge block was slowly raised and lowered inside the well screen section of the casing to create a flushing action until the sand pack was stabilized. Subsequently, a bailer was used to purge the well until relatively sediment-free water was produced by the well.

Monitoring Well Ground-Water Sample Collection

The monitoring wells were allowed to stabilize approximately 72-hours following development prior to sampling. Water levels were then measured to an accuracy of 0.1 foot using an electric sounder. Prior to sample collection, approximately three casing volumes were removed from each monitoring well using a Teflon bailer. During purging, pH, specific conductance, and temperature were monitored. Monitoring wells were purged until the pH, specific conductance, and the temperature stabilized to within 10% over two successive sampling intervals, and at least three casing volumes of ground-water has been purged. Monitoring wells which pumped dry were allowed to recover to within 80 percent of the original well volume, and then sampled.

Following purging, a ground-water sample was collected by slowly lowering a Teflon bailer into the well. Ground-water was carefully placed in laboratory-provided containers, labeled, and placed in a cooled ice chest.

A.5 DECONTAMINATION PROCEDURES

The following decontamination procedures were followed in order to maintain sample integrity and to prevent cross-contamination from occurring between sampling locations:

- All sampling equipment was cleaned with Liquinox and rinsed twice with deionized water prior to use at a new sampling location. Sampling equipment included:

  Split spoons;

  Stainless steel tubes;

  "Hydropunch" equipment;

  Sampling utensils;

  - Hand auger equipment; and
  - Ground-water sampling equipment.

- Hollow stem augers and drill bits were steam-cleaned between each drilling location.

- Rinsate water was retained and stored in labeled 55-gallon DOT 17H drums pending laboratory results.

A.5 STORAGE AND DISPOSAL OF GENERATED WASTES

Soil cuttings, development water, purge water and decontamination water generated from each parcel were not combined in drums with soil and ground water from other parcels. All soil cuttings and water were placed into DOT-approved 17H, 55-gallon drums. Following completion of drilling, all drums were moved to the former Kelly's Truck Repair yard located at Cypress and 7th Streets for storage.

A.5 ANALYTICAL PROGRAM

A summary of the projects analytical program is outlined below. Specific analyses performed and results for parcels are described within the text. All soil and ground-water samples were transported to CKY, Inc. in Pleasanton, California for chemical analyses.

A comprehensive list of the analytical methods used during this investigation is provided below:

Total Petroleum Hydrocarbons	
(TPH-Gasoline)	EPA Method 8015M-G
(TPH-Diesel)	EPA Method 8015M-D
Aromatic Volatile Organics	EPA Method 8020
Total Recoverable Petroleum Hydrocarbons (TRPH)	EPA Method 418.1
Total Metals (CAM metals by ICP/AAS)	EPA Method 6010
Volatile Organics (GC/MS)	EPA Method 8240
Semi-Volatile Organics (GC/MS)	EPA Method 8270
Pesticides & Polychlorinated Biphenyls (PCBs)	EPA Method 8080

All chemical analysis was performed on a one-week turn-around basis.

A.6 FIELD QUALITY CONTROL/QUALITY ASSURANCE

The following field documentation procedures were implemented by GRC field personnel.

Sample Identification

Each soil and ground-water sample was labeled, as applicable, with the following information:

- Boring or Monitoring Well Identification (I.D.) Number;
- Sample I.D. Number;
- Depth of Soil Sample Collection;
- Date and Time of Sample Collection; and
- Name of Person Collecting Sample.

Chain-of-Custody Procedures

Chain-of-custody records were used to document sample handling and shipping. Information recorded on the Chain-of-Custody Records included location of sample collection, sample identification (I.D.) number, date and time of collection, number and type of sample containers and analyses requested.

Sample Preservation

Samples were preserved upon collection by placing them in ice chests containing blue ice. Care was taken not to allow the samples to come into direct contact with the ice.

3" ASPHALT

SILTY SAND (SM)
dark gray to black, slightly moist, medium to fine-grained, strong hydrocarbon odor, gravel to 0.5" dia.,
abundant wood fragments in upper 2 feet

Fill

SAND (SP)
mottled gray and brown, very moist, dense, with silt

Hydropunch to 13.0 feet.
Boring terminated @ 13.0 feet.
Ground water not encountered during drilling.

2" ASPHALT OVER 6" BASE ROCK

SILTY SAND (SM)
dark gray-black, slightly moist,
medium to fine-grained, very dense,
gravel to 1.5" dia.

Fill ?

color changes to brown and gray, medium dense,
less gravel to 0.5" dia.

color changes to brown @ 8.2', samples wet,
very dense

SAND (SP)

wet, fine-grained, dense,
with some silt and clay

very dense

Boring terminated @ 27.0 feet.

Ground water measured @ 7.2 feet July 1, 1992.

APPENDIX E

REGULATORY FRAMEWORK

APPENDIX E - REGULATORY FRAMEWORK

This Appendix describes applicable regulations set forth by the California Environmental Protection Agency (CalEPA), the California Regional Water Quality Control Board (RWQCB), the Alameda County Water District (ACWD), and the Alameda County Department of Environmental Health (ACDEH).

E.1 CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY

Under CalEPA regulations, contaminated soils may be characterized as hazardous or as "designated" waste.

Regulations set forth by the CalEPA pertaining to contaminated ground water are based on the contaminants' known or suspected affects on human health. CalEPA provides state action levels and maximum contaminant levels (MCLs) for various organic and inorganic contaminants in drinking water. MCLs are statutes which may be enforced and state action levels are health advisory guidelines.

While CalEPA establishes safe drinking water standards, the California Regional Water Quality Control Board (RWQCB) is the regulating agency for ground-water investigations.

Hazardous Waste

At present, CalEPA has set a total petroleum hydrocarbon (TPH as gasoline) concentration of 1,000 milligrams per kilogram (mg/kg) as a hazardous waste classification criterion. This value is based on ignitability characteristics of gasoline in sandy soil (Memorandum by Toxic Substances Control Program, July 2, 1990). Although this level is not considered to be a sufficient criterion to classify wastes as hazardous by the DHS, The RWQCB Leaking Underground Fuel Tank (LUFT) Task Force recommends that the 1,000 mg/kg TPH value be used by field personnel to classify contaminated soil as hazardous waste until new criteria are released by CalEPA.

Standards pertaining to some oragnic and inorganic compounds (primarily metals) are described in the California Code of Regulations (CCR) Title 22, Division 4, Section 66699. These standards set Total Threshold Limit Concentration (TTLC) values and Soluble Threshold Limit Concentration (STLC) values for some constituents in soils. TTLC values refer to the maximum allowable total concentration of a constituent in soil and STLC values refer to the maximum allowable leachability from the soil. A generally accepted rule-of-thumb is that any compound with a TTLC analytical test result which is greater than 10 times its STLC value could be in excess of the STLC. To determine the constituent's leachability, the sample should be re-submitted for the Waste Extraction Test (WET).

Designated Wastes

In an attempt to provide standards for waste disposal, CCR Title 23 Subchapter 15 defines "desginated waste" as "nonhazardous wastes which consist of , cor contain, pollutants, which, under ambient environmental conditions at the waste management unit, could be released at concentrations in excess of applicable water quality objectives, or could cause degradation of waters of the state". Designated wastes may be discharged to Class II waste management units which have engineered containment features (Marshack, 1989). Designated wastes are addressed by ACDEH and are discussed further below.

State Action Levels and MCLs

California State Action Levels and MCLs are provided by the DHS Public Water Supply Branch (June, 1989). Although ground water within the project site area would probably not be considered as a potable water supply due to the proximity and potential intrusion of saline bay waters, these levels are provided within the text for comparative purposes.

E.2 UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

The U.S. Environmental Protection Agency (EPA) has finalized "waste characteristics" regulatory levels for 25 chemical constituents. Many of these chemical are regulated by CalEPA, and have corresponding TTLC and STLC. Benzene is one of the chemicals that are not regulated by CalEPA and are regulated by the U.S. EPA. The Toxic Characteristic Leaching Potential (TCLP) for benzene is 0.5 mg/l. The dilution for the TCLP test is 20:1. Thus, total benzene in concentrations of 20 times the TCLP could possibly exceed the TCLP. TCLP criteria are not provided for toluene, xylenes or ethyl benzene.

E.3 REGIONAL WATER QUALITY CONTROL BOARD

The RWQCB for the North Coast, the San Francisco Bay and the Central Valley have compiled "Tri-Regional Board Staff Recommendations for Preliminary Evaluation and Investigation of Underground Tank Sites" (August, 1990). This document describes guidelines for removing and investigating potential contamination from underground tank investigations, as well as procedures for site closures and remediation programs. However, these guidelines do not provide specific action levels or cleanup levels for petroleum constituent.

The RWQCB has also set forth guidelines to conduct a Leaching Potential Analysis for gasoline and diesel using TPH concentrations. These guidelines are set forth in the LUFT Manual (revised April, 1989). The LUFT Manual provides a scoring method for deriving TPH concentrations that may be left in-place without degrading shallow ground water. Through this scoring methods, depth to ground water and other pertinent physical characteristics of the site may be evaluated and a maximum allowable TPH level may be derived. These guidelines should be used when a site is more fully characterized and would not be appropriate for the Cypress Structure project at this preliminary phase of investigation.

E.4 ALAMEDA COUNTY WATER DISTRICT (ACWD)

Alameda County Water District (ACWD) is the agency that requires well permitting for most cities (including Oakland) within Alameda County. Zone 7 has provided guidelines regarding monitoring well construction, soil and ground-water sampling and guidances for underground tank investigations (ACWD, February, 1990 Revision). These guidelines were reviewed prior to initiating the site investigation for this project and should be used for further site investigations at specific sites.

The ACWD guidelines referred to above state that soil contaminated with petroleum products in excess of 1,000 mg/kg is considered a hazardous waste. Storage on site (above or below grade) for more than 90 days is not allowed under Title 22, Article 6 (666508A) without either a variance or permit. Materials shown to contain concentrations between 100 and 1,000 mg/kg TPH or Total Oil & Grease (TOG) are classified as "designated wastes" and may be subject to similar requirements.

E.5 ALAMEDA COUNTY DEPARTMENT OF ENVIRONMENTAL HEALTH

The Alameda County Department of Environmental Health (ACDEH) recommends that underground tank investigations be conducted in accordance with the RWQCB Tri-Regional guidelines as discussed above.

PRELIMINARY ENDANGERMENT ASSESSMENT

PHOENIX 800
800 CEDAR STREET
OAKLAND, CALIFORNIA

Cypress Reconstruction Phase 2
Contract No. 53S515
Task Order No. 04-192201-03

November 1993

1.0 INTRODUCTION

This document presents the results of a Preliminary Endangerment Assessment (PEA) conducted by On-Site Technologies, Inc. (OST) for the California Department of Transportation (Caltrans) at 800 Cedar Street, Oakland, Alameda County, California (Site).

The site is located along a portion of the proposed reconstruction alignment of the 1-880 Cypress Structure. Caltrans is in the process of designing the replacement of the Cypress Structure which collapsed in the 1989 Loma Prieta Earthquake and was subsequently demolished.

The State of California Environmental Protection Agency (Cal-EPA) Department of Toxic Substances Control (DTSC) in consultation with Caltrans established the need for preparing PEA Reports tor properties located along the proposed reconstruction alignment.

1.1 Preliminary Endangerment Assessment

The PEA is defined in Section 25319.5, Chapter 6.6 Division 20 of the California Health and Safety Code. The PEA is an activity which is performed to determine whether current or past waste management practices have resulted in the release or threatened release of hazardous substances which pose a threat to public health or the environment. The PEA is designed as a standard approach for evaluating sites contaminated or potentially contaminated with hazardous substances/wastes to determine if a removal or remedial action is required to protect public health and the environment. The basic objectives of the PEA include:

- Determine if a release of hazardous substances/wastes has occurred.

- Determine if the potential for a release of hazardous substances/wastes exists.

- Assess the threat to public health and the environment posed by the site.

- Determine if an emergency removal action is required to reduce the (potential) threat to public health and the environment.

- Determine if remediation actions are required at the site.

- Provide recommendations on the additional data that must be collected to further evaluate the site and how the site should be addressed in order to stabilize and remediate the long-term threats.

The PEA Report presented herein has been prepared in accordance with the DTSC's Interim Guidance for Preparation of a Preliminary Endangerment Assessment Report (June 22, 1990).

The PEA Report also includes a Baseline Risk Assessment (BRA) and Remedial Action Options Report (RAO).

1.2 Baseline Risk Assessment

The BRA has been prepared in accordance with the USEPA's Risk Assessment Guidance for Superiund. Volume 1. Human Health Evaluation Manual (Part Al. Interim Final (December 1989). The BRA is essentially an analysis of the potential adverse human health effects (current and future) caused by hazardous substances releases from the site in the absence of any actions to control or mitigate the releases. BRA's are site-specific. The BRA consists of five basic steps:

- Data collection and analysis
- Exposure assessment
- Toxicity assessment
- Risk characterization
- BRA Report preparation

1.3 Remedial Action Options Report

The RAO Report has been prepared in accordance with Article XXIV - Statement of Work, Part II - Site Investigations, pages 13 and 14, Remedial Action Options of Caltrans Statewide Contract Number 53S515. The RAO Report presents a review of

d} Michael Bondi Metal Design and Michael Bondi Wrought Edge Designs
e) Cypress Used Auto Parts
f) Ivan's Auto Body

Collectively, these businesses will be referred to as Phoenix 800.

2.1.2 Street Address

The Assessor's Parcel Number (APN) for the site is defined in Section 2.1.8. Within the site boundaries as defined by the **APN,** the following addresses were found:

a) 800 Cedar Street
b) 888 Cedar Street
c) 1812 Shorey Street
d) 1818 Shorey Street
e) 821 Pine Street

f) 1819 9th Street

Oakland, Alameda County, California 94607

Source: Site visit, Phoenix Properties

2.1.3 Mailing Address ,,·

a) 800 Cedar Street, Oakland, CA 94607
b) Post Office Box 24129, Oakland, CA 94623
c) unknown
d) 1818 Shorey Street, Oakland, CA 94607
e) 821 Pine Street, Oakland, CA 94607
f) 1819 9th Street, Oakland, CA 94607

Source: a,b,d,e, and **f** obtained from operators at each business

2.1.4 Phone Number

a) (510) 835-4118
b) (510) 465-9900
c) (510) 465-1648
d) (510) 763-1327
e) (510) 462-4534 and 451-3034
f} (510) 271-0138

Source: a,b,c,d,e,f - Pacific Bell

2.1.5 Other Site Names

1) Beginning date unknown through 1970 - entire parcel/building was occupied by Phoenix Iron Works; after 1970 building was split into 7 bays.

2) Date unknown, at 1823 Cedar Street (Bay 7) - "Terminal Manufacturing Company".

3) Date unknown (prior to 1970); at Bay 3 (address unknown) -"Vennell Steel".

4) Date unknown; at Bay 5 (address unknown) - plastic bag company

5) Up until 1951, Independent Iron Works occupied the entire building/parcel.

6) Sometime between and/or including 1912 and 1931, Independent Iron Works occupied the southern half of the parcel; California Fireworks Company occupied a portion of the northwest portion of the parcel; 3 dwellings occupied a portion of the northeast section of the parcel; and a soap factory occupied an area on the southern middle boundary of the parcel.

7) Sometime between and/or including 1902 and 1912, California Bedding & Upholstering Company occupied the southwest portion of the parcel; 14 dwellings occupied the northeast quarter of the parcel; The Dunn Cracker Company occupied the northwest area of the parcel. Chase Street bisected the center of the parcel between and perpendicular to Cedar and Pine Streets and New Street bisected the northern-half of the parcel perpendicular to and intersecting 9th Street. "

2.1.6 EPA Identification Number

EPA Identification Number CAL000010990. This number has been assigned to Pine Iron Works, 800 Cedar Street, Oakland, California.

Source: Department of Toxic Substances Control (DTSC)

2.1.7 DTSC Abandoned Site Program Information System (ASPIS) Database Number

The ASPIS Database is currently referred to as CALSITES. The site is listed on the CALSITES Database as number 01330037.

Source: Cal-EPA Department of Toxic Substances Control (DTSC)

2.1.8 Assessor's Parcel Number (APN) and Map

The Alameda County Tax Assessor's Office (ATCA) identifies the APN for the site as 6-47-1. The ACTA's plat map for the site is illustrated on Figure 2.1.8.

Source: Alameda County Tax Assessor's Office (ACTA)

2.1.9 Township, Range, Section, and Meridian

No township, range, section and meridian has been assigned to the site by the United States Geological Survey (USGS). The site is included within part of the VND Peralta Spanish Land Grant. Approximate longitude is 122° 18' 30". Approximate latitude is 37° 48' 30".

Source: United States Geologic Survey - Menlo Park (USGS)

2.1.10 Map of Site Location

Figure 2.1.1O illustrates the location of the site and vicinity within a one mile radius of the site.

Source: USGS 7.5 Minute West Oakland Quadrangle

2.2 Past and Current ,Site Activities

2.2.1 Business Type

The type of current and past businesses which have operated on the site are listed on Table 2.2.1.

Source: ACTA, SIM, OPL, historic Pacific Telephone and Telegraph directories (PT&T), Oakland Tribune {1945), Buyers Guide for Metropolitan Oakland 1938, 1942 and 1943

2.2.2 Years of Operation

Table 2.2.1 lists the operating dates for the current business operating on the site, and

for businesses that operated on the site in the past.

Source: ACTA, SIM, OPL, historic PT&T directories

2.2.3 Facility Ownership/Operators

Table 2.2.1 lists the persons or corporations which currently own/operate the current business on the site, and those persons or corporations which owned/operated businesses that operated on the site in the past.

Source: ACTA

2.2.4 Property Owners

The current and past owners of the property are listed on Table 2.2.1.

Source: ACTA, SIM, OPL

2.2.5 Site Business Activities or Manufacturing Processes

A summary description of the type of business activities and manufacturing processes undertaken at the site by past and current businesses operating on the site is presented on Table 2.2.5. Figures 2.2.5.a, 2.2.5.b, 2.2.5.c, and 2.2.5.d illustrate features on the site with respect to past and current business activities.

Several 55-gallon, black metal drums were observed in two separate areas along the west side of the building. These drums were not labeled and the contents are unknown.

Source: Site visit, Bay Area Air Quality Management District (BMQMO)

2.3 Hazardous Substance/Waste Management

2.3.1 Hazardous SubstancesjWastes Identification and Quantities

A summary description of hazardous substances/wastes utilized currently and in the past on the site is listed on Table 2.3.1. Amounts of hazardous wastes generated are unknown.

Source: ACDEH, SIM, OPL, Regional Water Quality Control Board (RWQCB)

2.3.2 On-Site Storage, Treatment, Disposal

Two underground diesel storage tanks (1,000 gallon and 300 gallon) are located on the site. Hazardous waste treatment or disposal activities undertaken on the site currently or in the past are unknown. **A** summary description of on-site storage of hazardous substances/wastes/treatment and disposal is presented on Table 2.3.2.

Figure 2.3.2 illustrates the location of the underground storage tanks on the site. Additionally, approximately 13 filled 55-gallon tanks are currently stored against the southwestern side of the building. One drum was open and appeared to contain black medium grained sand-sized material.

Source: ACDEH, RWOCB, BEC Phase I and Phase II Site Assessment, September 1990

2.3.3 Regulatory Status

No record of hazardous substances/waste permits held by businesses on the site were found.

Source: ACDEH, RWOCB

2.3.4 Inspection Results

A summary of regulatory inspections undertaken at the Site is presented on Table 2.3.4.

Source: ACDEH, BAAOMD

3.0 APPARENT PROBLEM

During May 1990, the site owner (Phoenix Properties) contracted Baseline Environmental Consulting (BEC) to conduct a Phase I and Phase II Site Assessment at the subject site. A complete description of the investigations and results attained is presented in Section 5.1 - Past Sampling Activities.

Soil at the site was found to be contaminated with total concentrations of lead at greater than ten times the Soluble Threshold Limit Concentration (STLC) for lead as established in Title 22 California Code of Regulations. Analyses to determine soluble lead concentrations using CalEPA Waste Extraction Test (WET) methods resulted in detecting soluble lead concentrations less than the STLC for lead. Ground water underlying the site was not sampled.

In June 1992, Caltrans contracted Geo/Resource Consultants, Inc. (GRC) to conduct a limited First Phase Site Investigation (FPSI), specifically in the immediate vicinity of the two existing underground storage tanks (Section **2.3.2). A** complete description of the investigation and results attained is presented in Section 5.1 - Past Sampling Activities.

Soil in the immediate vicinity of the two underground storage tanks was found to be contaminated with total petroleum hydrocarbons as gasoline (TPH-G) and diesel (TPH-

D). Ground water underlying the site was not found to be contaminated with TPH-G or TPH-D.

GRC concluded that additional soil borings be drilled to fully characterize the extent of the soil contamination in the immediate vicinity of the two underground storage tanks so remedial alternatives could be determined.

The primary human and environmental resources of concern on and in the immediate vicinity of the site are:

- Residential neighborhoods in the immediate vicinity of the site.
- Workers on-site.

The pathways of exposure to the primary and environmental resources of concern on and in the immediate vicinity of the site in consideration of the existing physical setting of the site may include:

- Incidental ingestion of contaminated soil.
- Dermal contact with contaminated soil.

Ingestion of contaminated ground water by humans is not an exposure pathway because ground water in the region is not used for drinking water purposes. This is further detailed in Section 4.2 - Factors Related to Water Pathways. The likely exposure pathways for this site are described in Section 6.3.

Source: Baseline Environmental Consulting (BEC), Phase I and Phase II Site Assessment, September 1990

Geo/Resource Consultants, Inc., (GRC), Site Investigation Report - Area 4, August 1992

Site visit; ACTA

Final Environmental Impact Statement/Report, I-880/Cypress Replacement, Alameda County, California, Caltrans, 1991

4.0 ENVIRONMENTAL SETTING

4.1 Factors Related to Soil Pathways

There is a documented release of metals and petroleum hydrocarbons to the underlying soil profile.

The site assessment conducted by SEC found elevated concentrations of barium, lead and zinc with respect to the other heavy metals analyzed.

No soil contamination remediation activities have been undertaken at the site.

Source: SEC Phase I & Phase II Site Assessment, September 1990. GRC Site Investigation Report - Area 4, August 1992

4.1.1 Topography of the Site and Surrounding Areas

The topography of the site and surrounding areas **is** generally flat. The topography of the site and vicinity is illustrated on Figure 4.1.1.

The site is located on Cedar Street between Shorey and Goss Streets. It is rectangular in plan, and occupies an area of approximately 77,400 square feet. Currently, the site is occupied by a large metal warehouse from which the various businesses operate. The property is not fenced. The property was part of the historic Independent Iron Works operation dating from the 1950's.

Source: USGS 7.5 Minute West Oakland Quadrangle, ACTA, Site visit

4.1.2 Land Use and Zoning for Site

The site is zoned M-30, General Industrial.

Source: Alameda County Planning Department (ACPD)

4.1.3 Environmental Impacts of Releases from the Site

Evidence of environmental impact from releases at the site were unable to be identified due to the restrictions of the Permit To Entry between Caltrans and the property owner. As stated in Section 4.1.1. the site presently is occupied by a warehouse which is underlain, at least in part, by an earthen floor.

Source: Site visit, ACDEH

4.1.4 Predominant Hydrologic Soil Group

The soil underlying the site is the Urban Land-Baywood Complex. This soil is classified under Hydrologic Soil Group A. Group **A** soils have a high infiltration rate when thoroughly wet and have a low runoff potential. They are mainly deep, well drained, and sandy or gravelly. This soil consists of approximately 60 percent Urban land, 35 percent Saywood loamy sand, and 5 percent other soils, including drained loams. Also included are small areas of a very deep, loamy sand that is weakly cemented below a depth of 30 inches.

Urban Land consists of areas that are covered by buildings and other structures. The soil material has been altered or mixed, but it closely resembles Baywood soil.

The Baywood soil is very deep and somewhat excessively drained. It formed in eolian sediment that derived from old beach deposits. Typically the surface layer is grayish brown and brown, slightly acidic loamy sand about 32 inches thick. The underlying material is pale brown and light yellowish brown, slightly acidic loamy sand and extends to a depth of 60 inches or more.

Permeability is rapid. The available water capacity is 0.06 to 0.10 inches. The root zone is more than 60 inches deep. Runoff is slow to medium. Wind erosion is substantial if this soil is left bare.

This soil has few limitations for urban development.

Source: United States Department of Agriculture (USDA); Soil Conservation Service (SGS) Soil Survey of Alameda County, California, Western Part 1981

4.1.5 Soil Permeability

Table 4.1.5 lists the permeability characteristics of the Urban Land - Baywood Complex underlying the site. The least permeable continuous layer under the site is the Older Bay Mud. Table 4.2.2 describes the lithology, depth, and thickness of this formation.

Source: USDA, SGS Soil Survey of Alameda County, California, Western Part 1981

4.1.6 Surface Slope

The surface slope at the site is to the southwest at approximately 0.003 percent and continues Jo the west towards the Oakland Middle Harbor approximately 1 mile from the site.

Source: USGS 7.5 Minute West Oakland Quadrangle

4.1.7 Soil Stability and Seismic Conditions

The soil underlying the site is stable and shows little to no liquefaction potential.

The maximum earthquake intensity predicted for the site assuming a 8.0 or greater Richter magnitude earthquake along the San Andreas or Hayward Fault is very strong.

Very strong has the capability of:

- Brickwork and masonry badly cracked with occasional collapse.
- Brick and masonry gables thrown down.
- Frame buildings lurched or listed on fair or weak underpinning structures with occasional falling from underpinning or collapse.
- General destruction of chimneys and **of** masonry, brick, or cement veneers.
- Considerable cracking or crushing of foundation walls.

Source: USGS Miscellaneous Field Studies Map MF-709.

4.1.8 Site Access

The entire site is occupied by a metal warehouse. Access to the structure is limited to the various businesses that operate within the structure. Access to the interior of the structure was restricted due to the Permit To Entry between Caltrans and the property owner. In addition, because of the type of activities being undertaken by the various businesses, access may be restricted to persons wearing appropriate health and safety gear. Partial visual access was only obtained at the various businesses exterior openings.

Source: Site visit

4.1.9 Measures to Prevent Exposures to Contaminated Soil

There are numerous drums stored on the western exterior of the warehouse, which are unmarked and sealed. These drums are placed directly on the asphalt on the exterior of the site. The drums are not on pallets, not fenced, and not covered. An earthen floor underlies at least part of the warehouse. Therefore hazardous materials or wastes have the potential to leak, spill or leach to underlying soil within the warehouse.

The remainder of the surticial soil at the site is covered with asphalt concrete pavement.

Source: Site visit, ACDEH-Hazardous Materials Management Plan

4.1.10 Nearby Residential Areas, Schools, Businesses, Day Care Centers, Nursing Homes, Senior Citizen Communities, or Hospitals Within One Mile of the Site

Figure 4.1.10 illustrates the locations of schools, day care centers, nursing homes, senior citizen communities and hospitals within one mile of the site.

Source: Final Environmental Impact Statement/Report, I-880/Cypress Replacement, Alameda County, California, Caltrans, 1991

4.1.11 Nearest Critical Habitat for Sensitive, Threatened, or Endangered Species within one mile of the Site

There are no sensitive, threatened, or endangered species within one mile of the site.

There are no flora, fauna, or sensitive ecosystems in the vicinity of the site known to be affected by contaminants emanating from or attributable to the site.

Source: Natural Diversity Data Base (NDDB), California Department of Fish and Game (CDFG)

4.2 Factors Related to Water Pathways

4.2.1 Net Seasonal Precipitation and One Year, 24-hour Rainfall Collection

The average annual net precipitation at the site is 18.69 inches based on average monthly and annual precipitation data measured over the period 1941 to 1970 at the Oakland International Airport.

The one year, 24-hour rainfall level at the site is approximately 0.10 inches over the period 1951 to 1960.

Source: United States Department of Commerce (USDC) - National Oceanic and Atmospheric Administration **(NOAA)**

4.2.2 Site Geology and Hydrogeology

The geology of the site is presented on Table 4.2.2. The hydrogeology of the site is presented on Table 4.2.2.a. Figure 4.2.2 illustrates the surficial geology of the site and vicinity.

Source: USGS Miscellaneous Geologic Investigation Map 1-239

4.2.3 Aquifer Contamination

Ground water occurring within the soil profile (Urban Land - Baywood Complex) underlying the site is contaminated based on the results of PEA sampling activities described in Section 5.3 -PEA Sampling Activities.

Ground water occurring in the Merritt Sand at depth is threatened as a result of contamination of ground water in the soil profile underlying the site. This is because the site and surrounding vicinity are located within the recharge area for ground water occurring at depth in the Merritt Sand.

Ground water occurring in permeable sediment intervals within the Older Bay Mud may be hydraulically interconnected with ground water occurring in the Merritt Sand. As a result, ground water occurring in the Older Bay Mud may also be threatened. However, there is no data available for determining the direction of ground water movement between the Merritt Sand and the Older Bay Mud.

Source: BEG Phase I & Phase II Site Assessment, September 1990

GRC Site Assessment- Area 4, August 1992

Initial Site Assessment for the Alternative Corridor Study, Route 880/Cypress Replacement, Caltrans. 1990

4.2.4 Aquifer Usage

Table 4.2.4 lists the usage c aracteristics for aquifers identified in Table 4.2.2.a.

Ground water in the vicinity and region of the site is not used for drinking water purposes or for municipal water supply (i.e. firefighting, industrial/manufacturing uses, etc.). Water for drinking and municipal supply is drawn from surface water supplies stored in reservoirs located east of the region which capture precipitation and snowmelt runoff derived from the Sierra Nevada foothills and mountains.

The water purveyor in the region is the East Bay Municipal Utilities District (East Bay MUD).

Source: East Bay Municipal Utility District (EBMUD)
Alameda County Flood Control and Water Conservation District {ACFCWCD)
Initial Site Assessment for the Alternative Corridor Study, Route 880/Cypress Replacement, Caltrans, 1990

4.2.5 Possible Migration Routes to Surface Waters and Critical Habitats

Surface water at the site drains off of the warehouse roof onto the asphalt pavement surrounding the building and either evaporates to the atmosphere or infiltrates into three subsurface drains identified adjacent to the site. These drains are located at: 1) the southwest corner; 2) the northwest corner; and 3) the southeast corner of the building exterior. It is unknown, if there are storm drains existing within the building. It is unknown as to where the existing drains flow. Table 2.2.5.d illustrates the storm drain locations. There is no discernable surface water runoff collection and conveyance system on the site.

Source: Site visit

4.2.6 Surface Waters

Figure 4.2.6 illustrates the locations of surface water, marshlands, wetlands, and critical habitats nearest the site. Table 4.2.6 lists the distances to surface water, marshlands, wetlands, and critical habitats nearest the site.

Source: National Wetlands Inventory, United States Department of the Interior, Department of Fish and Game, 1985; NDDB-CDF&G, 1993

4.2.7 Surface Water Body Intakes

There are no uses of water from San Francisco Bay for drinking water and/or municipal supply. ,

Source: EBMUD

4.2.8 Site Surface Water Runoff Mitigation Measures

There are no structures mitigating surface water runoff from the site.

Source: Site visit, ACDEH Hazardous Materials Management Plan (HMMP)

4.2.9 Location of Flood Plains

The site is not located within a flood plain. Figure 4.2.9 illustrates 100 year flood plains in the vicinity of the site.

Source: USGS Water Resources Investigation 37-73

4.2.10 Population Served by Surface Water Supplies

Water from San Francisco Bay is not used for any beneficial purpose other than to support salt and freshwater marine life and ecosystems. Surface water for drinking water, municipal supply (i.e. firefighting, industrial/manufacturing uses, etc.), irrigation of agricultural lands, and livestock watering in the region of the site is drawn from surface water supplies stored in reservoirs located east of the region which capture precipitation and snowmelt runoff derived from the Sierra Nevada foothills and mountains.

The water purveyor in the region is the EBMUD.

Source: EBMUD

4.2.11 Locations and Populations of Schools, Day Care Centers, Hospitals, Nursing Homes, or Retirement Centers Which Use Surface Water Supplies

Water from San Francisco Bay is not used for any beneficial purpose other than to support salt and freshwater marine life and ecosystems. Surface water for drinking water use by these facilities is drawn from surface water supplies stored in reservoirs located east of the region which capture precipitation and snowmelt runoff derived from the Sierra Nevada foothills and mountains.

The water purveyor in the region is the EBMUD.

Source: EBMUD

4.3 Factors Related to **Air Pathways**

No record of a release to the atmosphere from the site has been documented. D.isturbance of the soil profile underlying the site may result in the release of contaminants to the atmosphere.

Source: Site visit, Bay Area Air Quality Management District (BMOMD)

4.3.1 Potential Source and Mechanism of Release

A potential source of release would be the soil profile underlying the site should the soil profile be disturbed by excavation. The mechanism would be the release of dust contaminated with heavy metals from the soil to the atmosphere.

Source: Site visit

4.3.2 Prevailing Daily Wind Direction and Average Velocity at the Site

Table 4.3.2 lists the prevailing daily wind direction and average wind velocity at the site. Wind direction and velocity data was collected at the Oakland International Airport.

Source: United States Department of Commerce (USDC) - National Oceanic and Atmospheric Administration (NOAA)

4.3.3 Local Climactic Factors

Table 4.3.3 lists the local climactic factors for the site.

Source: USDC - NOAA

4.3.4 Timing of Potential Threatened Release

The potential release and mechanism could occur during excavation of the soil profile underlying the site by heavy equipment.

Source: Site visit

4.3.5 Possible Dispersion Routes for Potential Threatened Release

The possible dispersion routes would include:

- Transport from the site and dispersion with the prevailing wind
- Settlement of heavy metal impregnated dust downwind of the site

Source: USEPA Superfund Exposure Assessment Manual, 1988
USEPA Exposure Factors Handbook, 1987

4.3.6 Population Possibly Exposed to Potential Release from Site

The population possibly exposed to a potential release from the site as outlined in Section 4.3.1 is approximately 20,000 within 1 mile of the site, and approximately 200,000 within 5 miles of the site.

Source: United States Census Bureau, 1990

4.3.7 Schools, Day Care Centers, Hospitals, Nursing Homes, Retirement Communities, and Senior Citizen Communities Possibly Exposed to Potential Release from **Site**

Figure 4.1.1O illustrates the locations of schools, day care centers, hospitals, nursing homes, retirement communities, and senior citizen communities within one mile of the site that may be exposed to a potential release from the site borne by air pathway. Table 4.3.7 lists the distances from the site to these facilities.

Source: Thomas Guide for Alameda County

Final Environmental Impact Statement/Report, I880/Cypress Replacement, Alameda, California, Caltrans, 1991

4.3.8 Additional Areas Possibly Exposed to a Potential Release from the Site

Figures 4.3.8.a and 4.3.8.b illustrate the following areas that may be possibly exposed to a potential release from the site:

- Commercial/industrial areas
- Residential areas
- Historic/landmark sites

Titles shown on Figure 4.3.Ba (e.g., Peralta Villa, etc.) represent> distinct neighborhoods within the project area. Land use within each neighborhood is variable as commercial activities abut residential property; however, commercial/industrial areas are located within the following neighborhoods: Clawson, McClymonds, Ralph Bunche, Prescott and Phoenix. There are no prime and/or non-prime agricultural lands within 1/2 mile of the site.

Source: Final Environmental Impact Statement/Report, I-BO/Cypress Replacement, Alameda County, California, Caltrans, 1991

4.3.9 Sensitive Areas Possibly Exposed to a Potential Release from the Site

Figure 4.2.6 illustrates the locations of surface water, marshlands, wetlands, and critical habitats nearest the site. Table 4.2.6 lists the distances to surface water, marshlands, wetlands, and critical habitats nearest the site.

Source: National Wetlands Inventory, United States Department of the Interior, Department of Fish and Game, 1985

NDDB-CDF&G, 1993

5.0 SAMPLING ACTIVITIES AND REQUIREMENTS

5.1 Past Sampling Activities

During May 1990, the property owner (Phoenix Properties) contracted BEG to conduct a Phase I and Phase II Site Assessment at the subject site. The sampling objective was to determine ii hazardous substances are present in the shallow subsurface soil and/or ground water. Five soil borings were drilled and sampled. Soil borings PP-4, PP-5, and PP-6 were each drilled to 5.5 feet below ground surface (BGS). PP-7 was drilled to 6.0 feet BGS. PP-8 was drilled to 11.5 feet BGS. PP-9 was drilled to 8.5 feet BGS. Eleven soil samples were collected from the five soil borings and submitted for analyses. Laboratory results indicated the presence of lead at 52 milligrams per kilogram (mg/kg) in a soil sample from PP-6. The concentration exceeded ten times the Soluble Threshold Level Concentration (STLC), therefore, a Waste Extraction Test (WET) was performed. The results from the WET test indicate an STLC of 2.26 mg/I which is below the STLC of 5 milligrams per liter (mg/I) for lead. Petroleum hydrocarbon compounds, including semivolatile hydrocarbons, were not detected in any of the soil samples analyzed. Tables 5.1.a, 5.1.b, and 5.1.c summarize the analytical results.

In June 1992, Caltrans contracted GRC to conduct a limited FPSI. The sampling objective was estimated the areal and vertical extent of contamination in the soil and ground water. Two soil borings and one HydroPunch boring were drilled from 8 to 27 FBGS. One boring was converted to a ground water monitoring well. Ground water was measured at approximately 7 feet BGS. Soil and ground water samples were submitted for analyses. Soil samples were found to contain various concentrations of TPH-D (the highest at 2,400 mg/kg) and TPH-G (the highest at 17 mg/kg). Ground water samples did not contain analytically detectable concentrations of TPH-G or TPH-D. GRC concluded that additional soil borings be drilled to fully characterize the extent of the soil contamination so remedial alternatives could be determined. Table 5.1.d summarizes the analytical results.

Copies of BEC's Site Investigation Report, and GRC's FPS! Report - as submitted to Caltrans, are presented in Appendix B.

5.2 PEA Sampling Activities

PEA sampling activities were conducted by OST at the site during the week of March 22 - 26, 1993.

The PEA Sampling and Analyses Plan (SAP) for the site is presented in Appendix C.

5.2.1 PEA Sampling Objectives

The objective of the PEA SAP is to bound the extent of soil and ground water

contamination on the site that was discovered during the conduct of First Phase Site

Investigations (FPSl's) by BEC and GRC, to generate data and information to recommend appropriate remedial action options, and to prepare a PEA report for the site.

5.2.2 Standard and Guidance

The SAP was prepared in accordance with USEPA Preparation of a USEPA Region 9 Sampling Plan, (memorandum from Tom Huetteman-Remedial Project Manager to Sample Plan Writers and Remedial Project Managers, November 18, 1987).

Each SAP consists of a Field Sampling Plan, a Quality Assurance/Quality Control Plan, and a Site Safety Plan.

The Field Sampling Plan describes the investigative methods and procedures to be utilized to ensure the collection of representative soil and ground water samples for analyses. In general, field activities included drilling and collecting soil samples from soil borings, collecting grab ground water samples from the soil borings using HydroPunch apparatus, and analyzing the collected soil and ground water samples in accordance with the analytical protocol.

Both the field activities and the analytical protocol were developed by Caltrans, and are specified in Task Order Number 04-192201-03. Soil and well bore drilling were conducted in accordance with the provisions of Article XXIV - Statement of Work, Part II - Site Investigations, pages 19 through 21 "Drilling", Caltrans Statewide Contract Number 53S515. Soil sampling from soil and well borings will be conducted in accordance with the provisions of Article XXIV -Statement of Work, Part II - Site Investigations, page 21 "Sampling", Caltrans Statewide Contract Number 538515. HydroPunch grab ground water sampling were conducted in accordance with the methods and procedures outlined in the SAP for each property where HydroPunch sampling will take place.

The Site Safety Plan outlines methods and procedures for protecting personnel and the general public during the conduct of the SAPS. The Site Safety Plan was prepared in accordance with the provisions of Article XXIV - Statement of Work, Part II - Site Investigations, pages 15 through 17, "Health and Safety Plans", Caltrans Statewide Contract Number 53S515.

Quality Assurance/Quality Control describes the analytical methods and procedures utilized to analyze the samples collected, and to ensure that the analytical data generated are accurate, precise and complete. Quality Assurance/Quality Control was conducted in accordance with the provisions of Article XXIV - Statement of Work, Part II - Site Investigations, pages 22 through 23, "Quality Assurance/Quality Control", Caltrans Statewide Contract Number 53S515.

5.2.3 Sample Collection and Analyses

Three soil borings were drilled at the site. The SAP called for installing three ground water monitoring wells to collect ground water samples. However, Caltrans opted to collect ground water samples from all three borings using a HydroPunch sampling tool. Figure 5.2.3 illustrates the locations of soil borings for the PEA sampling activities conducted. Table 5.2.3 summarizes the soil boring identification, sampling depths, and general soil classifications.

Soil samples were collected to a depth of 8 feet below grade at each soil sample boring and HydroPunch location based on encountering ground water at a depth of approximately 8 feet below grade. The SAP outlined soil sampling to be conducted to a depth of 6 feet below grade assuming depth to ground water at 6 feet below grade based on the results of the FPSl's conducted at the site.

Subsequent to approval of the Plan, Caltrans requested that selected soil samples (at 2 feet BGS and immediately above ground water) and all ground water samples be analyzed for volatile organic compounds (VOC's).

With the exception of the collection of ground water samples, the soil sampling methods and procedures were conducted in accordance with the SAP. Soil boring logs are presented in Appendix D.

5.3 Evaluation of PEA Sampling Results

5.3.1 Sample Analyses"

Soil and ground water samples were submitted to Chromalab, Inc., for analyses. Table 5.3.1.a lists the soil analytical protocol. Table 5.3.1.b lists the ground water analytical protocol. Table 5.3.1.c lists the soil analytical results. Table 5.3.1.d lists the ground water analytical results. Laboratory analytical results, including QA/QC data, are presented in Appendix D. TPHg in ground water was not analyzed in this phase of the investigation because during the Phase I sampling no TPHg was detected in ground water.

5.3.2 Discussion

Based on the analytical results, which indicated that a release has occurred at the site, and on our review of spike and duplicate spike recoveries, the sampling and data quality objectives have been met. Soil sample analyses detected all metals, except for cadmium. None of the metals detected exceeded ten times their respective STLC; therefore, determination of soluble metal's concentrations using CalEPA WET was not conducted. Petroleum hydrocarbon compounds, including semivolatile and volatile organic compounds, were not detected in any of the soil samples in excess of their respective analytical detection limits. All spike and duplicate spike recoveries are within the respective USEPA Method range.

Ground water sample analyses detected all metals except for cadmium. Concentrations of total chromium and lead exceeded their respective USEPA Maximum Contaminant Levels (MCLs). Total petroleum hydrocarbons as diesel (TPH-D) were detected in all three samples. However, no semivolatile or volatile organic compounds were detected. All spike and duplicate spike recoveries are within the respective USEPA Method range. The data appears to be valid and appropriate methods and QA/QC measures were implemented to ensure data quality.

6.0 BASELINE RISK ASSESSMENT

6.0.1 Introduction

The purpose of this BRA is to evaluate potential public health risks associated with heavy metals and petroleum hydrocarbons detected at the site in soil and ground water samples, in consideration of the existing physical setting of the site and land use conditions, and prior to the implementation of any remedial action.

This BRA evaluates the environmental fate, transport, and toxicological properties of selected indicator chemicals detected in soil and ground water samples during the PEA sampling and analyses activities and earlier FPSl's conducted at the site. Exposure routes via soil and ground water, human populations potentially at risk, and potential carcinogenic and noncarcinogenic health risks relevant to the site are characterized. This BRA evaluates human health risks associated only with those heavy metals and petroleum hydrocarbon compounds identified in the soil and ground water samples collected during the conduct of the PEA sampling and analyses activities and earlier FPSl's.

6.0.2 Methodology

The sections, as outlined below, correspond to steps in the BRA:

- Chemicals of Potential Concern (Section 6.1). This section reviews soil and ground water analytical data to determine the chemicals of concern at the site (indicator chemicals) to be evaluated in the BRA. The methods used to establish indicator chemicals are discussed in this section.
- Exposure Assessment (Section 6.2). Routes of exposure of the indicator chemicals via soil and ground water to human receptors are identified.

- Toxicity Assessment (Section 6.3). Toxicological properties of the indicator chemicals and potential human health risks resulting from exposure to the indicator chemicals via soil and ground water are reviewed.

- Exposure Analysis (Section 6.4). Receptor populations evaluated in the BRA are identified. Exposure routes and intake assumptions for the exposure routes are discussed.

- Risk Characterization (Section 6.5). For chemicals identified in Section 6.1, intakes (doses) are estimated for the routes of exposure via soil and ground water.

- Sources of Uncertainty and Error (Section 6.6). Potential uncertainties in the BRA process are discussed.

- Summary and Conclusions (Section 6.7). The conclusions of this BRA are summarized.

6.0.3 Background

A complete description of the historical background of the site is presented in Section 2.0. The environmental setting of the site is presented in Section 4.0.

6.1 Chemicals of Potential Concern

The analytical data generated by the PEA sampling and analyses activities and earlier FPSI's are reviewed in this section, and indicator chemicals used in the risk characterization are selected. In identifying indicator chemicals the following information is considered:

- Concentrations of detected chemicals
- Detection frequency
- Chemical/physical properties and persistence
- Toxicities

6.1.1 Investigated Media

This section reviews the analytical data for soil and ground water samples collected at the site.

6.1.1.1 Soil

Soil samples were collected from areas on the site as described in Section 5.0. Figure 5.2.3 illustrates the soil sampling locations. Tables 5.1.a, 5.1.b, 5.1.c, and 5.1.d summarize the soil sampling activities and analytical results generated by FPSI's conducted at the site. Table 5.2.3 summarizes the PEA soil boring identification, sampling depths, and general soil classification. Table 5.3.1.c summarizes the soil analytical results generated by the PEA sampling and analyses activities.

The underlying soil profile is contaminated with elevated levels of heavy metals and total petroleum hydrocarbon compounds. The petroleum hydrocarbons are diesel and gasoline fuel compounds.

6.1.1.2 Ground Water

Ground water samples were collected during the FPSI's from one location on the site, and during the PEA sampling and analyses activities from three locations on the site. These locations are illustrated on Figure 5.2.3. Ground water samples collected during the FPSI's were collected from a ground water monitoring well. Samples collected during the PEA sampling and analyses activities were collected using a HydroPunch sampling tool. Table 5.1.d summarizes the ground water analytical results generated by the FPSI's. Table 5.3.1.d summarizes the ground water analytical results generated by the PEA sampling and analyses activities.

Uppermost ground water beneath the site is contaminated with elevated levels of heavy metals and TPH-G and TPH-D.

6.1.2 Selection of Indicator Chemicals

The indicator chemicals that will be used in the BRA are limited to those that were analytically detectable and identifiable by the FPSI and the PEA sampling and analyses activities. These chemicals include heavy metals detected in soil and ground water by the FPSI and the PEA sampling and analyses activities.

The indicator chemical suite does not include petroleum hydrocarbons compounds. Although TPH-G and TPH-D were detected in the FPSI's, and TPH-D in the PEA sampling and analyses activities, the concentrations detected represent only the total mass of diesel and/or gasoline fuel constituents present in the soil and/or ground water samples which were analyzed, and gives no identity as to what type, or types, of constituents were detected. The common gasoline constituents benzene, toluene, ethylbenzene, and total xylenes (BTEX) were not detected. As a result, only the heavy metals that were analytically detected in soil and ground water samples **will** be considered as the indicator chemicals.

An indicator chemical screening process is used which permits a focused study of the heavy metals at the site which pose the greatest potential risk to human health. The heavy metals used for indicator chemicals were selected based on concentrations, frequency, persistence, and toxicity that are most likely to contribute significantly to human health risks calculated for exposure scenarios involving soil and/or ground water. The method for selecting the indicator chemicals for this BRA is presented Risk

Assessment Guidance for Superfund. Volume 1, Human Health Evaluation Manual (Part A). Interim Final (RAGS; United States Environmental Protection Agency [USEPA], 1989).

Each heavy metal detected in soil and ground water is first scored according to its high and low·concentration and toxicity to obtain a risk factor using:

Rij = (Cij)(fij)
where: Rij risk factor for heavy metal i in medium **j;**
Cij Ratio of high to low concentrations of heavy metal i in medium j; and
Tij toxicity value for heavy metal i in medium j.

The toxicity factors used are oral slope factors for carcinogens. and the inverse of the oral Chronic Reference Dose (RID) for noncarcinogens. Separate scores are calculated for each medium and are presented in Table 6.1.2.

Heavy metal-specific risk factors are summed to obtain the total risk factor for all heavy metals of potential concern in soil and ground water using:

Rj = R1j + R2j + R3j + . . . + Rij

where: Rj = total risk factor for medium j; and
R1j + ... + Rij = risk factors for heavy metals 1 through i in medium j.

Separate scores are calculated for each medium and are presented in Table 6.1.2.

The ratio of the risk factor for each heavy metal (Rij) to the total risk factor (Rj) approximates the relative risk for each heavy metal in each medium. These ratios (Rij/Rj) are listed on Table 6.1.2.

6.1.3 Selected Indicator Chemicals

Heavy metals with Rij/Rj ratios greater than 0.05 were selected as the indicator chemicals. These are listed on Table 6.1.3.

Section 6.3 summarizes the toxicological information for each indicator chemical.

6.2 Exposure Assessment

This section identifies the potential human receptors, fate and transport of the indicator chemicals, and exposure pathways associated with the existing land use and physical setting of the site.

6.2.1 Human Receptor Populations

A human receptor population is a person or set of people who can be exposed to the indicator chemicals at the site at a specific exposure point at which human contact with an indicator chemical, or chemicals, can occur.·

The primary human receptors at and in the immediate vicinity of the site are:

- Residents in the immediate vicinity of the site.
- Workers at the site.

All of the human receptors are considered sensitive human populations.

6.2.2 Fate and Transport of the Indicator Chemicals in Soil and Ground Water

The indicator chemicals are heavy metals which are considered to be mobile in the underlying soil profile because of the lack of clay or organic matter within the soil profile and geologic material comprising the uppermost aquifer.

6.2.2.1 Soil

A description of the soil profile underlying the site is presented in Section 4.1.4.

The fate and transport of the indicator chemicals in the soil profile underlying the site are governed by several physical and chemical factors including:

- soil moisture
- leaching
- aeration
- mineralogy
- clay content
- organic matter content
- pH
- biological activity and soil chemical composition

These factors influence the fate-controlling processes of precipitation and dissolution of solids, acid-base reactions, complex formations, redox reactions, exchange and adsorption, and mass transfer.

Soil chemical reactions that may possibly shift the equilibrium in favor of the aqueous solution, such as decreased pH and complex or chelate formation or the presence of reducing conditions, greatly increase the mobility of the indicator chemicals. Lack of information of the chemical form of the heavy metals detected in the underlying soil profile, in addition to soil chemistry, makes it difficult to infer their possible fate. However, because of the lack of organic matter in the soil profile underlying the site, and based on the soil conditions described in Section 4.1.4, and those conditions encountered during the FPSl's and PEA sampling and analyses activities, it can be expected that the indicator chemicals are mobile in the soil profile underlying the site.

Surface water runoff at the site occurs only during storm events. Runoff from the site is captured and conveyed by storm drain to the Oakland Inner Harbor. Some off site transport of the indicator chemicals with runoff may occur in the form of sorbed species in suspended sediment.

6.2.2.2 Ground Water

A description of the hydrogeology of the site and contamination of the uppermost aquifer is presented in Sections 4.2.2 and 4.2.3, respectively.

The fate and transport of the indicator chemicals in uppermost ground water underlying the site are governed by several physical and chemical factors including, adsorption-desorption, ion exchange, complexing, pH, ion filtration, gas generation, precipitation-dissolution, biodegradation, and chemical degradation. These factors influence the fate-controlling processes of molecular diffusion and hydrodynamic dispersion (transverse, longitudinal, and vertical).

Chemical reactions that increase the likelihood of transport, such as decreased pH and complex or chelate formation or the presence of reducing conditions, greatly increase the mobility of the indicator chemicals in aqueous environments. Lack of information of the chemical form,of the indicator chemicals detected in the uppermost ground water samples, in addition to ground water chemistry, makes it difficult to infer their possible fate. However, because the indicator chemicals were detected in ground water samples collected from uppermost ground water beneath the site, the lack of organic matter in the aquifer material, the soil conditions described in Section 4.1.4, and those conditions encountered during the FPSl's and PEA sampling and analyses activities, it can be expected that the indicator chemicals are mobile in the uppermost ground water underlying the site with the potential for off site migration.

6.2.3 Potential Exposure Pathways

Soil and ground water may serve as transport media for the indicator chemicals to migrate from the site to human receptors. The potential exposure pathways are identified on the basis of information on the indicator chemicals and their environmental fate.

Potential exposure routes include inhalation, ingestion, and dermal adsorption. Generally, exposure to the indicator chemicals could occur through one or more of the following potential pathways:

- Soil
- Inhalation of soil particles
- Ingestion of soil
- Dermal adsorption resulting from skin contact **with** soil laden with the indicator chemicals.
- Ground Water
- Ingestion of ground water
- Dermal adsorption of water containing the indicator chemicals during household use (bathing. showering)
- Surface Water
- Ingestion of surface water
- Dermal adsorption of water containing the indicator chemicals during household use (bathing. showering)

Additionally, ingestion of contaminated fish and game or ingestion of plants irrigated with contaminated surface or ground water may be potential exposure pathways. Not all of these pathways are important at the site. The relative importance of each is discussed below, and are based on information presented in the PEA, site conditions, and fate and transport information on the indicator chemicals..

6.2.3.1 Soil

Potential exposure to soil laden with the indicator chemicals at the site may occur by three possible routes: inhalation of particulates, ingestion of soil, or dermal contact with soil.

6.2.3.1.1 Inhalation

Winds and vehicular traffic can suspend particulates in the air which may subsequently be inhaled. However, vehicular activity takes place around the periphery of the site on asphalt paved roads, and no vehicular traffic currently takes place at or inside the warehouse on the site. In addition, the warehouse structure restricts wind movement and therefore restricts wind erosion of the earthen floor of the warehouse and subsequent particulate suspension.

No surficial soil (top 0.5 foot) sampling was performed. Sampling of shallow soils (approximately 2 feet depth) indicates the presence of the indicator chemicals. However, no air sampling has been conducted at the site.

Because of the physical setting of the site, and the lack of air sampling and analyses data, this exposure pathway is not considered in this BRA.

6.2.3.1.2 Ingestion of Soil

Direct and incidental ingestion of soil laden with the indicator chemicals by adult workers is considered a potential pathway of exposure at the site, as limited work-related activities do take place at the site. Residents who live in the immediate vicinity of the site, particularly children, are also susceptible. Children are expected to ingest more soil than adults, because they are more susceptible to the abnormal craving to ingest substances not fit for food (i.e. soil). This is particularly of concern for children 1 to 6 years old.

Access to the site is restricted to the various businesses that operate within the structure on the site. Because access to the site is restricted incidental soil ingestion by children is not considered in this **BRA.**

6.2.3.1.3 Dermal Contact with Soil

The indicator chemicals are present in the surface soil at the site. The warehouse on the site has an earthen floor. Work takes place inside the warehouse. Therefore, direct skin contact is considered. The extent of dermal exposure is determined in part by the nature and concentrations of the indicator chemicals, the duration of the exposure, the surface area of the body in direct contact with the soil, and the presence of abrasions on the skin. Such abrasions provide easy access to the indicator chemicals that may be adsorbed into the bloodstream and circulated to target organs in the body. Because limited work-related activities take place at the site, dermal contact with soil is considered in this BRA.

6.2.3.2 Ground Water

As described in Section 4.2.4, Ground water in the vicinity and region of the site is not used for drinking water purposes or for municipal water supply (i.e. firefighting, industrial/manufacturing uses, etc.).

Water for drinking and municipal supply is drawn from surface water supplies stored in reservoirs located east of the region which capture precipitation and snowmelt runoff derived from the Sierra Nevada foothills and mountains.

For this reason, exposure to the uppermost ground water containing the indicator chemicals underlying the site is not considered an exposure pathway in this BRA.

6.2.3.3 Surface Water

Surface water runoff from the site is limited to storm events. Runoff is captured and conveyed by storm drain to Oakland Middle Harbor where it discharges into San Francisco Bay.

Potential exposure to chemicals in surface water may occur both directly or indirectly. Direct pathways include incidental ingestion, inhalation, and dermal absorption, which could occur during public participation in recreational activities (i.e. swimming, boating, playing). Indirect pathways include consumption of fish, animals, or plants that have been exposed to surface water containing chemicals.

Surface water at the site was not sampled. In addition, runoff from the site would commingle with runoff generated from other locales in the immediate vicinity and region as it travels down the storm drain system to the ciutlet at Oakland Middle Harbor. This action would result in diluting soluble indicator chemicals in the runoff, or adsorbed to sediment included with the runoff, to concentrations that, would not likely represent a threat to human health. For these reasons, exposure pathways related to surface water are not considered in this BRA.

6.2.3.4 Summary of Exposures

Two exposure pathways require further evaluation. these are:

- Direct and incidental soil ingestion
- Dermal contact with soil

Exposure pathways specific to the site are identified and discussed in the following sections.

6.2.3.4.1 Direct and Incidental Ingestion of Soil

Ingestion of contaminated soil is a route of exposure. Adults are far less likely to be exposed from direct ingestion of contaminated soil than children. However, workers at the site may ingest soil incidentally. Standard soil ingestion rates for adults have

been established by the USEPA (Human Health Evaluation Manual, Supplemental

Guidance: "Standard Default Exposure Factors" [SDEF). Memorandum, OSWER Directive 9285.6-03, March 25, 1991.). These values serve as the basis for quantifying ingestion exposures. Concentrations of the indicator chemicals detected at O to 3 FBGS were used to estimate adverse health effects from exposure through this pathway.

6.2.3.4.2 Dermal Contact

Direct dermal contact with soil laden with the indicator chemicals may occur at the site.

Dermal exposure may result in uptake through the skin membranes. The skin is the largest organ of the body, and therefore, more surface area is available for uptake. Uptake through the skin allows the indicator chemicals to cross directly into the circulatory system, where they travel to the target organ(s) to exert their effects. Large open sores or abrasions on the skin allow uptake more readily.

Standard soil dermal exposure rates for adults have been established by the USEPA in RAGS. These values serve as the basis for quantifying the dermal exposures. Concentrations of the indicator chemicals detected at O to 3 FBGS were used to estimate adverse health effects from exposure through this pathway.

6.3 Toxicity Assessment

The toxicological properties of each indicator chemical · are summa ized below (MERCK, Eleventh Edition, 1989).

6.3.1 Arsenic

Most forms of arsenic are toxic. Acute symptoms following ingestion relate to irritation of the gastrointestinal tract. These include nausea, vomiting, and diarrhea. **All** of these can progress to shock and death. Chronic poisoning can result-in exfoliation and pigmentation of skin, herpes, polyneuritis, altered hematopoieses, and degeneration of liver and kidneys.

Arsenic is a known carcinogen.

6.3.2 Antimony

Antimony and its compounds have been reported to cause dermatitis, keratitis, conjunctivitis, and nasal septa! ulceration by contact, fumes, or dust. Hydrogen will react with antimony to form stibine (SbH_3) which is extremely toxic (nausea, vomiting, headache, hemolysis, hematuria, abdominal pain, death). Stibine can be liberated from storage batteries when hydrogen is present, in an acid medium, with antimony present in the battery plates.

6.3.3 Chromium

Irritant effects on the skin and respiratory passages lead to ulceration. Oral ingestion may lead to severe irritation of the gastrointestinal tract, circulatory shock, and renal damage.

6.3.4 Lead

Lead poisoning is most common in young children. Acute symptoms include anorexia, vomiting, malaise, convulsions due to increased intracranial pressure. May leave permanent brain damage. Chronic symptoms show weight loss, weakness, and anemia. A blood lead content of > 0.05% and of urine > 0.08 milligrams/liter support a diagnosis of lead poisoning.

6.3.5 Thallium

Symptoms of acute toxicity include nausea, vomiting, diarrhea, tingling, pain in extremities, weakness, coma, convulsions, death. Chronic symptoms include weakness and pain in the extremities (polyneuritis) and loss of hair. Human systemic effects by ingestion. Nerve or sheath structural changes. Extra-ocular muscle changes.

6.4 Exposure Analysis

This section presents a discussion of the rationale used in selecting the receptor human populations to evaluate potential public health risks and a discussion of the intake assumptions for each exposure route:

6.4.1 Receptor Populations

This section quantifies potential health risks to on-site workers and residents living in the vicinity of the site.

6.4.1.1 On-Site Workers

Analytical results show that the indicator chemicals are present between O and 3 FBGS, from which it may be inferred that workers on-site can be exposed to soil laden with the indicator chemicals. On-site workers ranging in age from 20 to 65 may incidentally ingest soil in the course of normal hand-to-mouth activities, and may come into direct contact with soil. Worker exposure times are limited to those times when they are working on the site.

6.4.2 Routes of Exposure

This section evaluates the routes of exposure to soil laden with the indicator chemicals via ingestion and dermal contact. For both pathways, indicator chemicals in soil between 0 and 3 FBGS are considered because soil disturbance at the site is unlikely to exceed 3 feet under current land use and existing site activities.

To evaluate potential exposures a typical exposure using maximum concentrations of the indicator chemicals detected in the soil between 0 and 3 FBGS was used. This scenario was evaluated for adult worker on-site.

The exposure scenario was used to estimate the potential adverse health effects to the receptor populations. The following sections discuss the assumptions used to estimate these potential health effects.

6.4.2.1 Ingestion

The rate of soil ingestion is based on the quantity of soil a given population might ingest in a given day. Typical estimates of soil ingestion rates range from 100 to 200 milligrams per day, depending on age (SDEF). Soil ingestion exposures to receptor populations were calculated on the basis of these rates. The assumptions used in the ingestion exposure scenarios are summarized below.

6.4.2.1.1 Typical Exposure

For a typical exposure the maximum concentrations of the indicator chemicals from soil samples collected from 0 to 3 FBGS were used to estimate exposures resulting from ingestion of soil at the site.

6.4.2.1.2 Ingestion Exposure Equation

Using these assumptions, potential ingestion routes were calculated using the following equation (RAGS):

$$I = \frac{CS \times IR \times CF \times FI \times EF \times ED}{BW \times AT}$$

where:	I	Intake (mg/kg day ^{1})
	CS	Indicator chemical concentration in soil (mg/kg)
	IR	Ingestion Rate (mg soil/day)
	CF	Conversion Factor (10-^{6} kg/mg)
	FI	Fraction Ingested from Contaminated Source (unitless)
	EF	Exposure Frequency (days/years)

ED	Exposure Duration (years)
BW	Body Weight (kg)
AT	Average Time (period over which exposure is averaged -- days)

The standard default values are:

IR	50 mg (adult worker) [SDEF]
Fl	1 [SDEF]
EF	250 days/year (adult worker) (SDEF]
ED	25 years (adult worker) [SDEF]
BW	70 kg (adult worker) [SDEF]
AT	ED x 365 days/year [SDEF] 9,125 days (adult worker)

The results of these calculations are presented in Section 6.5 (Risk Characterization).

6.4.2.2 Dermal Contact

For the indicator chemicals sorption to soil particles is an important environmental fate mechanism. Therefore, exposure via direct skin contact with soil laden with the indicator chemicals was estimated.

The dermal exposure scenario assumes that on-site workers may come into direct contact with soil laden with the indicator chemicals. It is assumed that workers would be wearing long-sleeved coveralls, thus exposing only their hands.

6.4.2.2.1 Typical Exposure

For a typical exposure the maximum concentrations of the indicator chemicals from soil samples collected from O to 3 FBGS were used to estimate exposures resulting from dermal contact with soil at the site.

6.4.2.2.2 Dermal Contact Exposure Equation

Using these assumptions, potential dermal exposure routes were calculated using the following equation (RAGS):

$$AD = \frac{CS \times CF \times SA \times AF \times ABS \times EF \times ED}{BW \times AT}$$

where:	AD	Adsorbed dose (mg/kg-day)
	CS	Indicator chemical concentration in soil (mg/kg)
	CF	Conversion Factor (10^{-6} kg/mg)

SA	Skin surface area available for contact (cm^2/event)
AF	Soil to skin adherence factor (mg/cm^2)
ABS	Absorption factor (unitless)
EF	Exposure Frequency (events/year)
ED	Exposure Duration (years)
BW	Body Weight (kg)
AT	Average Time (period over which exposure is averaged·· days)

The standard default values are:

SA	820 (adult worker) [RAGS]
AF	1.45 mg/cm^2 (RAGS)
ABS	1% (RAGS)
EF	208 events/year (RAGS)
ED	25 years (adult worker) (SDEF]
BW	70 kg (adult worker) [SDEF]
AT	ED x 365 days/year (RAGS)
	9,125 days (adult worker)

The results of these calculations are presented in Section 6.5 (Risk Characterization).

6.4.3 Summary

The methodologies suggested by USEPA (RAGS and SDEF) were used to estimate potential noncarcinogenic health risks and carcinogenic risks. Potential soil ingestion and dermal risks were quantified for adult workers. Potential exposures to the indicator chemicals via ingestion and dermal absorption were estimated. Maximum concentrations of the indicator chemicals detected in the soil profile underlying the site from 0 to 3 FBGS were used.

6.5 Risk Characterization

This section discusses the methodologies used to evaluate potential adverse noncarcinogenic health effects and carcinogenic risks to the receptor populations that may results from ingestion and dermal contact pathways.

Noncarcinogenic risk is evaluated by comparing the daily dose to the USEPA established Chronic Reference Dose (RID) for chronic exposure to noncarcinogenic chemicals.

To evaluate carcinogenic effects, the daily dose is multiplied by a USEPA established slope factor, formerly called the carcinogenic potency factor. The estimated carcinogenic risk is compared to the acceptable risk range from 10·• to 10·^{1}

established by the USEPA (RAGS). These ranges translate to one excess cancer in 10,000 exposed individuals to one in 10,000,000 individuals, respectively. A 10^{-6} (or one in 1,000,000) risk is the level most often used by USEPA as the guideline for acceptable risk to protect public health and will be used in this BRA. An estimate of 10^{-6} means that over a lifetime of exposure to a carcinogen (70 years), a person experiences a maximum increased chance of one-in-a-million that he or she will develop cancer from exposure to that carcinogen.

6.5.1 Noncarcinogenic Health Effects

Noncarcinogenic health effects resulting from exposure to a single indicator chemical were evaluated through the calculation of a Chronic Hazard Quotient (CHO). The indicator chemicals were collectively evaluated through the calculation of a Chronic Hazard Index (CHI). Both are described in RAGS. The CHO is calculated from a ratio of estimated chemical intake to an established RID for each indicator chemical (representing an "acceptable dose"). An RfD is a USEPA established value that represents the concentration of indicator chemical that a receptor may be exposed for 70 years without experiencing adverse health effects.

The estimated chemical intake specific to each exposure scenario is referred to as the Intake (for ingestion) or the Absorbed Dose (for dermal contact). For the purposes of this discussion, both of these values will be collectively referred to as the Chronic Daily Intake (COi). Both COi's were calculated using equations presented in Section 6.4.2. The COi's represent an estimated "dose" of a chemical through ingestion or dermal pathway to receptor populations. The COi is then divided by the respective RID to derive the respective CHO. The sum of the CHO's represents the CHI.

Where the CHI exceeds unity (1.0) there may be concern for potential health risks. The results of the calculations for CHOls and CHls are presented in Tables 6.5.1.a and 6.5.1.b for ingestion and dermal exposure, respectively.

R!Ds for oral routes were used to calculate CHQs for both exposure routes (ingestion and dermal). This is a conservative approach.

6.5.1.1 Exposure from Ingestion

The calculated CHls for the ingestion pathway are presented in Table 6.5.1.a. Because the CIH value is less than unity (1.0), chronic exposure through the ingestion pathway does not appear to pose a noncarcinogenic health risk to adult workers on the site.

6.5.1.2 Exposure from Dermal Contact

The calculated CHls for the dermal pathway are presented in Table 6.5.1.b. Because the CIH value is less than unity (1.0), chronic exposure through the dermal absorption pathway does not appear to pose a noncarcinogenic health risk to adult workers on the site.

6.5.2 Carcinogenic Health **Risks**

The carcinogenic health risks for arsenic, the single potential carcinogen at the site (LIST), are calculated as follows:

Carcinogenic Risk (CR) = COi x Slope Factor (SF)

As discussed previously, the CDI of a chemical is based on its concentration at the exposure point, the duration of the exposure, and standard intake assumptions. Also, the CDI is a chemical-specific value for each particular exposure route. The CR values for arsenic for the exposure pathways are presented in Table 6.5.2.a for the ingestion pathway, and Table 6.5.2.b for the dermal pathway.

The Slope Factor (SF) is a value established by the USEPA. This value was formerly referred to as the Cancer Potency Factor (CPF) by the USEPA. This value represents the relative carcinogenic "potency" of the chemical and is generally based on laboratory animal or epidemiological studies.

SFs for ingestion were used to calculate CRs for both exposure routes (ingestion and dermal). This is a conservative approach.

6.5.2.1 Exposure from Ingestion

The calculated CR for the ingestion pathway is presented in Table 6.5.2.a. The CR is greater than 1.0 x 10^{-6} (one-in-a-million). Therefore, there does appear to be an excess carcinogenic risk with exposure to arsenic via the ingestion pathway to adult workers on the site.

6.5.2.2 Exposure from Dermal Contact

The calculated CR for the dermal pathway is presented in Table 6.5.2.b. The CR is greater than 1.0 x 10^{-6} (one-in-a-million). Therefore, there does appear to be an excess carcinogenic risk with exposure to arsenic via the dermal absorption pathway to adult workers on the site.

6.5.3 Exposure Summary

In summary, detailed calculations using data generated from PEA sampling and analyses activities and FPSI's conducted at the site indicate that adverse noncarcinogenic health effects to workers on the site do not appear to exist from exposure to indicator chemicals via the ingestion and dermal absorption routes.

However, excess carcinogenic health effect risks appear to exist due to exposure via ingestion and dermal absorption routes.

6.6 Sources of Uncertainty

There are three broad areas where uncertainties may be found in the BRA process:

- Generation of chemical-specific human risk values by Federal agencies through animal tests and/or epidemiological studies.
- Collection of site-specific data.
- Merging chemical-specific risk estimates with site-specific data

For each area, a number of factors may increase or decrease the confidence in the accuracy of the BRA. These factors, as they may apply to this BRA, are as follows.

6.6.1 Animal Tests and/or Epidemiological Studies

- Choice of species, strain, age, and sex of animals
- The number of animals or persons in the study ·
- Similarity in the routes of exposure between tested species and route of interest in humans ·
- Purity of test compound
- Decay of test compound and vehicle contribution
- Selection of dose levels and use of control groups
- Distribution of animals among doses
- Similarity between test animals and humans in metabolism and pharmacokinetics
- Statistical noise; statistical methods used to analyze data
- Proper histopathological examination of animals
- Proper animal husbandry and dietary considerations
- Experimental surroundings

- Consideration of concurrent exposures in epidemiological studies
- Exposure measurements concurrent to the period being evaluated in epidemiological studies
- Selection of proper endpoint in animal or epidemiological studies
- Synergism/antagonism
- Animal to human extrapolism: high dose to low dose, choice of dose/response model, confidence intervals
- Use of most sensitive, inbred animals versus average, heterogeneous animals.

6.6.2 Collection of Site Data

- Rationale for sample locations
- Sample collection methods and **QA/QC** procedures
- Analytical methods, detection limits, and **QA/QC** procedures
- Accurate characterization of area geology and hydrogeology
- Representativeness and completeness of data
- Adequacy of data to describe site conditions
- Characterization of exposed or potentially exposed populations

6.6.3 Development of Site-Specific BRA

- Errors associated with numerical approximation methods
- Laboratory analyses· errors
- Estimations of receptor population characterizations
- Interpretation of laboratory data

6.6.4 Strengths

Uncertainties in this BRA have been reduced because appropriate QA/QC methodologies were used in all field and laboratory activities, and all laboratory data have been validated. The techniques used in preparing this BRA are based upon

USEPA guidance, the current understanding of mechanisms of human exposure, and the toxicological properties of the chemicals identified through site sampling activities. Additionally, conservative assumptions regarding the toxicity of the indicator chemicals have also been used for all calculations. Therefore, any uncertainties in this area will tend to err, if at all, on the conservative side.

6.7 BRA Summary and Conclusions

This BRA was prepared to evaluate the potential adverse impacts to human health for chemicals detected at the site. Soil and ground water data and intake assumptions were used to estimate potential noncarcinogenic and carcinogenic health risks via the ingestion and dermal exposure pathways to identified receptor populations. The following discussion presents the conclusions of this BRA.

On the basis of available data, the indicator chemicals are:

- antimony, arsenic, lead, and thallium

The following receptor populations were defined:

- Adult workers on the site

The methodologies suggested by the USEPA (RAGS and SDEF) were used to estimate the potential noncarcinogenic and carcinogenic health risks of the indicator chemicals to these receptor populations. Ingestion and dermal intakes were estimated and compared to noncarcinogenic indicators of safe chronic daily intakes for each receptor population. For excess carcinogenic risks from exposures to potential carcinogens, slope factors established by the USEPA and average daily doses for each of the populations were used to estimate individual excess lifetime cancer risk.

Based on the results of this BRA, the _following conclusions are made:

- Adverse noncarcinogenic health effects do not appear to exist from potential exposure to the indicator chemicals via the soil ingestion and dermal absorption pathway.
- Excess carcinogenic risks exist from potential exposure to arsenic via the ingestion and dermal absorption pathway.

7.0 PEA CONCLUSIONS AND RECOMMENDATIONS

7.1 Release or Threat of a Release at the Site

Current and past practices of handling and/or storing hazardous substances or waste on the site has resulted in the release of heavy metals and petroleum hydrocarbons to the soil profile and uppermost ground water underlying the site.

7.2 Threat to Public Health and the Environment

The BRA indicates that no adverse noncarcinogenic health effects exist from potential exposure via ingestion and dermal absorption to the heavy metals within the soil profile between O and 3 FBGS.

However, the BRA does indicate that excess carcinogenic risks exist from potential exposure via ingestion and dermal absorption to arsenic within the soil profile between 0 and 3 FBGS.

Ground water in the vicinity and region of the site is not used for drinking water purposes or for municipal water supply (i.e. firefighting, industrial/manufacturing uses, etc.).

No evidence of environmental impact from releases at the site are evident pased on inspection of the site during the conduct of the PEA sampling and analyses program. However, additional investigation is needed to determine if contamination exists in the interior of the warehouse.

There are no flora, fauna, or sensitive ecosystems in the vicinity of the site known to be affected by contaminants that have or can potentially be released from or attributable to the site.

7.3 Need for Emergency Removal Action

Based on the results of the PEA and BRA, there is no need to conduct an emergency removal action of soil between O and 3 FBGS. Although cancer risk from ingestion and dermal absorption of arsenic-laden soil was shown to exist in the BRA, the exposure point would be the earthen floor at the base of the warehouse structure on the site. Access to the warehouse and the earthen floor is restricted only to employees of businesses that operate inside the structure.

The contaminated soil can be removed as part of demolishing the structure.

7.4 Additional Information

Additional information needed includes:

- Conduct a soil remedial investigation to determine the areal extent of heavy metals and petroleum hydrocarbons in the underlying soil profile from 0 to 3 FBGS, particularly those areas inside the structure where the earthen floor is exposed.
- Concomitant with the soil remedial investigation, conduct a ground water remedial investigation to determine the hydraulic characteristics of the uppermost aquifer, and determine the areal extent of heavy metals and petroleum hydrocarbons in uppermost ground water.

The structure on the site should be cleared to allow remedial investigation work to proceed inside the structure unimpeded.

8.0 RECOMMENDATIONS

It is recommended that the remedial investigations described be in Section 7.4 be implemented.

9.0 REMEDIAL ACTION OPTIONS REPORT

This report is based upon the findings of the PEA and previous FPSI's conducted at the site.

9.0.1 Underground Storage Tank Removal

Two underground storage tanks are present on the site. This is detailed in Section 2.3.2. For any remediation scheme, both tanks must be removed in accordance with ACDEH and State of California Water Resources Control Board requirements, and Title 22 California Code of Regulations. Remediation in the event the tanks have leaked must be conducted in accordance with the State of California Water Resources Control Board's Leaking Underground Fuel Tank Manual (LUFT), and the requirements of the State of California Regional Water Quality Control Board - San Francisco Region. Very limited information (Sanborn Insurance Map over 100 years old) is available on the 13,000-gallon oil tank used by the Dunn Cracker Company. Its fate is unknown. If located, the tank will have to be excavated.

9.1 Technical Objectives

The remedial action options proposed for this site are:

- Remove contaminated soil from the site
- Recover contaminated ground water from the site

9.2 Soil Remediation

9.2.1 No Further Action

The no further action scheme is not a viable alternative. This is because the BRA demonstrates that adverse noncarcinogenic health effects or excess cancer risks may exist from potential exposure via ingestion and dermal absorption to the heavy metals within the soil profile between O and 3 FBGS..

9.2.2 Ex-Situ Techniques

9.2.2.1 Removal and Disposal

The lateral extent of heavy metals and petroleum hydrocarbons in the soil profile underlying the site from O to 3 FBGS has not been determined. Further, the types of petroleum hydrocarbons detected by the PEA sampling and analyses activi ies and the FPSl's need to be determined to effect disposal and/or treatment. Based on the limited analytical data it appears that disposal in a Class Ill landfill is appropriate.

This technique involves removing the contaminated soil by excavation followed by disposal of the excavated soil at an off-site landfill facility. This technique offers a permanent solution with respect to remediating the contaminated soil profile and preventing environmental exposures. However, this technique merely moves the contaminated soil from one location to another without any treatment to reduce the toxicity or volume of the material. As a result, the liability of the soils still remains with Caltrans.

9.2.2.2 Removal and Treatment

This technique also involves removal of the contaminated soil by excavation, but the excavated soil is either treated on-site or off-site. The treatment techniques that are currently available include biodegradation, incineration (petroleum hydrocarbons), and chemical fixation (heavy metals).

All three treatment techniques would require open space on the site to treat the excavated soil. Typically, treatment by any technique requires a period of at least 6 months to a year or more to complete, considering the contaminant involved, the volumes of soil to be treated, and regulatory permitting requirements.

All three treatment techniques offer a permanent solution with respect to remediating the contaminated soil profile and preventing environmental exposures. In addition, these techniques eliminate continuing liability because the contaminants are irreversibly remedied by these techniques.

9.2.2.3 Biodegradation

Biodegradation is used exclusively to treat organic compounds, and basically involves uniformly spreading the organic contaminated soil, followed by the addition of nutrients on a regular basis to provide a favorable environment to enhance the proliferation of indigenous bacteria and micro-organisms in the soil being treated, which reduce the concentrations of the organic compound(s) within the spread soil pile metabolically. The treatment process is either further enhanced or initiated by the addition of contaminant-specific, genetically engineered micro-organisms to the spread soil pile. The spread soil pile is turned on a regular basis to allow reduction of the organic compounds in the soil through metabolic action. The effectiveness of the technique depends on the type of organic contaminants involved, the type of soil being treated, the type of indigenous, or introduced, bacteria or micro-organisms available, the volume of soil being treated, and the remediation goal. Biodegradation, generally, is more effective during the summer months when ambient air temperatures are high, thereby enhancing the growth and proliferation of bacteria and micro-organisms indigenous, or introduced to, the treated soil profile. Samples of the treated soil are collected on a regular basis to monitor the biodegradation environment, and the effectiveness of the technique.

9.2.2.4 Incineration

Incineration is used exclusively to destroy organic compounds. The process basically involves volatilizing the organic compounds using a high temperature thermal dryer, followed by destruction of the volatilized organics in an incinerator. The process proceeds until all fugitive volatilized organic material has been destroyed. The effectiveness of the technique depends on the organic contaminants to be incinerated, the type of soil being treated, the volume of soil being treated, the type of thermal drying/incineration equipment used, and the remediation goal.

9.2.2.5 Immobilization

Chemical fixation is used exclusively to treat heavy metals. Basically the process involves uniformly spreading the heavy metal-laden soil, followed by the addition of either a liquid or solid acid or base to precipitate the heavy metals as hydroxides, sulfides, carbonates, or other insoluble salts. Hydroxide precipitation with lime is most common. However, sodium sulfate is sometimes used to achieve lower heavy metal concentrations.

Limitations include that not all heavy metals have a common pH at which they precipitate. Chelating and complexing agents can interfere with the process. Organic compounds are not removed except through adsorptive carryover. The resulting mass may be hazardous by definition but often may be delisted The effectiveness of the technique depends on the type of heavy metals involved, the type of soil being treated, the type of liquid or soiled acid or base compounds available, the volume of soil being treated, and the remediation goal. Samples of the treated soil are collected on a regular basis to monitor the effectiveness of the technique.

9.2.2.6 Implementability

Implementability of excavation and disposal off-site is dependent upon the types of petroleum hydrocarbons and concentrations of heavy metals present in the soil profile underlying the site. Off-site disposal would be severely limited if restricted petroleum hydrocarbons, such as polychlorinated biphenyls (PCBs), are present in the soil, or if heavy metal concentrations exceed their respective STLC's. All of the ex-situ treatment techniques are feasible remediation options. Biodegradation is a feasible alternative but is lengthy in scope.

9.2.3 In-Situ Techniques

These techniques involve treating the contaminated soil in place to physically, biologically, or chemically transform, reduce or remove, the contaminants in the soil. There are three common in-place treatment technologies that are currently available•

- Degradation
- Extraction
- Immobilization

Immobilization is principally applied to soil profiles contaminated with inorganic compounds. Typically, in-situ remediation requires a period of at least 6 months to a year or more to complete, considering the contaminants involved, the type of soils being remediated, the volumes of soil to be treated, regulatory permitting requirements, and the remediation goal.

9.2.3.1 Degradation

This technique is applicable to inorganic or organic compounds and essentially converts the contaminants in the soil into innocuous or less toxic compounds. There are two principal degradation techniques:

- Chemical
- Biological

9.2.3.1.1 Chemical Degradation

Chemical degradation techniques convert contaminants by promoting the natural capacity of the soil to support oxidation or reduction reactions or by adding suitable reagents to the contaminated soil profile through injection well systems. The effectiveness of chemical degradation depends on the types of contaminants in the soil profile, the type of soils comprising the contaminated soil profile, the volume of contaminated soil, the chemistry of the soil profile excluding the contaminants, the geotechnical and hydraulic properties of the affected soil, the ability to sustain a favorable chemical environment to allow degradation to proceed, and the remediation goal. Samples of the treated soil profile are collected on a regular basis to monitor the effectiveness of the treatment, and the treatment environment. Chemical degradation is generally utilized to remediate soils contaminated with inorganic compounds. The petroleum industry has demonstrated in the laboratory that organic compounds can also be chemically degraded in-situ.

9.2.3.1.2 Biologlcal Degradation

Biological degradation techniques utilize the action of indigenous bacteria and/or micro-organisms to metabolize the contaminants into innocuous or less toxic compounds. In-situ biological degradation is utilized principally to remediate soil profiles contaminated with organic compounds. The technique involves enhancing the population growth of bacteria and/or micro-organisms in the contaminated soil profile through the introduction of nutrients into (including oxygen) the soil profile using injection well systems. The technique can be enhanced by introducing specific micro-organisms genetically engineered to metabolize the contaminants into the contaminated soil profile. Samples of the treated soil profile are collected on a regular basis to monitor the effectiveness of the in-situ biological technique and the treatment environment. The effectiveness of the technique depends on the types of contaminants in the soil profile, the type of soils comprising the contaminated soil profile, the volume of affected soils, the geotechnical and hydraulic properties of the contaminated soil profi.le, the ability to sustain a favorable environment in-situ to allow the bacteria/micro-organisms to flourish, and the remediation goal.

9.2.3.2 Extraction

This technique mobilizes the contaminants in the soil profile so that they can be removed by physical means. The removed constituents are then treated on the surface. Extraction techniques are principally applied to - soil profiles that are contaminated with organic compounds exhibiting low to moderate boiling points and high to moderate vapor pressures. There are two principal extraction techniques:

- Heat or steam
- Vacuum

9.2.3.2.1 Heat or Steam Extraction

Heat or steam extraction involves injecting heated air or superheated steam into the contaminated soil profile to vaporize and/or mobilize the contaminants. The mobilized/volatilized contaminants are then either allowed to migrate vertically to ground water where the mobilized contaminants are recovered by ground-water extraction/treatment systems, or the volatilized contaminants are recovered from the soil profile by vacuum extraction/treatment systems. The effectiveness of heat or steam extraction depends on the types of contaminants in the soil profile, the chemical/physical characteristics of the contaminants, the type of soil comprising the contaminated soil profile, the hydraulic characteristics of the contaminated soil profile, the volume of soil to be treated, the efficiency of the injection/extraction system(s), and the remediation goal. Both techniques are monitored for effectiveness and control purposes through the use of monitoring wells completed within the treated soil profile. Samples of the contaminated soil profile are collected on a regular basis to determine decreases in contaminant concentrations in the soil profile being treated by this technique. More commonly, however, the effluent from the extraction system, prior to treatment at the surface, is sampled to determine the decrease in contaminant concentrations in the effluent, which is directly related to the amount of contaminant removed from the treated soil profile. Effectiveness and/or control can be adjusted through an increase or decrease of heat or superheated steam.

9.2.3.2.2 Vacuum Extraction

Vacuum extraction consists of applying a vacuum to the contaminated soil profile to draw off the contaminants for treatment at the surface. The technique is most applicable to organic compounds exhibiting low boiling points and high vapor pressures. The basic principle is that liquid organic compounds will vaporize to a state of equilibrium in the air spaces that surround soil particles, at ambient soil temperatures. If the air is not continuously replenished, the liquid organic compounds adsorbed on the soil particles will remain trapped on the surface of the soil particles until leached by percolating water, or removed by natural diffusion. Both of these natural processes are very slow, and may take many years to remove the organic compounds from the affected soil profile. Soil ventilation draws air between soil particles and thus accelerates the rate of vaporization of the adsorbed organic compounds. The contaminated air is then vented to a treatment system (capture media).

To achieve air flow through the contaminated soil profile, a vacuum is created through a network of well points distributed throughout the volume of contaminated soil. The well point network is connected to a control manifold, which in turn is connected to a fan or blower. The vacuum created by the fan or plower causes air to flow through the volume of contaminated soil, from the high pressure in the contaminated soil to the low pressure at the well point. The flow of air created due to the pressure differential (high to low pressure) causes the liquid organic compounds adsorbed on the soil particles to vaporize. Maintaining the flow of air and the pressure differential continually vaporizes the liquid organic compounds retained on the soil particles. Vaporization continues until all of the liquid organic compounds have been removed from the soil particles. The net effect is a decrease in the concentration of organic compounds within the soil profile.

The amount of vaporized organic compounds that can be vented is directly proportional to the volume of air moving through the zone of contaminated soil and the vacuum head created by the fan or blower. This in turn affects the pressure differential, resulting in increasing the vaporization rate. Enhanced recovery of organic compounds can be realized by increasing the temperature of the contaminated soil profile.

The effectiveness of vacuum extraction depends on the types of contaminants in the soil profile, the physical characteristics of the contaminants, the type of soil comprising the affected soil profile, the permeability of the soil profile, the volume of soil to be treated, the efficiency of the extraction system to maintain a constant air flow and vacuum head, and the remediation goal. The influence of the system on the volume of contaminated soil is determined by measuring the negative head (vacuum) at various distances from a well point. The mass removal rate of the system is determined by correlating the organic compound vapor concentrations measured at each well point, or at the discharge point at the fan or blower, and air flow rates generated by the fan or blower, to mass removal of liquid organic compounds in pounds per day from the volume of contaminated soil. ·,

9.2.3.2.3 Immobilization

This process is basically the same as ex-stu chemical fixation, except that liquid acid or base solutions are injected into the soil profile to precipitate heavy metals.

9.2.3.3 Implementability

The advantage of in-situ techniques is that the remediation takes place within the contaminated soil profile. No removal of the soil profile (excavation) is required. Site closure to conduct in-situ treatment is not required. All of these techniques offer a permanent solution for remediating the contaminated soil profile. In addition, these techniques have the potential for eliminating continuing liability because the contaminants are irreversibly remedied by these techniques.

The disadvantages of in-situ techniques include the high probability that migration of contaminants outside the treatment zone may occur despite properly coordinated injection/extraction controls, thereby increasing the risk of environmental exposures, and the off-site disposal/treatment of capture media which, in all probability, would be regulatory restricted. Chemical reactions generated by these treatment methods may produce organic, or inorganic, compounds that are more toxic/hazardous than the contaminant(s) being targeted. In addition, some of the petroleum hydrocarbons may exhibit high boiling points and low vapor pressures, which would render heat and/or steam extraction techniques marginally suitable, and vapor extraction techniques unsuitable.

9.2.4 Capping

This technique essentially involves the placement of a cap over the contaminated soil profile. The objective is to prevent precipitation from sustaining any lateral and/or vertical migration of contaminants within, or from, the impacted soil profile, and to prevent environmental exposures from occurring. Capping is also considered an interim remedial measure in anticipation of the development, or refinement, of a more technologically and less regulatory restricted remediation.

9.3 Ground Water Remediation

9.3.1 No Further Action

The no further action scheme is not a viable alternative because the concentrations of heavy metals in uppermost ground water exceed Cal-EPA Maximum Contaminant Levels (MCLs). Although uppermost ground water beneath the site is not used for drinking water purposes, there is the potential that it may be used as such in the future. At that time it may be demonstrated that adverse noncarcinogenic health effects or excess cancer risks exist from potential exposure via ingestion ai;id dermal absorption to the heavy metals and petroleum hydrocarbons in uppermost ground water beneath the site.

9.3.2 Extraction and Treatment

Prior to implementing this option it will be necessary to determine the geohydrology of the uppermost aquifer, and the lateral extent of heavy metals and- petroleum hydrocarbons in uppermost ground water beneath the site. Further, the types of petroleum hydrocarbons detected by the PEA sampling and analyses activities need to be identified to determine treatment options.

Therefore, it will be necessary to conduct a ground water remedial investigation to determine the geohydrology of the uppermost aquifer beneath the site, and the areal extent of heavy metals and types of petroleum hydrocarbons in uppermost ground water prior to considering this option.

This option is lengthy in scope. However, the option can be built and operated to accommodate the construction of the 1-880 Cypress Replacement, and operated following completion of the freeway until remediation is complete.

9.3.2.1 Preliminary Treatment Options

The technologies available for remediating surface water all involve treatment to remove the contaminants, and disposal of the treated water. There are four common proven technologies that are available which are specifically used to remove organic compounds from ground water:

- Carbon adsorption
- Air stripping
- Biotreatment
- **S.A.V.E.**

All four treatment techniques have consistently demonstrated the ability to remove organic compounds from ground water to concentrations which meet or are below maximum contaminant levels or primary drinking water standards. Typically, treatment depends upon the contaminants involved, the volume amount of ground water to be treated, the flow rate at which surface water is being treated, and regulatory permitting requirements. Both techniques offer a permanent solution with respect to remediating petroleum hydrocarbons in the uppermost ground water beneath the site. In addition, these techniques eliminate continuing liability because the contaminants are irreversibly remedied by these techniques.

9.3.2.1.1 Carbon Adsorption

This physical treatment mechanism occurs when an organic molecule is brought to an activated carbon surface and held there by adsorptive forces, principally tension. The adsorption mechanism consists of diffusion of an organic molecule in the liquid phase to the carbon granule, diffusion through the pore space within the granule to the adsorption site, and adsorption of the organic molecule to the surface of the granule (adsorption site). The physical characteristics of the organic molecule will determine the rate of each step and, finally, the amount of time required for _the entire adsorption processes. Less soluble organic molecules, for example, **will** diffuse rapidly to the carbon particle. Large organic molecules will move slowly through the pore space distribution of the carbon granule, thereby delaying adsorption. Organic compounds exhibiting low water solubilities and small molecular size are very amenable to activated carbon adsorption, enabling effective use of adsorption surface areas within the carbon granule. What makes activated carbon such an excellent adsorbent is the large degree of surface area contained within the carbon granule that is accessible for the adsorption process. Surface areas of granular carbons range up to 44,000 fl^2 per ounce of material. A wide variety of activated carbons are available, and properties such as surface area and pore size distribution will determine their applicability.

Activated carbon adsorption may be accomplished by utilizing fixed or moving carbon beds in upright cylindrical vessels, arranged in series or parallel to treat the influent.

The fixed beds may employ downflow or upflow of the influent through the static activated carbon bed. Moving beds employ upflow of the influent and downflow of loose activated carbon. The quantity of an organic compound or group of organic compounds that can be adsorbed by activated carbon is determined by a balance between the forces that keep the organic compound in solution and the adsorptive forces that attract the organic compound to the carbon surface. Factors that affect this balance include:

- Adsorptivity, which increases as contaminant solubility decreases.
- The class of the organic compound.
- Temperature• adsorption capacity decreases **with** increasing temperature, although the rate of adsorption may increase.

In addition, carbon adsorption system performance is sensitive to the variations in influent flow and chemical composition of the influent. When the adsorptive capacity of the activated carbon is maximized, the spent carbon is removed from the system and regenerated for subsequent reuse. The contaminants adsorbed are either recycled or effectively destroyed during the regeneration cycle.

9.3.2.1.2 Air Stripping

The basic concept of this technique is to bring the contaminated ground water into intimate contact with ambient air, so that the organic compounds in the ground water can undergo a phase change (liquid to vapor). The vaporized compounds' are then vented directly to the atmosphere, or are discharged to a treatment system before being vented to the atmosphere, depending upon air quality regulatory requirements. The treated water can be discharged directly to waste, or may require further treatment to facilitate discharge to waste. An air stripping system typically consists of an upright cylindrical vessel containing a layer of loose or structured, high-efficiency packing material. Air and contaminated water are conducted counter-current to one another through the packing material. Typically, air is forced upward at the base of the cylinder utilizing a fan or blower, with contaminated water being passed downward through the cylinder utilizing a spray nozzle or distributor tray fitted at the top of the cylinder. The packing media enhances the air/liquid contact by exposing a greater amount of water to the air passing upward through the cylinder. The greater the surface area of the packing material exposed, the greater the opportunity for vaporization into the upward passing air of the organic compounds in the water being treated. The passing air carries the vaporized organic compounds out of the stripper vessel and into the atmosphere. The treated water passes out the base of the stripper vessel to be discharged directly, or to be treated, **if** necessary, to meet discharge requirements.

The effectiveness of an air stripping system depends on the flow rate of both water and air, the influent and effluent concentrations of both air and water, the packing media utilized, the height of the packing media, and the diameter of the cylindrical vessel.

9.3.2.1.3 Biotreatment

Biotreatment is a proven technology for reducing the concentrations of petroleum hydrocarbons in ground water. The relative cost effectiveness of this technology is usually best when diesel or heavier oils are involved which preclude the use of other competing technologies. Biotreatment is the most complex of all the listed treatment technologies to install, start-up, and operate, and requires frequent monitoring and care of the bioculture. The advantage over air stripping is that nearly all of the petroleum hydrocarbons are destroyed by decay and converted into harmless compounds, primarily CO_2 and $H_2$0, rather than simply being transferred to other media. To meet NPDES requirements, polishing the biotreatment effluent is required before discharge.

9.3.2.1.4 S.A.V.E.

The S.A.V.E. system (spray, aeration, vacuum, extraction) is manufactured and distributed by Remediation Service International (RSI}. Since the system integrates three separate remediation methods, it purports to be more efficient than the individual systems for treating both soil and ground water. The three methods are: vapor extraction from soil, spray aeration treatment of ground water, and thermal oxidation using an internal combustion engine for burning hydrocarbon laden vapors. A catalytic convertor is used to control the exhaust emissions.

The soil vapor extraction system consists of a vacuum pump driven by the internal combustion engine. The vacuum on the soil causes the hydrocarbons to volatilize and migrate with the induced flow of air to the engine where they are burned as fuel.

Ground water is remediated using a spray aerator. The spray aerator tank makes use of both vacuum and heat. The reduced pressure caused by the partial vacuum results in a lower temperature at which the hydrocarbons will vaporize. This temperature increase caused by heating the water further increases vaporization. The process includes drawing gasoline contaminated water from an extraction well under a partial vacuum and sprayed in the spray aeration tank where the hydrocarbons are vaporized. The gas vapors are used as fuel in the engine. The water is recirculated in the tank until the level of gasoline removed meets discharge requirements.

9.3.2.2 Implementability

For the treatment methods, the principal disadvantage is the off-site disposal/treatment of capture media, i.e. carbon and stripping tower packing material which may be regulatory restricted. In addition, it is very probable that air stripping contaminated water and discharge to the atmosphere would also be restricted by the regulatory community. However, all of the treatment options are feasible.

10.0 CERTIFICATION

To the best of our knowledge, all statements and information provided in this report are true and correct.

Site Geology

UNIT	LITHOLOGY	DEPTH	THICKNESS
Merritt Sand (includes overlying Urban Land - Baywood Complex Soil)	Fine-grained silty, clayey sand, with lenses of sandy clay and clay. Yellowish-brown to dark yellowish-orange. Well-sorted. Contains small fragments ol roots, twigs, grass. No bedding. Aeolian deposit, erratic distribution.	2.5 feet	2.5 to approximately 3
Older Bay Mud (includes Alameda Formation)	Predominately silty clay with varying thicknesses of interbedded sand and fine gravel. Dark greenish-gray. Frequent lateral and vertical grading of sand and gravel interbeds with surrounding silty clay. Occasional sharp contacts between sand and gravel interbeds and silty clay. Some crossbedding.	Approximately 35 to 50 feet	1 to 200 feet
Franciscan Formation (BEDROCK}	Fractured and sheared sandstone, shale, limestone, chert, and metavolcanic rock. Irregular erosional surface.	Grealer than 350 feet	Unknown

Site Geology

UNIT	LITHOLOGY	DEPTH	THICKNESS
lcrrilt Sand (includes overlying Urban Land - Baywood Complex Soil)	Fine-grained silty, clayey sand, with lenses of sandy clay and clay. Yellowish-brown to dark yellowish,orange. Well-sorted. Contains small fragments of roots, twigs, grass. No bedding. Aeolian deposit, erratic distribution.	2.5 feet	2.5 to approximately 35 feet
Older Bay Mud (includes Alameda Formation)	Predominately silty clay with varying thicknesses of interbedded sand and fine gravel. Dark greenish-gray. Frequent lateral and vertical grading of sand and gravel interbeds with surrounding silty clay. Occasional sharp contacts between sand and gravel interbeds and silty clay. Some crossbedding.	Approximately 35 to 50 feet	1 to 200 feet
Franciscan Formation (BEDROCK)	Fractured and sheared sandstone, shale, limestone, chert, and metavolcanic rock. Irregular erosional surface.	Greater than 350 feet	Unknown

Site Hydrogeology

GEOLOGIC UNIT	AQUIFER	AOUITARD	DEPTH TO GROUND WATER	MAGNITUDE AND DIRECTION OF HYDRAULIC GRADIENT	HYDRAULIC CONDUCTIVITY (CM/SEC)	FLOW VELOCITY (FEET/DAY)	WATER QUALITY	PRODUCTION WELLS
Merritt Sand (Includes overlying Urban L.and - Baywood Complex Soil)	Unconfined in overlying soil and within unit at deplh.	Lenses of silly clay and clay. Probably laterally and vertically discontinuous.	6 10 8 leet	Southwest for ground water in soil. Unknown for deeper ground water in unit. Hydraulic gradient unknown.	Unknown lor soil. Unit values range from 10^{1} to 10^{11}	Unknown for soil. Unit values range from 10:i to 10r.	Regionally, portions of Unit contains ground water that meets California Secondary Drinking Water Quality Standa,ds. Saltwater intrusion is possible.	No water supply wells in vicinity or region of the Site
Older Bay Mud (includes Alameda Formation}	Semi.confined to confined occurring in interbedded sand and gravels.	sil1y clay which separates aquifers. Considered continuous laterally and vertically beneath the site.	200 to 500 feet	Unknown	Unknown	Unknown	Regionally, portions of Unit contains ground water that meets California Primary Drinking Water Quality Standards. Saltwater intrusion is possible.	No water supply wells in vicinity of the site. Eight active industrial water supply wells are located on the Alameda Naval Air Station approximately 1 mile west of the site.

TABLE OF CONTENTS (Continued)

1 INTRODUCTION

OGISO Environmental removed a total of four underground storage tanks (USTs) from the Phoenix 800 site located at 888 Cedar Street in Oakland as part of a remedial action plan for this site. Two USTs, one approximately 1,000 gallons containing diesel fuel and another approximately 2,600 gallons containing gasoline, were removed on October 20, 1995. Two additional USTs, approximately 250 gallons and 25 gallons each, containing solvent were also removed on October 23 and October 31, 1995, respectively, from this site. The diesel and gasoline underground storage tanks were previously known to be present at this site. However, the solvent tanks were accidentally encountered during the remediation processes at the site.

This tank closure report discusses the excavation activities, initial and confirmatory sampling, sample analysis, analytical results, remedial measures and disposal of the exhumed underground storage tanks.

1.1 Site Background

The Phoenix 800 parcel is located at 888 Cedar Street within the western portion of the City of Oakland, about one mile west of the Oakland Outer Harbor. The site is located in a predominantly industrial neighborhood with nearby residential areas. Figure 1 shows the site location map. Residential homes are located to the south of Shorey Street and the east side of Pine Street between 9th and Shorey Streets, which is across the street from the Phoenix 800 site. The site consists of the southwestern portion of the parcel and is 43,965 ft2 in area (Figure 2).

A large warehouse building formerly occupied this parcel, but was demolished by California Department of Transportation (Caltrans) in June and July of 1995, after the contents of the warehouse were removed.

The Cypress "B" freeway reconstruction is planned to include this site. This construction is related to the replacement of the Cypress structure that was damaged during the October 1989 Loma Prieta Earthquake. As part of the Cypress replacement project, a new partially depressed frontage road, exiting to the north of 7th Street will be constructed parallel to the new Cypress Freeway. Approximately one-fifth of the Phoenix 800 site in the southwest comer will be paved for the frontage road. Construction of a concrete retaining wall on the site and adjacent to the frontage road is required to limit groundwater infiltration into the depressed area of the rerouted 7th Street undercrossing and frontage road. The future use of the remaining portions of the Phoenix 800 parcel has not been decided at this time, but Caltrans will be investigating those portions of the parcel at a later date.

1.2 Site Geology

The topography of the site is generally even and slopes gently to the west and south toward the San Francisco Bay and Oakland Inner Harbor. The site is 10 feet above mean sea level. The shallow soils in the vicinity of the site consist of an unknown thickness of fill materials and disturbed native soils. The fill materials are underlain by late Pleistocene (10,000 to 70,000 years old) and beach and dune sand deposits (Merritt Sand) consisting of loose, well sorted, fine to medium-grained sand with subordinate silt. Bay Mud is present to the west of the site. Bay Mud consists of Holocene (less than 10,000 years old) estuarine deposits comprised of unconsolidated, water-saturated, dark, plastic clay and silty clay rich in organic material. The depth to groundwater is approximately 7 to 10 feet below grade.

2. TANKREMOVALACTIVITIES

According to the preliminary site assessments and investigations previously conducted on the Phoenix 800 site (Baseline Environmental Consulting, September 1990), two underground storage tanks (UST) containing diesel fuel and gasoline were identified at this site. The Initial Remedial Action Plan and Health and Safety Plan prepared for the site only addressed removal of these two tanks. However, upon commencement of excavation work, two additional tanks containing solvent were encountered. In response to this discovery, the Remedial Action Plan and the Health and Safety Plan were modified. A total of four underground storage tanks were removed from this site.

2.1 Diesel Fuel Tank

The diesel UST permit application was filed with the Alameda County Department of Environmental Health (ACDEH) on June 28, 1995, for excavation of the diesel UST. The approved permit application forms are included in Appendix A.

The diesel fuel tank was a single-walled, steel tank approximately 1,000 gallons in capacity, located at the northwest comer of the Phoenix 800 site. Figure 3 depicts the approximate locations of the underground storage tanks exhumed from this site.

There is no record showing when the diesel tank was installed at this site. The tank was not in operation as of 1990 and was excavated, exhumed, inspected, loaded, and transported to a disposal/recycling facility on October 20, 1995. The diesel UST was buried approximately 4 to 5 feet below grade and was first exposed by removing the overlaying concrete pad and the top and surrounding soil. The excavated soil was stockpiled in an area east of the tank location (Figure 2). The quantity of soil excavated to uncover the tank was estimated at 150 cubic yards.

2.1-1 Associated **Piping**

There were no fittings or pipings attached to the tank at the time it was uncovered.

2.1-2 Tank Content

The liquid content of the tank was pumped into a vacuum truck by Erickson Environmental. The tank was rinsed with a pressurized stream of water and the rinsate was pumped concurrently into the vacuum truck, hence removing the diesel and waste residues in the tank. The tank liquid and rinsate were transported to an appropriate licensed facility for disposal. The manifest document for disposal of the tank content is included in Appendix B.

2.1-3 Tank **Purging**

The tank was purged of any remaining vapors by placing 20 lb of dry ice in the tank one hour prior to removal. Following purging of the gaseous content of the tank, the lower explosive limit (LEL} inside the tank was measured at 0%. The oxygen level in the tank was measured at 1.5% and 4.2% at the bottom and top of the tank, respectively. AU the tank openings and holes were securely covered with tape to maintain the elevated CO_2 content of the tank during removal and transportation to the disposal/recycling facility.

2.1-4 Tank Inspection

The tank was lifted out of the excavation and was brought to the surface for physical inspection by the ACDEH inspector (Ms. Susan Hugo). The tank showed severe signs of corrosion with a hole located at the bottom. The ACDEH site report is included in Appendix A. Figure 4 shows the diesel fuel tank prior to loading.

2.1-5 **Tank** Loading and Transportation

The tank was carefully lowered on to a flatbed truck, properly secured onto the truck bed with three straps, and then transported by Erickson Environmental to a licensed facility for disposal and/or recycling. A copy of the tank disposal manifest is included in Appendix B.

2.1-6 Sampline and Analysis

There was no free product or sheen observed in the soil immediately surrounding the diesel tank. Diesel odor was noted in the tank excavation and the soil around the tank showed greenish discoloration indicating diesel contamination. One soil sample was collected from the fill end (north end) and one from the discharge end (south end) of the tank at approximately 8 feet below ground surface (bgs) immediately following tank removal.

A backhoe bucket was used to scoop the soil from underneath each end of the tank to the surface for sampling. Samples were collected by pushing 2 in. x 6 in. brass sleeves, capped at one end, directly into the soil. Sampling sleeves were capped at the other end immediately following collection of the soil samples. The remaining soil in the backhoe bucket was replaced in its original location. Samples DIS-N (north-end) and DIS-S (south-end) were analyzed for total petroleum hydrocarbons as diesel (TPH-D) via EPA Method 3350/SOlSM. Chain-of-custody and laboratory analysis results are included in Appendix C and summarized in Table 1. As shown in Table 1, soil analytical results indicate a maximum TPH-D level of 1,300 ppm at the north end of the diesel UST. No TPH-D was detected at the south end of the UST.

2.1-7 Diesel UST Site Remediation

The diesel-affected soil in the UST excavation was visually identified from its greenish appearance and was excavated horizontally and vertically. Horizontally, the excavation continued in all four directions until soil discoloration was no longer observed or the boundary of Phoenix 800 area 'T' was reached. Vertically, the affected soil was excavated until clean soil was encountered or the groundwater was reached. Approximately 800 cubic yards of discolored (greenish) soil was excavated from around the diesel UST and stockpiled offsite on a concrete slab approximately 50 yards east of the diesel UST location.

2.1-8 Confirmatoo:: Samplin&

Confirmatory samples 2T14-6-W and 2T13-6-0 were collected from the western wall and bottom of the diesel UST excavation, respectively (Table 1). The above sample I.D. numbers correspond with the confirmatory sampling nomenclature developed for remediation of contaminated grids in area 'T'. At the time of confirmatory sampling, the northern, southern, and eastern walls of the UST excavation had already been excavated to the perimeter of area 'T' during remediation of the same area for diesel and/or lead contamination and hence did not exist. As shown in Table 1, confirmatory sampling results indicate TPH-D values of30 and 20 ppm, which are well below the preliminary remedial goal (PRG) of 100 ppm set for this site by the Department of Toxic Substances Control (DTSC). Chain-of-custody and laboratory analytical results are included in Appendix C.

2.2 Gasoline Tank

The gasoline UST permit application was filed with the ACDEH on June 28, 1995, for excavation of the gasoline UST. The approved permit application forms are included in Appendix A.

The gasoline tank was a single-walled, steel tank approximately 2,600 gallons in capacity. The tank was located at the northwest corner of the Phoenix 800 site southeast of the diesel fuel tank. Figure 3 depicts the approximate relative locations of the USTs.

There is no record showing when this tank was installed at the site. The tank was not in operation as of 1990 and was exhumed, loaded, transported, and disposed of on October 20, 1995. The tank was buried approximately 4 to 5 feet below grade and was first exposed by removing the surrounding soil. The excavated soil was stockpiled separately in an area located approximately 50 yards east of the UST excavation. The quantity of soil excavated was estimated to be 200 cubic yards.

2.2-1 Associated Piping

There were no fittings or pipings attached to the tank at the time it was wicovered.

2.2-2 Tank Content

Prior to excavation, the liquid content of the tank was pumped into a vacuum truck by Erickson Environmental. The tank was rinsed with a pressurized stream of water and the rinsate was pumped concurrently into the vacuum truck, hence removing the gasoline and waste residues in the tank. The tank liquid and rinsate were transported to an appropriate licensed facility for disposal. The manifest document for disposal of the tank content is included in Appendix B.

2.2-3 Tank Purging

The tank was purged of any remaining vapors by placing 40 lb of dry ice in the tank one hour prior to removal. Following purging of the gaseous content of the tank, the lower explosive limit (LEL) inside the tank was measured at 2%. The oxygen level in the tank was measured at 0.6%. All the tank openings and holes were securely covered with tape to maintain the elevated CO_2 content of the tank during removal and transportation to the disposal/recycling facility.

2.2-4 Tank Inspection

The tank was lifted out of the excavation and was brought to the surface for physical inspection by the ACDEH inspector (Ms. Susan Hugo). The tank showed moderate signs of corrosion with no apparent holes identified in the tank. The ACDEH site report is included in Appendix A. Figure 5 shows the gasoline fuel tank prior to loading.

2.2-5 Tank Loading and Transportation

The tank was carefully lowered on to a flatbed truck, properly secured onto the truck bed with three straps, and then transported to a licensed facility for disposal and/or recycling by Erickson Environmental. A copy of the tank disposal manifest is included in Appendix B.

2.2-6 Sampling and Analysis

There was no free **product,** sheen, or odor observed in the soil immediately surrounding the gasoline tank. One soil sample was collected from the fill end (east end) and one from the discharge end (west end) of the tank at approximately **8** feet below ground surface (bgs) immediately following tank removal.

A backhoe bucket was used to scoop the soil from underneath each end of the tank to the surface for sampling. Samples were collected by pushing 2 in. x 6 in. brass sleeves, capped at one end, directly into the soil. Sampling sleeves were capped at the other end immediately following collection of the soil samples. The remaining soil in the backhoe bucket was replaced in its original location. Samples GAS-E (east end) and GAS-W (west end) were analyzed for total petroleum hydrocarbons as gasoline (TPH-G), benzene, toluene, ethylbenzene, xylenes (BTEX), and methyl tertiary butyl ether (MTBE) via EPA Method 5030/8015M/8020. Chain-of-custody and laboratory analytical results are included in Appendix C and summarized in Table 2. As shown in Table 2, soil analytical results indicate all the suspected contaminants to be well below the designated PRG levels, hence requiring no UST site remediation.

2.3 First Solvent UST

Two underground storage tanks, each containing unknown quantities of solvents, were accidentally encountered while performing remedial excavation on the Phoenix 800 site.

The first solvent tank, encountered on October 15, 1995, was made of steel and its capacity was estimated at 250 gallons. The tank was located south of the diesel and gasoline tanks. Figure 3 shows the approximate location of the tank. There was no record showing the date the tank was installed or put into operation. The nature of the content of the tank was also unknown at the time it was discovered.

2.3-1 Tank Content Identification

At the time of discovery, the tank was struck by the bucket of an excavator puncturing a large hole in the tank and thereby releasing its liquid content into the surrounding soil. The remedial excavation work was immediately halted, the tank was covered with 2 - 3 feet of clean soil and the area was isolated and barricaded with caution tape. An emergency crew (Evergreen) was called to the site to conduct onsite hazardous material cataloguing tests and collect liquid and soil samples to help determine the chemical composition of the liquid in the tank. The crew members were equipped with level B personal protective equipment (PPE).

2.3-2 Soil and Liquid Sampling

Two soil samples were collected from the affected soil in the immediate vicinity of the tank, and one sample was collected from the tank liquid content. The samples were tested for VOCs (EPA Method 8240/8260), Semi-VOCs (EPA Method 3550/8270), and CAM-17 metals (Method 3050A M/6010/7471). Sample collection techniques are detailed in Section 4. The soil and liquid test results identified the liquid as a diluted solvent. The chain-of-custody and analytical results are included in Appendix C and summarized in Tables 3A, 3B, and JC. Photo ionization detector (PID) readings taken next to the tank indicated the presence of strong volatile organic compounds (VOCs).

2.3-3 ACDEH Notification

This incident was reported to ACDEH, Ms. Susan Hugo, on Monday October 16, 1995. She advised that the UST Closure Application form be modified by changing the original number of tanks to be closed at Phoenix 800 from 2 to 3 tanks. A separate Form B was completed for this tank and submitted to ACDEH. Appendix A includes a copy of the tank discovery notification letter and Form B submitted to ACDEH. A Hazardous Materials Release and Notification Report was also filed with the Alameda County Health Care Services Agency on October 19, 1995, and is included in Appendix A.

2.3-4 Associated Piping

There were no fittings or pipings attached to the tank at the time it was uncovered.

2.3-5 Tank Content

Most of the tank content spilled onto the surrounding soil when the tank was struck by the excavator backhoe.

2.3-6 Tank Rinsing

The tank was rinsed with a pressurized stream of water and the rinsate was absorbed (15 gallons) by the surrounding soil, which was later excavated and stockpiled for sampling and characterization.

2.3-7 Tank Purging

The tank was purged of any remaining vapors by placing 10 lb of dry ice in the tank one hour prior to removal. Following purging of the gaseous content of the tank, the LEL inside the tank was measured at 0%. Later all the tank openings and holes were securely covered with tape to maintain the elevated CO_2 content of the tank during removal and transportation to the disposal/recycling facility.

2.3-8 Tank Inspection

The tank was lifted out of the excavation and was brought to the surface for physical inspection by ACDEH inspector Mr. Brian Oliva on October 23, 1995. Inspection of the solvent tank showed that it had been ruptured due to the prior backhoe action. The ACDEH site report is included in Appendix A. Figure 6 shows the solvent tank prior to loading.

2.3-9 Tank Loadin& and Transportation

The tank was loaded for transportation and disposal/recycling on October 23, 1995. The tank was wrapped in visqueen, loaded onto a flatbed truck, properly secured with straps, and transported by Erickson Environmental to a licensed facility for disposal/recycling. A copy of the tank disposal manifest is included in Appendix B.

2.3-10 Personnel PPE

During tank rinsing, purging, inspection, and loading, the excavator operator was suited under level B PPE and the backup personnel were suited under level C PPE with half-face respirators.

2.3-11 Confirmatory Sampling

The soil affected by content of the solvent tank was excavated and stockpiled for sampling and characterization in a concrete- surfaced area located approximately 60 yards east of the tank excavation. The quantity of soil excavated was estimated to be 200 to 300 cubic yards. Confirmatory samples were collected from the bottom of the tank excavation and analyzed for oil and grease (EPA Method 5520), VOCs (EPA Method 8240/8260), semi-VOCs (EPA Method 3550/8270), and CAM 17 metals (EPA Method 3050A M/6010/7471). The chain-of-custody and laboratory analytical results are included in Appendix C and summarized in Tables 3D, 3E, and 3F. Confirmatory sampling results show all detected contaminants to be well below the established PRG levels, hence no further cleanup of the first solvent UST site was required.

2.4 Second Solvent Tank

A second solvent tank was encountered on October 28, 1995. The tank was made of steel and was estimated at 10 gallons. The tank was located to the south of the first solvent tank. Figure 3 depicts the approximate location of the second solvent tank. There was no record showing the date the tank was installed and put into operation. The nature of the content of the tank was unknown at the time it was discovered.

At the time of discovery, the tank was struck by an excavator bucket puncturing a hole in the tank and thereby releasing about 1 gallon of its liquid content into the native soil. Excavation work was immediately halted. The tank was covered with about 2 - 3 feet of clean soil and the area was isolated and barricaded with caution tape. PID readings of the tank indicated presence ofVOCs.

2.4-1 son and Ljgujd Sampling

One soil sample was collected from the surrounding affected soil, and one liquid sample was collected from the suspected solvent tank. The samples were analyzed for VOCs and semi-VOCs. The chain-of-custody and laboratory analytical results are included in Appendix C and summarized in Tables 4A and 4B. As indicated by the liquid test results, the tank contained low levels of solvents and VOCs. The soil test results did not indicate the presence of any of the analytes of interest.

2.4-2 ACDEH Notification

This incident was reported to Ms. Susan Hugo on October 30, 1995. She advised the UST Closure Application form be modified by changing the original number of tank closures from 3 to 4. Appendix A includes a copy of the notification letter sent to Ms. Hugo. A separate Form B was also completed for this tank and submitted to ACDEH (Appendix A). A Hazardous Materials Release and Notification Report was filed with the Alameda County Health Care Services Agency on October 30, 1995 (Appendix A).

2.4-3 Tank Loading and Transportation

The tank was uncovered, loaded, and transported by Erickson Environmental for disposal/ recycling on October 3I, 1995. There was no liquid content in the tank since it had been released into the surrounding soil. PID readings indicated the presence of VOCs in the tank prior to tank purging. The tank was purged by placing 5 lb of dry ice in the tank. LEL readings indicated 0%.

The tank was physically inspected prior to placing it in a truck-mounted roll-off bin. There were no fittings or pipings attached to the tank. The tank showed it had been ruptured due to the prior backhoe action. Figure 7 shows the second solvent tank prior to loading. The tank was wrapped in visqueen, carefully placed the in the truck-mounted roll-off bin, secured, and transported by Erickson Environmental to a licensed facility for disposal/recycling. A copy of the tank disposal manifest is included in Appendix B.

The Alameda County Department of Environmental Health and City of Oakland Fire Department were notified. However, no representative was present during the actual excavation and removal of the tank.

2.4-4 UST Site Remediation

The affected soil around the tank was excavated and stockpiled for sampling and characterization with the first solvent tank stockpile, east of the tank excavation. The quantity of soil excavated was estimated at 50 cubic yards.

2.4-5 Personnel PPE

The excavator operator was suited under level B PPE and the backup personnel were suited under level C with respirators during the sampling, uncovering, inspection, and loading of the solvent UST.

3 UST SITE REMEDIATION

3.1 Diesel UST Site

Analytical results of the soil samples collected from the excavation following removal of the diesel UST indicated the presence ofTPH-D at 1,300 mg/kg at the fill end of the tank (Table 1). In remediating this site, contaminated soils around the diesel tank were excavated vertically to groundwater (approximately 8-9 feet below grade). Horizontally, the contaminated soils were excavated until no visual signs of discoloration (greenish) were observed or the boundary of the Phoenix 800 area was reached. Analysis of soil samples collected from the tank site following diesel UST site remediation indicated TPH-D at 30 and 22 mg/kg (Table 1), which are well below the PRG value of 100 mg/kg. Hence, the diesel UST site was remediated.

3.2 Gasoline UST Site

Results of the soil sample analyses from the former gasoline tank location indicated detectable concentrations of some petroleum hydrocarbon constituents (Table 2). TPH-G was detected at a concentration of 27 ppm, ethyl benzene at a concentration of 0.10 ppm, and xylenes at a concentration of 0.05 ppm. Benzene, toluene, and methyl tertiary butyl ether (MTBE) were not detected in the soil samples.

Sampling results of the former gasoline tank location indicated the site did not require further remediation since the reported levels of TPH-D, ethylbenzene, and xylenes were well below the established PRG levels of 100 ppm, 74 ppm, and 99 ppm, respectively.

3.3 First Solvent UST Site

Two soil samples were collected from the floor of the first solvent tank excavation following tank removal. The soil samples were tested for voes, semi-VOes, and eAM-17 metals. Results of the soil sample analyses indicated detectable concentrations of volatile and semi-volatile organic compounds, and heavy metals (Tables 3A, 3B, 3e).

The soil VOC components: acetone, methylene chloride, and toluene were detected at maximum concentration of 3.1 ppm, 0.29 ppm, and at 1.9 ppm, respectively. No other voes were detected in the soil samples. A summary of the soil and liquid VOC results is presented in Table 3A.

The maximum concentration of semi-volatiles detected in the soil samples was 1.3 ppm for fluoranthene, 1.3 ppm for pyrene, 0.69 ppm for benzo (A) anthracene, 1.0 ppm for chrysene, 0.63 ppm for benzene (B) fluranthene, 1.30 ppm for benzo (A) pyrene, and 1.2 ppm for indeno (1,2,3,e,D) pyrene. A summary of the soil and liquid semi-volatile results is presented in Table 3B.

For the heavy metals, detectable concentrations were reported in the soil samples. Maximum concentrations of antimony at 10 ppm, arsenic at 6.1 ppm, barium at 87 ppm, cadmium at 1.4 ppm, chromium at 21 ppm, copper at 25 ppm, lead at 770 ppm, nickel at 14 ppm, selenium at 2.4 ppm, vanadium at 15 ppm, zinc at 150 ppm, and mercury at 0.11 p.m. were reported for the soil samples. A summary of analytical results of eAM-17 metals for the soil and liquid samples is presented in Table 3C.

Following excavation of the soils from around the solvent UST, two confirmatory soil samples were collected from the floor area of the excavation. The analytical results indicated that volatiles, semi-volatiles, and metal concentrations were well below the PRO levels set for this site, hence no further remediation was considered for this site. Tables 3D, 3E, and 3F nmmari7,e the confirmatory test results for volatiles, semi-volatiles, and CAM-17 metals, respectively.

3.4 Second Solvent UST Site

One soil sample was collected from the area directly underlying the 25-gallon. solvent tank and was tested for volatile and semi-volatile organic compounds. Analysis of the soil sample showed non-detect for all the analytes of interest (VOCs and semi-VOCs), hence remediation of the second solvent tank site was not considered.

4 STOCKPILE MANAGEMENT

The soils excavated from around the diesel and solvent USTs were stockpiled offsite (two diesel stockpiles and two solvent stockpiles) on a concrete slab approximately 50 yards east of area 'T'. Quantities of stockpiled soils from diesel- and solvent- affected UST sites were estimated at 800 and 250 cubic yards, respectively. The stockpiles were sampled for characterization and disposal. Figure **8** depicts the relative position and approximate siz.e of all of the Phoenix 800 stockpiles, including the diesels and solvent stockpiles. Figure 9 depicts the stockpiled soil sampling locations. Laboratory analytical results of characterization samples collected from the diesel stockpile are included in Appendix C and summarized in Tables 5A and 5B..

4.1 Diesel Stockpiles

Four soil samples were collected from the first diesel stockpile and tested for TPH-D (EPA Method 8015) and total and threshold concentration leaching procedure (TCLP) for lead (EPA Method 60I0). Each sample represented a stockpiled soil volume of approximately 100 cubic yards. Figure 9 depicts the sampling locations. The analytical test results are included in Appendix C and summarized in Table 5A. As shown in Table 5A, all the analytes tested for were well below their respective PRG levels, and hence the first diesel stockpile was characterized as non-hazardous. This stockpile will be used as fill material on the Cypress 'B' site.

Six composite samples were collected from the second diesel stockpile and tested for total recoverable petroleum hydrocarbons (TRPH)(EPA Method 418.1), TPH-D (EPA Method 8015), and total lead (EPA Method 3050/7420). Each composite soil sample represented a stockpiled soil volume of 100 cubic yards. Figure 9 depicts the composite sampling locations.

The analytical test results are included in Appendix C and summarized in Table 5B. As shown in Table 5B, all the analytes tested for were well below their respective PRO levels, and hence the second diesel stockpile was characterized as non-hazardous. This stockpile will be used as fill material on the Cypress **'B'** site.

4.2 Solvent Stockpiles

Six samples were collected from the solvent stockpiles and tested for VOCs (EPA Method 8240), semi-VOCs (EPA Method 8270) and CAM-17 metals (EPA Method 3050A M/60IOn471). Each sample represented a 20 foot section of the stockpile along its length. Figure 9 depicts the stockpile sampling locations. The detailed analytical results are included in Appendix C and summarized in Tables 6A, 6B, and 6C. As shown in Tables 6A and 6B, the majority of the analytes tested for were reported as non-detect and only a few were reported in very low concentrations.

VOCs were reported at maximum concentrations of 13 µg/kg for tetrachloroethene and 43 µg/kg for toluene. Semi-VOCs were reported at maximum concentrations of 480 µg/kg for Anthracene, 470 µg/kg for Fluoranthene, and 410 µg/kg for Pyrene. These concentrations are considered well below PRO levels. CAM-17 metals were reported at concentrations well below the PRO levels, except for lead. As shown in Table 6C, total lead was reported at 1900 mg/kg and 1,400 mg/kg for samples T.SOLV.STOC.1 and T.SOLV.STOC.2, respectively. TCLP lead was reported at 24 and 11 mg/I for these samples, respectively, characterizing the portion of the solvent stockpile represented by these samples (a 40-foot section of the solvent stockpile) as Resource Conservation and Recovery Act (RCRA) waste. The section of the solvent stockpile classified as RCRA waste was segregated, loaded, and transported to Laidlaw class I landfill in Buttonwillow, California, on November 17, 1995, for disposal. The hazardous waste disposal manifests are included in Appendix D.

5 SAMPLING

5.1 Sampling Procedure

Soil samples from UST excavations and remediated UST sites were collected by driving 2-in by 6-in brass sleeves capped at one end (Teflon paper+ plastic cap) directly into the soil. Following collection of the soil samples in the brass sleeves, the open sleeve ends were covered with Teflon paper and capped immediately. Each sample was properly labeled and refrigerated with blue ice in a cooler pending shipment to a laboratory for analysis. Liquid samples were collected in I-liter amber glass bottles. Tue chain-of-custody forms and the detailed analytical results are included in Appendix C.

Soil samples from the stockpiles were collected by first augering 2-3 feet below the surface and later employing a core sampler with a 2 inch x 6 in brass sleeve insert to collect the sample at 3 feet below the surface of the stockpile.

5.2 Equipment Contamination Prevention

All equipment used for collecting soil samples was cleaned with nonphosphate detergent and triple rinsed with deionized water prior to sampling. Trowels, hand augers, and core samplers were cleaned between each sampling event to prevent cross contamination from one sample location to another. Furthermore, fresh latex gloves were worn prior to each sampling event.

5.3 Soil and Liquid Sample Analysis

Soil and liquid samples **were** collected from UST excavations following UST removal. Confirmatory soil samples were later collected from remediated UST sites and analyzed for contaminants of concern.

Soil samples collected from the diesel UST site were analyzed for TPH-D via EPA Method 3550/8015M. Soil samples collected from the gasoline UST site were analyzed for TPH-G, benzene, toluene, ethylbenzene, xylenes (BTEX), and methyl tertiary butyl ether (MTBE) via EPA Method 5030/8015M/8020. Soil samples collected from the solvent UST site were analyzed for VOCs, semi-VOCs, and CAM-17 metals via EPA Methods 8240, 8270, and 6010, respectively.

KASLER CORPORATION

ACCEPTED

Underground Storage Tank Closure Permit Application
Alameda County Division of Hazardous Materials
80 Swan Way, Suite 200,
Oakland, CA 94621
Telephone: (510) 271-4320

These closure/removal plans have been received and found to be acceptable and essentially meet the requirements of State and Local Health Laws. Changes to your closure plans indicated by this Department are to assure compliance with State and local laws. The project proposed herein is now released for issuance of any required building permits for construction/destruction.

One copy of the accepted plans must be on the job and available to all contractors and craftsmen involved with the removal.

Any changes or alterations of these plans and specifications must be submitted to this Department and to the Fire and Building Inspections Department to determine if such changes meet the requirements of State and local laws.

Notify this Department at least 72 hours prior to the following required inspections: *

- ✓ Removal of Tank(s) and Piping
- ✓ Sampling
- ✓ Final Inspection

Issuance of a) permit to operate, b) permanent site closure is dependant on compliance with accepted plans and all applicable laws and regulations.

*THERE IS A FINANCIAL PENALTY FOR NOT OBTAINING THESE INSPECTIONS

14. Describe methods to be used for rendering tank(s) inert.

[illegible] (OD . l(S.

Before tanks are pumped out and inerted, all associated piping must be flushed out into the tanks. All accessible associated piping must then be removed. Inaccessible piping, must be permanently plugged.

The Bay Area Air Quality Management District, 415/771-6000, along with local Fire and Building Departments, must also be contacted for tank removal permits. Fire departments typically require the use of a combustible gas indicator to verify tank inertness. It is the contractor's responsibility to bring a working combustible gas indicator on-site to verify that the tank is inert.

15. Tank History and Sampling Information*** **(see instructions)*****

Dear Ms. Hugo:

RE: UNDER GROUND STORAGE TANK REMOVAL PERMIT

Following our telephone conversation and per your request. I am writing to inform you of the accidental discovery of an additional underground storage tank at the Phoenix Iron Works Site located on 888 Cedar Street, Oakland.

The capacity of the underground storage tank is estimated to be 250 gallons. Analytical results of the liquid content indicate presence of Toluene, Acetone, Phenols and Dichlorobenzenes. The Health and Safety Plan has been modified to incorporate the new findings.

A suggested, please change the number of underground storage tanks to be closed from 2 to 3 in the previous Underground Tank Closure Plan submitted for this site in June 1995. A separate Form B for this tank and site plan showing the approximate location of the new underground storage tank are attached.

The removal operations of the three tanks have been scheduled for Friday, October 20. 1995.

If you have any questions. please contact me. Thank you.

Dear Ms. Hugo:

RE: UNDER GROU1'1D STORAGE TANK REMOVAL PERMIT

Following our telephone conversation and per your request, I am writing to inform you of an additional underground storage tank accidentally encountered on October 28, 1995 at the Phoenix Iron Works **Site** located on 888 Cedar Street, Oakland.

A
W

The capacity of the underground storage tank is estimated to be 25 - 30 gallons. Analytlcal results of the liquid content indicate presence of trace amount of Toluene, Acetone, Phenols, Xylenes, Ethylbenzene, and Methyl Ether Ketone. The Health and Safety Plan has been modifiedto incorporate these new findings.

Please change the number of underground storage tanks to be closed from 3 to 4 in the previous Underground Tank Closure Plan submitted for this site in June 1995. A separate Fonn B for this tank and site plan showing the approximate location of the new underground storage tank are attached.

The removal operation for this tank is scheduled for Tuesday, October 3I, I995. A closure report will be submitted at a later date.

If you have any questions, please contact me. Thank you.

✓ III. Underground Storage Tanks

*Oakland Fire Dept - not available requested ACDEH to ____ tank's removals.

* Calif. Administration Code (CAC) or the Health & Safety Code (HS&C)

Comments: 2 USTs Removed: → TANK's Manifest = (95592816 contents) #95592442
TANKS Hauler = ERICKSON #616258[illegible]

#1 TANK (diesel, aprox 1000 gal.) Steel tank appeared corroded; hole at the bottom (some liquid dripping).
LEL = 0% O2 = (1.5% bottom) & 4.2% top
One soil sample collected from each end of the tank. (aprox. 8 ft).

#2 TANK (gasoline; aprox 2600 gal) steel tank appeared corroded; some pitting; no obvious holes.
LEL = 62.0% O2 = 0.6% MTBE will be added as target analytes. One soil sample collected fr. each end of the tank. (aprox. 8 ft bgs).

Stockpiled soil generated during the removal of the tank must be characterized for disposal.
The area of the former tanks will be part of the 60 ft excavation for the Cypress reconstruction. Limited overexcavation will be conducted around the tank. ~~Collected~~ Verification soil samples must be collected (Schedule with the County).

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

VOC	Volatile Organic Compound
WET	Waste Extraction Test

1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) describes the soil assessment activities that will be conducted during a Phase II Soil Investigation at Assessor's Parcel Number (APN) 006-047-001 in Oakland, Alameda County, California (the Site). The Site has also historically been identified as 800 Cedar Street. However, reconfiguration of Interstate 880 in Oakland has actually removed Cedar Street at this location. The work is being performed for the City of Oakland (City) under Brownfield Assessment Grant (BAG) Number 2B-00T18101-0 for both hazardous substances and petroleum hydrocarbons, issued by the United States Environmental Protection Agency (USEPA) for the West Oakland Development Area. The work will be performed in accordance with procedures outlined in the *Quality Assurance Project Plan, West Oakland Development Area, Oakland, California* prepared by Northgate on September 8, 2009 (the QAPP). The QAPP was prepared to serve as a master document to support site-specific SAPs.

The purpose of the Phase II Soil Investigation is to:

- Define the extent of semi-volatile organic compound (SVOC) and petroleum hydrocarbon soil contamination in several areas of the Site that were identified in previous investigations;
- Provide further evaluation of elevated lead concentrations detected in soil at the Site; and
- Evaluate the potential need for remediation or additional evaluation of risk at the Site.

1.1 Site Description

The Site consists of an approximate 5-acre (600 feet by 400 feet) parcel of land located on the west side of Pine Street, between 9th Street and Shorey Street in Oakland, California. The Site is almost entirely covered by the remnant concrete slab of a former building. The Site is currently used for equipment and supplies storage by the California Department of Transportation (Caltrans).

The Site is located in an area of mixed residential and commercial development. The Site is bordered on the north by 9th Street, across which are residences and industrial warehouse buildings. The Site is bordered on the east and south by Pine Street and Shorey Streets, followed by residences. The Site is bordered along the west by an access ramp for Interstate 880. Figure 1 shows the Site location and Figure 2 shows a current aerial view of the Site overlain by the approximate Site boundary as it existed in the early 1990s, along with historical features identified in previous environmental investigation reports.

1.2 Responsible Agency

The Site is currently regulated by the State of California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), under a Voluntary Cleanup Agreement (VCA), as amended in 1999. USEPA is the agency overseeing the BAG for the Site. Northgate will implement the SAP on behalf of the City. Northgate is an environmental consulting firm founded in 2000. Northgate specializes in environmental and soil and groundwater investigations related to brownfields redevelopment. Northgate will subcontract specialty services, including but not limited to utility survey, drillers, and chemical laboratory services. Licensed drillers will conduct all drilling activities. A State-certified laboratory will perform the chemical testing.

1.3 Project Organization

Key project staff and their responsibilities are presented below:

Title/Responsibility	Name	Phone Number
USEPA Project Officer	Wallace Woo	(415) 972-3270
USEPA Quality Assurance Manager	Eugenia McNaughton, Ph.D.	(415) 972-3411
City of Oakland Project Manager	Gopakumar Nair	(510) 238-6361
Contractor (Northgate Envt. Mgmt)	Dennis Laduzinsky, C.E.G.	(510) 839-0688 x 202

1.4 Statement of the Specific Problem

Multiple site investigations and remedial activities have been performed at the Site since 1990. The most recent report for the Site is from 2000, entitled “Site Investigation Report, Soil and Groundwater Investigation, Former Phoenix Iron Works Facility, 800 Cedar Street, Oakland, CA”, prepared by IT Corporation on behalf of Caltrans. Additionally, a Preliminary Endangerment Assessment (PEA) was prepared for the Site in 1993 (On-Site Technologies, 1993). The key issues identified in these reports are as follows:

- Historically, the Site was used for a variety of purposes between 1920 and the present, including auto parts manufacturing, steel and ironworks fabrication, and fireworks manufacturing.
- One diesel and one gasoline underground storage tank (UST) located on the western side of the Site were removed sometime between 1995 and 1997 and a total of 800 cubic yards of soil were excavated and disposed of as part of the UST removals.
- Soil sampling performed at the Site during the tank removals indicated up to 17,000 parts per million of lead and 44 parts per million of arsenic in soil in the southwest corner of

the former Phoenix Iron Works property, which is outside the current Site property boundary. Soil excavation was initiated to remove these elevated metals concentrations, and during this excavation, two solvent-containing USTs (approximately 250 gallons and 10 gallons) and a settling sump were encountered. A total of 3,300 cubic yards of soil were excavated and disposed of as part of this remedial action (IT, 2000).

- Soil sampling performed in 1999 indicated the western edge of the Site has an area of total recoverable petroleum hydrocarbons (TRPH) in shallow soil in excess of 1,000 parts per million (ppm), and this area was previously identified as containing "black-stained sand".
- The 1999 soil sampling indicated two boring locations with elevated SVOC concentrations in shallow soil samples, and the presence of elevated lead concentrations in shallow soil at multiple locations across the Site.

The property owner is now evaluating potential redevelopment options for the Site, although the proposed redevelopment use for the Site is not known at this time. The purpose of the present investigation is to evaluate the extent of Total Extractable Petroleum Hydrocarbons (TEPH) and SVOCs at selected locations at the Site and to provide additional data regarding the presence of metals in shallow soil at the Site.

1.5 Permits

A drilling permit will be obtained from the Alameda County Public Works Agency (ACPWA) to implement the field drilling and sampling activities. The Field Program Manager will notify Underground Service Alert of the proposed drilling activities at least 48 hours in advance of the field drilling in accordance with the law.

1.6 Site Access

Site access will be arranged through the City of Oakland. Site access is currently restricted by perimeter fencing, controlled entry and exit points and the presence of equipment and supplies being used by Caltrans at the Site.

2.0 BACKGROUND

2.1 Site Description

The Site consists of an approximate 5-acre (600 feet by 400 feet) parcel of vacant land paved with concrete. The Site is located on the west side of Pine Street, between Shorey and 9th Streets in West Oakland, and is bordered by a frontage road for Interstate Highway 880 on the west. The Site has historically been identified as 800 Cedar Street. However, reconfiguration of Interstate 880 in Oakland has removed Cedar Street at this location.

2.2 Operational History

Information presented in the 1993 PEA indicates that the Site was used for a variety of purposes between 1920 and the present, including auto parts manufacturing, steel and ironworks fabrication, and fireworks manufacturing. Table 2.2.1 of the PEA provides a list of the businesses and dates of operation at the Site. Table 2.3.1 of the PEA provides a list of hazardous substances that were historically used at the Site. In general, very little is known about the materials used at the Site, with the exception of the following businesses:

- Cypress Auto Parts - oxygen, acetylene, gasoline and waste oil used onsite, operated from an unknown time until the time of the PEA (1993);
- Pine Iron Works - paint, naphtha, paint thinner and waste oil used onsite, operated from an unknown time until 1990; and
- Phoenix Iron Works - two USTs, operation from approximately 1970 until the time of the PEA (1993).

2.3 Previous Investigations and Regulatory Involvement

The PEA was prepared for Caltrans, in consultation with DTSC in response to DTSC's determination that PEA reports were required for properties located along the proposed reconstruction alignment for the Highway 880/Cypress Freeway construction following the 1989 Loma Prieta Earthquake. Information in the PEA indicates that in May 1990, the property owner (Phoenix Properties) contracted with BEC, Inc. to perform Phase I and Phase II environmental assessments at the Site. Five soil borings were advanced to depths of 5.5 to 11.5 feet below ground surface (bgs) across the Site, and 11 soil samples were collected and submitted for laboratory analysis. Five soil samples analyzed for total petroleum hydrocarbons as gasoline (TPHg), total petroleum hydrocarbons as diesel (TPHd), and benzene, toluene, xylene and ethylbenzene, did not contain these analytes above the laboratory method reporting limits

(MRLs). Four of the samples and one additional soil sample analyzed for volatile organic compounds (VOCs) and SVOCs did not contain contaminants above the laboratory MRLs. Five different soils were found to contain low levels of metals, with the exception of one soil sample (PP-6, located in the southwestern corner of the Site), which contained a total lead concentration of 52 mg/kg, and soluble lead (analyzed using the Waste Extraction Test) of 2.26 mg/l.

In June 1992, Caltrans contracted with Georesource Consultants, Inc. to perform a limited field investigation at the Site, related to the Highway 880/Cypress reconstruction. Three borings for soil sample collection were advanced at the Site in the vicinity of the USTs and a hydropunch groundwater sample was also collected from one of these borings. A total of seven soil samples from these borings were analyzed for TPHg, TPHd and total recoverable petroleum hydrocarbons. Five of these samples were below the laboratory MRLs for these analytes. Two of the samples (PP800/H-1 at depths of 1.5 and 4 feet bgs) contained TPHg at concentrations of 10 and 17 milligrams per kilogram (mg/kg), and TPHd at concentrations of 1,600 and 2,400 mg/kg. The groundwater sample did not contain TPHg or TPHd above the laboratory MRLs (GRC, 1992).

In 1993, Caltrans contracted with On-Site Technologies to prepare a PEA and perform limited soil and groundwater sampling at the Site. Three soil borings for soil and groundwater sample collection were advanced at the Site to depths of 9 to 11 feet bgs, in the vicinity of the USTs. One soil sample from each boring was analyzed for TPHg and VOCs, two soil samples from each boring were analyzed for SVOCs, and four samples from each boring were analyzed for TPHd. All of these samples were below laboratory MRLs for these analytes. One groundwater sample collected from each boring was analyzed for TPHg, TPHd, VOCs and selected metals (cadmium, chromium, lead, nickel and zinc). The groundwater samples were below laboratory MRLs for TPHg, VOCs, and cadmium. TPHd was measured in the samples at 0.14 to 0.26 milligrams per liter (mg/l) along with low levels of the remaining metals (On-Site Technologies, 1993).

In 1994, Caltrans entered into a Voluntary Cleanup Agreement (VCA) with DTSC for the Cypress Freeway Reconstruction Project and East Bay Municipal Utility District Sewer Line Realignment in Oakland and Emeryville, California. The reconstruction project consisted of 34 separate properties, including the 800 Cedar Street property. The VCA was subsequently amended twice in 1996, and once each in 1997, 1999 and 2002.

Sometime between 1995 and 1997 two USTs were removed from the Site (IT, 2000), although Northgate was not able to obtain reports which identified the exact date of the tank removals.

Discolored soil was observed after the diesel UST was removed, and a total of 800 cubic yards of soil were excavated and disposed of as part of the UST removals.

Additional soil sampling performed at the Site during this time indicated up to 17,000 parts per million of lead and 44 parts per million of arsenic were present in soil samples in the southwest corner of the former Phoenix Iron Works property. Soil excavation was initiated to remove these elevated metals concentrations, and during this excavation, two solvent-containing USTs (approximately 250 gallons and 10 gallons) and a settling sump were encountered. A total of 3,300 cubic yards of soil were excavated and disposed of as part of this remedial action.

In 1999, IT Corporation performed a field investigation at the Site that included drilling 26 soil borings for collection and analysis of soil samples, and collection and analysis of grab groundwater samples from 15 of the borings. Soil borings were arranged in a regular grid pattern across the Site, and most of the borings were advanced to 11.5 feet bgs. A total of 95 soil samples were submitted for chemical analysis for TPHg, TPHd TPRH, VOCs, SVOCs and California Assessment Manual (CAM) 17 metals. Fifteen groundwater samples were analyzed for these same constituents and were also analyzed for total dissolved solids (TDS). Based upon the results of the soil metals analyses, selected samples were also analyzed for soluble metals. Analytical results from these samples indicated the following:

- TPHg and TPHd were not detected above the MRLs in any of the samples. TRPH was detected in 37 of the 95 samples, with concentrations ranging from 60 mg/kg to 1,200 mg/kg, although only three of these samples had concentrations in excess of 320 mg/kg.
- VOCs were detected in 11 of the 95 samples, with trichloroethene (TCE), tetrachloroethene (PCE) and styrene as the only VOCs that were detected. The maximum VOC concentration was 0.028 mg/kg TCE.
- SVOCs were detected in 2 of the 95 samples. The maximum SVOC concentration detected was 13 mg/kg benzo(a)pyrene.
- Antimony, molybdenum, selenium, silver and thallium were not detected above the MRLs in any of the 95 samples. The remaining CAM 17 metals were detected in at least one of the samples.
- Nine soil samples that contained lead at 10 times the Soluble Threshold Limit Concentration (STLC, 5 mg/l) for lead were analyzed for soluble lead using the Waste Extraction Test (WET), and 10 soil samples that contained lead at 20 times the STLC (5 mg/l) were analyzed for soluble lead using the Toxicity Characteristic Leaching Procedure (TCLP). The WET is typically used for characterization of soil for waste

disposal according to California standards, while the TCLP is typically used for characterization of soil for waste disposal according to Federal standards.

- TPHg, TPHd and TRPH were not detected above the MRLs in any of the groundwater samples.
- VOCs were detected in 8 of the 15 samples, with 8 different VOCs detected, including benzene, toluene and TCE.
- SVOCs were not detected above the MRLs in any of the samples.
- Groundwater samples for CAM 17 metals analysis were filtered in the laboratory following sampling collection. Antimony, arsenic, cadmium, molybdenum, selenium, silver and thallium were not detected above the MRLs in any of the 15 samples. The remaining CAM 17 metals were detected in at least one of the samples.
- TDS concentrations for the 15 groundwater samples ranged from 287 mg/l to 1,312 mg/l.

2.4 Geologic Information

Information presented in the PEA, developed from USGS Miscellaneous Geologic Investigation Map I-239, indicated the following stratigraphy at the Site:

- Merritt Sand from approximately 2.5 feet bgs to 35 feet bgs;
- Older Bay Mud (including the Alameda Formation) from approximately 35 to 50 feet bgs; and
- Francisco Formation below 50 feet bgs.

Boring logs from the investigation performed by GRC in 1992 indicated silty sand and sand at the Site to a depth of 27 feet bgs. Groundwater was measured in one of the borings at a depth of 7.2 feet bgs.

2.5 Environmental and/or Human Impact

Analytical data from the prior investigations indicate that VOCs do not appear to be constituents of potential concern (COPCs) in either soil or groundwater, and only isolated areas of the Site are impacted by TRPH and SVOCs in soil. The data indicate that elevated concentrations of lead are present in shallow soil across the Site, these elevated lead concentrations are limited to the upper 0.5 to 3 feet of soil, the lead is not connected to any obvious source area, and this is the only CAM 17 metal that is a COPC for the Site.

3.0 PROJECT DATA QUALITY OBJECTIVES

As discussed in Section A.3 of the QAPP, Data Quality Objectives (DQOs) are qualitative and quantitative statements that clarify technical and quality objectives, define the appropriate type of data, and specify tolerable levels of potential decision errors that will be used as the basis for establishing the quality and quantity of data needed to support decisions.

This section summarizes the DQOs for the investigation described herein and will include:

- The problem to be studied;
- Identification of the questions that the study will attempt to resolve and the decisions that may result;
- Identification of the information needed to be obtained and the measurements needed to be taken to resolve the decision statement(s); and
- Definitions of study boundaries, including when and where data should be collected.

3.1 Project Task and Problem Definition

Given the historical Site uses and operations at adjacent properties, there exists the potential for contaminants in soil and groundwater associated with a wide range of activities, including automobile parts manufacturing, steelworking, and fireworks manufacture. These contaminants include:

- Petroleum hydrocarbons;
- heavy metals;
- VOCs; and
- SVOCs.

Extensive soil and groundwater sampling has been conducted across the Site between 1990 and 1999, as discussed in Section 2.3 of this SAP. Over 40 soil borings were installed at the Site, and over 100 soil samples have been analyzed for various constituents. Grab groundwater samples were collected from 20 of these borings, with groundwater sample analysis for a variety of constituents.

Two USTs (one gasoline and one diesel), which were identified in historical reports from the Site, have been removed, and impacted soil in the vicinity of the USTs was over-excavated and removed from the Site. Two additional small USTs were identified in the lower southeast corner of the Site during grading activities, and these USTs, along with over 2,000 cubic yards of soil, have also been removed from the Site.

The following three potential issues of concern have been identified at the Site:

1. Residual, elevated concentrations of lead are present in the shallow surface soil across the Site. The distribution of lead in the subsurface does not indicate any obvious source area for the lead.
2. Elevated levels of total recoverable petroleum hydrocarbons (TRPH) are present in the western portion of the Site, in an area previously identified as containing “black-stained sand”.
3. SVOCs were detected in two shallow soil samples at the Site, at concentrations that exceed the RWQCB ESLs for residential development. One of these samples is located in the southwestern portion of the Site and the other sample is located approximately 50 feet east of the former USTs in the western portion of the Site.

Groundwater samples collected from the Site do not indicate the presence of constituents in groundwater at concentrations that would appear to significantly impact human health or the environment.

This SAP describes investigation activities that will be used to assess the lateral and vertical extent of SVOCs and TRPH in soil in isolated areas of the Site, and whether they represent a significant risk to anticipated future Site users, including construction workers. Samples collected for SVOC and TRPH analysis will also be analyzed for metals, to provide additional data regarding the distribution of metals across the Site. Actual redevelopment plans are unknown at the time but will most likely include redevelopment of the Site for commercial or residential use. This investigation will utilize the most conservative approach, and therefore will include, but is not limited to, residential screening goals to assess potential human health risks.

The information gained from this investigation will be used by the City to assist the owner with the redevelopment of the parcel. Proposed sampling activities are summarized in Section 4.0

3.2 Data Quality Objectives (DQOs)

The primary objective of this investigation is to assess the lateral and vertical extent of selected constituents in soil at the Site. The results will be used to judge whether such impacts may affect various redevelopment plans. There are no specific requirements to conduct abatement and/or remediation as a direct result of these findings. However, investigation results will be used to prepare recommendations that will be used during redevelopment activities. The soil investigation will assess the lateral and vertical extent and human health risk of SVOCs and petroleum hydrocarbons in isolated areas of the Site. Table 1 summarizes the environmental screening criteria for the primary COPCS for the Site.

3.3 Data Quality Indicators

As stated in Section A.3.2 of the QAPP, data quality indicators (DQIs) refer to quality control criteria established for various aspects of data gathering, sampling, or analysis activity. For this project, laboratory data will be reconciled with DQIs based on the following five assessment parameters:

3.3.1 *Accuracy*

To assess the accuracy of the data for this investigation, Northgate will review 100% of the laboratory reports to confirm compliance with the laboratory's own quality control (QC) limits, particularly with respect to the laboratory's matrix spike and surrogate spike results.

3.3.2 *Precision*

To assess the precision of the data, Northgate will evaluate the relative percent difference (RPD) between duplicate laboratory and field samples on 100% of the laboratory reports. Typically an RPD of <30% for aqueous samples and <50% for soil is considered acceptable. It is noted that unless soil samples are homogenized, the RPD for soil can vary greatly.

3.3.3 *Completeness*

Field completeness is a measure of the amount of valid samples obtained during all sampling for the project. The field completeness goal is 90 percent. Laboratory completeness is a measure of the amount of valid measurements obtained from all the measurements taken in the project. The laboratory completeness goal is 90 percent.

3.3.4 *Representativeness*

Representativeness expresses the degree to which sample data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. The design of the sampling program ensures that environmental conditions have been sufficiently represented. Representativeness will be evaluated by the Project Manager based on review of other data quality indicators, quality assurance/quality control (QA/QC) samples, laboratory QC results, and site-specific data.

Based on the quantitative assessment described above and other qualitative assessment of the findings, Northgate will judge whether the data appear to be representative of Site conditions and whether they are acceptable and comparable for the purposes of the project, particularly with respect to the units and detection limits for chemicals of concern being compared to environmental screening levels (ESLs). For data that does not meet DQIs, such as field or laboratory measurement error, Northgate will reconcile the data, flag the data in our summary tables, and include a discussion of the reconciliation in the report. Corrective actions will be handled on a case-by-case basis.

3.3.5 *Comparability*

The comparability goal for this project will be achieved by requesting that the laboratory report the analytical results in appropriate and consistent units (e.g., not interchanging mg/kg with µg/kg) and by maintaining consistency in sampling conditions, selection of sampling procedures, sample preservation methods, and analytical methods (e.g., using EPA Test Method 8015 for all Total Extractable Petroleum Hydrocarbons [TEPH] analysis, and EPA Method 8270 for all SVOC analysis). The DQIs referenced above and listed in Tables A-1 through A-21 in Appendix A of the USEPA-approved QAPP will ensure the laboratory data will be useable for its intended purpose.

3.4 Data Review and Validation

For the purpose of this investigation, Northgate will conduct a Tier 1 evaluation of 100 percent of the data. Data review and validation will be conducted by Northgate staff. Data will be accepted, rejected, or qualified based on the following criteria:

- Accuracy and completeness of recording, transmitting, and processing of data;
- Completeness of sample information, including sample numbers, sample matrices;
- QC samples, shipping dates, preservation methods, sample containers, holding times, etc; and
- Compliance of duplicate sample results, preservation methods, sample containers, holding times, precision and accuracy measurements, and other QC measurements with specified DQIs.

Data review will be performed to verify whether an analytical method has been performed according to method and project specifications, and that these results have been reported correctly. The data review will involve reviewing the documentation and analytical reports associated with the samples. Both detected results and results detected below the reporting limit will be included for data review. For data that do not meet DQIs, such as field or laboratory measurement error, Northgate will reconcile the data, flag the data in our summary tables, and include a discussion of the reconciliation in the report. Corrective actions will be handled on a case-by-case basis.

3.5 Data Management

Project activities are documented in project plans and project reports, which in turn are supported by daily field reports and laboratory analysis reports. When records are used in project documents, or when attachments are added to these documents, they must be specific so that the reviewer can readily find the appropriate sections and pages containing the pertinent information.

The analytical testing laboratory will provide all chemical data to Northgate in hardcopy format and in electronic data deliverables (EDD), which will be used to generate summary tables for our investigation report. Northgate will reconcile all listed concentrations against the hardcopies of the laboratory report to confirm the accuracy of our summary tables.

3.6 Assessment Oversight

As presented in Appendix B of the USEPA-approved QAPP, Northgate will utilize Standard Operating Procedures (SOPs) for this investigation. The SOPs describe the procedures that will be used during field sampling activities and the data review and validation process. No field audits are planned for this investigation. However, based on our field findings as well as the data review and validation, Northgate may elect to conduct a field audit which could require changes to our field program as well as our data review and validation process.

4.0 FIELD DRILLING AND SAMPLING

This section describes the general procedures Northgate will use to ensure high quality data are collected during the soil and groundwater investigation at the Site. In general, the investigation will be performed in accordance with standards outlined in American Society of Testing and Materials (ASTM) E1903-97 *Standards for Phase II Environmental Site Investigations*. Descriptions of specific field work tasks are in the following sections. Sample locations are illustrated on Figure 3.

4.1 Pre-field Activities

Northgate will prepare for the field work by performing the following activities:

- Contacting all appropriate parties to obtain Site access;
- Obtaining permits for the borings from the Alameda County Public Works Agency (ACPWA);
- Contacting Underground Service Alert at least 48 hours in advance of field work to locate and mark public utilities located at the Site;
- Retaining the services of a private utility locating subcontractor to protect underground utilities at the Site and identify the potential locations of USTs; and
- Scheduling the services of our drilling subcontractor.

4.2 Soil Sampling

Borings for soil sampling will be advanced using direct-push GeoProbe drilling methods. Continuous soil cores will be collected from each boring in clear acetate liners for lithologic logging and soil sampling. Once extracted from the borehole, the liners will be opened at select intervals to expose the soil core. The cores will be screened with a photo-ionization detector (PID) to allow an initial determination of soil contaminated with volatile compounds.

Soil type and characteristics of materials encountered during drilling will be examined and described by a geologist, engineer, or other scientist working under the direction of a California Professional Geologist. Soil descriptions will be recorded in the field on a Boring Log Form. Soil cores will be described in accordance with the Unified Soil Classification System and ASTM D2499-94 Color Chart. The following information will be recorded, as appropriate, on the Boring Log Form:

- Project name and location;
- Soil boring location;

- Sampling depth;
- Soil classification;
- Soil color;
- Moisture condition of the soil;
- Soil odor (if noticed incidentally and consistent with health and safety precautions);
- PID or flame ionization detector (FID) field measurements;
- Descriptive comments, including obstacles encountered or other drilling difficulties;
- Depth to first encountered groundwater (if encountered);
- Depth to stabilized ground-water level (if encountered);
- Depth of fill material (if present and distinct); and
- Depth to bedrock (if encountered).

4.3 Soil Sample Rationale and Sampling Program

Multiple investigations have been performed at the Site, with soil and groundwater sample analysis for a wide range of constituents, including TPHg, TPHd, TRPH, VOCs, SVOCs and metals. These data indicate not detectable or low concentrations of TPHg, TPHd and VOCs in soil, detections of elevated concentrations of TRPH and SVOCs in isolated areas of the Site, and elevated concentrations of lead in soil in multiple areas of the Site, with no obvious source areas for the lead. Groundwater samples only contained low levels of these constituents in isolated samples. Based upon this historical data, this SAP is focused on evaluating the lateral and vertical extent of the petroleum hydrocarbons and SVOC contamination in isolated areas of the Site, and providing additional data regarding the presence of metals in shallow soil at the Site.

This testing program will consist of collecting soil samples from 13 borings advanced at the Site. The location of the soil borings is shown on Figure 3.

Five of the soil borings are located in the area of elevated TRPH concentrations, where borings P-8, P-25 and P-26 from the 1999 investigation detected TRPH at concentrations in excess of 1,000 mg/kg in soil samples collected from a depth of 0.5 feet bgs, while the 3 feet bgs samples from these borings were all not detect for TRPH. The five soil borings are spaced approximately 50 feet away from the 1999 borings, in order to evaluate the lateral and vertical extent of TRPH-impacted soil. Soil samples will be collected at depths of 1, 3 and 5 feet bgs, and analyzed for Total Extractable Petroleum Hydrocarbons (TEPH) to provide delineation of the petroleum hydrocarbon-impacted soil. Two duplicate samples will be collected from these borings for

TEPH analysis. The 1 foot samples will also be analyzed for California Assessment Manual (CAM) 17 metals, using EPA Method 6000/7000 series. The 3 foot samples will be placed on hold pending the results of the 1 foot samples. If any of the 1 foot samples exceed the residential California Human Health Screening Level (CHHSL) for lead of 80 mg/kg, the 3 foot sample from that boring will also be analyzed for CAM 17 metals. The 5 foot samples will not be analyzed for CAM 17 metals, because the historical data indicate that elevated lead concentrations were primarily found in the upper 1 foot of soil at the Site. Duplicate sample selection will be made in the field, and will be based upon visual, olfactory and PID evidence of soil contamination. In general, we will select samples that appear to have some hydrocarbon contamination for duplicate sample analysis.

The remaining eight borings are designed to evaluate the lateral and vertical extent of elevated SVOC concentrations in soil around the two soil borings (P-16 and P-19) where SVOCs were previously detected at elevated concentrations in Site soil. Four of the borings are located around boring P-16 and four of the borings are located around boring P-19. Soil samples will be collected at depths of 1, 3 and 5 feet bgs, and will be analyzed for SVOCs to provide delineation of the SVOC-impacted soil. The 1 foot samples will also be analyzed for CAM 17 metals, using EPA Method 6000/7000 series. The 3 foot samples will be placed on hold pending the results of the 1 foot samples. If any of the 1 foot samples exceed the residential CHHSL for lead of 80 mg/kg, the 3 foot sample from that boring will also be analyzed for CAM 17 metals. The 5 foot samples will not be analyzed for CAM 17 metals, because the historical data indicate that elevated lead concentrations were primarily found in the upper 1 foot of soil at the Site. Three duplicate samples will be collected from these borings for SVOC analysis. Duplicate sample selection will be made in the field, and will be based upon visual, olfactory and PID evidence of soil contamination. In general, we will select samples that appear to have some SVOC contamination for duplicate sample analysis.

4.4 Sampling Equipment Calibration

The Field Team Leader will be responsible for ensuring that instruments are properly functioning. At a minimum, this will entail checking the instrument prior to shipment to the field and performing daily operational checks and calibration (described below). Routine maintenance and trouble-shooting procedures will be performed as described in the manufacturer’s instructions. See section B.3 of EPA approved QAPP for a complete discussion of instrument calibration.

4.5 Sampling Equipment Decontamination

All non-dedicated equipment used during the investigation that could possibly come into contact with chemically affected materials will be thoroughly cleaned before and after each use. Decontamination procedures may be modified and/or revised at the discretion of the Project Manager based upon the data obtained. Soil and groundwater sampling equipment, and other field equipment will be decontaminated as follows:

- All drilling equipment, including drill pipe and samplers, will be decontaminated by steam cleaning and/or washing with Alconox (a laboratory-grade detergent) at a designated decontamination area and rinsing with deionized or distilled water.

4.6 Sample Containers and Preservation

All samples prepared in the field will follow approved protocols for sample containers, preservation methods, and holding times for the various analyses. All sample vials and bottles containing preservatives must be labeled accordingly by the laboratory before samples are collected. With the exception of samples that require special handling and preservation, all samples will be stored in coolers chilled to 4 degrees Centigrade for shipment to the analytical laboratory. Sample containers will not be reused. Samples will be shipped to the laboratory within a time frame to allow for extraction and analysis to be performed within prescribed holding times.

A sample label will be completed and attached to each sample container for every sample collected. Labels are made of a waterproof material backed with a water-resistant adhesive. Labels are to be filled out using waterproof ink, and are to contain at least the following information:

- Date and time;
- Sample number;
- Location identification;
- Sampler's initials; and
- Analyses to be conducted.

5.0 ANALYTICAL PROGRAM

Soil samples collected during the investigation will be analyzed at Torrent Laboratory of Milpitas, California. Torrent is certified by California EPA for the analyses to be performed. The method reporting limits and practical quantitation limits for the analytical methods for this investigation are presented in Appendix A, along with a copy of Torrent's QA Manual.

5.1 Analytical Methods

Analytical procedures will generally be conducted in accordance with the methodology set forth in EPA, *Test Methods for Evaluating Solid Waste, Physical and Chemical Methods,* (SW-846), Third Edition of SW-846 with Update I (pages dated September 1992), Update IIA (pages dated August 1993), Update II (pages dated September 1994), Update IIB (pages dated January 1995), and Update III (pages dated December 1996); unless otherwise approved by Northgate. Samples will be analyzed for the following constituents:

- Total Extractable Petroleum Hydrocarbons – EPA Method 8015;
- Semi-Volatile Organic Compounds – EPA Method 8270; and
- CAM 17 Metals – EPA Method 6000/7000 series.

In general, samples will be analyzed within five days of the sample collection date. The approved maximum holding times prior to analysis are 14 days for organic compounds and six months for metals.

6.0 DISPOSAL OF RESIDUAL MATERIALS

In the process of collecting environmental samples during this Site investigation, Northgate will generate the following types of potentially contaminated Investigation Derived Waste (IDW) as follows:

- Used personal protective equipment (PPE);
- Decontamination fluids (rinsate water from steam cleaning the drilling rods); and
- Soil cuttings from soil borings.

The EPA's National Contingency Plan requires that management of IDW generated during sampling comply with all applicable or relevant and appropriate requirements to the extent practicable. The sampling plan will follow the *Office of Emergency and Remedial Response (OERR) Directive 9345.3-02* (May 1991), which provides the guidance for the management of IDW. In addition, other legal and practical considerations that may affect the handling of IDW will be considered.

Used PPE and disposable equipment will be double bagged and placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill. Any PPE and disposable equipment that is to be disposed of which can still be reused will be rendered inoperable before disposal in the refuse dumpster.

Decontamination fluids that will be generated during this sampling event will consist of rinse water and residual contaminants from the steam cleaning of the drilling rods, and these decontamination fluids will be stored in a DOT-approved 55-gallon drum. Soil cuttings will be stored in a separate 55-gallon drum or placed on and covered with plastic sheeting. All drums will be labeled, logged, and identified on a Site map or field sketch.

All IDW will be disposed of at an approved facility, in accordance with applicable local, state and federal regulations.

7.0 SAMPLE DOCUMENTATION AND SHIPMENT

7.1 Daily Field Logs

The field sampling outlined in this SAP will be performed in one to two days. As such, a daily field log will be completed by the field staff for each day of field work. The daily field form is included in Appendix C of the QAPP.

7.2 Photographic Record

Site conditions will be documented with photographs. A photographic record will be recorded on the daily field form.

7.3 Chain of Custody Documentation

Chain-of-custody forms will be prepared for groups of samples collected at a given location on a given day. Each chain-of-custody will be prepared in triplicate and will accompany each sample shipment to the laboratory. One of the three copies will accompany the samples to the laboratory. One copy will be kept in the QA/QC file and another copy will be retained in the project file, available at any time for review. The chain-of-custody form makes provisions for documenting sample integrity and the identity of any persons involved in sample transfer. Information entered on the chain-of-custody will consist of the following:

- Project name and number;
- Chain-of-custody serial number;
- Project location;
- Sample numbers;
- Sampler/recorder's signature;
- Date and time of collection of each sample;
- Sample type;
- Analyses requested;
- Name of person receiving the sample;
- Date of receipt of sample; and
- Name, address, and telephone number of laboratory.

A custody seal will be used when the samples are shipped through a common carrier (e.g., Federal Express), because a chain-of-custody signature will not document the shipment.

7.4 Sample Shipping Procedures

The method of shipment will be hand delivery by field personnel or laboratory courier within 24 hours of sample collection. The method of sample shipment will be noted on the chain-of-custody. If samples to be kept cool are to be held for longer than 24 hours, the samples will be placed in a refrigerator or similar insulated cooling container and maintained at approximately 4 degrees Centigrade.

7.5 Interaction with the Laboratory

The Field Program Manager will interact with the laboratory for sampling schedules and to coordinate adequate laboratory availability and qualifications. Field sampling activities will not start until the necessary laboratory equipment and personnel availability has been arranged. Once a shipment has been made, the laboratory will be contacted to provide specific information about the sample shipment, including the number of samples, types of samples, destination of samples, and analysis to be performed.

8.0 QUALITY CONTROL

Several types of field quality control sampling procedures are presented in Section A3 and B2 of the QAPP. Based on the scope presented in this SAP, the Site investigation will be completed over a one to two day period. Accordingly, QC samples for this investigation for soil will consist of two duplicate soil samples for TEPH and CAM 17 metals analysis and three duplicate samples for SVOC analysis. The duplicate soil samples will be collected simultaneously with the standard soil samples from selected borings.

Standard laboratory QA/QC procedures will be utilized as described in Section B6 of the QAPP. As part of the QC program, the laboratory will perform matrix spike / matrix spike duplicate (MS/MSD) analyses on the samples submitted from this investigation.

9.0 FIELD VARIANCES

As conditions in the field vary, it may be necessary to implement minor modifications to the sampling program presented in this SAP. Where appropriate, the QA Officer will be notified and a verbal approval will be obtained before implementing changes. Modifications to the approved SAP will be documented in the project report.

10.0 FIELD HEALTH AND SAFETY PROCEDURES

Field activities will be conducted in accordance with standard industry practices regarding worker health and safety. In addition, a site-specific health and safety plan will be prepared by Northgate prior to initiating field work. A copy of the health and safety plan will be submitted to DTSC prior to initiating field work. All field team members will read and sign the health and safety plan prior to each day's field work.

11.0 SCHEDULE AND REPORTING

We anticipate the following schedule for completing the work outlined in this SAP:

- Mobilizing for field work within two weeks of receiving authorization to proceed from the City of Oakland.

- Two weeks to complete the field work following mobilization.

- Receipt of sample analytical results within two weeks of completing the field work.

- Preparation of an investigation report within four weeks of receiving sample analytical results.

- Based upon this schedule, we anticipate completing a draft field investigation report within 10 weeks of of receiving authorization to proceed from the City of Oakland.

The investigation report will describe the sample collection procedures, summarize the chemical test results, present conclusions and recommendations regarding soil quality at the Site and provide recommendations, as appropriate, for remedial actions at the Site. The chemical test results will be compared to regulatory screening levels established by the California Regional Water Quality Control Board, the California Department of Toxic Substances Control, and other agencies as appropriate.

SECTION 2 - TABLE OF CONTENTS

SECTION 3 – INTRODUCTION AND SCOPE

The purpose of this *Quality Manual* is to outline the quality system for the laboratory. The *Quality Manual* defines the policies, procedures, and documentation that assure analytical services continually meet a defined standard of quality that is designed to provide clients with data of known and documented quality and, where applicable, demonstrate regulatory compliance.

POLICY

The Quality Manual sets the standard under which all laboratory operations are performed including the laboratory's organization, objectives, and operating philosophy.

3.1 Scope of Testing

The laboratory scope of analytical testing services includes those listed in Appendix A

3.2 Table of Contents, References and Appendices

The table of contents is in Section 2 of this Manual. This *Quality Manual* uses the references from the 2003 NELAC Standard, Chapter 5, Appendix A.

3.3 Glossary and Acronyms Used

Quality control terms are generally defined within the section that describes the activity.

Glossary

Appendix A, Chapter 1, 2003 NELAC Standards

Acronyms

A list of acronyms used in this document and their definitions are:

AA	–	Accrediting Authority
ANSI	–	American National Standards Institute
ASQC	–	American Society for Quality Control
ASTM	–	American Society for Testing and Materials
Blk	–	Blank
°C	–	degrees Celsius
cal	–	calibration
CAS	–	Chemical Abstract Service
CCV	–	Continuing calibration verification
COC	–	Chain of custody
DO	–	Dissolved oxygen
DOC	–	Demonstration of Capability
EPA	–	Environmental Protection Agency
g/L	–	grams per liter
GC/MS	–	gas chromatography/mass spectrometry
ICP-MS	–	inductively coupled plasma-mass spectrometry
ICV	–	Initial calibration verification
ISO/IEC	–	International Organization for Standardization/International Electrochemical Commission
lb/in2	–	pound per square inch

LCS – Laboratory control sample
LFB – Laboratory fortified blank
MDL – method detection limit
mg/Kg – milligrams per kilogram
mg/L – milligrams per liter
MS – matrix spike
MSD – matrix spike duplicate
NELAC – National Environmental Laboratory Accreditation Conference
NELAP – National Environmental Laboratory Accreditation Program
NIST – National Institute of Standards and Technology
PPBV - Parts per billion by volume (air unit)
PT – Proficiency Test(ing)
PTOB – Proficiency Testing Oversight Body
PTPA – Proficiency Testing Provider Accreditor
QA – Quality Assurance
QC – Quality Control
QM – *Quality Manual*
QAM – Quality Assurance Manager
RL – Reporting level
RPD – Relative percent difference
RSD – Relative standard deviation
SOPs – Standard operating procedures
spk – spike
std – standard
TNI - The NELAC institute
ug/Kg – micrograms per kilogram
ug/L - microgram per liter
ug/m3 - micrograms per cubic meter (air unit)
UV – Ultraviolet
VOC – Volatile organic compound
WET – Waste Extraction Threshold

SECTION 4 – ORGANIZATIONAL ROLES AND RESPONSIBILITIES

POLICY
The laboratory is a legally identifiable organization. Through application of the policies and procedures outlined in this chapter, the laboratory assures that it is impartial and that personnel are free from undue commercial, financial, or other undue pressures that might influence their technical judgment. The laboratory is responsible for carrying out testing activities that meet the requirements of the NELAC Standard and that meet the needs of the client.

4.1 Laboratory Organizational Structure

Policy
The organizational structure indicated minimizes the potential for conflicting or undue interests that might influence the technical judgment of analytical personnel.

The laboratory is a commercial organization. The tax ID number is available upon request, if applicable.

The current Organizational Chart can be found in Appendix B

4.2 Responsibility and Authority

MANAGEMENT includes the titles, Laboratory Director, Technical Directors (Department Managers) the Quality Manager.

Policy
Management has overall responsibility for the technical operations and authority needed to generate the required quality of laboratory operations.

Policy
Management’s commitment to quality and to the Quality System is stated in the Quality Policy, which is upheld through the application of related policies and procedures.

Policy
Management ensures technical competence of personnel operating equipment, performing tests, evaluating results, or signing reports, and limits authority to perform laboratory functions to those appropriately trained and/or supervised.

Procedure

The assignment of responsibilities, authorities, and interrelationships of the personnel who manage, perform, or verify work affecting the quality of environmental tests is documented in **Section 17.1**.

Management bears specific responsibility for maintenance of the Quality System. This includes defining roles and responsibilities to personnel, approving documents, providing required training, providing a procedure for confidential reporting of data integrity issues, and periodically reviewing data, procedures, and documentation.

Management ensures that audit findings and corrective actions are completed within required time frames.

Designated alternates are appointed by management during the absence of the Laboratory Manager, Technical Director(s) or the Quality Manager, and always if the absence is more than 15 days.

Management is responsible for defining the minimal level of education, qualifications, experience, and skills necessary for all positions in the laboratory and assuring that technical staff has demonstrated capabilities in their tasks.

Training is kept up to date as described in Section **17.4** by periodic review of training records and through employee performance review.

SECTION 5 – QUALITY SYSTEMS

The laboratory's Quality System is documented in this *Quality Manual* and associated quality system documents. Together they describe the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of the organization for ensuring quality in its work processes, products, and services.

5.1 Quality Policy

A Quality Policy statement, including objectives and commitments by top management is required in the Quality Manual. The quality policy is signed and dated, and is issued under the authority of the highest level of laboratory management, which demonstrates management's commitment to integrity, ethics, the quality system and associated standards.

Quality Policy Statement

The objective of the quality system and the commitment of management is to consistently provide our customers with data of known and documented quality that meets their requirements. Our policy is to use good professional practices, to maintain quality, to uphold the highest quality of service, and to comply with the NELAC Standard. The laboratory ensures that personnel are free from any commercial, financial, and other undue pressures, which might adversely affect the quality of work. This policy is implemented and enforced through the unequivocal commitment of management, at all levels, to the Quality Assurance (QA) principles and practices outlined in this manual. However, the primary responsibility for quality rests with each individual within the laboratory organization. Every laboratory employee must ensure that the generation and reporting of quality analytical data is a fundamental priority. Laboratory employees are required to familiarize themselves with the quality documentation and to implement the policies and procedures in their work. All employees are trained annually on ethical principles and procedures surrounding the data that is generated. The laboratory maintains a strict policy of client confidentiality.

5.2 Quality Manual

Policy

The Quality Manager ensures that the laboratory's policies and objectives for quality are documented by reference or by inclusion in the *Quality Manual*, and that the *Quality Manual* is communicated to, understood by, and implemented by all personnel concerned.

Policy

Where the *Quality Manual* documents laboratory requirements, a separate SOP or policy is not required.

Procedure

All employees sign a form, kept with their training records on file with the Quality Manager that states that they have read and understood the *Quality Manual*, including the quality policy.

The *Quality Manual* is a dynamic document that is maintained by the Quality Manager and up-dated at least annually and often more frequently.

SECTION 6 – DOCUMENT MANAGEMENT

This Section describes procedures for document management, which includes controlling, distributing, reviewing, and accepting modifications. The purpose of document management is to preclude the use of invalid and/or obsolete documents.

The laboratory manages three types of documents, 1) controlled, 2) approved, and 3) obsolete.

A CONTROLLED DOCUMENT is one that is uniquely identified, issued, tracked, and kept current as part of the quality system. Controlled documents may be internal documents or external documents.

APPROVED means reviewed, and either signed and dated, or acknowledged in writing or by secure electronic means by the issuing authority(ies).

OBSOLETE DOCUMENTS are documents that have been superseded by more recent versions.

POLICY

All documents that affect the quality of laboratory data are managed appropriate to the scope and depth required.

6.1 Controlled Documents

Policy

Documents will be reviewed and approved for use by the Quality Manager prior to issue.

Procedure

Documents are reviewed annually to ensure their contents are suitable and in compliance with the current quality systems requirements, and accurately describe current operations.

Approved copies of documents are available at all locations where operations are essential to the effective functions of the laboratory.

Copies of documents to distribute to laboratory personnel are consecutively numbered from 1 to the total number of printed copies such as “1 of 50” and are preceded by the ID “TLICD (Torrent Laboratory Inc Controlled Document). Management determines and lists the employees to whom the documents will be distributed. The sequential number of each copy is recorded next to the individual’s name in the distribution list. The date of distribution is recorded. The employee initials that the copy was received. When the document is no longer valid, the date the document became obsolete is recorded, and the retrieved copies are checked off next to each employee’s name.

Controlled internal documents are uniquely identified with 1) date of issue, 2) revision identification, 3) page number, 4) the total number of pages and 5) the signatures of the issuing authority (i.e. management).

A master list of controlled internal documents is maintained that includes distribution, location, and revision dates. A master list of controlled external documents is also maintained that includes title, author, copyright date, and date of publication, and location. The Quality Manager maintains the controlled document list. The controlled document list is updated as required and reviewed quarterly.

6.1.1 Document Changes to Controlled Documents

6.1.1.1 Paper Document Changes

Policy
Document changes are approved by the Quality Manager and/ or the Laboratory Director.

Policy
The document management process allows for handwritten modifications to documents. All had written changes must be dated and initialed by initiator, affected Technical Director and Quality Manager.

Procedure
All document changes must be approved. The modified document is then copied and distributed, and obsolete documents are removed.

Amendments to documents are incorporated into a new revision and reissued as soon as practicable.

6.1.1.2 Electronic Document Changes

Procedure
Suggested revisions to electronic documents are presented to Laboratory Director and/or Technical Director(s) for review and approval. Changes to electronic documents are approved either on an accompanying form or through electronic means (such as email, change tracking functions, or memoranda). Final approval must include the Quality Manager’s initials.

Where practicable, the altered text or new text in the draft is identified during the revision or review process to provide for easy identification of the modifications.

6.2 Obsolete Documents

Policy
All invalid or obsolete documents are removed from general distribution, or otherwise prevented from unintended use.

Procedure
Obsolete documents retained for legal use or historical knowledge preservation are appropriately marked and retained.

Obsolete documents are stored electronically and identified as “removed from service” with a “removed date”. All original hardcopies are collected and shredded.

6.3 Standard Operating Procedures

STANDARD OPERATING PROCEDURES (SOPs) are used to ensure consistency of application of common procedures, are written procedures that describe in detail how to accurately reproduce laboratory processes, and are of two types: 1) test method SOPs, which have specifically required details, and 2) general use SOPs which document the more general organizational procedures.

SOPs do not have to be formal documents with predefined section headings and contents. They can be less formal descriptions of procedures described in the *Quality Manual* or other documents.

Policy
Copies of all SOPs are accessible to all personnel.

Procedure
Each test method SOP indicates the effective date, the revision number, and the signature(s) of the Quality Manager, Technical Director(s), and Laboratory Director. QA Officer and/or the Laboratory Director sign general use and administrative SOPs.

6.3.1 Test Method SOPs

Policy
The laboratory has SOPs for all test methods within its scope, located in the Quality Manager’s office as well as in the appropriate department for which the SOP is directed, and for procedures that are part of the Quality System that accurately reflect how the analytical process is performed. A list of all test methods performed in the laboratory can be found in the Quality Manager’s master SOP files. Where equipment manuals or published methods accurately reflect laboratory procedures in detail, a separate SOP is not required.

Policy
Any deviation from a test method is documented, including both a description of the change made and a technical justification. The deviation from a test method is reported to the client.

Procedure
Each Test Method SOP includes or references (as applicable) the following:

a) identification of the test method;
b) applicable matrix or matrices;
c) detection limit;
d) scope and application, including components to be analyzed;
e) summary of the test method;
f) definitions;
g) interferences;
h) safety;
i) equipment and supplies;
j) reagents and standards;
k) sample collection, preservation, shipment and storage;
l) quality control, including acceptance criteria (5.4.10.6);
m) calibration and standardization;
n) procedure;
o) data analysis and calculations;
p) method performance;
q) pollution prevention;
r) data assessment and acceptance criteria for quality control measures;

s) corrective actions for out-of-control ;
t) contingencies for handling out-of-control or unacceptable data;
u) waste management;
v) references; and,
w) any tables, diagrams, flowcharts and validation data.

SECTION 7 – REVIEW OF REQUESTS, TENDERS AND CONTRACTS

POLICY

The review of all new work assures that oversight is provided so that requirements are clearly defined, the laboratory has adequate resources and capability, and the test method is applicable to the customer's needs. This process assures that all work will be given adequate attention without shortcuts that may compromise data quality.

Contracts for new work may be formal bids, signed documents, verbal, or electronic.

PROCEDURE

7.1 Procedure for the Review of Work Requests

The Quality manager in conjunction with the laboratory Director and/or Technical Directors determine if the laboratory has the necessary accreditations, and resources including schedule, equipment, deliverables, and personnel to meet the work request.

The Project Manager informs the client of the results of the review if it indicates any potential conflict, deficiency, accreditation issues, or inability of the lab to complete the work satisfactorily.

The client is informed of any deviation from the contract including the test method or sample handling processes. All differences between the request and the final contract are resolved and recorded before any work begins. It is necessary that the contract be acceptable to both the laboratory and the client.

The laboratory and client repeats the review process when there are amendments to the original contract. The participating personnel are given copies of the amendments.

7.2 Documentation of Review

Records are maintained for every contract or work request, when appropriate. This includes pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract. Records may include but are not limited to documented phone conversations, stored emails and written instructions submitted throughout the project progress.

SECTION 8 – SUBCONTRACTING OF TESTS

A SUBCONTRACT LABORATORY is defined as a laboratory external to this laboratory, or at a different location than the address indicated on the front cover of this manual, that performs analyses for this laboratory.

POLICY

When subcontracting analytical services, the laboratory assures work requiring accreditation is placed with an appropriately accredited laboratory or one that meets applicable statutory and regulatory requirements for performing the tests.

PROCEDURE

A list of subcontractors is maintained.

A copy of the certificate and analyte list for subcontractors may be retained as evidence of compliance. An approved subcontractor list is maintained and contains the certification number and accreditation authority for each laboratory.

The laboratory notifies the client of the intent to subcontract the work in writing.
When possible, the laboratory gains the approval of the client to subcontract their work prior to implementation, preferably in writing. Where appropriate, all quotes and login summaries sent to clients contain verbiage indicating the necessity of sub-contracting specific analyses.

The laboratory performing the subcontracted work is identified in the final report. The laboratory assumes responsibility to the client for the subcontractor’s work, except in the case where a client or a regulating authority specified which subcontractor is to be used. In such cases, records documenting the specific request are included in the final report.

SECTION 9 – PURCHASING SERVICES AND SUPPLIES

POLICY

The laboratory ensures that purchased supplies and services affecting the quality of environmental tests are of the required or specified quality by using approved suppliers and products.

POLICY

The laboratory has procedures for purchasing, receiving, and storage of supplies that affect the quality of environmental tests.

PROCEDURE

The Laboratory Director reviews and approves the supplier of services and supplies and the Quality Manager and /or Technical Manager(s) approves the technical content of purchasing documents prior to ordering.

Evaluation of suppliers is accomplished by signing packing slips or other supply receipt documents ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality. The purchasing documents contain the data that adequately describe the services and supplies ordered. The personnel whom approved the original purchase is responsible for ensuring the proper receipt of the ordered materials by initialing and dating the packing slip that arrives with the material. The packing slip is returned to the purchasing department where it is kept on file until the invoice is paid.

The laboratory keeps a list of approved suppliers and notes, where appropriate, there traceability standards (NIST, ISO 9001:2000, AIHA, etc).

SECTION 10 – SERVICE TO THE CLIENT

The laboratory collaborates with clients and/or their representatives in clarifying their requests and in monitoring of the laboratory performance related to their work. Each request is reviewed to determine the nature of the request and the laboratory's ability to comply with the request within the confines of prevailing statutes and/or regulations without risk to the confidentiality of other clients.

10.1 Client Confidentiality

Policy
The laboratory confidentiality policy is to not divulge or release any information to a third party without proper authorization.

Policy
All electronic data (storage or transmissions) are kept confidential, based on technology and laboratory limits, as required by client or regulation.

Procedure

Client data and support documents are stored and/or released in manner in which the client’s confidentiality is assured. Project management maintains strict control of all documents and correspondence associated with each work request and/or work order received. Individual folders are generated for each work order and are filed by work order number rather than client name. An electronic folder is also produced with the client’s name and all pertinent materials either scanned and stored or initiated in electronic format and stored. The client files are found on a computer drive that is accessible by password protection to only project management and the quality manager.

Use of a confidentiality statement on emails, documents and transmitted (fax) information is mandated for all written correspondences.

SECTION 11 – COMPLAINTS

The purpose of this section is to assure that customer complaints are addressed and corrected. This includes requests to verify results or analytical data.

POLICY

The laboratory reviews all complaints and determines appropriate action.

PROCEDURE

All customer complaints are documented by the person receiving the complaint and addressed by appropriate personnel. Initial complaints are kept in a log within the Project Management department. If it is determined that a complaint is without merit, it is documented, and the client is contacted. If it is determined that the complaint has merit, a corrective action is initiated. See Section 13 for corrective action procedures.

SECTION 12 – CONTROL OF NON-CONFORMING WORK

NON-CONFORMING WORK is work that does not meet acceptance criteria or requirements. Non-conformances can include unacceptable quality control results (see Section 24 - Assuring the Quality of Results) or departures from standard operating procedures or test methods. Requests for departures from laboratory procedures are approved by the Quality Manager and documented. (see Attachment H)

POLICY

The policy for control of non-conforming work is to identify the non-conformance, determine if it will be permitted, and take appropriate action. All employees have the authority to stop work on samples when any aspect of the process does not conform to laboratory requirements.

PROCEDURE

The responsibilities and authorities for the management of non-conforming work are detailed in Section 17.1.3. The procedure for investigating and taking associated corrective actions of non-conforming work are described in Section 13.

The laboratory evaluates the significance of the nonconforming work, and takes corrective action immediately. The client is notified if their data has been impacted. Resumption of work after a non-conformance has been issued is authorized by the either the Technical Director(s) or the Quality Manager, dependent on the severity of the non-conformance.

Where non-conformances are the result of quality control failures that can readily be attributed to either matrix interferences and /or failures that do not impact the validity of the data being reported, the non-conformance is communicated to the client in the form of a narrative statement in the final report. The statement details the non-conformance as well as why the non-conformance was accepted and how/why the non-conformance does or does not affect the reported data.

Where a non-conformance deviates outside of the established quality control parameters in a manner that is detrimental to either the acceptance of the data for it's intended use or due to a process or system malfunction, a corrective action must be initiated as detailed in Section 13.

SECTION 13 – CORRECTIVE ACTION

CORRECTIVE ACTION is the action taken to eliminate the causes of an existing nonconformity, defect, or other undesirable situation in order to prevent recurrence (NELAC, 2003).

POLICY

Deficiencies cited in external assessments, internal quality audits, data reviews, complaints, or managerial reviews are documented and require corrective action. Corrective actions taken are appropriate for the magnitude of the problem and the degree of risk.

PROCEDURE

Technical Directors and/or the Quality Manager are responsible for initiating corrective action on routine data reviews (See Attachment E). The Quality Manager is responsible for monitoring and recording corrective actions.

All deficiencies are investigated and a corrective action plan developed and implemented if determined necessary. The implementation is monitored for effectiveness.

Specific corrective action protocols specified in test methods may over-ride general corrective action procedures specified in this manual.

13.1 Selection and Implementation of Corrective Actions

ROOT CAUSE is the condition or event that, if corrected or eliminated, would prevent the recurrence of a deficiency.

Policy

Once a non-conformance is noted, the first action is an investigation to determine the root cause. Records are maintained of non-conformances requiring corrective action to show that the root cause(s) was investigated, and includes the results of the investigation (See 13.2).

Where uncertainty arises regarding the best approach for analysis of the cause of the non-conformances that require corrective action, appropriate personnel will recommend corrective actions to be initiated.
The appropriate Technical Director ensures that corrective actions are discharged within the agreed upon time frame.

13.2 Monitoring of Corrective Action

Policy

Appropriate personnel will monitor implementation and documentation of the corrective action to assure that the corrective actions were effective.

Procedure

The appropriate personnel detailing the non-conformance being investigated initiate a Corrective Action form. A suggested course of action is made and approved of by either the Technical Director affected or the Quality Manager. The action is taken and the outcome is documented. If the course of action is successful and a return to control is achieved, the corrective action form is signed off by the Quality Manager and stored appropriately. Where necessary, an affected client is informed and a copy of the completed corrective action form may be provided. If the corrective action results in a fundamental change/improvement to an existing procedure, the change is documented and promptly handwritten into the current SOP revision. At time of SOP review, it is permanently added to the affected SOP and the SOP is given a progressive revision number.

13.3 Technical Corrective Action

CAUSE ANALYSIS in corrective action investigates the root cause of the problem.

Policy
Sample data associated with a failed quality control are evaluated for the need to be reanalyzed or qualified.

Procedure
Unacceptable quality control results are documented, and if the evaluation requires cause analysis, the cause and solution are recorded.

The analyst is responsible for initiating or recommending corrective actions and ensuring that failures of quality control acceptance criteria are documented. Analysts routinely implement corrective actions for data with unacceptable QC measures. First level correction may include re-analysis without further assessment. If the test method SOPs addresses the specific actions to take, they are followed. Otherwise, corrective actions start with assessment of the cause of the problem.

Technical directors review corrective action reports and suggest improvements, alternative approaches, and procedures where needed. If the data reported are affected adversely by the nonconformance, the client is notified in writing.

The discovery of a non-conformance for results that have already been reported to the client must be immediately evaluated for significance of the non-conformance, its acceptability to the client, and determination of the appropriate corrective action.

13.4 Exceptionally Permitting Departures from Documented Policies and Procedures

Policy
The laboratory allows the release of non-conforming data only with approval by the appropriate Technical Director and/or the Quality manager or their designee on a case-by-case basis. Planned departures from procedures or policies do not require audits or investigations.

Procedure
Permitted departures for non-conformances, such as QC failures, are fully documented and include the reason for the departure, the affected test method(s), the impact of the departure on the data, and the data. Departures are addressed through the use of Non-Conformance Memos within the laboratory and through Case Narratives that are submitted to client with the final report. Case Narratives describe to the client the non-conforming event, any actions taken and the reason(s) why the data is being reported despite the non-conforming circumstance.

SECTION 14 – PREVENTIVE ACTION

PREVENTIVE ACTION, rather than corrective action, aims at minimizing or eliminating inferior data quality or other non-conformance through scheduled maintenance and review, before the non-conformance occurs.

Preventive action includes, but is not limited to, review of QC data to identify quality trends, regularly scheduled staff quality meetings, annual budget reviews, annual managerial reviews, scheduled column trimming, running a new LIMS system in tandem with the old system to assure at least one working system, and other actions taken to prevent problems.

All employees have the authority to recommend preventive action procedures, however management is responsible for implementing preventive action.

SECTION 15 – CONTROL OF RECORDS

RECORDS are a subset of documents, usually data recordings that include annotations, such as daily refrigerator temperatures posted to a laboratory form, lists, spreadsheets, or analyst notes on a chromatogram. Records may be on any form of media, including electronic and hard copy. Records allow for the historical reconstruction of laboratory activities related to sample handling and analysis.

POLICY
The laboratory maintains a record system appropriate to its needs, records all laboratory activities, and complies with applicable standards or regulations as required.

PROCEDURE
The laboratory retains all original observations, calculations and derived data, calibration records, and a copy of the test report for a minimum of five years.

Records of all procedures to which a sample is subjected while in the possession of the laboratory are kept.

15.1 Records Management and Storage

Policy
Records, including electronic records, are easy to retrieve, legible, and protected from deterioration or damage; held secure and in confidence; and are available to accrediting authorities for a minimum of five years.

Policy
The laboratory maintains a record management system for control of laboratory notebooks, instrument logbooks, standards logbooks, and records for data reduction, validation, storage, and reporting.

Policy
Archived information and access logs are protected against fire, theft, loss, environmental deterioration, vermin, and in the case of electronic records, electronic or magnetic sources.

Policy
In the event that the laboratory transfers ownership or goes out of business, records are maintained or transferred according to the clients' instructions.

Procedure
All electronic records are backed-up monthly. Access to protected records is limited to laboratory management or their designees to prevent unauthorized access or amendment.

Procedures for identification, collection, access, filing, storage, and disposal of records are found detailed in the Administrative SOP – Records Management.

15.2 Legal Chain of Custody Records

EVIDENTIARY SAMPLE DATA are used as legal evidence.

Policy
Procedures for evidentiary samples are documented in a separate SOP, if applicable.

Torrent laboratory provides a Chain of Custody (COC) that contains spaces for all information relevant to the material being submitted for analysis. While a client is free to use their own COC, all relevant information must be present on that COC before samples will be accepted at Torrent Laboratory for analysis. Below is the minimum number of items expected to be on an acceptable COC:

Client Name
Project Manger Name
Client Contact Information (phone, FAX and email)
Sampling Date
Sampling Location
Unique Client ID for each Sample received
Requested Analysis to be performed (description or method numbers)
Preservative Used in sample containers (if any)
“Relinquished By” Signature
“Received By” Signature
Special handling instructions
Requested Turn around Time (TAT) for report delivery

Any additional communication with the client regarding samples received on a COC including, but not limited to, separate instructions, emails, faxes or written phone records detailing conversations between project management and the client, become a part of the legal COC and copies will be included in the final report along with the original COC

SECTION 16 – AUDITS AND MANAGEMENT REVIEW

AUDITS measure laboratory performance and verify compliance with accreditation/ certification and project requirements. Audits specifically provide management with an on-going assessment of the quality system. They are also instrumental in identifying areas where improvement in the quality system will increase the reliability of data. Audits are of four main types: internal, external, performance, and system.

Notification of clients for events that cast doubt on the validity of the results is completed within one working day of the knowledge of said doubt on data validity.

16.1 Internal Audits

Policy
The laboratory conducts internal audits of its quality systems activities, including data integrity, and the use of trained and qualified personnel at least annually. Personnel may not audit their own activities except when it can be demonstrated that an effective audit will be carried out.

Procedure
Annually, the laboratory prepares a schedule of internal audits to be performed during the year. The schedule is prepared and distributed to the affected departments within the 1st quarter of each calendar year and audits are completed by the 3rd quarter of each calendar year. These audits verify compliance with the requirements of the quality system, including analytical methods, SOPs, ethics policies, other laboratory policies, and the NELAC Standard.

It is the responsibility of the Quality Manager to plan and organize audits as required by the schedule and requested by management.

Auditing forms specifically designed for each department to be audits are employed and include but are not limited to NELAC audit forms, QA Manager designed checklists and CA ELAP provided checklists.

The area audited, the audit findings, and corrective actions are recorded and a report written and submitted to the Laboratory Director.

All investigations that result in findings of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients.

Clients are notified promptly, in writing, when audit findings cast doubt on the validity of the data.

In the forth quarter of each calendar year, audits are reviewed after completion to assure that corrective actions were implemented and effective. A follow-up report is generated and presented to the Laboratory Director during the year end quality system assessment meeting.

16.2 External Audits

Policy
It is the laboratory's policy to cooperate and assist with all external audits, whether performed by clients or an accrediting authority.

Policy
All external audits are fully documented and tracked to closure.

Procedure
Management ensures that all areas of the laboratory are accessible to auditors as applicable and that appropriate personnel are available to assist in conducting the audit.

Any findings related to an external audit follow corrective action procedures. Where specific requests by outside auditors not related to regulating authorities are made, accommodations are incorporated into the operating system as long as they are not disruptive to or in opposition to NELAC quality control guidelines.

Management ensures that corrective actions are carried out within the timeframe specified by the auditor(s). Reports are initiated by the Quality Manager and submitted to the auditing authority and the Laboratory Director. Any corrective actions associated with an audit finding must contain both a planned implementation date and an actual implementation date. The actual implementation date may not be greater than 30 days past the planned implementation date without notifying both the auditing authorities and the laboratory director.

16.3 Performance Audits

Performance audits may be Proficiency Test Samples, internal single-blind samples, double-blind samples through a provider or client, or anything that tests the performance of the analyst and method.

The policy and procedures for Proficiency Test Samples are discussed in **Section 23.7**

16.4 System Audits and Management Reviews

Policy
The Laboratory Director reviews the quality system and maintains records of review findings and actions.

Procedure
The quality system is reviewed annually, and findings are recorded. Managers assure that actions are performed within agreed time frames.

Findings from management reviews are recorded. These records ensure that corrective actions are completed in an appropriate time frame not to exceed two weeks from the outcome of the corrective action investigation.

SECTION 17 – PERSONNEL, TRAINING, AND DATA INTEGRITY

17.1 Job Descriptions and Minimum Employment Requirements

Policy

Job descriptions are available for all positions that manage, perform, or verify work affecting data quality, and are located in the Laboratory Director’s office. All personnel employed by Torrent must have received, at a minimum, a high school diploma or a high school equivalency certificate recognized by the State of California. Non-technical positions require a minimum of a high school diploma or equivalent. Positions relating to sample receiving and sample preparation have a minimum requirement of high school graduation and the enrollment in a higher education program including but not limited to junior college, state college or university enrollment. A certificate program may be substituted for higher-level education enrollment if deemed by the Laboratory Director to be sufficient for a sample receiving or sample preparation position. All analytical positions require a minimum of a BA/BS in physical, life or biological science. Technical Director positions require a BA/BS in physical, life or biological science and either an advanced degree within the area of discipline of their hire or a sufficient number of years of experience within the area of discipline to warrant a Technical Director position (generally in excess of 10 years). The Quality Manager position requires a minimum of a BA/BS degree in physical, life or biological science and working experience within the laboratory environment within two or more disciplines. Participation in Industry Certificate programs is encouraged but not required.

Procedure

Job descriptions include the specific tasks, minimum education and qualification details, skills, and experience required for each position.

17.1.1 Laboratory Director

The Laboratory Director is in charge of all laboratory activities, and is the highest level manager. The laboratory director signs the *Quality Manual*.

17.1.2 Technical Director(s)

Day to day supervision of technical laboratory operations is the responsibility of the Technical Directors who are full-time members of the staff and who assure reliable data through the following activities: monitoring quality control, corroborating the analysis performed, and signing demonstrations of capability.

The Technical Directors certify that personnel with appropriate educational and/or technical background perform all tests for which the laboratory is accredited.

The Technical Directors sign SOPs appropriate to their department, Corrective Action Forms, Demonstration of Capability Forms for personnel within their department and the *Quality Manua*l.

17.1.3 Quality Manager

The Quality Manager has the authority and responsibility for ensuring that the quality system is implemented and followed.

The Quality Manager has direct access to the Laboratory Director and is independent of operations where the Quality Manager has oversight.

The Quality Manager:

- is the focal point for the quality system and has oversight of quality control data.
- evaluates data objectively and performs assessments without managerial influence.
- arranges for, or conducts, internal audits at least annually; and,
- notifies laboratory management of deficiencies (or opportunities for continuous improvement) and monitors corrective actions.
- keeps the *Quality Manual* current.
- signs all demonstrations of capability.
- signs all SOPs
- signs final corrective action implementation documents

17.2 Data Integrity and Ethics

DATA INTEGRITY is the result of the processes that together assure valid data of known and documented quality.

Data integrity and ethics procedures in the laboratory include training, signed, and dated integrity documentation for all laboratory employees, periodic monitoring of data integrity, and documented data integrity procedures. The Laboratory Director manages these records. The QA Manager keeps copies of the Ethics and Integrity Acceptance Forms.

Policy
Technical managers uphold the spirit and intent by supporting integrity procedures, by enforcing data integrity procedures, and by signing and dating the data integrity procedure training forms.

Policy
Data integrity procedures and evidence of inappropriate actions are reviewed annually or through regularly scheduled internal audits, and are updated by management.

Policy
The mechanism for confidential reporting of ethics and data integrity issues is (1) unrestricted access to senior management, (2) an assurance that personnel will not be treated unfairly for reporting instances of ethics and data integrity breaches, and (3) anonymous reporting.

Policy
Employees are required to understand and accept, through training and review of quality systems documents that any infractions of the laboratory data integrity procedures will result in a detailed investigation that could lead to very serious consequences such as immediate termination and/or civil/criminal prosecution.

Policy
Any potential data integrity issue is handled confidentially until a follow-up evaluation, full investigation, or other appropriate actions have been completed and the issues clarified. Inappropriate activities are documented, including disciplinary actions, corrective actions, and notifications of clients, if applicable. These documents are maintained for a minimum of 5 years.

Procedure
Any determination for detailed investigation of data integrity issues must be communicated to senior management. Allegations are investigated and remain confidential to the extent necessary.

Documentation for all investigations that result in findings of inappropriate activity must include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients.

Data integrity procedures are reviewed annually and are periodically monitored through in-depth data review, records review, or other thorough check processes.

Data integrity procedures are managed by Department Technical Directors under the oversight of the Quality Manager. Specific data checklists and other routine data quality monitoring forms are controlled by the Technical Directors once the Quality Manager approves original forms.

The Technical Directors of each department routinely audit 20% of all data submitted on a daily basis and perform random 100% audits at least once a month. Weekly reports of data integrity audits are submitted to the Quality Manager.

The Quality Manager audits data records randomly on a daily basis and formally at a minimum of quarterly. Weekly reports of data integrity audits from the Technical Directors are incorporated into a bi-weekly quality report that is submitted by the Quality Manager to the Laboratory Director.

17.3 Data Integrity and Ethics Training

Policy
Data integrity training is provided for all employees initially upon hire and annually thereafter. Data integrity training is the responsibility of the Laboratory Director.

Procedure
Attendance at an initial data integrity training (part of new employee orientation) and the annual refresher training is recorded with a signature attendance sheet or other form of documentation that demonstrates all staff participated and understand their obligations related to data integrity.

Training records regarding data integrity and ethics are signed and dated by senior management.

When contracted technical or support personnel are used, management is responsible for ensuring that they are trained to the laboratory's quality system and data integrity procedures, competent to perform the assigned tasks, and appropriately supervised.

Topics covered are provided in writing and provided to all trainees. Topics include but are not limited to the following:

General discussion of how "ethics" and " data integrity" are defined
Torrent "Bill of Rights"
Torrent "10 Commandments"
Ethical dilemmas within the environmental testing industry
Manual Integration policy (including demonstration of correct and incorrect integration techniques)
"Time Travelling"
Documentation of departures from "normal" procedure
Protecting Data Integrity through gatekeeper activities
Improper data manipulation and reporting practices
Proper use of LIMS and manual data checklists
Proper labeling of data files
Proper data storage procedures and redundancy practices
Consequences for improper handling and reporting of data

17.4 General Training

Policy
All personnel are appropriately trained and competent in their assigned tasks before they contribute to functions that can affect data quality. It is management's responsibility to assure personnel are trained.

Policy
Only trained personnel are authorized to perform specific tasks.

Policy
Training records are kept on individual training forms.

Procedure
New staff members are given introductory training and orientation upon arrival. Signature sheets of all who attended the training session document training.

The initial training for a new task contains the following steps:

- All documentation involved with a new and unfamiliar task is read and understood by the trainee.
- Training is under the direct supervision of a qualified senior analyst. During the time the analyst is training, the trainee may sign laboratory notebooks or logbooks, but the senior analyst, who is responsible for the data generated, must also co-sign all note/logbooks.

- The trainee demonstrates competency in the new task before they can operate independently. The competency for a test method is accomplished by a demonstration of capability as indicated in **Section 19**. Proof of competency is denoted with the initials or signature of the qualified senior analyst, the Technical Director of the trainee's department, and the Quality Manager. Prior to the release of the analyst for independent work, they must sign a statement that they have "read, understood and accepted" all materials submitted to them throughout the training process
- Each step of the training process is documented.

On-going training will consist of the following:

- The analyst attests, through signature that they have read, understood, and agreed to perform the latest version of the *Quality Manual* and any method SOP's that the analyst performs.
- Annually, the analyst shows continued proficiency in each method they perform.
- Other training as determined by management.
- Proof of acceptable on-going training is documented by the annual demonstrations of capability for each analyst and each method.

Cross Training – Employees participate in an active cross-training program. The reasons are two fold. First, management believes in extending every opportunity possible to their employees for both professional and personal growth. Management believes that providing continuous learning opportunity keeps analysts challenged and motivated to perform to the best of their ability. Secondly, management persistently strives to improve the laboratory's efficiency, and a highly motivated, cross-trained staff is germane to achieving that goal.

SECTION 18 – ACCOMMODATIONS & ENVIRONMENTAL CONDITIONS

POLICY

Laboratory facilities are designed and organized to facilitate testing of environmental samples. Environmental conditions are monitored to ensure that conditions do not invalidate results or adversely affect the required quality of any measurement.

POLICY

Environmental tests are stopped when the environmental conditions jeopardize the results.

POLICY

Access to, and use of areas affecting the quality of the environmental tests is controlled by restriction of areas to authorized personnel only.

POLICY

The laboratory workspaces are adequate for their use, and appropriately clean to support environmental testing and ensure an unencumbered work area.

PROCEDURE

Laboratory space is arranged to minimize cross-contamination between incompatible areas of the laboratory.

If the laboratory environment is required to be controlled by method or regulation, the adherence is recorded.

All areas of the laboratory are designated for appropriate activities such as sample homogenizing, sub-sampling from soil or bulk sample containers, performing WET/TCLP leaching procedures, adding preservatives to bottles, etc.

Technical Managers control the activities within their respective workspaces and are responsible for ensuring a clean, uncluttered workspace is maintained between shift changes and at the close of a business day. No unlabeled and/or uncovered containers are allowed at anytime, in any space.

The laboratory employs a janitorial service that will clean all exposed surfaces, floors and carpeted areas but will not invade bench top spaces or spaces under hoods. Tidiness of those spaces is the domain of the Technical Directors of the affected departments.

SECTION 19 – TEST METHODS AND METHOD VALIDATION

POLICY

A method is validated before it is put into use. All methods are published or documented.

19.1 Demonstration of Capability (DOC)

A DEMONSTRATION OF CAPABILITY (DOC) is a procedure to establish the ability of the analyst to generate data of acceptable accuracy and precision.

Policy

The laboratory confirms that and employee is capable of generating data of acceptable accuracy and precision on all methods before allowing them to proceed with process and procedures without direct supervision.

Procedure

The DOC is documented on the form similar to the form found in Appendix C of the 2003 NELAC Standard, and these completed forms are kept in the training files for each analyst.

A DOC is performed for each analyte and/or compound list whenever the method, analysts, analytes, or instrument type is changed.

The Technical Director certifies that technical staff members in their area of expertise are trained and authorized to perform all tests for which the laboratory are accredited by signing the DOC form.

The process for DOC is documented on a IDOC/DOC form that is maintained by the Quality Manager (Appendix B – Laboratory Quality Assurance Forms). All records supporting a DOC are submitted by the Technical Director to the Quality Manager whom, upon review of all data, gives final approval of DOC compliance. Once approval is given, the analyst performing the DOC is released into the work cell as a fully trained member of that cell.

19.2 On-Going (or Continued) Proficiency

After the demonstration of capability is completed, on-going proficiency is maintained and demonstrated at least annually through the analysis of either single-blind samples, performing another DOC, or use of four consecutive laboratory control samples compared to pre-determined acceptance limits for precision and accuracy.This is documented in the training file of each analyst.

19.3 Initial Test Method Evaluation

For chemical analyses, the INITIAL TEST METHOD EVALUATION involves the determination of the Limit of Detection (LOD) or Method of Detection (MDL), confirmation of the Limit of Quantitation (LOQ) or Practical Quantitation Limit (PQL), an evaluation of precision and bias, and an evaluation of the selectivity of the method.

19.3.1 Limit of Detection (LOD)

The LIMIT OF DETECTION (LOD) is an estimate of the minimum amount of a substance that an analytical process can reliably detect. An LOD is analyte-and matrix specific and may be laboratory-dependent. (NELAC Glossary 2003).

19.3.2 Limit of Quantitation (LOQ)

The LIMIT OF QUANTITATION (LOQ) is an estimate of the minimum amount of a substance that can be reported with a specified degree of confidence. (NELAC Glossary 2003).

Policy
If an LOD study is not performed, concentrations less that the Limit of Quantitation are not reported. If results are not reported outside of the calibration range (low), the LOD determination is not required.

Policy
The lowest calibration standard is equal to or less than the LOQ.

Policy
The LOQ will always be greater than the LOD.

Procedure
LODs are determined from a quality system matrix using all sample processing steps, and are verified annually or when there is a change in the test method or instruments affects sensitivity.

LODs are performed annually for all parameters within a test method that require a calibration procedure. LODs are performed per parameter per matrix (Aqueous, Solid, Wipe, Oil). First, the standard deviation of concentrations found over a minimum of 5 and a maximum of 10 consecutive samples spiked at or below the expected LOQ are determined. The standard deviation found is multiplied by the appropriate Student T value and a final LOD is determined. The LOQ is normally set at between 2 to 5 times the LOD and is only set at the LOQ if a method requires a specific LOQ that is not greater than 2 times the LOD.

The LOQ is verified using a quality systems matrix sample spiked at 1-2 times the determined LOQ that returns a concentration within the acceptance criteria for accuracy, according to the requirements of the method or client data quality objectives.

19.3.3 Precision and Bias

PRECISION is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms.

BIAS is the systematic error that contributes to the difference between the mean of a significant number of test results and the accepted reference value.

Policy
Precision and bias are determined for standard and non-standard methods.

Procedure
Precision and bias are determined for standard methods through the performance of a Demonstration of Capability.

Precision and bias using non-standard, modified standard or laboratory-developed methods are compared to the criteria established by the client (when requested), the method, or the laboratory.

Replicate spikes in a quality system matrix are analyzed according the procedures outlined in the 2003 NELAC Standard, Appendix C.3.3.b. where applicable.

DOC Procedure (Evaluation of Precision and Bias)

1. Analyze QC samples in quadruplicate containing the analytes of concern at or near the limit of quantitation, at the upper-range of the calibration (upper 20%) and at a mid-range concentration.
2. Process these samples on different days as 3 sets of samples through the entire measurement system for each analyte of interest.
3. Each day, one QC sample at each concentration is analyzed.
4. A separate method blank shall be subjected to the analytical method along with the QC samples on each of the three days. (Note that the three samples at the LOQ concentration can demonstrate sensitivity as well).
5. For each analyst, calculate the mean recovery for each day, for each level over each day, and for all nine samples.
6. Calculate the relative standard deviation for each of the separate means obtained.
7. Compare the standard deviations for the different days and the standard deviations for the different concentrations.
8. If the different standard deviations are all statistically insignificant (e.g. F-test), then compare the overall mean and standard deviation with the established criteria from above.

19.3.4 Selectivity

SELECTIVITY is the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances (EPA-QAD).

Policy
The laboratory evaluates selectivity through procedures defined in the test method SOPs.

19.4 Estimation of Uncertainty

ESTIMATION OF UNCERTAINTY consists of the sum (combining the components) of the uncertainties of the numerous steps of the analytical process, including, but not limited to, sample plan variability, spatial and temporal sample variation, sample heterogeneity, calibration/calibration check variability, extraction variability, and weighing variability.

Procedure

The laboratory estimates uncertainty using the standard deviation calculated from routine quality control samples.

All routine quality control sample data points are captured in the Laboratory Information Management System (LIMS) from both passing and failing criteria. Those points are used to establish in-house quality control acceptance and warning limits for all parameters tested per method per matrix. Points are accepted or rejected based on using GRUBS outlier calculation software. Limits are up-dated quarterly and are either equal to or stricter than those prescribed by a specific method. When a trend develops (6 consecutive data points on either side of the mean), a Corrective Action Form is initiated by either the Technical Director of the department affected and/or by the Quality Manager. When warning limits are reached, the Technical Directors affected are to take appropriate pro-action to regain control of their procedures. These pro-actions do not require a Corrective Action Form be initiated.

19.5 Laboratory-Developed or Non-Standard Method Validation

Policy
Laboratory developed, modified standard methods, and non-standard methods require method validation.

METHOD VALIDATION is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled (NELAC 2003).

Policy
Where applicable, the laboratory validates non-standard methods, laboratory-designed/developed methods, standard methods used outside their published scope, and amplifications and modifications of standard methods to confirm that the methods are fit for the intended use.

Policy
The range and accuracy of the values obtainable from validated methods (e.g. the uncertainty of the results, detection limit, selectivity of the method, linearity, limit of repeatability and/or reproducibility, robustness against external influences and/or cross-sensitivity against interference from the matrix of the sample/test object), is assessed for the intended use and whether it is relevant to the clients' needs.

Procedure
The laboratory’s method validation procedures include, at a minimum, the steps described in Appendix C.3 to Chapter 5 (NELAC 2003). The laboratory records method validation results, the procedure used for the validation, and a statement as to whether the method is fit for the intended use.

19.6 Control of Data

Policy
All calculations and all relevant data are subject to appropriate checks in a systematic manner.

Policy
Commercial off-the-shelf software (e. g. word processing, database and statistical programs) used within the designed application range is considered sufficiently validated when in-house programming is not used.

Procedure
The laboratory assures that computers and software are protected, maintained, and secure through measures such as documentation, locked access, and control of the laboratory environment.

Administrative SOP “Computer and Computer Software Management” details the procedure for assuring computer and software control

The laboratory procedures to insure that reported data are free from transcription and calculation errors can be found in each department under the responsibility of the Technical Directors. All procedures meet the approval of the Quality Manager prior to implementation.

The laboratory procedure that all quality control measures are reviewed and evaluated before data are reported is found in each department reporting data and is under the responsibility of the Technical Director of the department. All procedures meet the approval of the Quality Manager prior to implementation.

The laboratory procedure to address manual calculations, including manual integrations is found within the specific SOPs affected by the need for manual calculations and/or integrations.

The laboratory assures that computers, user-developed computer software, automated equipment, or microprocessors used for the acquisition, processing, recording, reporting, storage, or retrieval of environmental test data is:

a) documented in sufficient detail and validated as being adequate for use;
b) protected for integrity and confidentiality of data entry or collection, data storage, data transmission and data processing;
c) maintained to ensure proper functioning and are provided with the environmental and operating conditions necessary to maintain the integrity of environmental test data; and
d) held secure including the prevention of unauthorized access to, and the unauthorized amendment of, computer records.

SECTION 20 – EQUIPMENT

20.1 General Equipment Requirements

Policy
The laboratory provides all the necessary equipment required for the correct performance of the scope of environmental testing presented in this *Quality Manual*.

Policy
All equipment and software used for testing and sampling is capable of achieving the accuracy required and complies with the specifications of the environmental test method as specified in the laboratory SOP.

Policy
Equipment is operated only by authorized personnel.

Policy
The laboratory procedure for safe handling, transport, storage, use and planned maintenance of measuring equipment to ensure proper functioning and in order to prevent contamination or deterioration is found in the front cover of all maintenance logbooks.

Procedure

Up-to-date instructions on the use and maintenance of equipment (including any relevant manuals provided by the manufacturer of the equipment) are readily available for use by laboratory personnel.

All equipment is calibrated or checked before being placed into use to ensure that it meets laboratory specifications and the relevant standard specifications.

Test equipment, including hardware and software, are safeguarded from adjustments, which would invalidate the test result measures, by limiting access to the equipment and using password protection where possible.

Equipment that has been subject to overloading, mishandling, given suspect results, or been shown to be defective or outside specifications is taken out of service, isolated to prevent its use, or clearly labeled as being out of service until it has been shown to function properly. If it is shown that previous tests are affected, then procedures for non-conforming work are followed.

When equipment is needed for a test that is outside of permanent control of the laboratory, the lab ensures the equipment meets the requirements of this manual prior to its use by inspecting or otherwise testing it.

Each item of equipment and the software used for testing that is significant to the results is uniquely identified, and records of equipment and software are maintained. This information includes the following:

a) Identity of the equipment and its software;
b) Manufacturer's name, type identification, serial number or other unique identifier;
c) Checks that equipment complies with specifications of applicable tests;

d) Current location;
e) Manufacturer's instructions, if available, or a reference to their location;
f) Dates, results and copies of reports and certificates of all calibrations, adjustments, acceptance criteria, and the due date of next calibration;
g) Maintenance plan where appropriate, and maintenance carried out to date; documentation on all routine and non-routine maintenance activities and reference material verifications;
h) Any damage, malfunction, modification or repair to the equipment;
i) Date received and date placed into service (if available); and
j) Condition when received, if available (new, used, reconditioned).

A current *analytical equipment* list is maintained by the Quality Manager and can be found as an attachment to the current Quality Manual (Appendix C). Equipment list up-dates are performed at least annually or as necessary based on equipment replacement and /or equipment additions.

20.2 Support Equipment

SUPPORT EQUIPMENT includes, but is not limited to: balances, ovens, refrigerators, freezers, incubators, water baths, temperature measuring devices, volumetric dispensing devices, and thermal/pressure sample preparation devices.

Policy
All support equipment is maintained in proper working order and records are kept of all repair and maintenance activities, including service calls.

Procedure
All raw data records are retained to document equipment performance. These records include logbooks, data sheets, or equipment computer files.

All support equipment is calibrated or verified annually over the entire range of use using NIST traceable references where available. The results of the calibration of support equipment are within specifications or (1) the equipment is removed from service until repaired, or (2) records are maintained of correction factors to correct all measurements.

Support equipment such as balances, ovens, refrigerators, freezers, and water baths are checked with a NIST traceable reference if available, each day prior to use, to ensure they are operating within the expected range for the application for which the equipment is to be used.

Mechanical volumetric dispensing equipment, including burettes (except Class A glassware), is checked for accuracy quarterly.

Glass micro-liter syringes have a certificate attesting to the established accuracy. If the certificate of accuracy for glass micro-liter syringes is not available, the accuracy of the syringe is demonstrated upon receipt and documented.

For chemical tests that use autoclaves, the temperature, cycle time, and pressure is documented by use of chemical indicators or temperature recorders and pressure gauges.

A current *support equipment* list is maintained by the Quality Manager and can be found as an attachment to the current Quality Manual (Appendix D). Equipment list up-dates are performed at least annually or as necessary based on equipment replacement and /or equipment additions

20.2.1 Support Equipment Maintenance

Regular maintenance of support equipment, such as balances and fume hoods is conducted at least annually.

Maintenance on other support equipment, such as ovens, refrigerators, and thermometers is conducted on an as needed basis.

Records of maintenance to support equipment are documented in Instrument Maintenance Logs. Each piece of support equipment does not necessarily have its own logbook. Maintenance logbooks may be shared with equipment that is housed in the same laboratory area.

20.2.2 Support Equipment Calibration

Calibration requirements for analytical support equipment are found in the table below. For analytical instrumentation, the calibration requirements are found in the SOP specific to the methods requiring the use of the equipment and/or in the table found below:

Table 20.2 - 2 Calibration And Maintenance

Instrument	Activity	Frequency	Documentation
Balance	1. Clean 2. Check alignment 3. Certification	1. Before use 2. Before use 3. Annually	Worksheet/log book Post annual service date on balance Keep Certificate
ASTM Class 1Weights	1. Only use for the intended purpose 2. Use plastic forceps to handle 3. Keep in case 4. Re-calibrate	Once every year	Keep certificate
Thermometers: 1. Glass and electronic 2. Dial thermometers	Check at the temperature used, against a reference NIST certified thermometer	1. Annually for glass and electronic 2. Quarterly for dial thermometers	Calibration factor and date of calibration on thermometer and worksheet/log book
pH probe ISE Probes Ammonia Probe DO Probe	Maintenance: Use manufacturer's specifications	As needed	Worksheet/log book
Spectrophotometer.	1. Keep cells clean 2. Service contract. Check wavelength settings with color standards	Annually	Post service date on cover
Automatic or digital type pipettes	Calibrate for accuracy and precision using reagent water and analytical balance	At least Quarterly	Worksheet/logbook
Refrigerators and Freezers	1. Thermometers are immersed in liquid to the appropriate immersion line 2. The thermometers are graduated in increments of 1°C or less	Temperatures are recorded each day in use	Worksheet/log book

20.3 Analytical Equipment

20.3.1 Maintenance for Analytical Equipment

Policy
All equipment is properly maintained, inspected, and cleaned.

Procedure
Maintenance of analytical instruments and other equipment may include regularly scheduled preventive maintenance or maintenance on an as-needed basis due to instrument malfunction and is documented in Instrument Maintenance Logs, which become part of the laboratory's permanent records.

Table 20.3-1 Analytical Equipment Maintenance

Instrument	Procedure	Frequency
PerkinElmer FIMS Mercury Analyzer	Check tubing for wear	Daily
	Fill rinse tank with 10% HCl	Daily
	Insert clean drying tube filled with Magnesium Perchlorate	Daily
	Fill reductant bottle with 10% Stannous Chloride	Daily
ICP	Check pump tubing	Daily
	Check liquid argon supply	Daily
	Check fluid level in waste container	Daily
	Check filters	Weekly
	Clean or replace filters	As required
	Check torch	Daily
	Check sample spray chamber for debris	Monthly
	Clean and align nebulizer	Monthly
	Check entrance slit for debris	Monthly
	Change printer ribbon	As required
	Replace pump tubing	As required
UV-Vis Spectrophotometer	Clean ambient flow cell	As required
	Precision check/alignment of flow cell	As required
	Wavelength verification check	Semi-annually
TOC Analyzer	Clean sampler	Daily
	Check all tubing	Daily
	Clean pump well and pump rollers	Quarterly
	Clean wash fluid receptacle	Weekly
	Oil rollers/chains/side rails	Weekly
	Clean optics and cells	Quarterly
IR Spectrophotometer	Clean cell	Annually
	Check/adjust cell alignment	As required
Varian and Shimadzu GC/MS	Ion gauge tube degassing	As required
	Pump oil-level check	Monthly
	Pump oil changing	Semi-annually
	Analyzer bake-out	As required
	Analyzer cleaning	As required
	Resolution adjustment	As required
	COMPUTER SYSTEM AND PRINTER:	
	Air filter cleaning	As required
	Change data system air filter	As required
	Printer head carriage lubrication	As required
	Paper sprocket cleaning	As required
	Drive belt lubrication	As required
Varian and Shimadzu Gas Chromatograph	Compare standard response to previous day or since last initial calibration	Daily
	Check carrier gas flow rate in column	Daily via use of known compound retention
	Check temp. of detector, inlet, column oven	Daily
	Septum replacement	As required
	Glass wool replacement	As required
	Check system for gas leaks with SNOOP	W/cylinder change as required
	Check for loose/fray wires and insulation Bake	Monthly

Table 20.3-1 Analytical Equipment Maintenance

Instrument	Procedure	Frequency
	injector/column Change/remove sections of guard column Replace connectors/liners Change/replace column(s)	As required As required As required As required
Electron Capture Detector (ECD)	Detector wipe test (Ni-63) Detector cleaning	Semi-annually As required
Flame Ionization Detector (FID)	Detector cleaning	As required
Photoionization Detector (PID)	Change O-rings Clean lamp window	As required As required
IC	Change guard columns Change lamps Change pump seals Replace tubing Change fuses in power supply Filter all samples and eluents Change autosampler rotor/stator	As required As required Semi-annually or as required As required As required Daily As required
Balances	Class "S" traceable weight check Clean pan and check if level Field service	Daily, when used Daily At least annually
Conductivity Meter	0.01 M KCl calibration Conductivity cell cleaning	Daily As required
Turbidimeter	Check light bulb	Daily, when used
Deionized/Distilled Water	Check conductivity Check deionizer light Monitor for VOA's System cleaning Replace cartridge & large mixed bed resins	Daily Daily Daily As required As required
Drying Ovens	Temperature monitoring Temperature adjustments	Daily As required
Refrigerators/ Freezers	Temperature monitoring Warning system checked Temperature adjustment Defrosting/cleaning	Daily Monthly As required As required
Vacuum Pumps/ Air Compressor	Drained Belts checked Lubricated	Weekly Monthly Semi-annually
pH/Specific Ion/Gas Meter	Calibration/check slope Clean electrode	Daily As required
Centrifuge	Check brushes and bearings	Every 6 months or as needed
Water Baths	Temperature monitoring Water replaced	Daily Monthly or as needed

20.3.2 Initial Instrument Calibration

Initial instrument calibration and continuing instrument calibration verification are an important part of ensuring data of known and documented quality. If more stringent calibration requirements are included in a mandated method or by regulation, those calibration requirements override any requirements outlined here or in laboratory SOPs. Generally, instrument calibrations are provided in test methods.

Policy
All initial instrument calibrations are verified with a standard obtained from a second source traceable to a national standard when commercially available. If a second source is not available, a standard prepared from a separate lot may be used as long as the manufacturer can demonstrate the lot was prepared independently from other lots purchased.

Policy
If the reference or mandated method does not specify the number of calibration standards to use, the minimum number is three not including blanks or a zero standard.

Policy
Any samples that are analyzed after an unacceptable initial calibration are re-analyzed or the data are reported with qualifiers, appropriate to the scope of the unacceptable condition.

Policy
Quantitation is always determined from the initial calibration unless the test method or applicable regulations require quantitation from the continuing calibration.

Policy
The lowest calibration standard is the lowest concentration for which quantitative results can be reported without qualification. The lowest calibration standard is equal to the Limit of Quantitation and is greater than the limit of detection.

Policy
The highest calibration standard is the highest concentration for which quantitative results can be reported without qualifiers.

Policy
Data reported that are greater than the highest calibration standard without dilution are considered to be an estimate and are reported with a qualifier code and explained in the case narrative.

Procedure
Initial instrument calibration includes calculations, integrations, acceptance criteria, and associated statistics referenced in the test method SOP.

Sufficient raw data records are collected to allow reconstruction of the initial instrument calibration. These include, at a minimum, calibration date, test method, instrument, analysis date, analyte names, analysts signature or initials, concentration and response, calibration curve or response factor, or unique equation or coefficient used to reduce instrument responses to concentration.

Calibration date and expiration date (when recalibration is due) is recorded for equipment requiring calibration, where practicable.

Acceptance criteria are listed in individual method SOPs.

Corrective actions are performed when the initial calibration results are outside acceptance criteria. Calibration points are not dropped from the middle of the curve unless the cause is determined and documented. If the cause cannot be determined, the calibration curve is re-prepared. If the low or high calibration point is dropped from the curve, the working curve is adjusted and sample results outside the curve are qualified.

Results that are less than the lower calibration standard are considered to have increased uncertainty, and are either reported with a qualifier code or explained in the case narrative.

Results that are greater than the highest calibration standard are either diluted to within the calibration range, or considered to be an estimate; and are reported with a qualifier code, and explained in the case narrative.

For instrumentation where single point calibration is recommended by manufacturer’s instructions, such as with some ICP and ICP/MS technologies (with a zero and single point calibration), the following apply:

a) For single point plus zero blank calibrations, the zero point and the single point standard are analyzed prior to the analysis of samples, and the linear range of the instrument established by analyzing a series of standards, one of which is at the lowest quantitation level.
b) Zero blank and single point calibration standards are analyzed with each analytical batch for methods where they are specified.
c) A standard corresponding to the limit of quantitation is analyzed with each analytical batch and must meet established acceptance criteria when using single point plus zero blank calibrations.
d) The linearity of single point plus zero blank calibrations is verified at a frequency established by the method or the manufacturer.

20.3.3 Continuing Instrument Calibration

Policy
The validity of the initial calibration is verified prior to sample analysis by use of continuing instrument calibration verification (CCV) standards.

Policy
Corrective action is initiated for continuing instrument calibration verification results that are outside of acceptance criteria.

Procedure
Continuing instrument calibration verification is performed at the beginning and end of each analytical batch, except for instances when an internal standard is used. For methods employing internal standards, a single verification is performed at the beginning of the analytical batch.

Continuing instrument calibration verification is performed whenever it is expected that the analytical system may be out of calibration or might not meet verification acceptance criteria.

Continuing instrument calibration verification is performed when the time period for calibration or the most recent calibration verification has expired.

Continuing instrument calibration verification is performed for all analytical systems that have a calibration verification requirement.

Calibration is verified for each compound, element, or other discrete chemical species.

The calculations and associated statistics for continuing instrument calibration are included or referenced in the test method SOP.

Sufficient raw data records are retained to allow reconstruction of the continuing instrument calibration verification. Continuing instrument calibration verification records connect the continuing verification date to the initial instrument calibration.

Continuing instrument calibration verification criteria are specified in each method specific SOP as appropriate.

20.3.4 Unacceptable Continuing Instrument Calibration Verifications

If routine corrective action for continuing instrument calibration verification fails to produce a second, consecutive (immediate) calibration verification within acceptance criteria, then a new calibration is performed or acceptable performance is demonstrated after corrective action with two consecutive calibration verifications.

For any samples analyzed on a system with an unacceptable calibration, some results may be useable if qualified and under the following conditions:

a) If the acceptance criteria are exceeded high (high bias) and the associated samples are below detection, then those sample results that are non-detects may be reported as non-detects.

b) If the acceptance criteria are exceeded low (low bias) and there are samples that exceed the maximum regulatory limit, then those exceeding the regulatory limit may be reported.

SECTION 21 – MEASUREMENT TRACEABILITY

Measurement quality assurance comes in part from traceability of standards to certified materials.

POLICY

All equipment used that affects the quality of test results are calibrated prior to being put into service and on a continuing basis. These calibrations are traceable to national standards of measurement where available.

POLICY

Measurements from laboratory equipment provide the uncertainty required by test method or client.

POLICY

If traceability of measurements to SI units is not possible or not relevant, evidence for correlation of results through inter-laboratory comparisons, proficiency testing, or independent analysis is provided.

PROCEDURE

All equipment that affects the quality of test results are calibrated according to the minimum frequency suggested by the manufacturer, by regulation, by method, or as needed.

Clients can verify that required uncertainty is achieved by reviewing the internal quality control data provided with each report. Instrument quality control data is available to a client upon the client's request.

21.1 Reference Standards

REFERENCE STANDARDS are standards of the highest quality available at a given location, from which measurements are derived.

Policy

Reference Standards, such as ASTM Class 1 weights, are used for calibration only and for no other purpose unless it is shown that their performance as reference standards will not be invalidated.

Procedure

Reference standards, such as ASTM Class 1 weights, are calibrated by an entity that can provide traceability to national or international standards.
The following reference standards subject to certification via an outside source to a national standard:

a) Class 1 weights are calibrated every year by an qualified outside vendor
b) Reference thermometers are calibrated every year by an qualified outside vendor

21.2 Reference Materials

REFERENCE MATERIALS are substances that have concentrations that are sufficiently well established to use for calibration or as a frame of reference.

Policy
Reference materials, where commercially available, are traceable to national standards of measurement, or to Certified Reference Materials, usually by a Certificate of Analysis.

Policy
Internal reference materials, such as working standards or intermediate stock solutions, are checked as far as technically and economically possible.

Procedure
Purchased Reference Materials require a Certificate of Analysis where available. Otherwise, purchased reference materials are verified by application to a certified reference material, inter-laboratory comparison, past performance evaluation study samples and/or demonstration of capability.

Internal Reference Materials, such as working standards and intermediate stock solutions, are checked with proficiency tests or a second source independently prepared quality sample.

a) Internal thermometers are checked annually against the NIST certified reference thermometer.
b) Working class weights are checked against Class 1 weights at least monthly.
c) Class A pipettes are verified for accuracy gravimetrically at least twice a year.

21.3 Transport and Storage of Reference Standards and Materials

Policy
The laboratory handles and transports reference standards and materials in a way that protects their integrity.

Procedure
Reference standard and material integrity is protected by separation from incompatible materials and/or minimizing exposure to degrading environments or materials.

Reference standards and materials are stored according to manufacturer’s recommendations and separately from working standards or samples.

21.4 Labeling of Reference Standards, Reagents, and Materials

Policy
Reference standards and materials are tracked from purchase, receipt, and storage through disposal.

Policy
Expiration dates can be extended if the reference standard or material’s integrity is verified against a standard whose expiration data has not been met.

Policy
Reagent quality is verified during routine blank analyses.

Procedure

Records for all standards, reagents, reference materials, and media include:

1. the manufacturer/vendor name (or traceability to purchased stocks or neat compounds)
2. the manufacturer's Certificate of Analysis or purity (if supplied)
3. the date of receipt
4. reference to the method of preparation
5. date of preparation
6. recommended storage conditions
7. an expiration date after which the material shall not be used (unless its reliability is verified by the laboratory). It may be documented elsewhere if referenced.
8. preparer's initials (if prepared)

In methods where the purity of reagents is not specified, analytical reagent grade is used. If the purity is specified, that is the minimum acceptable grade. Purity is verified and documented according to Section 9, Purchasing, Services, and Supplies.

All containers of standards, reagents, or materials, whether original or prepared, are labeled with an expiration date.

All containers of prepared standards and reference materials have a preparation date and unique identifier. This laboratory uses lab book number, lab book page and sequential numbers to identify prepared materials.

Standard preparation records are kept in laboratory notebooks and indicate traceability to purchased stocks or neat compounds, reference to the method of preparation, date of preparation, expiration date, and preparer's initials.

Prepared reagents are verified to meet the requirements of the test method through Blank analysis.

SECTION 22 – SAMPLE MANAGEMENT

22.1 Sample Receipt

Procedure
When samples are received at the laboratory, their condition is documented, they are given unique identifiers, and they are logged into the sample tracking system.

22.2 Sample Acceptance

Policy
The minimum conditions a sample must meet on receipt are:
Person to whom the sample results are to be reported, unique client sample ID, location, date of collection, collector's name, preservation type (outlined below), sample type, and comments, relinquished by signature, expected Turn around time for report delivery

If these conditions are not met, the client is contacted prior to any further processing.

A notation regarding the presence of a sampling time is also noted. Samples are not rejected if no sampling time is present on the CoC but a note is added to the login summary indicating to the client that no times were supplied at time of sample acceptance

A second notation is made regarding client sample label durability. It is the policy of Torrent to only accept samples that have labels that are legible and are attached directly to the sample container being submitted to the laboratory.

If this condition is not met, the client is contacted immediately by voice and by email prior to any further processing of the samples.

Procedure
The laboratory checks samples for the conditions above, where appropriate, to evaluate sample acceptance.

The following preservation checks are performed and documented upon receipt:

Thermal preservation:

a) For temperature preservation, the temperature must be within ± 2°C unless otherwise stated.
b) For samples that require preservation at 4°C, the acceptable range is "from just above freezing to 6°C".
c) Samples that are delivered to the lab the same day as they are collected are likely not to have reached a fully chilled temperature. This is acceptable if there is evidence that chilling has begun.
d) Record on the receipt form if ice is present and the temperature.

pH checks:

e) The pH of samples requiring acid/base preservation is checked upon sample receipt or upon initiation of analysis.

The sample acceptance policy is available to sample collection personnel, and emphasizes the need for use of water resistant ink, durable labels, use of appropriate containers, and adherence to holding times, sample volume requirements, and what to do with compromised samples.

Sample submission sheets from the field are maintained in client folders and scanned and stored electronically

If the checks performed upon sample receipt indicate the criteria are not met, then 1) the sample is rejected as agreed with the client, 2) the decision to proceed is documented and agreed upon with the client, 3) the condition is noted on the Chain of Custody form and/or lab receipt documents, and 4) the data are qualified in the report.

22.3 Sample Identification

Policy
Samples, including sub-samples, extracts, and digestates, are uniquely identified in a permanent chronological record through the LIMS to prevent mix-up and to document receipt of all sample containers.

Procedure
Sample Receiving, Storage and Disposal – Torrent Laboratory utilizes a state-of the-art Laboratory Information Management System (LIMS) to track all aspects of sample analysis from sample receipt to sample disposal. Through the use of this system and an additional document, the Sample Receipt Log, control of the samples from sample receipt to sample disposal is maintained. When samples are received at Torrent they are subjected to a seven-step procedure:.

1. The samples are relinquished to and received by Torrent through the client submitted COC. The samples are removed from the coolers and a representative sample's temperature is taken using an infrared temperature gun.
2. A sample receipt log is filled in with the information found on the sample containers, the condition of the samples as they arrived (broken bottles, seal not intact, bubbles in VOAs), the temperature taken in step one, the type of delivery (walk-in, courier, over-night delivery), and the types of containers received (see example receipt log following this section). There is also space for a laboratory ID (assigned in step 4), signature line for sample receiver, and a space to record the disposal date of the samples.
3. The sample receipt log is then compared to the chain of custody received with the samples and any discrepancy noted between the COC and the receipt log is noted on the receipt log.
4. The samples are then logged into the LIMS system according to the analyses requested on the COC. The groups of samples received on the COC (s) are given a unique ID referred to as the Work Order number. Each sample on that Work Order is given a unique laboratory ID associated with that Work Order. Now each sample can be tracked through the entire analytical process by its unique identifier. For example: Seven samples are received on work order 041101. Each sample receives sub identifiers – 0401101-001, 04011-001-002, etc. If more than one container is

received for the sample analysis on the same sample, those containers can be further identified by the addition of a alphabetic identifier – 04011001-001A, -001B, -001C, etc.
5. Labels are printed out and attached to the samples and the samples are properly stored. The label information includes the unique work order and sample ID, the client sample ID, the sample date and time, and the sample storage location.
6. The COCs and the Receipt Log are placed in a binder located with the Project Manager where the COC is reviewed for completeness. The Project Manager will contact the client with any findings or discrepancies that were observe ed during sample log in or that are identified upon the Project Manager's review.
7. Once samples are logged in and reviewed by project management through the LIMS system, the samples are available to the analysts for preparation and analysis.

The following information is collected in the Work Order Module of the LIMS

a) Client or project name
b) Date and time of sampling
c) Date and time of receipt at lab
d) Unique laboratory identification number
e) Unique field identification number (may be same as lab #)
f) Initials of recorder
g) Analyses requested
h) Comments regarding rejection (if any).

22.4 Sample Storage

Procedure
Storage conditions are monitored for any required criteria, verified, and the verification recorded in logbooks. This includes temperature monitoring and holding times.

Samples are held secure, as required. Liquid samples are held up to 30 days from sample receipt and soil samples are held up to 6 months from sample receipt. Samples are stored apart from standards, reagents, food or potentially contaminating sources, and such that cross-contamination is minimized. All portions of samples, including extracts, digestates, leachates, or any product of the sample is maintained according to the required conditions. Longer retention times can be arranged with a written request from the client.

22.5 Sample Disposal

Policy
Samples are disposed of according to Federal, State and local regulations. Procedures are available for the disposal of samples, digestates, leachates, and extracts.

22.6 Sample Transport

Policy
Samples that are transported under the responsibility of the laboratory, where necessary, are done so safely and according to storage conditions. This includes moving bottles within the laboratory. Specific safety operations are addressed outside of this document.

22.7 Sampling Records

Policy
Sub-sampling within the laboratory is performed according to test method SOPs.

SECTION 23 – QUALITY OF TEST RESULTS

23.1 Essential Quality Control Procedures

Policy
All essential quality control elements are collected and assessed on a continuing basis.

Policy
The qualities of test results are recorded in such a way that trends are detectable, and where practicable, are statistically evaluated.

Policy
For test methods that do not provide acceptance criteria for an essential quality control element or where no regulatory criteria exist, acceptance criteria are developed. Control limits are developed using the mean, plus or minus 3 standard deviations; or static limits such as +/- 15 percent. These limits can be found in Section 19.4

Policy
Laboratory personnel follow the quality control procedures specified in test methods. The most stringent of control procedures is used in cases where multiple controls are offered. If it is not clear which is the most stringent, that mandated by test method or regulation is followed.

Procedure
To monitor the validity of environmental tests performed, review includes any one or combination of the techniques below:

a) use of certified reference materials or cultures and/or internal quality control using secondary reference materials;
b) participation in proficiency testing programs;
c) replicate testing using the same or different methods;
d) retesting of retained samples; and/or
e) correlation of results for different characteristics of a sample.

Written procedures to monitor quality controls including acceptance criteria are located in the test method SOPs, except where noted, and include such procedures as:

a) use of laboratory control samples and blanks to serve as positive and negative controls for chemistry methods;
b) use of laboratory control samples to monitor test variability of laboratory results;
c) use of calibrations, continuing calibrations, certified reference materials and/or PT samples to monitor accuracy of the test method;
d) measures to monitor test method capability, such as limit of detection, limit of quantitation, and/or range of test applicability, such as linearity;
e) use of regression analysis, internal/external standards, or statistical analysis to reduce raw data to final results;
f) use of reagents and standards of appropriate quality;

g) procedures to ensure the selectivity of the test method;

h) measures to assure constant and consistent test conditions, such as temperature, humidity, rotation speed, etc., when required by test method;

i) use of sterility checks for equipment, media and dilution water for microbiology; and

j) use of positive and negative culture controls for microbiology.

23.2 Internal Quality Control Practices

Analytical data generated with QC samples that fall within prescribed acceptance limits indicate the test method is IN CONTROL.

QC samples that fall outside QC limits indicate the test method is OUT OF CONTROL (non-conforming) and that corrective action is required or that the data are qualified.

Policy
Detailed QC procedures and QC limits are included in text method standard operating procedures (SOPs), or where unspecified in the SOPs, are detailed elsewhere.

Policy
All QC measures are assessed and evaluated on an on-going basis, so that trends are detected.

Procedure
The following general controls are used:
Positive and Negative Controls such as:

a) Blanks (negative)

b) Laboratory control sample (positive)

Selectivity is assured through:

a) absolute and relative retention times in chromatographic analyses;

b) two-column confirmation when using non-specific detectors;

c) use of acceptance criteria for mass-spectral tuning (found in test method SOPs);

d) use of the correct method according to its scope assessed during method validation; and

Consistency, Variability, Repeatability, and Accuracy are assured through:

a) proper installation and operation of instruments according to manufacturer’s recommendations or according to the processes used during method validation;

b) monitoring and controlling environmental conditions (temperature, access, proximity to potential contaminants);

c) selection and use of reagents and standards of appropriate quality; and

d) cleaning glassware appropriate to the level required by the analysis. Cleaning procedures not provided in test method SOPs are provided in a separate SOP. Note: Make an SOP for glassware cleaning if you don’t have one.

e) following SOPs and documenting any deviation, assessing for impact, and treating data appropriately; testing to define the variability and/or repeatability of the laboratory results, such as replicates;

f) use of measures to assure the accuracy of the test method, including calibration and/or continuing calibrations, use of certified reference materials, proficiency test samples, or other measures;

g) use of duplicate plate counts on positive samples (microbiology only).

Acceptance or rejection criteria are created according to laboratory policy where no method or regulatory criteria exist. Acceptance criteria define the boundary for the appropriate response from laboratory personnel, such as corrective action, reporting with qualifiers, reanalysis, review, and others.

Test Method Capability is assured through:

a) establishment of the limit of detection (LOD) where appropriate;

b) establishment of the limit of quantitation (LOQ)or reporting leve (RL)l; and/or

c) establishment of the range of applicability such as linearity;

Data reduction is assured to be accurate by:

a) selection of appropriate formulae to reduce raw data to final results such as regression;

b) periodic review of data reduction processes to assure applicability.

The following tables summarize the key elements of a quality control system for a laboratory performing chemistry.

Table 23.2-1 Essential Quality Control Elements for Chemistry

Item	Frequency	Acceptance Criteria	Corrective action
Negative Control (Method Blank)	1/batch	Method specific or reporting limit	Qualify data and take corrective action
Positive Control (Laboratory Control Sample)	1/batch	Method specific or determined by laboratory	Reprocess, reanalyze, or qualify data.
Matrix Spike; Matrix Spike Duplicates	Per method requirement	Method specific or determined by laboratory	Corrective action and qualify data.
Surrogate spikes	Per method requirement	Method specific or determined by laboratory	Corrective action and qualify data
Matrix Duplicates	Per method requirement	Method specific or determined by laboratory	Corrective action and qualify data
Continuing Calibration Verification	Per method requirement	Method specific or determined by the laboratory	Reanalyze standard immediately; Corrective action
Initial calibration Verification	Start of each analytical run	Method specific or determined by laboratory	Reanalyze standard immediately; Corrective action

Page Left Intentionally Blank

23.3 Method Blanks

Policy
Contaminated blanks are identified according to the acceptance limits in the test method SOPs or laboratory documentation.
Policy
Samples associated with a contaminated blank are evaluated as to the appropriate corrective action for the samples (e.g. reprocessing or data qualifying codes).

Procedure
Our laboratory identifies a blank as contaminated when analyte results are greater than the reporting limit AND greater than 1/10 of that found in any sample, or where the contamination affects the sample results according to test method requirements or client objectives.

When contamination of a blank is determined, the cause must be investigated and measures taken to minimize or eliminate the problem.

Data that are unaffected by the blank contamination (non-detects or other analytes) are reported unqualified.

Sample data that are suspect due to the presence of a contaminated blank are reanalyzed, qualified, or deleted.

23.4 Laboratory Control Samples

LABORATORY CONTROL SAMPLES (LCS) are prepared from analyte free water, and spiked with verified and known amounts of analytes for the purpose of establishing precision or bias measurements.
Policy
Laboratory control samples are analyzed at a frequency mandated by method, regulation and/or client request whichever is more stringent.

Procedure
The results of laboratory control samples (LCS) are calculated in percent recovery or other appropriate statistical technique that allows comparison to established acceptance criteria. The laboratory documents the calculation in the test method SOP.

The individual LCS is compared to the acceptance criteria as published in the mandated test method, or where there are no established criteria, the laboratory established limits.

23.5 Matrix Spikes and Matrix Spike Duplicates

MATRIX SPIKES (MS and MSD [duplicates]) are environmental samples fortified with a known amount of analyte to help assess the affect of the matrix on method performance.

Policy
The MS/MSD results are used to help assess the effect of the sample matrix on method performance.

Procedure
The laboratory procedure for MS/MSD includes spiking appropriate analytes at appropriate concentrations, calculating percent recoveries and relative percent difference (RPD), and evaluating and reporting the results.

Where there are no established criteria, the laboratory uses the mean plus or minus three standard deviations as the control limits for MS/MSD.

For MS/MSD results outside established criteria corrective action is documented or the data are reported with appropriate data qualifying codes.

23.6 Surrogate Spikes

SURROGATES are substances with chemical properties and behaviors similar to the analytes of interest used to assess method performance in individual samples.

Policy
Surrogates are added to all samples (in test methods where surrogate use is appropriate) prior to sample preparation or extraction.

Procedure
Surrogate recovery results are compared to the acceptance criteria as published in the mandated test method.

Where there are no established criteria, the laboratory uses the mean plus or minus three standard deviations as surrogate control limits.

For surrogate results outside established criteria that are either low or high bias with detected results of associated compounds, data are evaluated to determine the impact. Corrective actions include re-analysis of the sample (a single sample may act as a representative of an entire group of samples collected from the same site) to prove possible matrix interference, re-analysis of the sample if the surrogate spiking solution is suspect, or qualifying of the surrogate recovery if evidence exists through associated analysis of possible matrix effects.

If surrogates fail (high bias) and there are no detections of associated compounds, the results are reported and the high bias failure narrated.

23.7 Proficiency Test Samples or Interlaboratory Comparisons

Policy
The laboratory participates in proficiency test (PT) samples annually.

Policy
The laboratory institutes corrective action procedures for failed PT samples.

Policy
The laboratory does not share PT samples with other laboratories, does not communicate with other laboratories regarding current PT sample results, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

Procedure
Proficiency Testing (PT) or Proficiency Evaluation (PE) samples are treated as typical samples in the normal production process where possible, including the same preparation, calibration, quality control and acceptance criteria, sequence of analytical steps, number of replicates, and sample log-in. PT samples are not analyzed multiple times unless routine environmental samples are analyzed multiple times.

23.8 Data Review

Policy
The laboratory reviews all data generated in the laboratory for compliance with method, laboratory and, where appropriate, client requirements.

Policy
All data review is documented.

Procedure
Initially, the analyst reviews data for acceptability of quality control measures and accuracy of the final result(s).

After the initial review, a second reviewer (peer and/or Technical Manager) considers all manual transfers and calculations of data in detail and spot checks all electronic transfers of data.

Final reports are compared to raw data either directly or through several reviewed steps.

Bench sheets are used to record the information required for traceability of the analysis. The bench sheets include quality control measurements and acceptance criteria. Data are recorded on the bench sheets promptly at the time of the analysis, in ink.
Analysts review sample data and the QC information at the time of analysis and indicate if the QC parameters meet the acceptance criteria by marking the bench sheet.
The analyst signs and dates the bench sheet to indicate that they have performed the steps indicated and that the analysis meets acceptance criteria or has exceptions that are noted in the comments section of the bench sheet.

When the analyst has finished the primary analysis review, another person in the laboratory checks the bench sheet for the following items:

a) All required information has been recorded on the bench sheet.
b) QC criteria have been met or exceptions are documented in the comments section of the bench sheet.
c) Manual calculations are checked for accuracy.

When these checks have been completed, the reviewer signs and dates the bench sheet to document that the review has been performed.

SECTION 24 – REPORTING OF RESULTS

POLICY

The result of each test carried out is reported accurately, clearly, unambiguously, and objectively and complies with all specific instructions contained in the test method.

POLICY

Data are reported without qualification if they are greater than the lowest calibration standard; lower than the highest calibration standard, and without compromised sample or method integrity.

24.1 Test Reports

Policy

The report format has been designed to accommodate each type of test performed and to minimize the potential for misunderstanding or misuse.

Procedure

Each test report generated contains the following information (unless not required by the client):

a) a title, such as Test Report or Test Results;

b) the name and address of the laboratory, the location of the laboratory if different from the address, and the phone number and name of a contact person;

c) unique identification of the test report, such as a serial number, on each page and a pagination system that ensures that each page is recognized as part of the test report and a clear identification of the end of the report, such as 3 of 10;

d) the name and address of the client if applicable;

e) the identification of the test method used;

f) an unambiguous identification of the sample(s), including the client identification code;

g) the date of sample receipt when it is critical to the validity and application of the results, date and time of sample collection, dates the tests were performed, the time of sample preparation and analysis if the required holding time for either activity is less than or equal to 72 hours;

h) reference to the sampling plan and procedures used by the laboratory where these are relevant to the validity or application of the results;

i) the test results with failures identified, units of measurement, an indication of whether results are calculated on a dry weight or wet weight basis, and for Whole Effluent Toxicity, an identification of the statistical package used;

j) the name, function, and signature or an equivalent electronic identification of the person authorizing the test report, and the date of issue;

k) a statement to the effect that the results relate only to the samples;

l) at the laboratory’s discretion, a statement that the report shall not be reproduced except in full without written approval of the laboratory;

m) certification that the results are in compliance with the NELAC Standards if accredited to be in compliance or provide reasons and/or justification if they do not comply.

24.2 Supplemental Test Report Information

When necessary for interpretation of the results or when requested by the client, test reports include the following additional information:

a) deviations from, additions to, or exclusions from the test method, information on specific test conditions, such as environmental conditions, and any non-standard conditions that may have affected the quality of the results, and any information on the use and definitions of data qualifiers;
b) a statement of compliance/non-compliance when requirements of the quality systems are not met, including identification of test results that did not meet NELAC sample acceptance requirements, such as holding time, preservation, etc.;
c) where applicable and when requested by the client, a statement on the estimated uncertainty of the measurement;
d) where appropriate and needed, opinions and interpretations
a. When opinions and interpretations are included, the basis upon which the opinions and interpretations are documented. Opinions and interpretations are clearly marked as such in the test report.

e) additional information which may be required by specific methods or client;
f) qualification of results with values outside the working range.

For test reports that contain the results of sampling, the following is provided if necessary for the interpretation of the results:

a) the date of sampling;
b) unambiguous identification of the material sampled;
c) the locations of the sampling, including diagrams, sketches, or photographs;
d) a reference to the sampling plan and procedures used;
e) details of any environmental conditions during sampling that may affect the interpretations of the test results;
f) any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

24.3 Environmental Testing Obtained from Subcontractors

Test results obtained from tests performed by subcontractors are clearly identified on the test report by subcontractor name and/or accreditation number.

The test results from subcontractors are reported in writing or electronically. A copy of the subcontractors report is made available to the client if requested.

24.4 Electronic Transmission of Results

Policy
All test results transmitted by telephone, fax, telex, e-mail, or other electronic means comply with the requirements of this *Quality Manual* and associated procedures to protect the confidentiality and proprietary rights of the client.

24.5 Amendments to Test Reports

Policy
Material amendments to a test report after it has been issued are made only in the form of another document or data transfer. All supplemental reports meet all the requirements for the initial report and the requirements of this *Quality Manual*.

Procedure
Amended test reports are titled, “Revision to Original Report ….. (with applicable revision #)” or an equivalent form of wording to assure they can be differentiated from other test reports.

When it is necessary to issue a complete new report, the new report is uniquely identified and contains a reference to the original that it replaces.

SECTION 25 – APPENDICES

Appendices A, B, E, F, G and H are chronicled in the form of Attachments found at the end of the paginated section of the Quality Assurance Manual.

APPENDIX C & D
Laboratory Equipment List

Appendix C – Laboratory Analytical Equipment			
Name	**Brand**	**Model**	**Date Purchased / Date Placed in Service**
6 – Gas Chromatograph	Varian	CP-3800 GC	
2 – GC/MS	Varain	Saturn 2200	2003 & 2006/ 2003 & 2006
2 – GC/MS	Varian	Saturn 2000	2003/2003
Oxidation Catalyst Furnace	Thermo Electron Corp	Lindberg/Blue M	2006/2006
12 Position Suma Canister Cleaner	Despatch	Custom Made	2006/2006
Ion Chromatograph	Dionex	IC25	2003/2003
Flashpoint Closed Cup		Rapid Tester	2001/2001
3-51 Position Autosamplers	Varain	Archon	2003 – 2006/ 2003 – 2006
16 Position Air Autosampler	Teeydyn/Tekmar	Autocan (custom)	2006/2006
2- Purge & Trap Concentrators	Tekmar	3000	2003 – 2006 / 2003 – 2006
Purge & Trap Concentrator	Teledy/Tekmar	Velocity	2003
2- IC Autosamplers	Dionex	AS40	2003 & 2005 / 2003 & 2005
IC Absorbance Detector	Dionex	AD 25	2005/2005
IC Isocratic Pump	Dionex	IP25	2003/2003
IC Pneumatic Controller	Dionex	PC 10	2003/2003
Reverse Osmosis H2O Purifier	Purelab	Option Q	2006
ICP –AES Sequential	Varain	Liberty AX	1999
ICP-OES Simultaneous	PerkinElmer	Optima 5300 OV	2004
ICP 52 Pos Autosampler	Varain	SPS-5	1999
ICP 120 Pos. Autosampler	PerkinElmer	AS 93 Plus	2004
ICP-MS	PerkinElemer	ELAN DRC-e	2008
ICP-MS 120Pos Autosampler	PerkinElmer	AS 93 Plus	2008
2-Midi-Distillation Systems	LabCrest	Cyanide/Phenol	1999 & 2006 / 1999 & 2006
CVAA Mercury Analyzer	PerkinElmer	FIMS 400	2006 / 2006
Mercury 106 Pos. Autosampler	PerkinElmer	AS 90	2006 / 2006
Analytical Balance	Mettler	AB204	1999/ 1999
Analytical Balance	Mettler	AB104-S	1999 / 1999
pH/DO/ISE/Cond Meter	VWR	Symphony SB90 M5	2007 / 2007
Conductivity/TDS Meter	HACH		2001 / 2001
Spectrophotometer	HACH	DR2000	2001 / 2001
TOC Water Analyzer w/68 Pos autosampler	Shimadzu	TOC-V CSH	2003 / 2003
TC/IC Soil Analyzer	Shimadzu	SSM-5000A	2003 /2003
Mechanical Convection Oven	Precision Scientific	25EM	1999 / 1999

1.0 INTRODUCTION AND SCOPE OF SERVICES

This report presents the results of a Phase II Soil Investigation performed by Northgate Environmental Management, Inc. (Northgate) for the City of Oakland (the City) at 800 Cedar Street in Oakland, California (the Site). The Site consists of an approximate five acre vacant parcel located on the west side of Pine Street between 9th Street and Shorey Street in Oakland and is owned by the California Department of Transportation (Caltrans). The Site has historically been identified as 800 Cedar Street. However, reconfiguration of Interstate 880 in Oakland has removed Cedar Street at this location. The parcel is identified as Assessor's Parcel Number (APN) 006-047-001 in Alameda County. A Site Location Map is shown on Figure 1.

The work is being performed for the City under Brownfield Assessment Grant (BAG) Number 2B-00T18101-0 for both hazardous substances and petroleum hydrocarbons, issued by the United States Environmental Protection Agency (USEPA) for the West Oakland Development Area. The work was performed in accordance with the following documents:

- *Quality Assurance Project Plan, West Oakland Development Area, Oakland, California*, Northgate, September 8, 2009 (the QAPP), and
- *Sampling and Analysis Plan, Phase II Soil Investigation, APN 006-047-001 (800 Cedar Street), Oakland, California*, Northgate, July 14, 2011 (the SAP).

The purpose of this Phase II Soil Investigation is to:

- Define the extent of semi-volatile organic compound (SVOC) and petroleum hydrocarbon soil contamination in specific areas of the Site that were identified in previous investigations;
- Further evaluate elevated lead concentrations detected in soil at the Site; and
- Evaluate the potential need for remediation or additional evaluation of risk at the Site.

The scope of work for this investigation included the following services:

- Collecting soil samples from 13 borings advanced at the Site;
- Selectively analyzing soil samples for 17 metals, total extractable petroleum hydrocarbons (TEPH), and SVOCs; and
- Preparing this report.

2.0 BACKGROUND

2.1 Site Description

The Site consists of an approximate five acre (600 feet by 400 feet) parcel of land located on the west side of Pine Street, between 9th Street and Shorey Street in Oakland, California. The Site is almost entirely covered by the remnant concrete slab of a former building. The Site is currently owned by Caltrans, and is used for construction material storage.

The Site is located in an area of mixed residential and commercial development. The Site is bordered on the north by 9th Street, across which are residences and industrial warehouse buildings. The Site is bordered on the east and south by Pine Street and Shorey Streets, followed by residences. The Site is bordered along the west by an access ramp for Interstate 880. Figure 1 shows the Site location and Figure 2 (Site Plan) shows a current aerial view of the Site overlain by the approximate Site boundary as it existed in the early 1990s, along with historical features identified in previous environmental investigation reports. Figure 2 also shows historical soil borings where elevated concentrations of total petroleum hydrocarbons (TPH) and/or SVOCs have been detected in soil, as well as the locations of the soil borings installed during this current investigation.

2.2 Previous Investigations and Regulatory Involvement

The Site is currently regulated by the State of California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), under a Voluntary Cleanup Agreement (VCA), as amended twice in 1996, and once each in 1997, 1999 and 2002. USEPA is the agency overseeing the BAG for the Site.

Multiple investigations and remedial activities have been performed at the Site since 1990. The following investigation reports have been prepared for the Site:

- Geo/Resource Consultants, Inc. (GRC), 1992. *Site Investigation Report – Area 4, Department of Transportation T.O. Number: 04-192201-01, Highway 880, Cypress Reconstruction, Oakland, California,* August 1992.
- On-Site Technologies, 1993. *Preliminary Endangerment Assessment, Phoenix 800, 800 Cedar Street, Oakland, California,* November 1993.
- IT Corporation, 2000. *Site Investigation Report, Soil and Groundwater Investigation, Former Phoenix Iron Works Facility, 800 Cedar Street, Oakland, California,* dated March 8, 2000.

The key issues identified in these reports are as follows:

- Historically, the Site was used for a variety of purposes between 1920 and the present, including auto parts manufacturing, steel and ironworks fabrication, and fireworks manufacturing.
- One diesel and one gasoline underground storage tank (UST) located on the western side of the Site were removed sometime between 1995 and 1997, and a total of 800 cubic yards of soil were excavated and disposed of as part of the UST removals.
- Soil sampling performed at the Site during the tank removals indicated up to 17,000 parts per million (ppm) of lead and 44 ppm of arsenic in soil in the southwest corner of the former Phoenix Iron Works property, which is now outside the current Site property boundary. Soil excavation was initiated to remove these elevated metals concentrations, and during this excavation, two solvent-containing USTs (approximately 250 gallons and 10 gallons) and a settling sump were encountered. A total of 3,300 cubic yards of soil were excavated and disposed of as part of this remedial action (IT, 2000).
- Soil sampling performed in 1999 indicated that shallow soil along the western edge of the Site contains total recoverable petroleum hydrocarbons (TRPH) in excess of 1,000 ppm. This area was previously identified as containing “black-stained sand”, and was previously characterized by soil sampling in borings P-25, P-26 and P-8 (see Figure 2).
- The 1999 soil sampling indicated two boring locations (borings P-16 and P-19 on Figure 2) with elevated SVOC concentrations in shallow soil samples, and the presence of elevated lead concentrations in shallow soil at multiple locations across the Site.

A detailed summary of these prior investigations is provided in the SAP, and in the *Site Investigation Summary Report, APN 006-047-001 (800 Cedar Street), Oakland, California,* (Northgate, 2011).

The City of Oakland Redevelopment Agency is considering purchasing this property from Caltrans. The City of Oakland Redevelopment Agency is evaluating potential commercial redevelopment options for the Site, although the exact redevelopment use for the Site is not known at this time. The purpose of this investigation is to evaluate the extent of TEPH and SVOCs at selected locations at the Site and to provide additional data regarding the presence of metals in shallow soil at the Site.

3.0 SOIL INVESTIGATION

3.1 Investigation Methods

Northgate performed soil sampling at the Site on August 11, 2011. Prior to sampling, Northgate notified Underground Service Alert (USA, ticket #0260009) and contracted with a private utility locator to scan each boring location with utility locating equipment to ensure the boring locations were clear of any underground utilities. Following the scanning, 13 soil borings (NG-1 through NG-13) were advanced to depths of 5 feet below the ground surface (bgs) for soil sample collection. Approximate boring locations are shown on Figure 2. Permit number W2011-0062 for the borings, obtained from the Alameda County Public Works Department, is presented in Appendix A.

The borings were advanced using a track mounted direct-push GeoProbe drill rig. A continuous soil core was collected from each boring in clear acetate liners. The acetate liner was opened at multiple intervals, and the soils were screened for the possible presence of volatile aromatic compounds using a photoionization detector (PID). Soil lithology observations for each boring were recorded in the field notes.

Soil samples were collected for chemical analysis at approximate depths of 1, 3, and 5 feet bgs in each boring. Samples were collected by cutting 6 inch lengths of the acetate liners from the continuous cores, sealing the 6 inch segments with Teflon tape and plastic caps, labeling the samples and storing them on ice in a cooler. Samples were transported to the analytical laboratory (Torrent Laboratories of Milpitas, California) under chain-of-custody control. Duplicate soil samples were collected at 1 foot bgs from borings NG-2, NG-3, NG-7, NG-10, and NG-13. Boring locations for duplicate sample collection were chosen at locations where either soil discoloration was observed or to provide geographic coverage across the Site.

Soil samples collected from borings NG-1 through NG-5 were analyzed for the following constituents:

- Total petroleum hydrocarbons as motor oil (TPH-mo) and diesel (TPH-d) using EPA Method 8015; and
- 17 metals using EPA Method 6010/7471.

Soil samples collected from borings NG-6 through NG-13 were analyzed for the following constituents:

- SVOCs using USEPA Method 8270; and
- 17 metals using USEPA Method 6010/7471.

All drilling equipment was steam-cleaned prior to use at each boring location. After completion of sampling activities, all borings were backfilled with neat cement in accordance with the Alameda County Public Works Agency, Water Resources Section permit requirements and with oversight from the Alameda County Public Works Agency Water Resources inspector. Soil cuttings were used to fill the top 2 feet of boring NG-5 (located on bare soil).

3.2 Subsurface Conditions

Subsurface soils encountered at the Site consisted primarily of a gravelly sandy fill underlain by well graded sand. Subsurface conditions were similar at all of the borings. Groundwater was not encountered in any of the borings.

3.3 Soil Screening Levels

Analytical results from the soil samples were evaluated using the following screening levels:

- California Human Health Screening Levels (CHHSLs) for both residential and commercial/industrial land use;
- Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) Table A-1, Residential Land Use, Groundwater is a Current or Potential Source of Drinking Water (RWQCB 2008);
- RWQCB ESLs Table A-2, Commercial/Industrial Land Use, Groundwater is a Current or Potential Source of Drinking Water (RWQCB 2008);
- RWQCB ESLs Table K-3, Direct Exposure Soil Screening Levels, Construction/Trench Worker Exposure Scenario (RWQCB 2008);
- The City of Oakland's Urban Land Redevelopment Program (ULRP) Survey of Background Metal Concentration Studies; and
- Total Threshold Limit Concentrations (TTLCs) for characterization of hazardous waste.

Additional information regarding each of these screening levels is provided below.

The CHHSLs were developed by the Office of Environmental Health Hazard Assessment (OEHHA) on behalf of California Environmental Protection Agency (Cal/EPA) and are based on an excess lifetime cancer risk of 10^{-6} and a hazard quotient of 1.0 for noncancer health effects. The CHHSLs were developed using standard exposure assumptions and chemical toxicity values published by the USEPA and Cal/EPA. Under most circumstances the presence of a chemical in soil at concentrations below the corresponding CHHSLs can be assumed to not pose a significant health risk to people who may live (residential CHHSLs) or work (commercial/industrial CHHSLs) at the site. The presence of a chemical at concentrations in excess of a CHHSL does not necessarily indicate that adverse impacts to human health are occurring or will occur, but suggests that further evaluation of potential human health concerns is warranted (Cal/EPA, 2005).

The RWQCB presents ESLs in their guidance document *Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater* (RWQCB, 2008) for multiple site use scenarios and for different media. For site characterization studies such as the present investigation, ESLs are used as a general screening guide to determine whether additional investigation, remedial actions, or risk assessment may be required. The presence of a chemical at a concentration above an ESL does not necessarily indicate that adverse impacts to human health or the environment are occurring, but rather, indicate that a potential for adverse risk may exist and that additional evaluation may be warranted. Neither the ESLs nor the CHSSLs are regulatory cleanup standards, and they are intended to be used for screening evaluation only.

In some cases, particularly with respect to metals such as arsenic and vanadium, both the CHSSLs and the RWQCB residential and commercial/industrial ESLs are lower than the naturally occurring regional background concentrations. In these cases, generally accepted background concentrations are used for evaluation. The City of Oakland's ULRP has developed a Survey of Background Metal Concentration Studies, and values from this table were included as screening levels for the soil analytical results for metals.

The TTLCs are used to define material as a hazardous or non-hazardous waste for landfill disposal purposes and do not necessarily have any relation to health risk evaluation. However, these levels are used to evaluate the volume of soil that may require disposal as hazardous waste and are included as screening levels in this report.

3.4 Soil Analytical Results

Soil sample analytical results are presented in Tables 1, 2, 3, and 4. Laboratory analytical reports are presented in Appendix B. Analytical results for each of the analyte groups are discussed below.

3.4.1 Total Petroleum Hydrocarbons

A total of 17 soil samples (including two duplicate samples) collected from four different soil borings were analyzed for TPH-d and TPH-mo. TPH-d and TPH-mo analytical results are presented in Table 1 and on Figure 3. As shown in Table 1, TPH-d was detected in two samples; sample NG-1-1.0 at a concentration of 630 milligrams per kilogram (mg/kg) and sample NG-2-1.0 at a concentration of 4.4 mg/kg. The TPH-d result from sample NG-2-1.0 was reported by the lab to be not typical of the diesel standard pattern. The NG-1-1.0 TPH-d concentration exceeds the 83 mg/kg ESL for both residential and commercial/industrial land use, but was well below the 4,200 mg/kg ESL for construction/trench worker exposure.

TPH-mo was detected in 11 of the 17 samples at concentrations ranging from 4.8 to 2,700 mg/kg. The TPH-mo result from sample from NG-1-5.0 (13 mg/kg) was reported by the lab to be atypical of the motor oil standard pattern. Two of these samples (NG-1-1.0 and NG-3-1.0 duplicate) exceeded the 370 mg/kg ESL for residential land use. Sample NG-1-1.0 (2,700 mg/kg) exceeds the 2,500 mg/kg ESL for commercial/industrial land use. All of the sample concentrations were well below the 3,700 mg/kg ESL for construction/trench worker exposure.

3.4.2 17 Metals Analytical Results

A total of 28 soil samples (including two duplicate samples) collected from 13 different borings were analyzed for 17 metals. Analytical results for metals are shown in Table 2. Beryllium, molybdenum, selenium, and thallium were not detected above the laboratory Practical Quantitation Limits (PQLs) in any of the samples. With the exception of arsenic, cadmium, and lead, metals concentrations were below their respective residential CHHSLs in all of the samples.

Arsenic was detected in 16 samples at concentrations ranging from 1.7 to 65 mg/kg. All of these reported concentrations exceed the residential CHHSL of 0.07 mg/kg and the commercial/industrial CHHSL of 0.24 mg/kg. However, only two of the measured concentrations (17 mg/kg in NG-2-1.0 and 65 mg/kg in NG-1-3.0) were above the RWQCB ESL for construction worker/trench worker exposure of 15 mg/kg. The City of Oakland ULRP indicates naturally-occurring background concentrations of 1.8 - 31 mg/kg for arsenic in soil. All of the detected values were less than the TTLC of 500 mg/kg.

Cadmium was detected in four of the samples at concentrations of 1.7 to 4.9 mg/kg. Three of the reported concentrations exceeded the residential CHHSL of 1.7 mg/kg, but none of the reported concentrations were above the commercial/industrial CHHSL of 7.5 mg/kg, the RWQCB ESL for construction worker/trench worker exposure of 39 mg/kg, or the TTLC of 100 mg/kg.

Lead was detected in all of the samples, at concentrations ranging from 1.3 to 2,900 mg/kg. Lead analytical results are shown graphically on Figure 4. Lead concentrations in 11 of the samples exceeded the 80 mg/kg residential CHSSL, and six of these samples (NG-2-1.0 at 640 mg/kg; NG-2-1.0 duplicate at 340 mg/kg; NG-3-1.0 at 350 mg/kg; NG-5-1.0 at 520 mg/kg; NG-10-1.0 at 460 mg/kg; and NG-13-1.0 at 2,900 mg/kg) exceeded the 320 mg/kg commercial/industrial CHHSL. The only sample that exceeded the 1,000 mg/kg TTLC for lead was NG-13-1.0, with a concentration of 2,900 mg/kg of lead. Nine samples (NG-1-1.0, NG-2-1.0, NG-2-1.0-D, NG-3-1.0, NG-5-1.0, NG-6-1.0, NG-10-1.0, NG-11-1.0, and NG-13-1.0-D) were analyzed for soluble lead using the Waste Extraction Test (WET) to classify the soil for hazardous waste landfill disposal. Seven of the samples (NG-1-1.0, NG-2-1.0, NG-2-1.0-D, NG-3-1.0, NG-6-1.0, NG-10-1.0, and NG-13-1.0-D) contained soluble lead above the Soluble Threshold Limit Concentration (STLC) of 5 mg/kg, with NG-13-1.0-D having the highest concentration of soluble lead (520 milligrams per liter, mg/L).

3.4.3 SVOC Analytical Results

A total of 28 samples (including three duplicates) collected from eight soil borings were analyzed for SVOCs. Analytical results for SVOCs are shown in Table 3. Fluoranthene and pyrene were the only SVOCs detected above the laboratory PQLs, and these chemicals were only detected in one sample, NG-6-1.0 (21 mg/kg fluoranthene and 25 mg/kg pyrene). Both of these detections were below their respective residential and commercial/industrial ESLs.

3.5 Quality Assurance/Quality Control

Soil samples were collected following sampling protocols and quality assurance/quality control (QA/QC) procedures outlined in the SAP. QC objectives include *precision*, a measure of mutual agreement among individual measurements of the same property; *accuracy*, the agreement of a measurement with the accepted reference value; *representativeness*, the degree to which sample distribution falls within the statistical bounds of a population; *completeness*, a measure of the amount of valid data obtained compared to what was planned; and *comparability*, the confidence with which one data set can be compared to another. QC procedures are designed to increase or improve data quality and to help interpret discrepancies in results. Sampling QA/QC procedures were followed with respect to equipment, field procedures, sample containers, decontamination, storage, holding times, and field QC sampling. Chain-of-custody forms were completed for all samples, and samples were preserved according to the analytical method requirements. Torrent Laboratory in Milpitas, California performed the analyses and is state-certified for the methods listed. All samples were preserved according to the analytical methods requirements, all analyses were performed according to standard methods, and all sample holding times and preservation requirements were met. Analytical results were reported for all values above the PQL.

Northgate collected the following duplicate samples for analysis:

- For TPH-d and TPH-mo: NG-2-1.0/NG-2-1.0-D and NG-3-1.0/NG-3-1.0-D;
- For 17 metals: NG-2-1.0/NG-2-1.0-D and NG-13-1.0/NG-13-1.0-D; and
- For SVOCs: NG-7-1.0/NG-7-1.0-D, NG-7-1.0/NG-7-1.0-D and NG-13-1.0/NG-13-1.0-D.

Comparison of primary and duplicate sample results using the relative percent difference (RPD) between the duplicate sample results is used to assess the precision of the test data. Typically, an RPD of 50% or less is considered acceptable for soil samples. Table 4 presents the duplicate sample results, and the RPD calculations for each of the analyses. RPD calculations cannot be performed for samples where the analytical result is non-detect. Because the duplicate samples did not contain detectable concentrations of SVOCs above the PQL, SVOCs are not included in Table 4.

The results presented in Table 4 indicate that over half of the duplicate analyses had RPDs that were greater than 50%. This high RPD is likely due to the natural heterogeneity of the soil samples.

Several QA/QC analyses were performed by the analytical laboratory. Method blanks were analyzed for each analytical method performed to assess the level of contamination introduced by the laboratory. Results of the method blank analyses were all non-detect, with the exception of TPH-d and TPH-mo, reported at 0.86 and 2.2 mg/kg in the method blank sample. Results of the method blank analyses for SVOCs were all non-detect, with the exception of dimethyl phthalate and diethylphthalate, reported at 0.47 and 0.28 mg/kg. Several metals were also reported at very low-level concentrations in the method blank samples for soil.

Surrogate recoveries were performed in which selected samples were spiked with a known concentration of contaminant (laboratory control spike [LCS] and laboratory control spike duplicate [LCSD]) and the percent recovery was calculated to assess the accuracy of the analytic method. Surrogate recoveries and the RPD between duplicate results - calculated to assess the precision of the data - were all within the acceptable ranges, with the following exceptions:

- The percent recoveries for pyrene for one analytical batch were outside of laboratory control limits but were within the percent RPD limits.
- The percent recoveries for barium, copper and zinc for one analytical batch were outside of laboratory control limits, but the associated LCS/LCSD percent recoveries and percent RPDs were within the laboratory control limits.
- The spikes for the matrix spike/matrix spike duplicate (MS/MSD) for lead were not recoverable.

The laboratory stated that no corrective actions were required based on these QA/QC results. Details regarding the QA/QC results are provided in the Case Narrative in the laboratory analytical report, which is included in Appendix B.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The soil sampling performed during this investigation was intended to supplement prior investigation work at the Site. The prior investigation work indicated the following:

- Elevated concentrations of lead (above the 80 mg/kg residential CHSSL and in many cases, above the 320 mg/kg commercial/industrial CHSSL) were detected in shallow soil samples from across the Site. There was no apparent pattern to these elevated lead concentrations, with the exception that they were confined to the upper 1 to 3 feet of soil.
- The only area of TPH-impacted soil at the Site was limited to the northwest portion of the Site, and was labeled as a “black-stained sand area”.

Results from the current soil investigation were consistent with the results from these prior investigations, and indicated the following:

- Elevated concentrations of lead, in excess of the 80 mg/kg residential CHSSL, are present across the Site in the upper 1 foot of soil. Soil samples that were collected from a depth of 3 feet bgs consistently had concentrations of lead below this CHSSL and were typically below 20 mg/kg. Eleven of the 28 samples analyzed for lead during this investigation contained lead above the residential land use CHHSL of 80 mg/kg. Six of these samples contained lead above the commercial/industrial land use CHSSL of 320 mg/kg. Nine of the 1 foot depth samples were analyzed for soluble lead using the WET, and seven of these samples exceeded the 5 mg/L STLC for lead, indicating that if this soil is to be disposed of at a landfill, it may have to be disposed of as hazardous waste. Additional evaluation of soluble lead would be required to determine if the soil would be classified as a RCRA or Federal hazardous waste.
- The area of TPH-impacted soil in the northwest portion of the Site that had previously been delineated as a “black-stained sand area” is relatively limited and is confined to the upper 1 to 2 feet of soil. Three of the five sampling locations in this area had soil samples at a depth of 1 foot that contained concentrations of TPH-mo in excess of 100 mg/kg, but the maximum concentration of TPH-mo detected in a sample below 1 foot was 14 mg/kg.
- The elevated concentrations of SVOCs that were previously detected in soil borings P-16 and P-19 appear to be of limited extent. SVOCs were only detected in 1 of 27 samples collected from 8 borings surrounding these two borings, and fluoranthene and pyrene were the only SVOCs detected. These SVOCs were present at concentrations well below their residential and commercial/industrial land use ESLs.

Based upon these data and data from prior investigations at the Site, it appears that the primary hazardous substance present at the Site is lead in shallow soil, and the elevated lead concentrations appear to be confined to the upper 1-2 feet at the Site. Based on a Site area of 240,000 square feet, the volume of impacted soil may be as much as 18,000 cubic yards. The lead appears to be soluble, based upon the WET analysis results, and these soluble lead concentrations may result in this soil being classified as hazardous waste if the soil is excavated and removed from the Site. Almost the entire Site is capped by concrete, and therefore, the lead does not appear to currently present a human health risk. However, we recommend some form of remedial action be implemented in order to redevelop the Site. Suitable alternatives include:

1. Selective excavation and off-site disposal of soil containing lead above commercial land use standards.
2. Selective excavation and on-site encapsulation of soil containing lead above commercial land use standards.
3. On-site treatment of soil containing elevated concentrations of lead in order to reduce the solubility or bio-availability (toxicity) of lead, in order to re-use the soil in a commercial land use setting.

We recommend that all soil containing lead above the residential land use CHSSL be excavated and removed from the Site if the Site will be redeveloped for residential land use.

The extent of TPH-impacted soil in the northwest corner of the Site appears to be relatively limited. Soil containing TPH above commercial land use standards could be excavated and removed from the Site. However, TPH is not a hazardous chemical by itself. Historical analytical results from the Site have demonstrated that the more hazardous substances associated with TPH, such as benzene, toluene and naphthalene, are not present in the soil in this area. Under these circumstances, it may be appropriate to leave the TPH-impacted soil in place. We recommend that regulatory discussions to establish Site-specific cleanup goals be initiated before any remedial efforts are started at the Site. Additionally, if soils are left on Site with concentrations of contaminants above the unrestricted (residential) land use screening levels, a soil management plan should be prepared to outline procedures for managing the impacted soil.

5.0 LIMITATIONS

The purpose of a soil quality investigation is to reasonably characterize existing Site conditions based on the results of a limited target subsurface investigation. In performing such a study, it is understood that a balance must be struck between a reasonable inquiry into the Site conditions and an exhaustive analysis of each conceivable environmental characteristic. The following paragraphs discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to describe all environmental conditions of interest at a given Site. If conditions have not been identified during the study, such findings should not, therefore, be construed as a guarantee of the absence of such conditions at the Site, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

We are unable to report on or accurately predict events that may change the Site conditions after the described services are performed, whether occurring naturally or caused by external forces. We assume no responsibility for conditions we were not authorized to evaluate or conditions not generally recognized as predictable when services were performed.

Environmental conditions may exist at the Site that cannot be identified solely by visual observation. Where subsurface exploratory work was performed, our professional opinions are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions at unsampled locations.

APPENDIX A
BORING PERMITS

Alameda County Public Works Agency - Water Resources Well Permit

399 Elmhurst Street
Hayward, CA 94544-1395
Telephone: (510)670-6633   Fax:(510)782-1939

Application Approved on: 02/10/2011 By jamesy

Permit Numbers: W2011-0062
Permits Valid from 08/10/2011 to 08/17/2011

Application Id:	1297297504974	**City of Project Site:**	Oakland
Site Location:	800 Cedar St, Oakland, CA		
Project Start Date:	02/23/2011	**Completion Date:**	02/24/2011
Extension Start Date:	08/10/2011	**Extension End Date:**	08/17/2011
Extension Count:	1	**Extended By:**	priest

Assigned Inspector: Contact Steve Miller at (510) 670-5517 or stevem@acpwa.org

Applicant:	Northgate Environmental Mgt. - Adam Klein 300 Ogawa Plaza, Ste 510, Oakland, CA 94612	**Phone:**	510-839-0688 x215
Property Owner:	City of Oakland c/o Gopakumar Nair, Envr. Services Div. 250 Frank Ogawa Plaza, Ste 5301, Oakland, CA 94612	**Phone:**	510-238-5361
Client:	** same as Property Owner **		

	Total Due:	$265.00
Receipt Number: WR2011-0033	**Total Amount Paid:**	~~$265.00~~
Payer Name : Northgate	Paid By: CHECK	**PAID IN FULL**

Works Requesting Permits:

Borehole(s) for Investigation-Environmental/Monitorinig Study - 15 Boreholes
Driller: RSI - Lic #: 802334 - Method: DP

Work Total: $265.00

Specifications

Permit Number	Issued Dt	Expire Dt	# Boreholes	Hole Diam	Max Depth
W2011-0062	02/10/2011	05/24/2011	15	3.00 in.	15.00 ft

Specific Work Permit Conditions

1. Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings. All cuttings remaining or unused shall be containerized and hauled off site. The containers shall be clearly labeled to the ownership of the container and labeled hazardous or non-hazardous.

2. Boreholes shall not be left open for a period of more than 24 hours. All boreholes left open more than 24 hours will need approval from Alameda County Public Works Agency, Water Resources Section. All boreholes shall be backfilled according to permit destruction requirements and all concrete material and asphalt material shall be to Caltrans Spec or County/City Codes. No borehole(s) shall be left in a manner to act as a conduit at any time.

3. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.

4. Applicant shall contact Steve Miller for an inspection time at (510) 670-5517 or email to stevem@acpwa.org at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

5. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit

application on site shall result in a fine of $500.00.

6. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

7. Permit is valid only for the purpose specified herein. No changes in construction procedures, as described on this permit application. Boreholes shall not be converted to monitoring wells, without a permit application process.

APPENDIX B
LABORATORY ANALYTICAL REPORTS

Northgate Environmental Management Inc.

RE: 800 Cedar St. , Oakland, CA

Work Order No.: 1108085 Rev: 1

Dear Adam Klein:

Torrent Laboratory, Inc. received sample(s) on August 11, 2011 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

August 19, 2011

Patti Sandrock

Date

Date: 8/19/2011

Client: Northgate Environmental Management Inc.

Project: 800 Cedar St. , Oakland, CA

Work Order: 1108085

CASE NARRATIVE

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Analytical Comments for method S_8270C, 1108085-028 MS/MSD, QC Analytical Batch ID 406344, Note:The % recoveries for Pyrene are outside of laboratory control limits but are within % RPD limits. The associated LCS/LCSD % recoveries and % RPD are within limits. No corrective action required.

Analytical Comments for method S_6010B, 1108085-015 MS/MSD, QC Analytical Batch ID 406312, Note:The % recoveries for Barium, Copper and Zinc are outside of laboratory control limits. The associated LCS/LCSD % recoveries and % RPD are within limits. No corrective action required.

Analytical Comment for S)6010B, Note:The spikes in the MS/MSD for Lead are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

REVISIONS:

Per client request, STLC analysis added to several samples.

Note: Extraction of 50 g sample / 500g 0.2M Sodium Citrate Solution was performed according to wet extraction procedure (WET) which was rotated in a rotary shaker for 48 hours.

STLC:Extraction started on 8/22/11 @2:45 PM and ended on 8/24/11 @2:45 PM.

Sample 1108085-041 (NG-13-1.0) TTLC and STLC ratio was outside of acceptance limits. TTLC results was 2900 mg/Kg while STLC was 520 mg/L. The ratio for TTLC to STLC should not be greater than 10:1 in a normal, homogeneous sample. As a result, the TTLC was re-prepared in triplicate and yielded the following results:

4600 mg/Kg
3400 mg/Kg
5600 mg/Kg

These wide ranges of results are indicative of a heterogeneous sample. Because only 1 - 2 grams is used in TTLC preparation while a minimum 50 grams is used in STLC preparation, the STLC data is likely the most representative value for this sample.

Data for the triplicate analyses can be reported upon client request.

Rev 1 (8/29/11)

Report prepared for: Adam Klein
Northgate Environmental Management Inc.

Date Received: 08/11/11
Date Reported: 08/19/11

NG-10-1.0 1108085-031

Parameters:	Analysis Method	DF	MDL	PQL	Results	Unit
Arsenic	SW6010B	1	0.28	1.7	3.6	mg/Kg
Barium	SW6010B	1	1	5.0	200	mg/Kg
Chromium	SW6010B	1	0.0590	5.0	26	mg/Kg
Copper	SW6010B	1	0.0900	5.0	34	mg/Kg
Lead	SW6010B	1	0.043	1.0	460	mg/Kg
Nickel	SW6010B	1	0.0590	5.0	18	mg/Kg
Vanadium	SW6010B	1	0.12	5.0	20	mg/Kg
Zinc	SW6010B	1	0.59	5.0	240	mg/Kg
Mercury	SW7471A	1	0.01	0.10	0.54	mg/Kg
Lead (STLC)	SW6010B	1	0.0500	0.10	58	mg/L

NG-10-1.0 D 1108085-032

Parameters:	Analysis Method	DF	MDL	PQL	Results	Unit

All compounds were non-detectable for this sample.

NG-10-3.0 1108085-033

Parameters:	Analysis Method	DF	MDL	PQL	Results	Unit
Barium	SW6010B	1	1	5.0	32	mg/Kg
Chromium	SW6010B	1	0.0590	5.0	25	mg/Kg
Copper	SW6010B	1	0.0900	5.0	5.1	mg/Kg
Lead	SW6010B	1	0.043	1.0	1.6	mg/Kg
Nickel	SW6010B	1	0.0590	5.0	16	mg/Kg
Vanadium	SW6010B	1	0.12	5.0	18	mg/Kg
Zinc	SW6010B	1	0.59	5.0	9.2	mg/Kg

NG-10-5.0 1108085-034

Parameters:	Analysis Method	DF	MDL	PQL	Results	Unit

All compounds were non-detectable for this sample.

SAMPLE RESULTS

Report prepared for:	Adam Klein Northgate Environmental Management Inc.	**Date Received:**	08/11/11
		Date Reported:	08/19/11

Client Sample ID:	NG-13-5.0	**Lab Sample ID:**	1108085-044A
Project Name/Location:	800 Cedar St. , Oakland, CA	**Sample Matrix:**	Soil
Project Number:	1204.18		
Date/Time Sampled:	08/11/11 / 12:20		
Tag Number:	800 Cedar St		

Parameters:	**Analysis Method**	**Prep Date**	**Date Analyzed**	**DF**	**MDL**	**PQL**	**Results**	**Lab Qualifier**	**Unit**	**Analytical Batch**	**Prep Batch**
Benzo[k]fluoranthene	SW8270C	8/18/11	08/18/11	1	0.169	0.330	ND		mg/Kg	406344	3432

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.

Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.

Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)

Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.

Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)

Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.

Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero

Practical Quantitation Limit (PQL) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.

Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates

Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis

Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.

Units: the unit of measure used to express the reported result - **mg/L** and ***mg/Kg*** (equivalent to PPM - parts per million in **liquid** and ***solid***), **ug/L** and ***ug/Kg*** (equivalent to PPB - parts per billion in **liquid** and ***solid***), **ug/m3**, ***mg.m3***, **ppbv** and ***ppmv*** (all units of measure for reporting concentrations in air), **%** (equivalent to 10000 ppm or 1,000,000 ppb), **ug/Wipe** (concentration found on the surface of a single Wipe usually taken over a 100cm2 surface)

LABORATORY QUALIFIERS:

B - Indicates when the anlayte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H- Indicates that the recommended holding time for the analyte or compound has been exceeded
J- Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather the quantitative
NA - Not Analyzed
N/A - Not Applicable
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R- The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S- Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: Northgate Environmental Management Inc.

Project Name: 800 Cedar St. , Oakland, CA

Work Order No.: 1108085

Date and Time Received: 8/11/2011 16:35

Received By: NK

Physically Logged By: NG

Checklist Completed By: NG

Carrier Name: First Courier

Chain of Custody (COC) Information

Chain of custody present?	Yes
Chain of custody signed when relinquished and received?	Yes
Chain of custody agrees with sample labels?	Yes
Custody seals intact on sample bottles?	Not Present

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Not Present
Shipping Container/Cooler In Good Condition?	Yes
Samples in proper container/bottle?	Yes
Samples containers intact?	Yes
Sufficient sample volume for indicated test?	Yes

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes			
Container/Temp Blank temperature in compliance?	Yes	Temperature:	5	°C
Water-VOA vials have zero headspace?	No VOA vials submitted			
Water-pH acceptable upon receipt?				

pH Checked by:

pH Adjusted by:

Go ahead and run the STLC/WET test for Lead on the samples listed previously
on a standard turn around.
Thanks,
Kevin

Hi Kevin,
Yes, we can add WET test on the requested samples and we will analyze the
samples on HOLD for CAM 17.
I will have sales department help you with the pricing.

Thank you!

Kind Regards,
Guergana

SOIL STOCKPILE SAMPLING REPORT

1.0 INTRODUCTION

This Soil Sampling Report for the 800 Cedar Street Stockpile Sampling Project in Oakland, California was prepared by Geocon Consultants, Inc. under California Department of Transportation (Caltrans) Contract No. 04A3578 and Task Order No. 55 (TO-55), EA 04-0R0002.

1.1 Project Description and Proposed Improvements

The 800 Cedar Street Stockpile Sampling Project consists of soil sampling of the stockpiled soil located at the intersection of 9th and Pine Streets (APN 0006-047-001), historically identified as 800 Cedar Street in Oakland, California. Caltrans has used the approximately five-acre parcel of land for temporary storage of construction material. Additionally, a soil brokerage business operated on site and stockpiled soil was abandoned when the business closed. Caltrans plans to remove the stockpiled soil. The project location is depicted on the attached Vicinity Map, Figure 1.

1.2 General Objectives

The purpose of the site investigation was to evaluate concentrations of California Assessment Manual 17 (CAM 17) metals, total petroleum hydrocarbons as diesel (TPHd), as motor oil (TPHmo), and as gasoline (TPHg), organochlorine pesticides, polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and pH in soil.

The information obtained from this investigation will be used by Caltrans to evaluate soil stockpile handling practices, worker health and safety, and soil stockpile reuse and disposal options.

2.0 BACKGROUND

2.1 Hazardous Waste Determination Criteria

Regulatory criteria to classify a waste as California hazardous for handling and disposal purposes are contained in the CCR, Title 22, Division 4.5, Chapter 11, Article 3, §66261.24. Criteria to classify a waste as Resource, Conservation, and Recovery Act (RCRA) hazardous are contained in Chapter 40 of the Code of Federal Regulations (40 CFR), Section 261.

For waste containing metals, the waste is classified as California hazardous when: 1) the representative total metal content equals or exceeds the respective Total Threshold Limit Concentration (TTLC); or 2) the representative soluble metal content equals or exceeds the respective Soluble Threshold Limit Concentration (STLC) based on the standard Waste Extraction Test (WET). A waste has the potential of exceeding the STLC when the waste's total metal content is greater than or equal to ten times the respective STLC value since the WET uses a 1:10 dilution ratio. Hence, when a total metal is detected at a concentration greater than or equal to ten times the respective STLC, and assuming that 100 percent of the total metals are soluble, soluble metal analysis is required. A material is classified as RCRA hazardous, or Federal hazardous, when the representative soluble metal content equals or exceeds the Federal regulatory level based on the Toxicity Characteristic Leaching Procedure (TCLP).

The above regulatory criteria are based on chemical concentrations. Wastes may also be classified as hazardous based on other criteria such as ignitability and corrosivity; however, for the purposes of this investigation, toxicity (i.e., representative lead concentrations) is the primary factor considered for waste classification since waste generated during the construction activities would not likely warrant testing for ignitability or other criteria. Waste that is classified as either California hazardous or RCRA hazardous requires management as a hazardous waste.

2.2 Environmental Screening Levels

The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) has prepared a technical report entitled *User's Guide: Derivation and Application of Environmental Screening Levels, Interim Final 2013* (updated December 2013), which presents Environmental Screening Levels (ESLs) for over 100 commonly found contaminants in soil, groundwater, soil gas, and surface water, to assist in evaluating sites impacted by releases of hazardous chemicals. "The ESLs are considered to be protective for typical bay area sites. Under most circumstances, …the presence of a chemical is soil, soil gas, or groundwater at concentrations below the corresponding ESL can be assumed to not pose a significant threat to human health, water resources, or the environment." (SFRWQCB, December 2013). ESLs are risk assessment tools and are "not intended to serve as a rule to determine if a waste is hazardous under the state or federal regulations."

Residential and commercial/industrial land use ESLs are commonly used by contractors, soil trucking companies, and private and commercial land owners as default acceptance criteria to evaluate suitability of import soil material. The following ESL tables were used for this characterization:

- Table A. Shallow Soil (≤3m bgs), Groundwater is a Current or Potential Source of Drinking Water
- Table K-3. Direct Exposure Soil Screening Levels, Construction/Trench Worker Exposure Scenario.

The respective ESLs are listed at the end of Tables 3 to 6 for comparative purposes.

3.0 SCOPE OF SERVICES

The scope of services performed under TO-55, EA 04-0R0002 included the following:

3.1 Pre-field Activities

- Prepared the *Preliminary Site Investigation Workplan* and *Health and Safety Plan*, dated September 2013.
- Retained the services of Advanced Technology Laboratories, Las Vegas (ATL-LV), a Caltrans-approved and California-certified analytical laboratory, to perform the chemical analyses of soil samples.

3.2 Field Activities

The field investigation was performed on September 11 and 12, 2013, by Geocon staff. The following field activities were performed during the sampling efforts:

- Advanced 41 soil borings into 4 stockpiles (Stockpile 1 through Stockpile 4) at the project location using hand-auger and direct-push drilling techniques to collect soil samples. The borings were advanced to a maximum depth of 16 feet.

All samples were transported to a California-certified environmental laboratory for analysis under standard chain-of-custody (COC) documentation.

4.0 INVESTIGATIVE METHODS

4.1 Sampling Procedure

Soil samples were collected using a direct-push sample rig or hand-auger sampling techniques from 41 locations identified by the Caltrans TO Manager. Samples collected from the 37 borings located in Stockpile 1 through Stockpile 3 were collected at multiple depths determined by the Task Order Manager. Four discrete samples were collected from Stockpile 4. Each of the four samples was collected from a different quadrant of the stockpile at depths determined by the Task Order Manager. Sampling coordinates are presented on Table 1 and locations are shown on the Site Plan, Figure 2.

Soil samples collected using a hand-auger were placed in stainless steel tubes and sealed with Teflon tape and plastic lids prior to being stored in a chest cooled with ice.

Soil samples collected using a direct-push sample rig were obtained by advancing a two-inch-diameter, four-foot-long stainless steel core-barrel sampler lined with an acetate sample tube into soil. Soil samples were collected for laboratory analysis by cutting an approximately six-inch-long section of the acetate tube from the target sample depth, capping the ends with Teflon tape and plastic end caps, and then placing the sample tube in a chest cooled with ice for storage and delivery to the analytical laboratory.

Sample containers were labeled and transported to a Caltrans-approved, certified environmental laboratory using standard COC documentation. Soil borings were backfilled to surface with soil cuttings.

Geocon provided QA/QC procedures during the field activities. These procedures included washing the sampling equipment with a Liqui-Nox® solution followed by a double rinse with deionized water. Decontamination water was disposed of to the ground surface within Caltrans right-of-way in a manner not to create runoff, and away from drain inlets or potential water bodies.

4.2 Laboratory Analyses

Laboratory analyses were performed by ATL-LV under standard turnaround-time (TAT). The laboratory reports and COC documentation are included as Appendix A.

The samples were analyzed as follows:

- 71 samples for total lead using EPA Test Method 6010 ICAP.
- 48 samples for CAM 17 metals according to EPA Test Methods 6010 ICAP and 7471.
- 11 samples for hexavalent chromium using EPA Test Method 3060A.
- 28 samples with total lead concentrations equal to or exceeding 50 mg/kg (i.e., equal to or exceeding ten times the STLC of 5.0 mg/l) were further analyzed for WET lead.
- 12 samples with a total lead concentration equal to or exceeding the TTLC of 1,000 mg/kg or had WET lead concentrations equal to or exceeding 5.0 mg/l were further analyzed for TCLP lead.
- 71 samples for TPHd/mo using EPA Test Method 8015B.
- 42 samples for TPHg using EPA Test Method 8015B.
- 28 samples for Organochlorine pesticides using EPA Test Method 8081A.
- 28 samples for PCBs using EPA Test Method 8082.

- 42 samples for VOCs using EPA Test Method 8260B.
- 71 samples for SVOCs using EPA Test Method 8270CSIM.

4.3 Laboratory QA/QC

QA/QC procedures were performed for each method of analysis with specificity for each analyte listed in the test method's QA/QC. The laboratory QA/QC procedures included the following:

- One method blank for every ten samples, batch of samples or type of matrix, whichever was more frequent.
- One sample analyzed in duplicate for every ten samples, batch of samples or type of matrix, whichever was more frequent.
- One spiked sample for every ten samples, batch of samples or type of matrix; whichever was more frequent, with spike made at ten times the detection limit or at the analyte level.

Prior to submitting the samples to the laboratory, the COC documentation was reviewed for accuracy and completeness.

5.0 INVESTIGATIVE RESULTS

5.1 Soil Description

Four stockpile areas were identified by the Task Order Manager for sampling purposes. These areas are shown on Figure 2 and described below:

Stockpile 1: A total of 28 borings (A1 to E4) were collected from this portion of the site. Stockpile 1 was irregularly shaped and measured up to 200 feet wide, 450 feet long, and 18 feet deep. Soil in Stockpile 1 consisted primarily of medium light brown sandy silt with occasional gravel overlaying and mixing with clays (Bay Mud). The stockpile had been sculpted to allow vehicle access to the top and was sampled using direct-push and hand-auger drilling techniques.

Stockpile 2: A total of 5 borings (G1 to G5) were collected from this portion of the site. Stockpile 2 was mounded and measured up to 20 feet wide, 30 feet long, and 9 feet deep. Soil in Stockpile 2 consisted primarily of medium brown sand covered with older used aggregate base. The stockpile was sampled using hand-auger sampling techniques.

Stockpile 3: A total of 4 borings (H1 to H4) were collected from this portion of the site. Stockpile 3 was mounded and measured up to 10 feet wide, 20 feet long, and 5 feet deep. Soil in Stockpile 3 was clean aggregate base. The stockpile was sampled using hand-auger sampling techniques.

Stockpile 4: Four grab soil samples (N1-0 to N1-3) were taken at various depths and locations from this portion of the site. Stockpile 4 was located immediately adjacent to Stockpile 1 and measured less than 5 feet wide, 5 feet long, and 3 feet deep. Soil in Stockpile 4 consisted primarily of very loose, dark brown sandy clay with organic matter. The stockpile was sampled using hand-auger sampling techniques.

5.2 Laboratory Analytical Results

The analytical results are summarized in Tables 2 to 6 and are summarized below:

- The following metals were not detected above their respective laboratory reporting limits: beryllium, cadmium, silver, and thallium.
- Total chromium was reported at concentrations ranging from 17 to 81 mg/kg.
- WET chromium was reported at concentrations ranging from 0.068 to 0.29 mg/l.
- Total lead was reported at concentrations ranging from 1.1 to 1,900 mg/kg.
- WET lead was reported at concentrations ranging from 0.63 to 30 mg/l.
- TCLP lead was detected in one sample (H1-4) at a concentration of 0.66 mg/l. Remaining TCLP lead samples were non-detect (<0.25 mg/l).
- Remaining CAM 17 metals and hexavalent chromium were reported in the samples at total concentrations below ten times their respective STLCs.
- TPHg was not detected at or above the laboratory detection limit of 1.0 mg/kg.
- TPHd was reported at concentrations ranging from 3.3 to 900 mg/kg.
- TPHmo was reported at concentrations of 7.0 to 2,000 mg/kg.
- Organochlorine pesticides were reported at concentrations ranging from <1.0 µg/kg to 29 µg/kg.
- PCB Aroclor 1254 was reported in one sample at a concentration of 99 mg/kg.
- Remaining PCBs were not detected at or above the laboratory reporting limits.
- VOCs were not detected at or above the laboratory reporting limits.
- SVOCs were reported at concentrations ranging from <5.0 to 20,000 µg/kg.

5.3 Laboratory Quality Assurance/Quality Control

We reviewed the QA/QC results provided with the laboratory analytical reports. The data indicate a detection of zinc in a method blank at a concentration of less than 10% of that found in the associated analytical batch. Remaining method blanks reported non-detect results at or above reporting limits. The Matrix Spike (MS) and/or Matrix Spike Duplicate (MSD) were outside recovery criteria for several samples, possibly due to matrix interference; however, the associated laboratory control sample recoveries (LCDs) were acceptable. The relative percent differences (RPD) for MS/MSD were outside of recovery for several samples; however, the data was validated by the LCS. Surrogate tetrachloro-m-xylene recovery was biased low on sample G4-4, possibly due to matrix interference. The soil sample was clay-type. Internal standards were biased low on several SVOC samples, possibly due to matrix interference. Samples were analyzed with dilution and internal standards met method criteria. Affected analytes for these failed internal standards were reported at a dilution that met the internal standard recovery limit. The remaining associated surrogate was recovered within control limits. Surrogate recovery was outside of acceptance limits for TPHd analysis of sample D2-0, possibly due to matrix interference; the sample extract was black and viscous. Remaining samples and internal laboratory QA/QC samples showed acceptable recoveries and relative percent differences (RPDs). Based on this limited data review, no additional qualifications of the soil data are necessary, and the data are of sufficient quality for the purposes of this report.

5.4 Statistical Evaluation for Lead Detected in Soil Samples

Statistical methods were applied to the total lead data for the site to evaluate: 1) the upper confidence limits (UCLs) of the arithmetic means of the total lead concentrations for the site; and 2) if an acceptable correlation between total and WET lead concentrations exists that would allow the prediction of WET lead concentrations based on calculated UCLs. At the request of the Task Order Manager, the lead data for the site were treated as a single sample population for statistical evaluation.

5.4.1 Calculating the UCLs for the Arithmetic Mean

The upper one-sided 90% and 95% UCLs of the arithmetic mean are defined as the values that, when calculated repeatedly for randomly drawn subsets of site data, equal or exceed the true mean 90% and 95% of the time, respectively. Statistical confidence limits are the classical tool for addressing uncertainties of a distribution mean. The UCLs of the arithmetic mean concentration are used as the mean concentrations because it is not possible to know the true mean due to the essentially infinite number of soil samples that could be collected from a site. The UCLs therefore account for uncertainties due to limited sampling data. As data become less limited at a site, uncertainties decrease, and the UCLs move closer to the true mean.

Non-parametric bootstrap techniques were used to calculate the UCLs. For those samples in which total lead was not detected, a value equal to one-half of the detection limit was used in the UCL calculation. The reported maximum concentration of lead (E4-0, 1,900 mg/kg) was determined to be a statistical outlier (see Appendix B) and, as such, is not likely representative of stockpile conditions. The bootstrap and outlier test results are included in Appendix B. The following tables present the calculated total lead UCLs and statistics for the complete soil stockpile total lead data and the data with the outlier omitted.

Lead Statistics Including Outlier

Total Lead 90% UCL (mg/kg)	Total Lead 95% UCL (mg/kg)	Total Lead Mean (mg/kg)	Total Lead Minimum (mg/kg)	Total Lead Maximum (mg/kg)
78.1	79.0	57.2	1.1	1,900

Lead Statistics Omitting Outlier

Total Lead 90% UCL (mg/kg)	Total Lead 95% UCL (mg/kg)	Total Lead Mean (mg/kg)	Total Lead Minimum (mg/kg)	Total Lead Maximum (mg/kg)
48.8	51.0	41.6	1.1	460

5.4.2 Correlation of Total and WET Lead

Total and corresponding WET lead concentrations are bivariate data with a linear structure. This linear structure should allow for the prediction of WET lead concentrations based on the maximum total lead concentrations presented in the tables above.

To estimate the degree of interrelation between total and corresponding WET lead values (x and y, respectively), the *correlation coefficient [r]* is used. The correlation coefficient is a ratio that ranges from +1 to –1. A *correlation coefficient* of +1 indicates a perfect direct relationship between two variables; a *correlation coefficient* of –1 indicates that one variable changes inversely with relation to the other. Between the two extremes is a spectrum of less-than-perfect relationships, including zero, which indicates the lack of any sort of linear relationship at all. The *correlation coefficient* was calculated for 15 (x, y) data points (i.e., soil samples analyzed for both total lead [x] and WET lead [y]) from the site. To achieve an acceptable correlation, the total WET soluble lead data from samples B3-5 (200, 0.81) and B6-5 (280, 4.2) were excluded from the regression analysis. The excluded total and WET soluble lead data have the highest squared residual WET soluble lead value (presented in Appendix B). Excluding these data points from the regression analysis yields an acceptable *coefficient of determination* (r^2) of 0.7723, which yields a corresponding *correlation coefficient* (r) of 0.8788.

For the *correlation coefficient* that indicates a linear relationship between total and WET lead concentrations, it is possible to compute the line of dependence or a best-fit line between the two variables. A least squares method was used to find the equation of a best-fit line (regression line) by forcing the y-intercept equal to zero since that is a known point. The equation of the regression line was determined to be $y = 0.0615(x)$, where x represents total lead concentrations and y represents predicted WET lead concentrations.

This equation was used to estimate the expected WET lead concentrations for the total lead UCLs for the data set (see Section 5.4.1). Regression analysis results and a scatter plot depicting the (x, y) data points along with the regression line are included in Appendix B.

6.0 CONCLUSIONS

6.1 Lead

The following tables summarize the total and WET lead calculations and predicted waste classification for stockpile soil based on the total lead UCLs and predicted WET lead concentrations for all data collected at the site and for total lead data with the outlier omitted from the statistical analysis:

Total Lead Data including Statistical Outlier

90% UCL Total Lead (mg/kg)	90% UCL Predicted WET Lead (mg/l)	95% UCL Total Lead (mg/kg)	Waste Classification
78.1	4.8	79.0	Non-hazardous

90% UCL applicable for waste classification and onsite reuse; 95% UCL applicable for risk assessment and offsite disposal

Total Lead Data without Statistical Outlier

90% UCL Total Lead (mg/kg)	90% UCL Predicted WET Lead (mg/l)	95% UCL Total Lead (mg/kg)	Waste Classification
48.8	3.0	51.0	Non-hazardous

90% UCL applicable for waste classification and onsite reuse; 95% UCL applicable for risk assessment and offsite disposal

Based on the data presented in the above tables, stockpile soil at the site would be classified as non-hazardous since the 90% UCL-predicted WET lead concentrations are less than the lead STLC of 5.0 mg/l. Based on the TCLP lead results, the soil stockpile would not be classified as a RCRA hazardous waste.

6.2 Remaining CAM 17 Metals

Five samples contained total chromium at concentrations of greater than 50 mg/kg (i.e., greater than ten times the STLC of 5 mg/l). The samples were further analyzed for WET chromium and the reported concentrations were below the STLC. Total chromium concentrations in remaining samples were below ten times the STLC. Accordingly, the soil stockpile would be classified as non-hazardous based on chromium content.

With the exceptions of chromium and lead, CAM 17 metals were reported in the samples at total concentrations below ten times their respective STLCs.

The CAM 17 metals concentrations in the site soil were compared to ESLs. Antimony, arsenic, cobalt, and lead were reported at concentrations greater than one or more ESL values.

Non-parametric bootstrap techniques were used to calculate the 95% UCLs for antimony, arsenic, cobalt, and lead. The bootstrap test results are included in Appendix B. ESLs, UCLs, and published background concentrations for antimony, arsenic, cobalt, and lead are summarized in the table below:

Metal	Maximum	95% UCL	Shallow Soil Residential ESL	Shallow Soil Commercial/ Industrial ESL	Worker Direct Exposure ESL	Published Background Mean[1]	Published Background Range [1]
Antimony	31	---	20	40	120	0.60	0.15 to 0.73
Arsenic	16	8.86	0.39	1.6	10	3.5	0.6 to 11.0
Cobalt	24	12.0	23	80	49	14.9	2.7 to 46.9
Lead	1,900	79.0	80	320	320	23.9	12.4 to 97.1

Concentrations reported in mg/kg

[1] Kearney Foundation of Soil Science, March 1996

Antimony was detected in 1 of 38 samples (B6-5 at 31 mg/kg); therefore, the 95% UCL concentration could not be calculated. The reported maximum concentration of antimony is above the residential land use ESL but below the commercial/industrial land use and construction exposure ESLs. The maximum value is above the published background range. This single detection of antimony was determined to be a statistical outlier (see Appendix B) and, as such, is not likely representative of stockpile conditions.

The 95% UCL arsenic concentration is greater than the residential and commercial land use ESLs; however, it is less than the construction exposure ESL and within the published background range. The SFRWQCB *November 2007 Update to Environmental Screening Levels (ESLs) Technical Document* states that ambient background concentrations of arsenic typically exceed risk-based screening levels. In such instances, it may be more appropriate to compare site data to regionally specific established background levels.

Based on the reported results for arsenic, offsite reuse or disposal of the soil stockpile may be restricted based on arsenic content, depending on proposed use.

The 95% UCL cobalt concentration is less than the residential and commercial land use ESLs and the construction exposure ESL, and is within the published background range.

The 95% UCL lead concentration is less than the residential land use, commercial/industrial land use and the construction exposure ESLs, and also within the published background range.

Metals results for soil samples are summarized in Tables 2 and 3.

6.3 Petroleum Hydrocarbons

TPHg was not detected at or above the laboratory reporting limits.

TPHd was reported at concentrations ranging from 3.3 to 900 mg/kg, above the residential land use ESL of 100 mg/kg and the commercial/industrial land use ESL of 110 mg/kg, and equal to the construction exposure ESL of 900 mg/kg. The calculated 95% UCL for TPHd is 66.9 mg/kg, below the ESLs (SFRWQCB, December 2013, Tables A and K-3).

TPHmo was reported at concentrations ranging from 7.0 to 2,000 mg/kg, above the residential land use ESL of 100 mg/kg and the commercial/industrial land use ESL of 500 mg/kg, but below the construction exposure ESL of 28,000 mg/kg. The calculated 95% UCL for TPHmo is 168 mg/kg, below the ESLs.

A summary of petroleum hydrocarbons concentrations in site soil is presented in Table 4.

6.4 Organochlorine Pesticides

Organochlorine pesticides were detected in 9 of 28 samples at concentrations ranging from <1.0 µg/kg to 29 µg/kg. Dieldrin was reported at concentrations of up to 4.9 µg/kg, above the residential and commercial/industrial land use ESL of 2.3 µg/kg, but below the construction exposure ESL of 930 µg/kg. The 95% UCL concentration for dieldrin is 1.75 µg/kg, below the ESLs.

Remaining organochlorine pesticide concentrations were below their respective ESLs (SFRWQCB, December 2013, Tables A and K-3). A summary of organochlorine pesticide concentrations in site soil is presented in Table 5.

6.5 PCBs

PCB Aroclor 1254 was reported in one sample at a concentration of 99 µg/kg (E4-6), below the ESLs. Remaining PCBs were not detected at or above the reporting limits. A summary of PCB results in site soil is presented in Table 5.

6.6 VOCs

VOCs were not detected at or above the laboratory reporting limits. VOC results are summarized in Table 5.

6.7 SVOCs

SVOCs were reported at concentrations ranging from <5.0 to 20,000 µg/kg. Benzo(a)pyrene and benzo(b)fluoranthene were reported at concentrations of up to 7,400 and 11,000 µg/kg, respectively, exceeding the ESLs for residential and commercial/industrial land use and the construction exposure ESL. Benzo(a)pyrene and benzo(b)fluoranthene have calculated 95% UCLs of 359 µg/kg and 490 µg/kg, respectively, above the residential and commercial/industrial land use ESLs, but below the construction exposure ESLs. Benzo(a)anthracene, Benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene were reported at concentrations of up to 5,300 µg/kg , 4,000 µg/kg, 6,200 µg/kg, and 3,600 µg/kg, respectively, exceeding the residential and commercial/industrial land use ESLs but below the construction exposure ESLs. Benzo(a)anthracene, Benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene have calculated 95% UCLs of 247 µg/kg, 192 µg/kg, 292 µg/kg, and 175 µg/kg, respectively, below the ESLs. Remaining SVOCs were below ESLs. SVOC results are summarized in Table 6.

6.8 Worker Protection

The contractor(s) should prepare a project-specific health and safety plan to prevent or minimize worker exposure to metals, petroleum hydrocarbons, organochlorine pesticides, and SVOCs in soil. The plan should include protocols for environmental and personnel monitoring, requirements for personal protective equipment, and other health and safety protocols and procedures for the handling of soil.

Notes:

Results are shown in milligrams per kilogram (mg/kg).

*Value listed is for Chromium III, as there is no construction exposure standard for total chromium.

Values listed in italics are results of WET analysis

< = Analyte was not detected above the laboratory reporting limit.

ESLs = Environmental Screening Levels, Tables A and K-3, SFRWQCB, December 2013.

TTLC = total threshold limit concentration

STLC = soluble threshold limit concentration

TCLP = toxicity characteristic leaching procedure

RE: Caltrans - Cedar Street Stockpiles, E8560-02-55

Attention: Rick Day

Enclosed are the results for sample(s) received on September 13, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

Advanced Technology Laboratories, Inc. **Date:** *24-Sep-13*

Project: Caltrans - Cedar Street Stockpiles, E8560-02-55
Lab Order: N011008

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) is outside criteria for Lead ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

RPD for sample duplicates N011008-002, N011008-020 are outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 7196:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8015B_DRO/ORO:

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) on N011008-003A-MS/MSD is outside criteria ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

RPD for sample duplicates N011008-006, N011008-024 are outside criteria ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 8081A:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Surrogate Tetrachloro-m-xylene recovery bias low on sample N011008-023 possibly due to matrix interference. Soil sample was clay type. The other surrogate was recovered within control limits.

Analytical Comments for EPA 8082:

Surrogate Tetrachloro-m-xylene recovery bias low on sample N011008-023 possibly due to matrix interference. Soil sample was clay type. The other surrogate was recovered within control limits.

Analytical Comments for EPA 8270C_SIM:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) is outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

RPD for sample duplicates are outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Internal Standard Perylene-d12 low bias on samples N011008-003, N011008-009, N011008-010, N011008-011A-MS and N011008-021 possibly due to matrix interference. Samples were analyzed with dilution and internal standard met method criteria. Affected analytes for this failed internal standard were reported at a dilution that meet internal standard recovery limit.

Internal Standards Perylene-d12 and Chrysene-d12 low bias on samples N011008-022, N011008-022-DUP, N011008-023, N011008-024, N011008-025, N011008-026, N011008-027 possibly due to matrix interference. Samples were analyzed with dilution and internal standard met method criteria. Affected analytes for these failed internal standards were reported at a dilution that meet internal standard recovery limit.

Package 1 of 1

Send Label To Printer ☑ Print All Edit Shipment Finish

LABEL INSTRUCTIONS:

Do not copy or reprint this label for additional shipments - each package must have a unique barcode.

STEP 1 - Use the "Send Label to Printer" button on this page to print the shipping label on a laser or inkjet printer.
STEP 2 - Fold this page in half.
STEP 3 - Securely attach this label to your package, do not cover the barcode.
STEP 4 - Request an on-call pickup for your package, if you do not have scheduled daily pickup service or Drop-off your package at the nearest GSO drop box. Locate nearest GSO dropbox locations using this link.

ADDITIONAL OPTIONS:

Send Label Via Email Create Return Label

TERMS AND CONDITIONS:

By giving us your shipment to deliver, you agree to all the service terms and conditions described in this section.
Our liability for loss or damage to any package is limited to your actual damages or $100 whichever is less, unless you pay for and declare a higher authorized value. If you declare a higher value and pay the additional charge, our liability will be the lesser of your declared value or the actual value of your loss or damage. In any event, we will not be liable for any damage, whether direct, incidental, special or consequential, in excess of the declared value of a shipment whether or not we had knowledge that such damage might be incurred including but not limited to loss of income or profit. We will not be liable for your acts or omissions, including but not limited to improper or insufficient packaging, securing, marking or addressing. Also, we will not be liable if you or the recipient violates any of the terms of our agreement. We will not be liable for loss, damage or delay caused by events we cannot control, including but not limited to acts of God, perils of the air, weather conditions, act of public enemies, war, strikes, or civil commotion. The highest declared value for our GSO Priority Letter or GSO Priority Package is $500. For other shipments the highest declared value is $10,000 unless your package contains items of "extraordinary value", in which case the highest declared value we allow is $500. Items of "extraordinary value" include, but or not limited to, artwork, jewelry, furs, precious metals, tickets, negotiable instruments and other items with intrinsic value.

Hi Marlon and Glen,

Attached is a scan of the COC's for this project. I noted necessary changes in red ink and initialed nearby. Please proceed with the analyses as shown here. The TAT is still standard. If you could, please send results to Rick Day as well. I may be on vacation when they come in, as noted below.

Thank you for your patience. I appreciate it.

Sincerely,
Luann

I will be on vacation September 23rd through 27th . If you need assistance during that time, please contact Rick Day at (925) 961-5270.

RE: Caltrans - Cedar Street Stockpiles, E8560-02-55

Attention: Rick Day

Enclosed are the results for sample(s) received on September 13, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

CASE NARRATIVE

Analytical Comments for EPA 6010B_STLC:

Matrix Spike Duplicate (MSD) on QC sample N011008-003A-MSD is outside recovery criteria for Lead possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RE: Caltrans - Cedar Street Stockpiles, E8560-02-55

Attention: Rick Day

Enclosed are the results for sample(s) received on September 13, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for Nancy

Jose Tenorio Jr.
Laboratory Director

CLIENT:	Geocon Consultants, Inc.
Project:	800 Cedar St, E8560-02-55
Lab Order:	N011009

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) is outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

RPD for sample duplicate is outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Method Blanks for Batch 43923 has hit above the reporting limit for Zinc but less than 1/10 of the amount measured in sample.

Analytical Comments for EPA 7196:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8015B DRO:

Surrogate recovery outside recovery criteria for sample N011009-048 possibly due to matrix interference. Sample extract was black and viscous.

RPDs for sample duplicates N011008-024ADUP , N011009-04ADUP, N011009-049ADUP are outside criteria possibly due to non-homogeneity of sample.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) on N011009-075A-MS/MSD is outside criteria ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 8081A:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for sample duplicate N011009-006 is outside criteria for gamma-Chlordane ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Surrogate Tetrachloro-m-xylene recovery bias low on sample N011009-002 possibly due to matrix interference. The other surrogate was recovered within control limits.

Analytical Comments for EPA 8082:

Surrogate Tetrachloro-m-xylene recovery bias low on sample N011009-002 possibly due to matrix interference. The other surrogate was recovered within control limits.

Analytical Comments for EPA 8260B:

Surrogate Toluene-d8 recovery bias low on sample N011009-039 possibly due to matrix interference. The other surrogates were recovered within control limits.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) is outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 8270C_SIM:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RPD for Matrix Spike(MS) and Matrix Spike Duplicate(MSD) is outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

RPD for sample duplicates are outside criteria for some analytes ; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Internal Standards Perylene-d12 and Chrysene-d12 low bias on most of the samples possibly due to matrix interference. Samples were analyzed with dilution and internal standard met method criteria. Affected analytes for these failed internal standards were reported at a dilution that meet internal standard recovery limit.
