Completed Document Type:	Land Use Restriction - Site Inspection/Visit
Completed Date:	03/23/2009
Comments:	On 3/23/09, DTSC approved the 2007 Annual Monitoring and Compliance Report (Annual Report) dated March 2008 for the Heroic War Dead East Bay Municipal Utility District (EBMUD) site, also known as the EBMUD West End Property. The Annual Report presents the results of the first bi-annual monitoring event conducted in July 2007, discusses soil disturbance activities, and serves as an annual report with site inspection summary pursuant to Section 4.02(d) of the Covenant to Restrict Use of Property, Environmental Restriction.

Completed Area Name:	Basewide
Completed Sub Area Name:	Not reported
Completed Document Type:	Correspondence
Completed Date:	09/24/2009
Comments:	When conducting semi-annual groundwater monitoring pursuant to the 2008 Operation and Maintenance Plan at wells FMW-1, FMW-2, FMW-3, FMW-4, MW-5, MW-6, and EMW-4, EBMUD does not need to obtain DTSC s written approval before conducting groundwater monitoring activities.

Completed Document Type:	Consent Agreement
Completed Date:	04/07/2009
Comments:	EBMUD and DTSC entered into the Consent Agreement on 4/7/09. The purposes of this Agreement are (a) to bind EBMUD to comply with the

OAB HEROIC WAR DEAD USAR AKA: HEROIC W (Continued) **S105954429**

Operation and Maintenance Plan approved by DTSC on September 29, 2008, which specifies inspection, soil management, groundwater monitoring, annual reporting, and five-year review requirements at the Site, and (b) to provide for reimbursement of DTSC's oversight costs from EBMUD.

Completed Area Name: Basewide
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Plan
Completed Date: 09/29/2008
Comments: DTSC approved the Operation and Maintenance (O&M) Plan on 9/29/08. The O&M Plan specifies procedures for operation, monitoring, and maintenance of remedial actions implemented at the Heroic War Dead EBMUD. The plan outlines O&M procedures for: the Building 1070 Yard engineered asphalt cap, the Building 1070 Yard lead-impacted soil area, groundwater monitoring at the Building 1070 Yard area, the Building 1064 Yard PV-18 PAH-impacted soil area, and site-wide soil and groundwater/liquid management. The O&M Plan also contains requirements for annual reporting and Five-Year Reviews.

Completed Area Name: Basewide
Completed Sub Area Name: Not reported
Completed Document Type: Long Term Monitoring Report
Completed Date: 03/23/2009
Comments: DTSC received the revised 2007 Annual Monitoring and Compliance Report (Annual Report) dated March 2008 for the Heroic War Dead East Bay Municipal Utility District (EBMUD) site, also known as the EBMUD West End Property. The Annual Report presents the results of the first bi-annual monitoring event conducted in July 2007, discusses soil disturbance activities, and serves as an annual report pursuant to Section 4.02(d) of the Covenant to Restrict Use of Property, Environmental Restriction. On October 30, 2008, DTSC provided comments on a previous draft report. DTSC has reviewed the revised Annual Report and the EBMUD s response letter dated March 17, 2009, and found the Annual Report and response letter satisfactory. DTSC hereby approves the 2007 Annual Report.

Completed Date: 10/08/2009
Comments: DTSC concurs with the 2008 Annual Monitoring and Compliance Report.

Completed Area Name: Basewide
Completed Sub Area Name: Not reported
Completed Document Type: Soils Management Plan
Completed Date: 07/02/2010
Comments: On 7/2/10, DTSC approved EBMUD s request to import fill approximately 2,600 cubic yards of the soil from EBMUD s Main Waste Wastewater Treatment Plant to backfill the former Building 1101 area. DTSC has reviewed laboratory data and confirmed that chemical concentrations from the proposed fill are below hazardous waste levels and HWD EBMUD s remediation goals. DTSC has reiterated that the Covenant s provisions regarding soil excavation and disturbance continue to apply at the former Building 1101 area.

Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	04/15/2003
Comments:	On 4/15/03, DTSC approved the Engineering Evaluation/Cost Analysis and Removal Action Workplan for Removal Action, Installation Restoration Site 1 (RAW) for the Heroic War Dead United States Army Reserve Center. The RAW proposes removal of the vehicle wash rack and oil water separator (WR/OWS) and adjacent contaminated soil at Installation Restoration Site 1. The Army Reserve will dispose the excavated soil and debris at off-site permitted disposal facilities. The removal action is an interim action for soil which may or may not serve as the final remedy. The Army Reserve should continue to characterize soil and groundwater contamination and to evaluate remedial alternatives at Installation Restoration Site 1.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/31/2011

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

	Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/25/2011	Source: EPA
Date Data Arrived at EDR: 03/01/2011	Telephone: 703-412-9810

	Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA’s knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/15/2011

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/15/2011
Date Data Arrived at EDR: 07/07/2011
Date Made Active in Reports: 08/08/2011
Number of Days to Update: 32

Federal institutional controls / engineering controls registries

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 03/16/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/25/2011	Telephone: 703-603-0695
Date Made Active in Reports: 06/14/2011	Last EDR Contact: 09/12/2011
Number of Days to Update: 81	Next Scheduled EDR Contact: 12/26/2011
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 03/16/2011	Source: Environmental Protection Agency

	Data Release Frequency: Annually

State- and tribal - equivalent NPL

RESPONSE: State Response Sites

Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

Date of Government Version: 08/09/2011	Source: Department of Toxic Substances Control
Date Data Arrived at EDR: 08/09/2011	Telephone: 916-323-3400
Date Made Active in Reports: 09/09/2011	Last EDR Contact: 09/15/2011
Number of Days to Update: 31	Next Scheduled EDR Contact: 11/21/2011
	Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control’s (DTSC’s) Site Mitigation and Brownfields Reuse Program’s (SMBRP’s) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Date of Government Version: 08/09/2011

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 04/08/2011

Local Land Records

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

	Data Release Frequency: Varies

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program’s oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder’s office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

Number of Days to Update: 41	Next Scheduled EDR Contact: 12/26/2011
	Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995	Source: EPA

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

SAN DIEGO COUNTY:

Hazardous Materials Management Division Database
The database includes: HE58 - This report contains the business name, site address, business phone number, establishment 'H' permit number, type of permit, and the business status. HE17 - In addition to providing the same information provided in the HE58 listing, HE17 provides inspection dates, violations received by the establishment, hazardous waste generated, the quantity, method of storage, treatment/disposal of waste and the hauler, and information on underground storage tanks. Unauthorized Release List - Includes a summary of environmental contamination cases in San Diego County (underground tank cases, non-tank cases, groundwater contamination, and soil contamination are included.)

Date of Government Version: 09/09/2010

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 12/31/2007
Date Data Arrived at EDR: 08/26/2009
Date Made Active in Reports: 09/11/2009

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5’ Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Longitude (West):	122.3033 - 122˚ 18’ 11.9’’
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	561327.9
UTM Y (Meters):	4184735.8
Elevation:	14 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	37122-G3 OAKLAND WEST, CA
Most Recent Revision:	1980

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

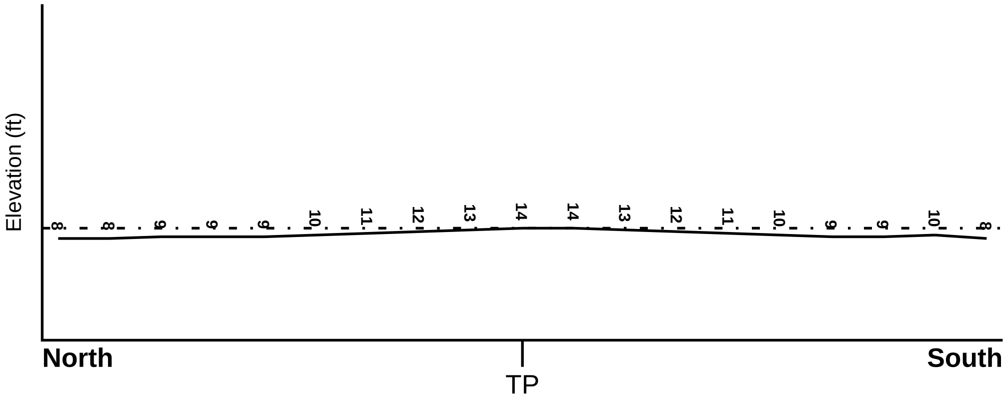
TOPOGRAPHIC INFORMATION

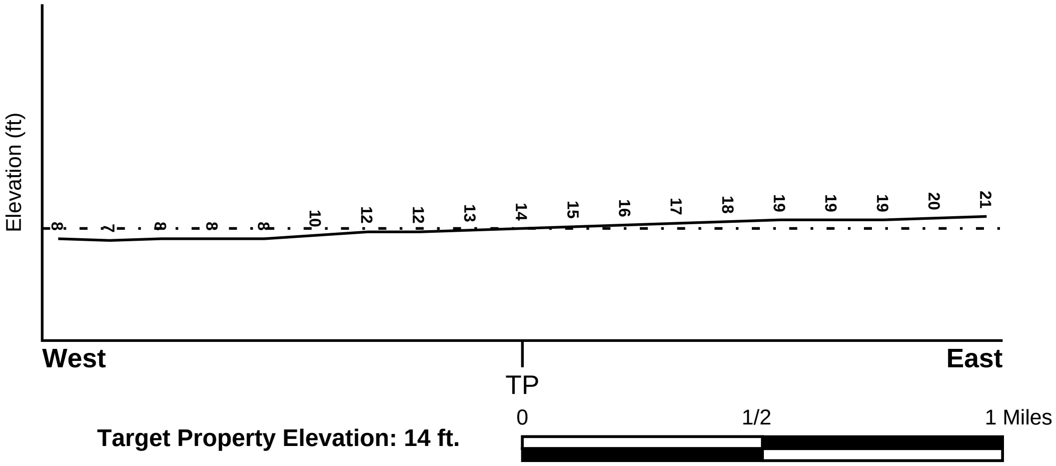
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 14 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
ALAMEDA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06001C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
OAKLAND WEST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT		GEOLOGIC AGE IDENTIFICATION	
Era:	Cenozoic	Category:	Stratifed Sequence
System:	Quaternary		
Series:	Quaternary		
Code:	Q *(decoded above as Era, System & Series)*

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name:	Urban land
Soil Surface Texture:	
Hydrologic Group:	Not reported
Soil Drainage Class:	
Hydric Status: Partially hydric	
Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name:	Urban land
Soil Surface Texture:	
Hydrologic Group:	Not reported
Soil Drainage Class:	
Hydric Status: Partially hydric	
Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5’ Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5’ Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5’ Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture’s (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.’s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR’s City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

Subject:	Public Records Request No. 2019-03-0117

Dear Erik Brown,

Thank you for your request. We have searched our records and have no records that respond to your below request for:

800 Cedar Street
Oakland

If you have any questions or concerns, please call or e-mail me.

Sincerely,

Rochelle Reed

SITE CERTIFICATION SYNOPSIS

NAME AND LOCATION OF SITE:

B&A Auto Dismantlers
1823 Shorey Street
Oakland, California
Alameda County

DATE PROJECT BEGAN: 1992

DATE PROJECT CERTIFIED: January 8, 1997

DESCRIPTION OF SITE AND CONTAMINANTS: The Site is located at 1823 Shorey Street, within the western portion of the city of Oakland, approximately 1 mile west of the Oakland Outer Harbor. The Site is relatively level and approximately 1,875 square feet in area. The site was previously used as an auto dismantling facility. Caltrans acquired the property in 1990 as a right-of-way acquisition to reconstruct the section of the I-880 freeway that collapsed in the 1989 Loma Prieta earthquake. Residential homes are located directly across from the site along the east side of Pine Street and the south side of Goss Street.

Soil and groundwater investigations conducted in December 1992 found that the soil contained elevated concentrations of petroleum hydrocarbons and soluble lead above preliminary remedial goals.

DESCRIPTION OF REMOVALS AND REMEDIAL ACTIONS: Approximately 80 cubic yards of debris and 670 cubic yards of California-hazardous soils were excavated from the B&A Auto Site on November 18, 1995. The debris consisted of wood and metal scraps, metals pipes, tires, tree branches and brush. The debris and soil were taken to the Southern Pacific Transportation Company staging area on November 18, 1995 and subsequently loaded onto rail cars on November 20, 1995 for transport to the ECDC landfill in Utah.

The Site was then dewatered and excavated to a depth of approximately 15 to 20 feet to install the Contract 'B' frontage road connecting to the Seventh Street undercrossing. The floor of the excavation was sealed with a concrete slab to construct a sub-base road.

DESCRIPTION OF PROBLEMS ENCOUNTERED WHICH CAUSED MAJOR DELAYS: None

DESCRIPTION OF ACCOMPLISHMENTS UNIQUE TO THIS SITE: None

FINAL USE OF SITE: Part of a frontage road connecting to the Seventh Street undercrossing. The Site was excavated to a depth of approximately 15-20 feet and the floor of the excavation was sealed with a concrete slab to construct a sub-base road.

REMEDIAL ACTION CERTIFICATION FORM

---

1. Site Name and Location:

B&A Auto Dismantlers
1823 Shorey Street
Oakland, California
Alameda County

Assessor's Parcel Numbers: 6-45-3

2. Project Proponent:

Mr. Nino Cerruti
CALTRANS
P.O. Box 23660
Oakland, California 94623-0660

3. Brief Description and History of the Site: The Site is located at 1823 Shorey Street, within the western portion of the city of Oakland, approximately 1 mile west of the Oakland Outer Harbor. The Site is relatively level and approximately 1,875 square feet in area. The site was previously used as an auto dismantling facility. Caltrans acquired the property in 1990 as a right-of-way acquisition to reconstruct the section of the I-880 freeway that collapsed in the 1989 Loma Prieta earthquake. Residential homes are located directly across from the site along the east side of Pine Street and the south side of Goss Street.

Soil and groundwater investigations conducted in December 1992 found that the soil contained elevated concentrations of petroleum hydrocarbons and soluble lead above preliminary remedial goals.

4. Type of Site:
Included in the Annual Workplan? No, a Voluntary Cleanup Program project.

5. Size of Site: Small

6. Dates of Remedial Action:
Initiated: Implementation of the field activities approved in the Remedial Design and Implementation Plan began on November 18, 1995.

Completed: Excavation activities were completed on November 18, 1995 and the excavated soil and debris were loaded onto rail cars on November 20, 1995

7. Response Action Taken on Site:

A. Type of Remedial Action: Excavation and offsite disposal of soil exceeding cleanup goals.

B. Estimated quantity of wastes associated with the Site: Approximately 80 cubic yards of debris and 670 cubic yards of California-hazardous soils.

8. Cleanup Levels/Standards.

A. What were the cleanup standards established by DTSC pursuant to the final remedial action plan (RAP)? The Remedial Action Plan included preliminary remedial goals. See attached Table 1.

B. Were the specified cleanup standards met? Yes

C. If "no", why not:

9. DTSC Involvement in the Remedial Action:

A. Did DTSC order the remedial action? The remedial action was conducted pursuant to a Voluntary Cleanup Agreement.

B. Did DTSC review and approve:

Sampling and Analysis Procedures?	Yes	Date: 11/16/95
Health and Safety Procedures?	Yes	Date: 11/16/95
Removal/Disposal Procedures?	Yes	Date: 11/16/95
Remedial Action Plan	Yes	Date: 8/14/95

C. If the site was abated by a responsible party, did DTSC receive a signed statement from a licensed professional on all Remedial Actions? Yes

D. Did a registered engineer or geologist verify that acceptable engineering practices were implemented? Yes

E. Did DTSC confirm completion of all Remedial Action? Yes

F. Did DTSC (directly or through a contractor) actually perform the Remedial Action? No

G. Was there a community relations plan in place? Yes.

H. Was a remedial action plan developed for this Site? Yes.

I. Did DTSC hold a public meeting regarding the draft RAP? Yes, a public meeting was held on July 13, 1995 to discuss and receive comments on the Final Feasibility Study/Remedial Action Plan, Interstate 880, Cypress Replacement Project, Oakland, California, August 1995. This Site was one of the properties addressed under this RAP.

J. Were public comments addressed? Yes, a Responsiveness Summary, dated August 10, 1995, was prepared which addressed all comments received.

K. Are all of the facts cited above adequately documented in DTSC files? Yes.

10. EPA Involvement in the Remedial Action:
Was the EPA involved in the site cleanup? No.

11. Other Regulatory Agency Involvement in the Cleanup Actions: DTSC coordinated activities with CALTRANS, the San Francisco Bay Region of the Regional Water Quality Control Board (RWQCB), Alameda County Environmental Health Department and City of Oakland staff.

12. Post-Closure Activities:

A. Will there be post-closure activities at this Site (e.g., Operation and Maintenance)? No.

B. Have post-closure plans been prepared and approved by DTSC? Not applicable.

C. What is the estimated duration of post-closure (including operation and maintenance) activities? Not applicable

D. Are deed restrictions proposed or in place? No

E. Has cost recovery been initiated? As per the Voluntary Cleanup Agreement, Caltrans should be receiving quarterly invoices for DTSC's oversight costs.

F. Were local planning agencies notified of the cleanup action? Yes. The Oakland Public Works Department and the Alameda County Environmental Health Department were notified of the availability of the draft RAP for public comment.

G. Expenditure of Funds and Source: Funding Source and Amount Expended:

_____ HWCA $______________
_____ HSCF $______________
_____ RP $______________

_____ HSA $_____________
_____ Other $_____________

14. Certification Statement: Based upon the information which is currently and actually known to DTSC, DTSC has determined that all appropriate removal/remedial actions have been completed and that no further remedial action is necessary.

15. Certification of Remedial Action:

I hereby certify that the foregoing information is true and correct to the best of my knowledge.

P&D ENVIRONMENTAL, INC.
55 Santa Clara Avenue, Suite 240
Oakland, CA 94610
(510) 658-6916

February 14, 2019
Report 0772.R4

Mr. Jamie Hiteshew
Urban Designs, LLC
1201 Pine Street, Suite 151
Oakland, CA 94607

SUBJECT: LIMITED SUBSURFACE INVESTIGATION REPORT
(S1 Through S9, GW3 Through GW11, and SG4 Through SG20)
RO Number 0003269
The Phoenix
801 Pine Street
Oakland, CA

Dear Mr. Hiteshew:

P&D Environmental, Inc. (P&D) has prepared this report documenting a limited subsurface investigation of soil, soil gas and groundwater performed at 801 Pine Street in Oakland, California (historically known as 800 Cedar Street, however Cedar Street no longer exists). Historical documents have also identified the site address as 800 Pine Street.

The purpose of the investigation was to evaluate the property in preparation for site development for the presence of near-surface lead concentrations in soil and for Volatile Organic Compounds (VOCs) that were historically detected at the subject site. The work was performed in accordance with a March 23, 2018 Limited Subsurface Investigation Work Plan (document 0772.W2) prepared by P&D, a May 15, 2018 Limited Subsurface Investigation Work Plan Addendum (document 0772.W2A) prepared by P&D, a May 22, 2018 Alameda County Department of Environmental Health (ACDEH) letter approving the work plan and work plan addendum, and subsequent discussions during meetings with the ACDEH on September 13, 2018 and November 7, 2018.

A total of nine boreholes designated as S1 through S9 were drilled on June 1, 2018 to a depth of 5.0 feet below the ground surface (bgs) for soil sample collection for shallow soil lead evaluation. Seven boreholes designated as GW3 through GW9 were hand augered on May 31, 2018 to a depth of 11.5 feet bgs and two additional boreholes designated as GW10 and GW11 were hand augered on October 13, 2018 for groundwater grab sample collection for VOC evaluation and for the evaluation of metals in groundwater at selected locations. Additionally, six soil gas wells, designated as SG4 through SG9 were installed at the site on May 24, 2018, five soil gas wells designated as SG10 through SG14 were installed on October 13, 2018, and an additional six soil gas wells, designated as SG15 through SG20 were installed on November 19, 2018 each to a depth of 7.0 feet bgs with the collection of soil gas samples from soil gas wells on the following dates:

- June 4 and 5, 2018 soil gas wells SG6 through SG9.
- September 6, 2018 soil gas wells SG4 and SG5. Based on the presence of water in soil gas wells SG4 and SG5 during the June 2018 sampling event, soil gas samples were not collected from these two soil gas wells.
- October 17 and 18, 2018soil gas wells SG2, SG4, SG5, SG6, and SG10 through SG14
- December 10 and 15, 2018 soil gas wells SG15 through SG18, and SG20. Based on the presence of water in soil gas wells SG10, SG11 and SG19 during the December 2018 sampling event, soil gas samples were not collected from these soil gas wells.

A Site Location Map is attached as Figure 1 and Figures 2 through 9 show detected VOC, petroleum, lead, and metals concentrations for historical and the current investigation. All work was performed under the direct supervision of a professional geologist.

BACKGROUND

The property is presently a vacant lot that is entirely covered with a concrete slab. The property is presently divided into four parcels (see Figure 2) and is presently scheduled for residential development beginning with development at Parcel 1.

A search of the State Water Resources Control Board's (SWRCB) Geotracker website lists the subject site address as 888 Cedar Street and as an active Leaking Underground Storage Tank (LUST) site. There are no documents associated with the Geotracker case for the subject site, except for a directive letter from the Alameda County Department of Environmental Health (ACDEH) dated July 3, 2008 outlining Geotracker upload requirements for the site.

A search of the ACDEH Local Oversight Program's (LOP) website shows various miscellaneous historical documents and correspondence including the following documents:

- Preliminary Endangerment Assessment (PEA) Volume II for 800 Cedar Street dated November 1993 and prepared by On-Site Technologies (OST),
- Underground Storage Tank Closure Report for Cypress "B" Freeway Reconstruction Project - Phoenix 800 Area "T" dated November 27, 1995 and prepared by OGISO Environmental.

Review of the November 1993 PEA shows that OST reports that the site is located along a portion of the then proposed reconstruction of the I-880 Cypress structure by the California Department of Transportation (Caltrans). The original Cypress structure was demolished following its collapse during the Loma Prieta Earthquake in 1989. Additionally, the PEA identifies the following company names and past site activities:

- The Dunn Cracker Co. from approximately 1889 to 1902,
- California Bedding & Upholstery Co. from approximately 1902 to 1912,
- A soap factory from some period of time between 1912 and 1931,
- California Fireworks from approximately 1923 to 1927,
- Independent Iron Works from 1924 to approximately 1960,

- Pine Iron Works from some unknown time until 1990.
- J&A Machine shop from 1985 through at least the date of the PEA.
- Phoenix Iron Works from approximately 1970 through at least the date of the PEA.
- Michael Bondi Metal Design from 1985 through at least the date of the PEA.
- Cypress Auto Parts from 1970 through at least the date of the PEA.
- Ivan's Auto Body, Unknown Plastic Bag Co., Vennell Steel, and Terminal Manufacturing were located at the subject site at unknown dates and for unknown durations.

A search of the Department of Toxic Substances Control (DTSC) Envirostor website shows that the site is listed as a Voluntary Cleanup site located at 800 Cedar Street and as an Inactive open case as of September 3, 2010. The Envirostor summary page for the site lists only diesel as a potential contaminant of concern and only soil for a potentially impacted media. The Envirostor summary page also states that the site is part of the Cypress Freeway Reconstruction Project as well as having been historically used as an iron works plant that occupied the entire block bounded by Shorey, 9th, Pine, and Cedar (no longer exists) Streets. When the iron works plant went out of business, the building was subdivided into 5 bays and subsequently leased to commercial tenants including machine shops, iron works, auto parts dismantlers, and other manufacturing. The subject site building is reported to have been demolished in July 1995. The former location of Cedar Street (west side of subject site) is shown on Figure 2.

Envirostor also references the approval of proposed excavation of 104 cubic yards of soil on January 13, 1998 and the last available activity listed is dated February 27, 2012 and states that sampling activities were complete and that results were expected in 60 days. Among the documents on Envirostor were the following:

- Site Investigation Report for Highway 880, Cypress Reconstruction - Area 4 dated August 28, 1992 and prepared by Geo/Resource Consultants, Inc.
- Sampling and Analysis Plan Phase II Soil Investigation for 800 Cedar Street dated July 14, 2011 and prepared by Northgate Environmental Management, Inc. (Northgate).

Other documents obtained and reviewed by P&D are as follows:

- Site Investigation Report for 800 Cedar Street dated March 8, 2000 and prepared by IT Corporation,
- Phase II Soil Investigation Report for 800 Cedar Street dated November 9, 2011 and prepared by Northgate,
- Soil Stockpile Sampling Report for 800 Cedar Street dated December 31, 2013 and prepared by Geocon Consultants, Inc.

P&D's September 5, 2017 Limited Subsurface Investigation Report (document 0772.R1) documents the installation and sampling of soil gas wells SG1 through SG3 and the collection of two groundwater grab samples designated GW1 and GW2 at the site during August 2017.

Historical investigation sample results were summarized by P&D in a December 1, 2017 Soil and Groundwater Management Plan (SGMP) for the site. Soil, groundwater, and soil gas have been impacted at the Site from historical Site use and potentially from off-site sources. Tabulated results of analytical data with figures showing the sample collection locations are provided in Appendix B of P&D's December 1, 2017 SGMP. Appendix A of the SGMP also contains figures that summarize contaminants historically detected at concentrations exceeding San Francisco Bay Regional Water Quality Control Board (SFRWQCB) February 2016 revision 3 Tier 1 screening levels.

FIELD ACTIVITIES

Prior to performing field activities, drilling permits W2018-0430, W2018-0431, and W2018-1010 were obtained from the Alameda County Public Works Agency (ACPWA), permits were obtained from the City of Oakland for work in the public right-of-way, site access was arranged, the drilling locations were marked with white paint, Underground Service Alert was notified for underground utility location, a health and safety plan was prepared, and notification of the drilling dates was provided to the ACDEH, ACPWA, and the City of Oakland.

Continuous Coring and Soil Sample Collection

P&D personnel oversaw drilling at locations S1 through S9 on June 1, 2018 for the collection of shallow soil samples to further evaluate the presence and vertical extent of lead concentrations in soil at the subject site. A Site Aerial Photograph showing lead concentrations in historical soil samples is attached with this report as Figure 2 and a Site Aerial Photograph showing lead concentrations in soil samples collected from boreholes S1 through S9 is attached with this report as Figure 3.

All drilling was performed by VTS Drilling LLC of Hayward, California (VTS) using Geoprobe dual tube direct push methods with a Macrocore barrel sampler lined with transparent PVC sleeves. Boreholes S1 through S9 were each drilled to a total depth of 5.0 feet bgs.

The soil from the boreholes was logged in the field in accordance with standard geologic field techniques and the Unified Soil Classification System (USCS), and was evaluated with a Photoionization Detector (PID) equipped with a 10.6 eV bulb that was calibrated with a 100 parts per million (ppm) isobutylene standard. The soil was also evaluated for other evidence of contamination such as odors, staining, and discoloration. No elevated PID values, odors, staining, or discoloration were detected in the boreholes. Copies of the boring logs for boreholes S1 through S9 are attached with this report in Appendix A.

Groundwater was not encountered during the drilling of boreholes S1 through S9. Soil samples were collected from boreholes S1 through S9 by cutting the Macrocore barrel sampler PVC liner in 6-inch long sections and sequentially covering the ends of the sections of PVC liner with Teflon sheets and plastic endcaps.

All of the boreholes were sampled at depths of 0.5, 1.0, 2.0, and 3.0 feet bgs. Following evaluation and collection the soil samples were labeled and placed into a cooler pending delivery to the laboratory. Chain of custody procedures were observed for all sample handling.

Hand Augering and Groundwater Sample Collection

P&D personnel oversaw hand augering at locations GW3 through GW9 on May 31, 2018 and at locations GW10 and GW11 on October 13, 2018, (see Figures 4 through 7) for the collection of groundwater grab samples to evaluate the presence of VOCs in groundwater and metals at specific locations in groundwater at the subject site. All hand augering was performed by VTS using a 2.75-inch outside diameter hand auger. Boreholes GW3 through GW9 were all hand augered to a total depth of 11.5 feet bgs and boreholes GW10 and GW11 were hand augered to a total depth of 10.0 feet bgs.

Groundwater was first encountered in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 at depths of approximately 9.5, 9.5, 9.5, 11.0, 8.5, 9.0, 9.0, 9.0, and 9.0 feet bgs, respectively. Following verification of the presence of groundwater in each borehole a temporary 1-inch diameter slotted PVC pipe was placed into the borehole. One groundwater grab sample was collected from each of the boreholes using new ¼-inch outside diameter polyethylene tubing and a peristaltic pump with silicone tubing in the pump rollers. The sample was discharged directly from the discharge tubing into 40-milliliter Volatile Organic Analysis (VOA) vials that contained hydrochloric acid and also into unpreserved 1-liter amber glass containers which all were sealed with Teflon-lined screw caps. Groundwater from boreholes GW3 and GW4 was also collected into unpreserved 500 milliliter (mL) HDPE bottles for metals analysis. The VOA vials were overturned and tapped to ensure that no air bubbles were present, and the bottles were then labeled and transferred to a cooler with ice until they were transported to the laboratory. Chain of custody procedures were observed for all sample handling.

The soil from the boreholes was logged in the field in accordance with standard geologic field techniques and the USCS, and was evaluated with a PID equipped with a 10.6 eV bulb that was calibrated with a 100 ppm isobutylene standard. The soil was also evaluated for other evidence of contamination such as odors, staining, and discoloration. No elevated PID values, odors, staining, or discoloration were detected in the boreholes. The shallowest depth at which groundwater was subsequently encountered in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 prior to grouting the boreholes was at depths of 6.3, 7.0, 6.7, 6.9, 6.8, 6.8, 6.9, 9.4, and 9.4 feet bgs, respectively. Copies of the boring logs for boreholes GW3 through GW11 are attached with this report in Appendix A. Boreholes GW3 through GW9 were grouted on May 31, 2018 and boreholes GW10 and GW11 were grouted on October 13, 2018 with neat cement using the temporary PVC casing as a tremie pipe.

All drilling and sampling equipment was cleaned with an Alconox solution followed by a clean water rinse prior to use in each borehole, and all temporary PVC casing and tubing used for sample collection was new and unused. All soil and rinse water generated during subsurface investigation was stored in labeled 55-gallon drums at the site pending characterization and proper disposal.

Soil Gas Well Construction and Soil Gas Sample Collection

Six soil gas wells, designated as SG4 through SG9 were constructed on May 24, 2018; five soil gas wells, designated as SG10 through SG14 were constructed on October 13, 2018; and six soil gas wells, designated as SG15 through SG20 were constructed on November 19, 2018. Soil gas samples were collected from soil gas wells SG6 through SG9 on June 4 and 5, 2018, from soil gas wells SG4 and SG5 on September 6, 2018, from soil gas wells SG2, SG4, SG5, SG6, SG10 through SG14 on October 17 and 18, 2018, and from SG15 through SG18 and SG20 on December 10 and 15, 2018 using shrouds with helium tracer gas in accordance with procedures recommended in the following Department of Toxic Substances Control (DTSC) documents:

- July 2015 Advisory - Active Soil Gas Investigations.
- August 2015 - FAQ for the 2012 Active Soil Gas Investigations Advisory.
- October 2011 - Vapor Intrusion Guidance.
- October 2011 - Vapor Intrusion Mitigation Advisory.

The boreholes for the soil gas wells were each drilled to a depth of 7.0 feet bgs at locations SG4 through SG20 (see Figures 8 and 9) using a 3.5-inch outside diameter hand auger. The soil from the boreholes was logged in the field in accordance with standard geologic field techniques and the USCS, and was evaluated with a PID equipped with a 10.6 eV bulb that was calibrated with a 100 ppm isobutylene standard. The soil was also evaluated for other evidence of contamination such as odors, staining, and discoloration. No elevated PID values, odors, staining, or discoloration were detected in any of the boreholes.

Based on the presence of groundwater in the initial hand augered soil gas borehole (drilled at proposed location SG6 identified in the work plan), the initial borehole was designated as SG6A and no soil gas well was constructed in the borehole. An alternate borehole designated as SG6 was hand augered at a nearby location in an effort to determine if the groundwater encountered in the first borehole was localized or related to a buried utility, and a soil gas well designated as SG6 was constructed in the alternate borehole.

Groundwater was not encountered during hand augering in soil gas well boreholes SG4, SG5, and SG8 through SG20, and was encountered during hand augering in soil gas well boreholes SG6, SG6A (no soil gas well was constructed in borehole SG6A), and SG7 at depths of 6.7, 5.0, and 6.8 feet bgs, respectively. The shallowest depth at which groundwater was subsequently encountered in soil gas well boreholes SG4, SG5, SG6, SG6A, SG7, SG8 and SG9 was 5.5, 5.4, 5.9, 5.7, 5.6, 6.1 and 6.1 feet bgs, respectively. Copies of the boring logs for the soil gas well boreholes are attached with this report as Appendix A.

Each soil gas well was constructed with a sand filter pack in the bottom of the borehole consisting of #2/12 CEMEX sack sand between the depths of 7.0 and 5.0 feet bgs. A 0.250-inch outside diameter (0.187-inch inside diameter) Teflon tube measuring 7.0 feet in length with a HDPE filter at the bottom of the tube was placed in the center of the borehole during placement of the sand so that the HDPE filter. Based on the shallow depth of groundwater encountered in the soil gas well boreholes the HDPE filter was placed at a depth of 5.5 feet bgs. The annular space above the sand was filled with hydrated bentonite to a height of 0.5 feet above the top of the sand, and the remaining borehole annular space was filled with neat cement to approximately 0.5 feet below the ground surface. The top of the tubing for each soil gas well was enclosed with a Swagelok nut and plug, and the top of each soil gas well was enclosed in a well box with a lid secured with bolts.

Following construction, the soil gas wells were not sampled for a minimum of 48 hours. Additionally, not more than 0.5 inches of precipitation occurred during the five days prior to the sampling dates of June 4 and 5, 2018, September 6, 2018, October 17 and 18, 2018 and December 15, 2018 (see Appendix C).

Soil gas samples were collected using a manifold that was enclosed in a shroud provided by the laboratory. A helium tracer gas was introduced and maintained at a concentration of approximately 20 percent in the shroud during soil gas well purging and sampling in accordance with procedures identified in Appendix B. A manifold in the shroud connected the soil gas well to a well purging source (vacuum pump) and to a sampling Summa canister. The manifold was isolated with valves from the soil gas well, the purging source, and from the sampling Summa canister. Different valves on the manifold were opened during different operations associated with purging and sampling. A flow restrictor located in the manifold limited air flow from the soil gas well into the manifold at a nominal rate of 150 cubic centimeters (cc) per minute. The calculated purge volume for the soil gas wells is provided in Appendix B. Vacuum gages in the manifold on each of the soil gas side of the flow restrictor and on the sampling Summa canister side of the flow restrictor allowed vacuum to be monitored in the soil gas well and in the manifold during soil gas sample collection. An opening in the bottom of the shroud allowed the shroud to cover the soil gas well while still allowing access to the soil gas well through the bottom of the shroud.

The soil gas samples collected on June 4 and 5, 2018, September 6, 2018, and October 17 and 18, 2018 were collected in accordance with the following documents.

- July 2015 DTSC Active Soil Gas Investigations Advisory Appendix C Quantitative Leak Testing Using a Tracer Gas.
- September 2017 Enthalpy Analytical Field Guide for Use of the Helium Shrouds (see Appendix B).

The soil gas samples collected on December 10 and 15, 2018 were collected in accordance with the following documents.

- July 2015 DTSC Active Soil Gas Investigations Advisory Appendix C Quantitative Leak Testing Using a Tracer Gas.
- Standard Operating Procedures: MAI Helium Shroud During Soil Gas Sampling for Quantitative Leak Detection (see Appendix B).

The soil gas samples were collected in the following manner. A new shroud with a new soil gas sampling manifold with a 1-liter Summa sampling canister for each location was assembled in the shroud. At the time that the sampling manifold was assembled, the vacuum for the sample canister was verified with a vacuum gauge and recorded. Duplicate samples were collected on each of the three sample collection events in a shroud with a manifold that was constructed for the simultaneous collection of two soil gas samples in the same shroud.

Because the laboratory provided pre-assembled manifolds in shrouds with a vacuum for the June 4 and 5, 2018, September 6, 2018, and October 17 and 18, 2018 soil gas sampling events, it was not necessary to perform a shut in test prior to soil gas sampling. Shut in tests were performed for the manifold and sampling Summa assemblies for the December 10 and 15, 2018 sampling event. Following review of the manifold vacuum gage to verify that no unacceptable leaks were present in the manifold, a helium tracer gas was introduced into the shroud at a concentration of approximately 20 percent beginning a minimum of 5 minutes before purging the soil gas well. A default of three purge volumes of the tubing and filter pack were purged prior to sample collection. The purge time was calculated using a nominal flow rate provided by the manifold flow controller of 150 cc per minute. The shroud tracer gas concentration was monitored with a continuously operating helium detector and maintained at a concentration of approximately 20 percent and recorded during purging for the June 4 and 5, 2018, September 6, 2018, and October 17 and 18, 2018 soil gas sampling events. The shroud helium concentration was periodically monitored during the December 10 and 15, 2018 soil gas sampling event by using a syringe to draw shroud air through a helium detector .

An in-line helium detector located between the shroud and the vacuum source used for purging was monitored and recorded during purging to determine if the helium tracer gas was detected in the manifold during purging. No elevated helium concentrations were detected during purging, indicating that no leaks were detected during the purging process.

Following the completion of the soil gas well purging, the valve to the purge source was closed and the valve to the 1-liter Summa canister was opened for sample collection. The shroud tracer gas concentration was maintained at a concentration of approximately 20 percent and monitored as described above. Once the vacuum for the sample canister valve had decreased to 5 inches of mercury, the sample canister valve was closed. The pressure gage on the inlet side of the flow controller was monitored during sample collection to ensure that the vacuum applied to the soil gas well did not exceed 100 inches of water column. Vacuum did not exceed 100 inches of water column at any of the locations where soil gas samples were collected. During the June 4 and 5, 2018 soil gas sampling event the process was then repeated for soil gas sample collection using a second 1-liter Summa canister with the second soil gas sample identified by the soil gas well number followed by the letters REP based on the laboratory requiring a replicate sample for nitrogen analysis.

Following soil gas sample collection, a PID was connected to the soil gas well tubing to obtain a preliminary field value for the sample collection location. The soil gas Summa canister samples were stored in a box and promptly shipped to the laboratory for extraction and analysis. Chain of custody procedures were observed for all sample handling. Because of the presence of water in soil gas wells, soil gas samples were not collected at locations SG4 and SG5 during the June 4 and 5, 2018 soil gas sampling event, and were not collected from locations SG10, SG11, and SG19 during the December 10 and 15, 2018 soil gas sampling event. Measurements of vacuums, purging and equilibration time intervals, helium shroud concentrations, in-line helium detector readings during purging, and PID readings following soil gas sample collection were recorded on Soil Gas Sampling Data Sheets (see Appendix B).

All hand augering equipment was cleaned with an Alconox solution wash followed by a clean water rinse prior to use at each location. New Teflon tubing and a new filter were used for construction of each soil gas well. Clean, unused vacuum gages and a stainless steel sampling manifold were used at each sample collection location. All soil and rinse water generated during soil gas well construction was stored in 55-gallon drums at the site and labeled pending characterization and proper disposal.

Investigation-Derived Waste

All soil and rinse water generated during subsurface investigation was stored in labeled 55-gallon drums at the site pending characterization and proper disposal.

GEOLOGY AND HYDROGEOLOGY

Review of regional geologic maps from U. S. Geological Survey Professional Paper 943, "Flatland Deposits - Their Geology and Engineering Properties and Their Importance to Comprehensive Planning," by E. J. Helley and K. R. Lajoie, 1979, indicates that the subject site is underlain by Pleistocene beach and dune sand deposits (Merrit Sand) (Qps), which is described as loose well-sorted fine to medium sand. Immediately to the west of the western property boundary the subsurface materials are identified as Bay Mud (Qhbm), which is described as unconsolidated water-saturated dark plastic carbonaceous clay and silty clay.

The subsurface materials encountered in boreholes S1 through S9, GW3 through GW11, and SG4 through SG20 consisted of silty sand and silty clayey sand to the maximum depths explored of 11.5 feet bgs. Geologic cross sections for the site are provided in P&D's March 23, 2018 Limited Subsurface Investigation Work Plan (document 0772.W2).

Groundwater was not encountered during drilling in boreholes S1 through S9 or during hand augering boreholes SG4, SG5, SG8, SG9, and SG15 through SG20. Groundwater was first encountered during hand augering in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 at depths of 9.5, 9.5, 9.5, 11.0, 8.5, 9.0, 9.0, 9.0, and 9.0 feet bgs, respectively. Groundwater was not encountered during hand augering in soil gas well boreholes SG4, SG5, and SG8 through SG14, and was encountered during hand augering in soil gas well boreholes SG6, SG6A, and SG7 at depths of 6.7, 5.0, and 6.8 feet bgs, respectively. The shallowest depth at which groundwater was subsequently encountered in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 was at depths of 6.3, 7.0, 6.7, 6.9, 6.8, 6.8, 6.9, 9.0, and 9.4 feet bgs, respectively. The shallowest depth at which groundwater was subsequently encountered in soil gas well boreholes SG4, SG5, SG6, SG6A (no soil gas well was constructed in borehole SG6A), SG7, SG8 and SG9 was 5.5, 5.4, 5.9, 5.7, 5.6, 6.1 and 6.1 feet bgs, respectively.

Review of Figure 1 shows that the ground surface elevation at the site is approximately 11 feet above sea level. The San Francisco Bay is located approximately 3,800 feet to the north and approximately 5,500 feet to the west of the subject site, and the Oakland Inner Harbor which is connected to the San Francisco Bay is located approximately 5,500 feet to the south of the subject site. Based on site vicinity topography and the proximity of surface water bodies the groundwater flow direction at the site is presumed to be westerly towards the San Francisco Bay.

WEATHER

No precipitation total exceeding 0.5 inches occurred for the 5 days preceding any of the soil gas sampling events or occurred on the days of any of the soil gas sampling events.

Weather data, including precipitation and barometric pressure for May 21 through June 20, 2018, August 23 through September 20, 2018, October 3 through November 1, 2018, and December 1 through 29, 2018, including the dates of soil gas sample collection, are provided in Appendix C.

The weather station is located north of the intersection of Marshall Street and Peabody Lane in Oakland at an elevation of 36 feet above sea level, approximately 2.7 miles to the north-northeast of the subject site. The subject site is located at an elevation of approximately 11 feet above sea level. An internet link to the weather station information is provided in Appendix C.

LABORATORY ANALYSIS

All of the soil and groundwater samples were analyzed at McCampbell Analytical, Inc. (McCampbell) in Pittsburg, California.

The soil samples were analyzed for total lead using EPA Method 6020.

The groundwater samples were analyzed for the following analytes:

- Total Petroleum Hydrocarbons as Gasoline (TPH-G) using EPA Method 5030B in conjunction with EPA Methods 8021B and modified 8015B.
- Total Petroleum Hydrocarbons as Diesel (TPH-D), Total Petroleum Hydrocarbons as Motor Oil (TPH-MO), and Total Petroleum Hydrocarbons as Bunker Oil (TPH-BO) using EPA Method 3510C in conjunction with EPA Method 8015B.
- VOCs including the petroleum compounds methyl-tert-butyl ether (MTBE), benzene, toluene, ethylbenzene, and xylenes (MBTEX), and naphthalene, and Halogenated Volatile Organic Compounds (HVOCs) including tetrachloroethene (PCE) and trichloroethene (TCE) using EPA Method 5030B in conjunction with EPA Method 8260B.
- The groundwater samples collected from boreholes GW3 and GW4 were additionally analyzed for CAM 17 metals using EPA Method E200.8.

The soil gas samples collected on December 10 and 15, 2018 were analyzed at McCampbell for the following analytes:

- VOCs including the petroleum compounds MBTEX and naphthalene, and HVOCs including PCE and TCE using EPA TO-15.
- Oxygen, Carbon Dioxide, and the tracer gas Helium using ASTM D1946-90.

All of the other soil gas samples were analyzed at Enthalpy Analytical in Berkeley, California (Enthalpy) for the following analytes:

- VOCs, including BTEX, PCE, TCE, cis-1,2-Dichloroethene (cis-1,2-DCE) , trans-1,2-Dichloroethene (trans-1,2-DCE), and vinyl chloride using EPA Method TO-15.
- Oxygen, Carbon Dioxide, and the tracer gas Helium using ASTM D1946-90.

Additionally, the soil gas samples collected on June 4, 2018 were analyzed at Enthalpy for Gasoline Range Organics (C6-C12) using EPA Method TO-3, and for nitrogen using ASTM D1946-90.

The shallow soil sample laboratory analytical results are summarized in Table 1, the borehole groundwater sample laboratory analytical results for Petroleum and VOCs are summarized in Table 2A, the borehole groundwater sample laboratory analytical results for Metals are summarized in Table 2B, the soil gas sample HVOC analytical results are summarized in Table 3A and non-HVOC analyte results are summarized in Table 3B. Copies of the laboratory analytical reports and chain of custody documentation for all of the samples are attached with this report in Appendix D.

DISCUSSION AND RECOMMENDATIONS

All known historical lead soil sample results are shown on Figure 2. Review of Table 1 shows that below a depth of 0.5 feet bgs all of the detected lead concentrations from boreholes S1 through S9 were below the SFRWQCB January 2019 residential soil Environmental Screening Level (ESL) value for lead of 80 milligrams per kilogram (mg/kg). Review of the boring logs in Appendix A for borings S1 through S9 shows that the elevated lead concentrations are limited to dark brown material that overlies brown silty sand.

Review of Table 2A shows that TPH-G, TPH-D, TPH-MO, TPH-BO, and VOCs were not detected in any of the groundwater samples from boreholes GW3 through GW11 with the following exceptions:

- TCE in sample GW5 at a concentration of 3.4 micrograms per Liter (ug/L).
- MTBE in sample GW7 at a concentration of 3.9 ug/L.
- PCE in sample GW10 at a concentration of 5.1 ug/L.
- TPH-D and TCE in sample GW11 detected at concentrations of 76 and 9.3 ug/L, respectively.

Only the detected PCE concentration in sample GW10 and the TCE concentrations in samples GW5 and GW11 exceed their respective SFRWQCB January 2019 Tier 1 groundwater ESL values. Similarly, the same detected PCE and TCE concentrations in GW10 and GW11 exceed their respective SFRWQCB January 2019 Table GW-3 groundwater vapor intrusion human health risk screening levels for groundwater with a residential land use (see Figure 4). Figure 4 also shows all detected analytes from locations GW1 and GW2 that were sampled in 2017. Review of Figure 4 shows that the extent of PCE and TCE in groundwater has been defined. Figure 5 shows all detected VOC groundwater concentrations exceeding SFRWQCB January 2019 Tier 1 groundwater ESL values (none of the petroleum groundwater concentrations at location GW1 exceeded Tier 1 groundwater ESL values).

Review of Table 2B shows that none of the detected metals in groundwater samples GW3 and GW4 exceed their respective SFRWQCB January 2019 Table GW-1 Groundwater Direct Exposure Human Health Screening Level MCL values (see Figure 6). The historical water quality results for metals for samples that were collected in 1999 are not considered to be dissolved metals concentrations (the 1999 groundwater metals results appear to be total metals concentrations) and for this reason are not included on Figure 6.

Review of HVOC soil gas results in Table 3A and the non-HVOC soil gas results in Table 3B for soil gas samples collected from soil gas wells SG4 through SG20 in 2018 shows that the tracer gas helium was not detected in any of the soil gas samples with the exception of 1.1 percent detected in sample SG6 and duplicate SG6-DUP collected on October 17, 2018. The absence of helium in the soil gas samples indicates that atmospheric dilution of the soil gas samples is not a concern. The helium detected in the October 17, 2018 SG6 soil gas samples was equivalent to approximately 5.5 percent of the shroud helium concentration, indicating that these SG6 soil gas samples may have experienced atmospheric dilution. Samples were also collected at location SG6 on June 4, 2018 that did not have detectable tracer gas concentrations, and location SG6 is also surrounded by soil gas wells where soil gas samples were collected that did not have detectable tracer gas concentrations.

Review of Table 3B shows that oxygen was detected in all of the soil gas samples at concentrations ranging from 9.7 to 18 percent. Review of Tables 3A and 3B shows that the only analytes detected in soil gas at concentrations exceeding their respective SFRWQCB January 2019 Tier 1 soil gas ESL values were PCE, TCE and chloroform at the following locations:

- PCE at locations SG2, SG3, SG4, SG6, SG7, SG9, SG10, SG11 and SG12.
- TCE at locations SG2, SG5, and SG6.
- Chloroform at location SG17.

The source of the chloroform is unknown, and is assumed to be related to domestic water supply.

PCE soil gas sample results are shown in Figure 7 and TCE soil gas sample results are shown in Figure 8. Review of Figures 7 and 8 shows that the extent of PCE and TCE in soil gas has been defined for the subject site.

Based on the sample results P&D recommends that a Corrective Action Plan be prepared for development of the site for residential use.

DISTRIBUTION

A copy of this report will be uploaded to GeoTracker.

LIMITATIONS

This report was prepared solely for the use of Urban Designs, LLC. The content and conclusions provided by P&D in this assessment are based on information collected during our investigation, which may include, but not be limited to, visual site inspections; interviews with site owner, regulatory agencies and other pertinent individuals; review of available public documents; subsurface exploration and our professional judgment based on said information at the time of preparation of this document. Any subsurface sample results and observations presented herein are considered to be representative of the area of investigation; however, geological conditions may vary between boreholes and may not necessarily apply to the general site as a whole. If future subsurface or other conditions are revealed which vary from these findings, the newly revealed conditions must be evaluated and may invalidate the findings of this report.

This report is issued with the understanding that it is the responsibility of the owner, or his representative, to ensure that the information contained herein is brought to the attention of the appropriate regulatory agencies, where required by law. Additionally, it is the sole responsibility of the owner to properly dispose of any hazardous materials or hazardous wastes left onsite, in accordance with existing laws and regulations.

This report has been prepared in accordance with generally accepted practices using standards of care and diligence normally practiced by recognized consulting firms performing services of a similar nature. P&D is not responsible for the accuracy or completeness of information provided by other individuals or entities which is used in this report. This report presents our professional judgment based upon data and findings identified in this report and interpretation of such data based upon our experience and background, and no warranty, either express or implied, is made. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur.

Should you have any questions, please do not hesitate to contact us at (510) 658-6916.

Sincerely,

P&D Environmental, Inc.

NOTES:
TPH-G = Total Petroleum Hydrocarbons as Gasoline.
TPH-D = Total Petroleum Hydrocarbons as Diesel.
TPH-MO = Total Petroleum Hydrocarbons as Motor Oil.
TPH-BO = Total Petroleum Hydrocarbons as Bunker Oil.
MTBE = Methyl tertiary-butyl ether.
VOCs = Volatile Organic Compounds.
PCE = Tetrachloroethene.
TCE = Trichloroethene.
cis-1,2-DCE = cis-1,2-Dichloroethene.
1,1-DCA = 1,1-Dichloroethane.
1,1-DCE = 1,1-Dichloroethene.
1,1,1-TCA = 1,1,1-Trichloroethane.
ft bgs = feet below ground surface.
ND = Not detected.
a = Laboratory Note: Diesel range compounds are significant; no recognizable pattern.
ESL^1 = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated January 2019, from Summary of Groundwater ESLs, GW Tier 1 ESL.
ESL^2 = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated January 2019, from Table GW-3 – Groundwater Vapor Intrusion Human Health Risk Screening Levels. Residential Land Use. Cancer Risk.
ESL^3 = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated January 2019, from Table GW-3 – Groundwater Vapor Intrusion Human Health Risk Screening Levels. Residential Land Use. Non-Cancer Hazard.
Results in bold exceed their respective ESL^1 values.
Underlined results exceed their respective ESL^2 values.
Italicized results exceed their respective ESL^3 values.
Results and ESL values, reported in micrograms per Liter (µg/L), unless otherwise indicated.

Notes:
Feet bgs = Feet Below Ground Surface.
TPH-G = Total Petroleum Hydrocarbons as Gasoline.
MEK = Methyl Ethyl Ketone (2-Butanone).
NA = Not Analyzed.
ND = Not Detected.
NR = Not Reported.
-- = No Value.
b = Laboratory Note: Estimated Value.
ESL= Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated January 2019, Soil Gas Tier 1 ESL from Summary of Vapor ESLs.
BOLDED concentrations exceed their respective ESL value.
Results and ESLs in micrograms per cubic meter (µg/m3), unless otherwise indicated.

APPENDIX A

Soil Boring Logs

- S1 Through S9 (9 pp)
- GW3 Through GW11 (7 pp)
- SG4 Through SG6, SG6A, and SG7 Through SG20 (18 pp)

P&D ENVIRONMENTAL, INC.

BORING NO.: S1	**PROJECT NO.:** 0772	**PROJECT NAME:** The Phoenix - 801 Pine Street, Oakland	
BORING LOCATION: Approximately 97 ft. north and 67 ft. west of southeast corner of property		**ELEVATION AND DATUM:** None	
DRILLING AGENCY: VTS Drilling LLC	**DRILLER:** Glenn/Joel	**DATE & TIME STARTED:** 6/1/18 1016	**DATE & TIME FINISHED:** 6/1/18 1233
DRILLING EQUIPMENT: Geoprobe 7822 DT			
COMPLETION DEPTH: 5.0 Feet	**BEDROCK DEPTH:** Not Encountered	**LOGGED BY:** LKD	**CHECKED BY:** PMK
FIRST WATER DEPTH: Not Encountered	**NO. OF SAMPLES:** 4 Soil		

DEPTH (FT.)	DESCRIPTION		GRAPHIC COLUMN	BLOW COUNT PER 6"	WELL CONSTRUCTION LOG	PID	REMARKS
	0.0 to 0.3 ft. (3.5-inches) Concrete (FILL)		FILL		No Well Constructed	0	Concrete cored, then borehole continuously cored from 0.3 to 5.0 ft. using a Geoprobe 7822 DT dual tube sampling system where the smaller 5.0-foot long 1.5-inch O.D. rods were placed inside 5-foot long 2.25-inch O.D. outer casing. The smaller rod was lined with a 5.0-foot long 1.75-inch O.D. transparent PVC tube.
	0.3 to 1.0 ft. Dark brown silty clayey sand (SM); moderately dense, moist. No Petroleum Hydrocarbon (PHC) or solvent odors. (0,60,40)	X X X X	SM		S1-0.5 at 0.5 ft. S1-1.0 at 1.0 ft. S1-2.0 at 2.0 ft. S1-3.0 at 3.0 ft.	0 0	
	1.0 to 5.0 ft. Color change to brown, loose, moist.	X X	C1-3.5 C1-4.0			0	
5							The sand catcher was removed from the transparent PVC tube prior to soil sample collection. Water was not encountered during drilling. Borehole terminated at 5.0 ft. and borehole grouted with neat cement grout and a tremie pipe on 6/1/18. Mr. Marcelino Vialpando with Alameda County Public Works Agency onsite to observe and document grouting of the borehole. Drilling Notes: 1) Field estimates of percent gravel, sand, and fines are shown in parentheses. 2) Density determinations are qualitative and are not based on quantitative evaluation.

Enthalpy Analytical Field Guide For Use of the Helium Shrouds

ENTHALPY
ANALYTICAL

Field Guide for Use of the
HELIUM SHROUDS

Table of Contents

Figures & Diagrams

Introduction

Sampling soil gas wells using Helium leak tracer is not inherently difficult using Enthalpy Analytical's equipment, but it is relatively unforgiving of mistakes. The equipment has been field tested and through these tests we've learned that good results necessitate reviewing this document and following the procedures specified here. We strongly encourage our clients to practice set-up, Helium charging the shroud, using the detectors, and breakdown prior to sample collection. We've seen a very strong correlation between a thorough equipment orientation and successful sampling events. User errors related to a lack of orientation and preparation are the primary root cause of sampling errors and equipment failures.

The equipment supplied by Enthalpy Analytical's Berkeley laboratory has been cleaned, assembled, and leak tested using both pressurized Helium and vacuum decay methods. The preparation of all sampling equipment and media has been thoroughly documented.

If you suspect the sampling equipment is damaged or not functional, before using it please inform your laboratory Project Manager by calling the lab at 510-486-0900. Used and returned damaged equipment will be assessed cost for repair and replacement. Please do not disassemble and reassemble sampling trains and shrouds. They have been critically cleaned, assembled and leak checked for your use without further need for alteration. By breaking connections in sampling trains, users invalidate the lab's cleaning and prep effort.

Use of and Care for the EA-Berkeley Helium Detectors

When used properly, these diffusion cell He detectors provide real time measurement of Helium concentration in air from 1% to 99% Helium to accuracies of 0.1%. Prior to delivery, the He detectors are calibrated and performance verified. If, upon initial check, you discover the He gauge is apparently not working properly, call your C&T project manager immediately; repair and replacement costs will be assessed for all sensors returned damaged to the lab.

Figure 1: Diffusion Cell (left) and Flow-Through cell (right) Helium Detectors

Battery Charges last 4 hours: Helium Detectors using rechargeable NiCd batteries are fully charged before leaving the lab and hold a charge for 4 hours of use. Turn detectors on for use and off immediately after use and you'll make it through a day's sampling event without losing charge. The lab does not supply rechargers to users because the Diffusion and Flow-Through types require different voltages; using the wrong charger damages the detectors.

3 position switch: **On** is up, **Off** is neutral and down.

Required use technique for accurate Helium tracer measurements: These He detectors are sufficiently durable for portable field use; however they are precision measurement devices unforgiving of mistreatment or abuse, accordingly:

- Keep the He detector clean at all times, particularly around the white diffusion membrane cell opening. Dirt on, or in, the diffusion cell well will compromise calibration and result in extra fees for cleaning and recalibration.
- The He detectors are shock sensitive. Dropping the gauges onto a hard surface from a height of 2' or more can compromise calibration and may irreversibly damage the sensor and cause replacement or maintenance cost assessments. Please store and transport the gauges in the foam lined box provided.
- Helium detectors are moisture sensitive, don't get them wet

Accepting Enthalpy's Helium detectors binds your firm to the following conditions of use:

- Replacement costs are $900 + applicable shipping costs and sales tax.
- Minimum diagnostic, recalibration, and maintenance charges for damaged sensors are $120.

1. SETTING UP the Equipment

Equipment Supplied by EA-Berkeley

The following equipment should be present in the supply kit provided from the lab:

a. Integral shroud box and sampling train with 3 port valve
b. Helium supply components a) Helium bottle(s) (one bottle supplies enough for 4 wells), b) Braided steel Helium transfer tube with male QT connectors and; 3) Helium supply regulator with female QT connector
c. Helium Detector: Diffusion cell type (4 hours use on one charge)
d. Helium Detector: Flow-Through type (4 hours use on one charge)
e. Male QT ¼" OD Teflon tubing connector for connecting in port on flow through Helium detector to Purge port on Shroud
f. QT Vacuum gauge
g. 1.4 liter Sample canisters, one for each sample to be taken, some users request an extra to cover any aborted sampling events, well relocations etc…
h. Graphite or Ceramic ferules for joining ¼" OD Teflon tubing to well, one provided in each shroud/train inside the nut in the open port of the 3 port valve used to connect the soil gas well to the train.

Equipment NOT supplied by EA-Berkeley:

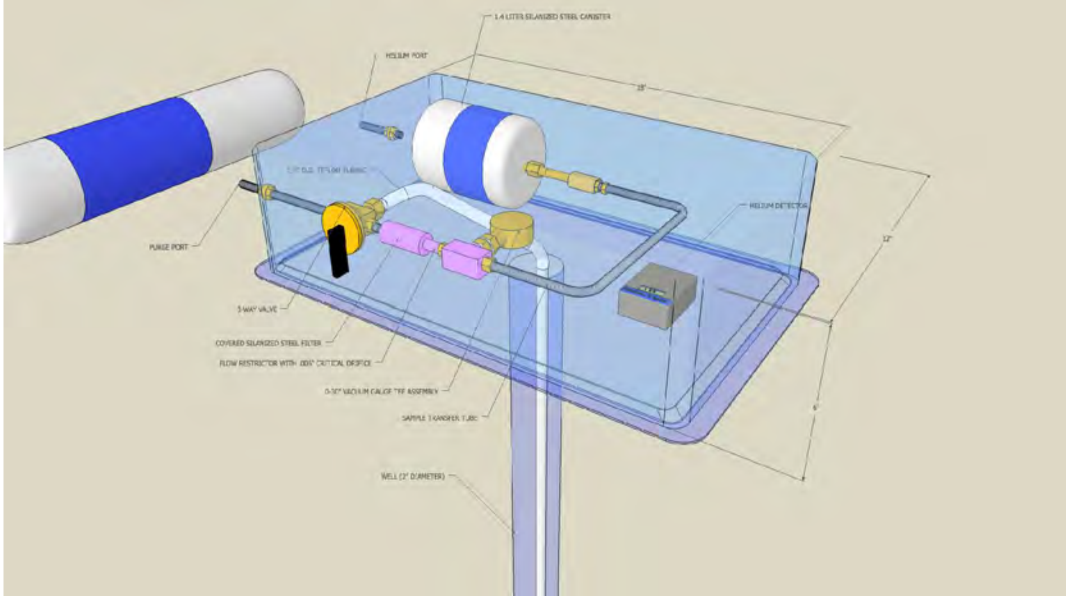
You will need the following items to complete your work; these items are not supplied by C&T unless specially requested:

a. Well purge suction source, alternatives available from the lab are: a) 50 ml disposable syringe with tubing adapters, b) evacuated 6 liter summa canister with 180 ml/min flow restrictor and filter, c) battery powered vacuum pump, d) 110V VAC powered vacuum pump
b. ½" x 9/16" open end combination wrench and one small crescent wrench. These are the tools needed to make compression fitting connections. C&T does not rent wrenches.
c. Extra Graphite or ceramic ferules as needed to insure you make a good well to train connection
d. ¼ OD Teflon tubing…Typically the well drillers have a lot of this stuff, if you need it
e. Knife (for cutting Teflon tubing)

1.1. **Position the shroud lid over the well.** Consistent Helium concentrations arise when the shrouds are used with the wellhead box lids provided. Some user protocols specify no box lid; in these cases, piling dirt around the edges of the box works to keep Helium inside the shroud. On windy days, a plastic windscreen employed either as a cover over the shroud or as an "air dam" has provided good results. We've experimented with using yoga mat material as "gaskets" for subslab sampling with mixed results.

If you're using the lid, and we recommend you do, position the lid over the wellhead with the tubing arising through the hole in the lid. There is an audible snap when the lid is optimally attached.

Figure 2: Helium Tracer Shroud Components



1.2. Once the shroud lid is positioned over the well, check that the 3-way valve is in the ***off*** position and the train pressure gauge showing a vacuum.

This is your indication that the train is leak-free since leaving the lab and all you need do is make a tight connection from the well to the open port on the 3-way valve. If the 3-way valve is not in the ***off*** position as a result of some error in shipment, there may be no vacuum on the gauge. At this point, your sampling protocols will determine whether the train can be used or not.

All trains leave the lab holding vacuum with decay rates less than 5” in 12 hours. Many shroud trains have inconsequentially slow leaks; trains are stored more than 3 days since being shipped from the lab may have no vacuum showing on the gauge. In these cases, you can check the vacuum decay rate by connecting an extra canister to the train and observing the vacuum decay rate.

2. CONNECTING the Well to the Train 3-port Valve

2.1. To connect the soil gas well to the sampling train, you will be joining ¼” Teflon tubing to the 3-port valve. Either a ceramic or graphite ferule has been provided inside the nut on the open port of the 3-port valve for you to make this connection. The most important component in a compression fitting is the ferrule, which is prone to damage. Care should be used when installing it although if ceramic or graphite ferules become defective, it is easy to install a replacement.

A “straight” even tubing end in the ¼” OD Teflon tubing from the well to the 3-port valve is important to making a “tight” connection. Use a knife rather than scissors to cut the tubing at a 90 degree angle to the tube axis. Remove any “burrs” or irregularities in the tubing end before attempting the connection. Slip the nut over the tubing, then the ferule. The ferule should “point” toward the 3-port valve. Usually, it is not possible to install ferules “backwards”.

2.2. Keeping the 3 way valve in the ***off*** position, attach the well tubing to the open 3 way valve port. Avoid excessive force when tightening the nut. Over-tightening is the most common cause of leaks in compression fittings. If the nut is over-tightened, the ceramic or graphite ferrule frequently deforms, improperly causing the joint to fail. A good way to make these connections is to tighten the nut first by hand, until it is too difficult to continue, and then use a 9/16” open end wrench to tighten the nut with a full 360 degree turn; no more than a 1 and 1/4 turn should be needed to create a leak tight connection.

3. ATTACHING the Sample Canister to the Train

3.1. **Check the vacuum** in the sample canister using the QT Vacuum gauge, it should read -30” of Hg (full vacuum) if it reads less, use another sample canister.

3.2. While keeping the 3 way valve in the off position, attach the canister to the female QT fitting at the rear of the sampling train as follows:

  3.2.1. Pull the external sleeve of the female QT connector back to its stop, then
  3.2.2. Insert the male valve stem and allow the sleeve to return to its spring loaded position. When the QT connection is made the canister (male) valve is open to the train.
  3.2.3. Try to pull the canister off the train without retracting the female QT sleeve. A correctly made QT connection cannot be broken without retracting the sleeve on the female valve stem.

A word about Micro QT Fittings: Micro Quick connect valves (QT) offer superior performance and ease of use compared to alternative tubing connections and valves. QT fittings provide highly reliable leak free connections without tools especially for fittings that are made and broken frequently.

Fine sand and/or grit (such as dry bentonite) damages male and female QT valves and connections. Keep both male and female QT valve components scrupulously clean. Please use the orange or red plastic caps provided for the male QT fittings, they protect the valve stem while shipping and protect your sample during return shipment to the lab.

When removing or replacing orange plastic protective caps on the male QT fittings, push them straight on and pull then straight off the valve stem. Twisting the cap counterclockwise while removing or replacing on the valve stem can dissemble the valve stem causing vacuum and/or sample loss.

4. POSITIONING the Shroud over the Well

4.1. Position the diffusion Helium gauge out of the way on a portion of the lid that allows you a good view of the display with the shroud in place. Then invert the shroud assembly over the lid and snap lid into position.

4.2. With the shroud assembled in place, you should be able to view the vacuum gauge well enough to verify that vacuum is holding and you can see the Helium detector display. Our apologies for the opaque portions of the boxes, if you know of hard plastic boxes, with clear panels we'd love to learn about them.

5. CHARGING the Shroud with Helium

Enthalpy provides Aluminum lecture bottles filled with 300 psi Helium; each bottle of Helium contains 48 liters at atmospheric pressure, enough to easily supply 20% Helium atmospheres to 6 single Shrouds and 3 double shrouds. The amount of Helium used depends predominantly on wind and time required to sample the well, with experience, you'll use less Helium. Your protocol will specify the Helium concentration in the shroud. The following guidance is based on sampling under a 20-25% Helium in air atmosphere. Regardless of your target helium concentration, your objective

should be to maintain a steady concentration of Helium during the sampling event at levels above 10% Helium in air.

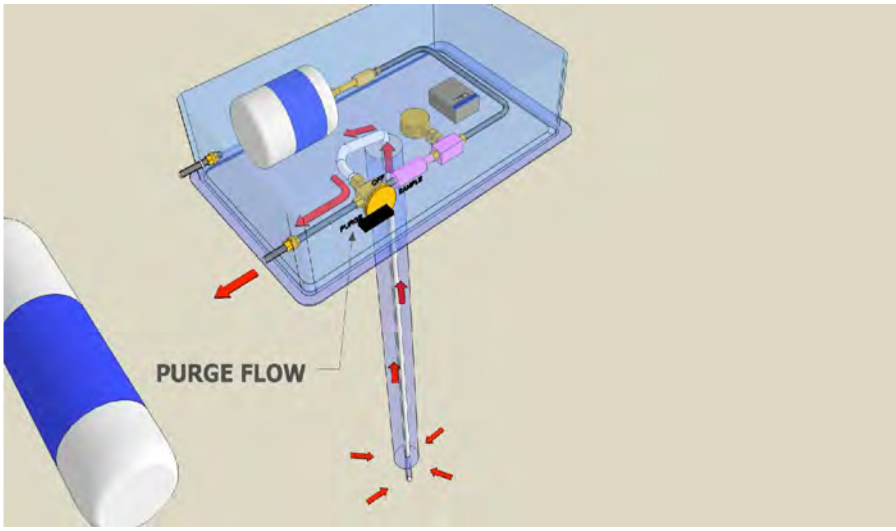
5.1. Locate and assemble the Lecture bottle, Helium transfer line, and the gas supply regulator. Tighten the brass nut attaching the regulator to the bottle one half turn past finger tight with a crescent or 9/16" open end wrench. The regulator is preset to deliver Helium at ideal pressure; ***you need not adjust the regulator***. Add Helium to the shroud by opening and closing the valve at the top of the bottle. Attach the Helium transfer line using the QT fittings at the regulator and at the Helium port on the shroud.

5.2. To provide Helium flow, slowly open the lecture bottle valve by twisting ***counterclockwise*** about ¼ turn.

5.3. Deliver 10 lbs of Helium at a time to the ***single*** shroud and 20 lbs to the ***double***. The diffusion cell Helium detector will respond in about 30 seconds to the new concentration. Unstable Helium detector readings reflect turbulent gas mixing inside the shroud. Plug holes between the shroud and the surface, use plastic sheeting to create an "air dam" or take other measures to air movement around the shroud and thus turbulence inside the shroud.

5.4. Monitor the Helium concentration displayed on the gauge in the shroud for about a minute in single shrouds, 90 seconds or longer in doubles. Under ideal conditions, 40 psi from the bottle will charge a single shroud to 25% helium concentration; double shrouds will require 80 psi. 25% Helium concentrations are maintained in the lab (zero wind) for 6-10 minutes. You may add more helium while purging and sampling. We suggest 10 psi increments for singles and 20 psi for doubles by opening the lecture bottle valve ¼ turn. We suggest users record/document the Helium concentration in the shroud at a minimum of 2 minute intervals during sampling.

Figure 3: Purge Flow Diagram



6. PURGE TESTING the Well under Helium

This test will help you establish the integrity of the well and the train to well connection. If no Helium is detected in the purge gas flow using this technique, one can assume the well is tight to breakthrough, and the train connections are all tight, and thus there will be no Helium detected in the sample that goes to the lab.

6.1. While getting the Helium concentration established, assemble the well purge train. Place the inline Helium detector between the shroud and whatever device (evacuated canister, syringe, or vacuum pump) that you're using to provide purge suction.

6.2. With the Helium atmosphere established in the shroud at 20% or more, and the purge system ready to operate, begin purging by moving the 3 way valve selector position to ***Purge*** and then establishing suction on the purge line.

6.3. Observe the inline Helium detector display while applying suction on the purge line. If you've purged enough vapors from the well to represent the entire volume of the path from the surface (under Helium atmosphere) to the distal end of the sampling tube and back up the tube and through the detector without detecting any Helium, your well shows signs of integrity and you may have a good leak free sample.

CA-DTSC guidance provides the opinion that a 5% ambient air dilution is inconsequential to sample integrity. When sampling under a 20% Helium in air atmosphere, 1% Helium detected in the purge gas represents a 5% ambient air sample dilution.

7. SAMPLING the Well under Helium

After you've completed purging the well, verify the reading on the Vacuum gauge of the train is -30 inches and that you have a steady state concentration of Helium between 20-25%, and then begin sampling by moving the 3 way selector valve to the ***Sample*** position.

Monitor the Helium concentration in the shroud by recording the reading on the diffusion cell detector inside the shroud every other minute or so. Add Helium from the bottle as needed to maintain a steady state concentration of Helium under the shroud.

Figure 4: Sampling Flow Diagram

www.mccampbell.com : main@mccampbell.com

Standard Operating Procedure:

MAI Helium Shroud during Soil Gas Sampling for Quantitative Leak Detection

1. Scope and Application

1.1 The purpose of the Helium shroud technique is to detect leaks during the soil gas sampling procedure.

2. Summary

2.1 The shroud is placed over the borehole to be tested & infused with helium at low pressure. The shroud does NOT need to be gas tight, just rich with Helium vapor. Compared to other liquid leak check compounds such as propanol(s) or Freons, Helium does not interfere with the target compound measurements and hence eliminates the need for sample dilutions, which results in better reporting limits. If there is a leak that comprises less than 5% of the sample, Helium content can be quantitatively analyzed, and the leak dilution factor can be determined during the laboratory analysis after soil gas sampling. A leak of less than 5% is considered an acceptable leak as specified in March 2010 DTSC soil gas sampling guidelines.

2.2 Use of the Helium shroud with an MAI designed soil gas manifold has the following capabilities.

2.2.1 Borehole seal integrity. Surface air intrusion can be checked in real-time, so that sampling can be aborted as wanted.

2.2.2 The Helium shroud can be used with MAI supplied purge can, user-supplied vacuum pump, or a manual syringe.

2.2.3 Allows shut-in-test for verification of leak free manifold.

2.2.4

- Quantitative measurement of Helium content within shroud, which combined with lab analysis of Helium content in sample can, allows quantitative evaluation of leak and assessment of < 5% DTSC criteria.
- Rotameter and vacuum gauges allow assessment of DTSC defined low permeability soils and provide the needed flow/ vacuum measurements required for compliant sampling.
- MAI's specially designed sampling manifolds offer the option for split sampling upon request. Simultaneous duplicate TO15 and sequential TO15 followed by TO17 sorbent tube (ST).
- MAI's special design optionally allows for simultaneous sampling of a borehole at 2 different depths.
- Allows visual monitoring of shroud helium content via helium meter.
- Sample technician friendly: allows flood or trickle/maintenance helium input.

2.3 MAI's helium shroud is covered with a secured flexible plastic sheet that functions as the lid. Handling of the equipment inside the shroud is done through the sheet. Practice before field sampling is encouraged for a successful sampling experience.

3. Equipment & Supplies

3.1 All the necessary devices needed for a complete soil gas sampling process with Helium as leak check compound are provided by MAI. Complete basic kit includes: Helium tank, Helium meter, small pump, purge can with Rota meter attached, cork borehole barriers, sample cans and manifolds. (See figure 1.)

3.2 The following equipment listed below is provided by MAI.

3.2.1. Six-liter plastic shroud box with lid of plastic sheeting. There are five connection ports located on the sidewalls of the shroud. They are labeled respectively as Port #1, Port #2, Port #3, Port #4 and Port #5 (See figure 1).

a. Port #1 is for attaching the Purge can/ a vacuum pump to the sample train.

b. Port #2 is the connection of the air pump to the shroud. The air pump facilitates the stabilization of the Helium concentration at 20%.

c. Port #3 connects the Helium meter to the shroud for monitoring Helium content in the shroud.

d. Port #4 allows a reading of Helium in the borehole, when borehole integrity test is needed, as well as a purged volume determination with a syringe

e. Port #5 connects the Helium shroud to the Helium supply tank.

f. Two inch diameter opening for borehole access.

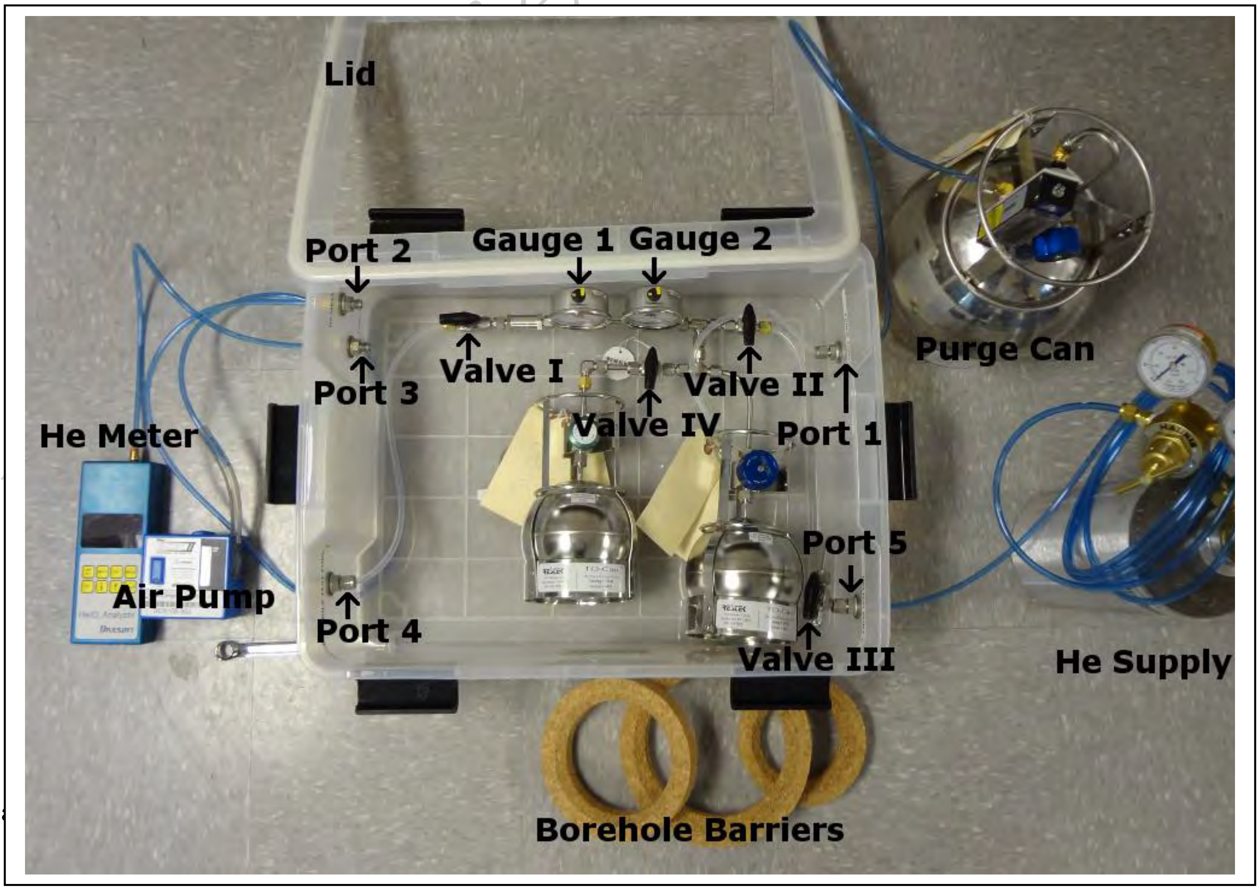

Figure 1. MAI designed Helium Shroud

3.2.2 A 2.24-liter Helium (99.995%) cylinder with a regulator set at 10 psi. Check the pressure gauge on Helium tank prior to sampling. If the pressure gauge reads less than 100 psi, then the Helium tank must be replaced.

3.2.3 A superior Helium meter, which measures Helium/Oxygen concentrations from 0% to 100% with ± 0.1% accuracy. The connection ports on the helium meter have been labeled for your convenience. A fully charged Helium meter should last up to 10 hours. *Note: To obtain an accurate reading on the Helium meter, the sampler must use the 60 mL syringe and give a quick pull on the plunger. (Pulling 60 mL of air through within a second is sufficient.)

3.2.4 The 60mL syringe is used to provide suction and force the airflow through the Helium meter or to quantify the "purged volume"

3.2.5 One Sensidyne pump set at 1250mL/min for maintaining a stable 20 %(±2%) Helium concentration in the shroud.

3.2.6 One 6-liter purge canister with Rota meter attached as suction/evacuation source for leak testing, well purging and a check for low permeability soils.

3.2.7 Cork shroud stabilizers of various sizes are included to level/stabilize the helium shroud.

3.2.8 An additional 1-liter sample canister can be provided for the optional TO17 sampling in order to:

a) to provide vacuum to pull sample through.
b) to allow calculation of the volume pulled through.
c) analyze for Helium as a leak check compound

The helium shroud may be reused for multiple borehole sites. However, due to potential cross contamination between borehole sampling, each borehole tested requires a separate certified 1-liter sample canister and certified sampling manifold. As there is no helium shroud tubing that contacts the sample upstream of the manifold; all Teflon tubing is reused.

4. Sampling Media

4.1 MAI's sampling manifold, which includes the following:

a. 3-way valveI on the borehole side of the manifold. The tapered end of the valve points to its connection direction.
b. A stainless steel 7-micron particle filter.
c. Vacuum gauge #1 reads the borehole side pressure.
d. A stainless steel flow restrictor.
e. Vacuum gauge #2 reads the sampling canister pressure and indicates when to stop sampling
f. Optional split sample attachment.
g. 2-way valve turns on/off the access to the purge can.

4.2 A 1-liter certified sample canister

4.3 An optional thermal desorption tube (sorbent tube) for TO-17 (MAI routinely includes naphthalene in TO15).

4.4 An optional split sample manifold attachment
  a. for simultaneous TO15 duplicate
  b. for serial TO15 and TO17 sorbent tube
  c. Optional second manifold for dual depth simultaneous sampling.

4.5 The soil gas manifold is leak checked in the lab prior to preparation for distribution. DO NOT DISASSEMBLE SOIL GAS MANIFOLD IN ANYWAY. Any damage to the equipment during sampling will incur repair fees.

5. Procedure

5.1 Assemble the shroud

5.1.1 Place cork shroud stabilizer over wellhead (various sizes provided for convenience and shroud stabilization)

5.1.2 Position shroud box so 'borehole access' is over borehole/borehole barrier, ensure well sampling tube rises up through wellhead and gasket into helium shroud box.

5.1.3 Position sampling manifold and sample canister(s) in shroud and make necessary connections.

Note: Optimally, to reduce contamination, cut surface section of well tubing before connecting to Valve I.

5.1.4 Connect the well tubing to 3-way valve I (the port that is perpendicular to the manifold) Tighten the nut over the tubing to make a good seal but do not over tighten as brass ferrules can easily shear Teflon tubing.

5.1.5 Connect the port 4 tubing to the remaining end of Valve I on the manifold. (the port in line with the manifold)

5.1.6 Connect Valve II to the tubing of port1

5.1.7 Connect purge can to Port #1 on the outside of the shroud box

5.1.8 Helium supply line is connected to Port #5.

5.1.9 Helium meter is initially connected to Port #3 for testing Helium concentration in the shroud. Prior to sampling, to conduct well integrity test for helium content, connect helium meter to Port 4.

5.1.10 Connect air pump to Port #2.

5.2 Charge the shroud with Helium

5.2.1 Initial Charge

5.2.1.1 Place plastic sheet loosely over box and secure with lid and lid clamps. Ensure a loose fit for valve manipulation. Ensure there are no gaps between the plastic sheet and lid. It is NOT necessary to adjust regulator pressure for helium supply bottle; it is preset at 10 Psi by MAI to sustain a constant 250mL/min helium flow to shroud and optimized for maintaining a 20% helium concentration. Turn 3-way valve III to 'flood' position (tapered end of the valve points to the nearest shroud wall) for initial Helium charge, which takes less than 5 seconds to is needed to reach a 20% Helium concentration. Briefly kneading the plastic cover post helium "flood" will expedite a 20% Helium equilibrium within the shroud.

5.3 Sampling train volume estimation.

- MAI has estimated sampling train volumes for multiple sampling configurations. Volume estimates are calculated from manifold's Valve I to the source of suction. They are listed here for sampler's convenience:
- Single sample configuration: 18.8 mL
- Duplicate sample configuration: 20.6 mL
- Serial TO15 and TO17 with Helium sample canister: 20 mL
- Serial TO15 and TO17 without Helium canister: 18.8 mL

5.4 Maintaining Helium Concentration in Shroud

5.4.1 After initial "flood" of helium (about 5 sec), turn Valve III to 'low purge' position (tapered end of valve –with arrow– will point toward far shroud wall/Port 1). The helium tank is set at 250 mL/min helium flow, used in conjunction with an air pump at the opposing side of the shroud; pulling 1.25 mL/min out of the shroud will roughly maintain a 20% helium concentration within the shroud.

Note: Initial helium concentration will be much higher than 20%, however it will stabilize in roughly 5 min.

5.4.2 Monitor helium concentration within shroud regularly throughout sampling process to assure it is maintained at 20% helium (±2%). To do this, simply attach the 60mL syringe to the outlet on the meter and quickly pull 60mL, repeat two times (total of three pulls). It is recommended to record the helium concentration within the shroud once every minute (April 2012 DTSC Advisory).

5.4.3 Maintain helium at 20% concentration for five minutes before beginning sampling process.

5.5 Shut In test

5.5.1 The purpose of this test is to detect leaks in the above-ground sampling apparatus.

5.5.2 A six liter evacuated canister is employed as the vacuum source for the Shut-In test and the Leak test. A Rota meter attached to the purge can monitors flow rate, Gauge 1 (left side) on the manifold indicates vacuum level of well in negative inches of mercury (- inHg).

5.5.3 Ensure sampling container(s) and Valve I are closed (Valve I is closed when perpendicular to manifold); open Purge Can valve, then open 2-way Valve II (Valve II open when in line with manifold).

5.5.4 Once vacuum gauges read -30 inHg (or 100 inH20) close Purge Can valve. Verify absence of a significant leak by monitoring vacuum gauges on sampling manifold for a loss of vacuum for AT LEAST ONE MINUTE.

Note: No movement on either gauge for ONE MINUTE is sufficient to proceed (during this time, see "6. Leak Test" below, and perform the Leak test before proceeding here). If there is a noticeable leak *of the sampling train during the Shut-In test, REPLACE the manifold and REPEAT the Shut-In test of the new manifold.*

5.5.5 If no significant leak is detected; Valve I and purge can valve are reopened and soil permeability is noted.

Note: Two criteria MUST be met; sample flow of at least 100mL/min AND borehole vacuum of -7.35 inHg are required to proceed. If these conditions are not met, damage to MAI equipment may occur at the expense of the sampler. Please see the "Sampling" section of this document for sampling procedure when the aforementioned criteria are not met.

5.6 Leak Test

5.6.1 The purpose of this test is to determine if ambient air is introduced into the sample during collection

5.6.2 The MAI Helium Shroud design allows for the Leak test to be performed while the Shut-In test is in progress. The Leak test is performed to verify a gas-tight connection between the borehole tubing and the manifold as well as confirm a good grout "seal" prior to sample collection.

5.6.3 It is used for shallow wells to determine if there is high permeability between the sub-surface sample tubing and the ground surface. This test is useful only if sampling will be aborted if a borehole leak is detected.

5.6.4 While waiting the "one minute" time requirement of the Shut-In test, attach helium meter to end of blue tubing on Port 4.

5.6.5 Using 60mL syringe take a helium reading of the borehole; attach syringe to outlet of meter and give a quick pull on the plunger. (Pulling 60 mL of air through within a second is sufficient.) Repeat 2 times to get an accurate reading.

5.6.6 If shroud is charged to 20% (±2%) helium and meter reads < 1% helium in well, borehole seals pass DTSC< 5% leak criteria.

5.7 Purge Volume Test

5.7.1 *Note: There are several procedures for determining well volume and purging well volume. Please refer to the* April 2012 DTSC Advisory section 4.2.3 – 4.3 *for more information. An accepted method is listed below; however, this method may not be appropriate for all wells and may not always apply.*

5.7.2 Turn 3-way Valve I so it is perpendicular to the manifold (pointing towards Port 4). Attach 60 mL syringe to end of blue tubing attached to outside of shroud box at Port 4.

5.7.3 Using the supplied 60mL syringe, pull suction on borehole sampling tube until plunger resistance is felt, noting final volume evacuated. The default purge volume is three times that of the well tubing volume (April 2012 DTSC Advisory

5.8 Sampling

5.8.1 After Shut-In test, Leak test, and purge volume procedures have been completed and helium concentration is maintained at 20% (±2%); ensure 3-way Valve I is perpendicular to manifold (pointing towards Port 4) and therefore allowing sampling from well.

5.8.2 Conventional TO15 summa sample collection procedures are now used. Generally, sample collection ceases when Gauge 2 (located on the sample canister side) reads approximately -5 inHg. **At 150ml/min a 1L summa will fill in approximately six minutes**. During sampling monitor helium concentration regularly.

5.8.3 DTSC recommends samples not be collected if down hole vacuum (Gauge 1) registers < -7.35 inHg (-100 inches of water), or flow falls below 100ml/min, indicating soil permeability is too low.

5.8.4 If low permeability is observed, close sampling can from sampling train IMMEDIATELY to prevent excessive moisture from entering into sampling canister, as this will invalidate the sample.

5.8.5 If soil is observed as low permeability soil, special sampling procedures are required as outlined in April 2012 DTSC Advisory App D.

5.8.6 If borehole vacuum reaches < -7.35 inHg, sampling should be suspended by closing valve on sampling can. After a few minutes, soil gas will replenish borehole and vacuum will gradually dissipate (refer to Gauge 1 located on borehole side of manifold for vacuum reading during this time). Sampling may resume after soil gas replenishes.

5.8.7 Once vacuum decreases, and sampling resumes, it is imperative that the sampler closely monitors borehole pressure as it may drop below -7.35 inHg again. If this occurs, repeat the 'shut' to 'replenish', then 'sample' cycle until sampling is completed. Length of replenish time depends on permeability of soil.

5.9 Optional Sampling Step

5.9.1 Sequential TO15 and TO17 sampling:

Naphthalene may be required to be sampled using TO17 sorbent tubes and a helium shroud. A modified set up for split sampling can be used, which consists of one TO15 sample can, a sorbent tube (ST), a TO17 purge/sample can, an additional 2-way valveIV and a 75ml/min flow restrictor, the latter two items are both located on the 'split sample attachment'. The TO17 ST is located between the 2-way valveIV/flow restrictor and the purge/sample can. This configuration is ideal for the following:

5.9.1.1 Restricts flow to the prescribed 50-100ml/minute (DTSC stipulation)

5.9.1.2 Allows naphthalene to be collected on the ST

5.9.1.3 Helps determine collected air STP volume that has passed thru the ST by lab measurement of the sample can initial and final pressur

5.9.1.4 Collects sample for helium leak check analysis in that branch's sample can.

5.9.2 Installation of TO17 sorbent tube also requires the sampling flow direction is the same as indicated on the tube body. Naphthalene cannot be desorbed from the tube if collected at the wrong end of the tube. Teflon (TFE) ferrules are used for connections on the ST. Use of metal ferrules are strictly prohibited for connecting TO17 ST as they permanently damage the tube, Such damage will be billed to sampler.

5.9.3 An alternative TO-17 sampling technique, using the above set up but without the helium shroud & without the second pristine purge can, can be performed by using IPA wetted rags as the leak check and a vacuum pump or 'used' purge can suction. IPA needs to be added to analytical the target list.

5.9.4 Duplicate TO15 sampling. Simultaneous duplicate sampling can be achieved by connecting an additional 1-liter canister to the manifold. The designated 'split sample attachment' must be used. Note: When TO17 ST sampling is needed, 2-way valveIV is in 'off' position during the shut in test. The valve is only turned on for sampling TO17 ST. On the contrary, 2-way valveIV is 'on' for the shut in test during simultaneous TO15 sampling.

6.0 Disconnect and move to the next site

6.1 After sample collection; close valve to sample canister, close valve on helium Supply, remove shroud lid, and detach borehole tubing from sample manifold.

6.2 Carefully label and remove sample manifold(s), canister(s) or sorbent tube(s) from shroud and ready the sampling apparatuses for shipment to McCampbell Analytical Inc.

6.3 Place the attached purge can, helium tank, 60 mL syringe, helium meter, air pump and tools into the shroud body, carefully remove the shroud and its contents from the borehole and collect the borehole seals/stabilizers and place them into the shroud box.

6.4 The shroud is now ready for transport to next borehole: the helium shroud, helium supply tank, helium meter, air pump, syringes and purge can are reusable. However, a clean certified manifold and sampling canister are needed for sampling the next well site.

6.5 When the sampling apparatuses are shipped to McCampbell Analytical Inc., TO-15 (or client specific target list) helium should be requested for analysis. Be sure to fill out Chain of Custody (COC) as completely as possible. All serial numbers of the equipment used for the sampling event need to be recorded on the COC.

Soil Gas Purge Volume Calculations

Report 0772.R4
7.0 feet tubing, 12 inch sand interval, 6 inches hydrated bentonite interval above sand

Soil Gas Purge Volume Calculations

One Purge Volume is calculated as the volume of the tubing interior plus the volume of the sand interval of the borehole.

The tubing interior volume is calculated as follows:

V tubing = pi x (r x r) x h, where pi = 3.14, r = 0.187 in/2, and h = 7.0 ft.

V tubing = 3.14 x (0.0935 x 0.0935) x (7 ft. x 12 in./ft) = 2.31 cubic inches.

The sand interval volume is calculated as follows:

V sand interval = pi x (r x r) x h x porosity, where pi = 3.14, r = 3.5 in./2, h = 12 in., and porosity = 0.35

V sand interval = 3.14 x (1.75 x 1.75) x 12 x 0.35 40.39 cubic inches.

The total volume for one purge volume is V tubing + V sand interval, where

V total = 2.31 cubic inches + 40.39 cubic inches = 42.69 cubic inches.

To convert to cubic centimeters:

V total = 42.69 cubic inches x 16.39 cubic centimeters/cubic inches = 699.8 cubic centimeters.

The total volume to be purged is 3 purge volumes.

V purge total = 699.8 cubic centimeters x 3 2099 cubic centimeters.

The flow controller has a nominal flow rate of 150 cubic centimeters per minute.

The purge time is calculated as follows:

T purge = 2099 cubic centimeters/ 150 cubic centimeters per minute = 14.00 minutes.

Converting the purge time to seconds, 14.00 minutes x 60seconds/ minute = 840 seconds.

Notes:

🟨 Yellow hi-lite indicates data entry required.
🟦 Blue hi-lite indicates values are calculated or automatically updated.

Sand interval is 1 ft from 5 to 6 ft bgs, filter is at center of sand pack, 0.5 ft hydrated bentonite above sand, then neat cement to surface.

APPENDIX D

Laboratory Analytical Reports and Chain of Custody Documentation

- **McCampbell Workorder #1806040 - Shallow Soil Samples from Locations S1 Through S9 Lead Results**
- **McCampbell Workorder #1806063 - Borehole Groundwater Samples GW3 Through GW9 Results**
- **McCampbell Workorder #1810751 - Borehole Groundwater Samples GW10 and GW11 Results**
- **Enthalpy Analytical Workorder #300421 - Soil Gas Samples SG6, SG6-DUP, and SG7 Through SG9 Results**
- **Enthalpy Analytical Workorder #302994 - Soil Gas Samples SG4, SG5, and SG5-DUP Results**
- **Enthalpy Analytical Workorder #304310 - Soil Gas Samples SG2, SG4, SG5, SG6, SG6-DUP, and SG10 Through SG14 Results**
- **McCampbell Workorder #1812906 - Soil Gas Samples SG15 Through SG17, SG20, and SG 20 DUP Results**
- **McCampbell Workorder #1812907 - Soil Gas Sample SG18 Results**

McCampbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 1806040

Report Created for: P & D Environmental

55 Santa Clara Ave, Ste.240
Oakland, CA 94610

Project Contact: Lindsey Deschenes
Project P.O.:
Project: 0772; The Phoenix

Project Received: 06/01/2018

Analytical Report reviewed & approved for release on 06/08/2018 by:

Yen Cao

Yen Cao
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix
WorkOrder: 1806040

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 μm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Quality Control Qualifiers

F10	MS/MSD outside control limits. Physical or chemical interferences exist due to sample matrix.

NOTES:

- **STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).**
- **MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.**

REMARKS:

Sample Receipt Checklist

Client Name:	**P & D Environmental**		Date and Time Received:	**6/1/2018 16:15**
Project:	**0772; The Phoenix**		Date Logged:	**6/1/2018**
			Received by:	Lilly Ortiz
WorkOrder №:	**1806040**	Matrix: Soil	Logged by:	Lilly Ortiz
Carrier:	Lorenzo Perez (MAI Courier)			

Chain of Custody (COC) Information

Chain of custody present?	Yes ☑	No ☐	
Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
Chain of custody agrees with sample labels?	Yes ☑	No ☐	
Sample IDs noted by Client on COC?	Yes ☑	No ☐	
Date and Time of collection noted by Client on COC?	Yes ☑	No ☐	
Sampler's name noted on COC?	Yes ☑	No ☐	
COC agrees with Quote?	Yes ☐	No ☐	NA ☑

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes ☐	No ☐	NA ☑
Shipping container/cooler in good condition?	Yes ☑	No ☐	
Samples in proper containers/bottles?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes ☑	No ☐	NA ☐
Samples Received on Ice?	Yes ☐	No ☑	
Sample/Temp Blank temperature	Temp:		NA ☑
Water - VOA vials have zero headspace / no bubbles?	Yes ☐	No ☐	NA ☑
Sample labels checked for correct preservation?	Yes ☑	No ☐	
pH acceptable upon receipt (Metal: <2; 522: <4; 218.7: >8)?	Yes ☐	No ☐	NA ☑
UCMR Samples:			
pH tested and acceptable upon receipt (200.8: ≤2; 525.3: ≤4; 530: ≤7; 541: <3; 544: <6.5 & 7.5)?	Yes ☐	No ☐	NA ☑
Free Chlorine tested and acceptable upon receipt (<0.1mg/L)?	Yes ☐	No ☐	NA ☑

McCampbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 1806063

Report Created for: P & D Environmental

55 Santa Clara Ave, Ste.240
Oakland, CA 94610

Project Contact: Lindsey Deschenes
Project P.O.:
Project: 0772; The Phoenix 801 Pine Street Oakland, CA

Project Received: 06/01/2018

Analytical Report reviewed & approved for release on 06/11/2018 by:

Jennifer Lagerbom
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

1534 Willow Pass Rd. Pittsburg, CA 94565 ♦ TEL: (877) 252-9262 ♦ FAX: (925) 252-9269 ♦ www.mccampbell.com
CA ELAP 1644 ♦ NELAP 4033 ORELAP

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine Street Oakland, CA
WorkOrder: 1806063

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 μm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Analytical Qualifiers

F	Sample was filtered upon arrival to the lab

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine Street Oakland, CA
WorkOrder: 1806063

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD is out of acceptance criteria; LCS validates the prep batch.

Chain of Custody (COC) Information

Chain of custody present?	Yes ☑	No ☐	
Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
Chain of custody agrees with sample labels?	Yes ☑	No ☐	
Sample IDs noted by Client on COC?	Yes ☑	No ☐	
Date and Time of collection noted by Client on COC?	Yes ☑	No ☐	
Sampler's name noted on COC?	Yes ☑	No ☐	
COC agrees with Quote?	Yes ☐	No ☐	NA ☑

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes ☐	No ☐	NA ☑
Shipping container/cooler in good condition?	Yes ☑	No ☐	
Samples in proper containers/bottles?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes ☑	No ☐	NA ☐
Samples Received on Ice?	Yes ☑	No ☐	
	(Ice Type: WET ICE)		
Sample/Temp Blank temperature	Temp: 0.7°C		NA ☐
Water - VOA vials have zero headspace / no bubbles?	Yes ☑	No ☐	NA ☐
Sample labels checked for correct preservation?	Yes ☑	No ☐	
pH acceptable upon receipt (Metal: <2; 522: <4; 218.7: >8)?	Yes ☐	No ☐	NA ☑
UCMR Samples:			
pH tested and acceptable upon receipt (200.8: ≤2; 525.3: ≤4; 530: ≤7; 541: <3; 544: <6.5 & 7.5)?	Yes ☐	No ☐	NA ☑
Free Chlorine tested and acceptable upon receipt (<0.1mg/L)?	Yes ☐	No ☐	NA ☑

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine St. Oakland, CA
WorkOrder: 1810751

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 μm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine St. Oakland, CA
WorkOrder: 1810751

Analytical Qualifiers

S	Surrogate spike recovery outside accepted recovery limits
c4	Surrogate recovery outside of the control limits due to coelution with another peak(s) / cluttered chromatogram.
c12	Surrogate recovery outside of the control limits
e2	Diesel range compounds are significant; no recognizable pattern

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD is out of acceptance criteria.

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

CASE NARRATIVE

Laboratory number:	**300421**
Client:	**P&D Environmental**
Project:	**0772**
Location:	**801 Pine Streets Oakland, Ca.**
Request Date:	**06/06/18**
Samples Received:	**06/06/18**

This data package contains sample and QC results for five air samples, requested for the above referenced project on 06/06/18. The samples were received cold and intact.

Volatile Organics in Air by MS (EPA TO-15):
No analytical problems were encountered.

Volatile Organics in Air GC (ASTM D1946-90 and EPA TO-3):
Gasoline range organics C6-C12 was detected between the MDL and the RL in the method blank for batch 260467. No other analytical problems were encountered.

REMARKS:

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 300421 Date Received 06/06/18 Number of coolers 0

Client PDE Project 0772

Date Opened 06/06/18 By (print) BNL (sign)

Date Logged in ↓ By (print) ↓ (sign)

Date Labeled ↓ By (print) ↓ (sign) ↓

1. Did cooler come with a shipping slip (airbill, etc)_____ YES [✓ NO]

Shipping info_____

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☑ NO

How many _____ Name_____ Date_____

2B. Were custody seals intact upon arrival? _____ YES NO [✓ N/A]

3. Were custody papers dry and intact when received?_____ [✓ YES] NO

4. Were custody papers filled out properly (ink, signed, etc)? _____ [✓ YES] NO

5. Is the project identifiable from custody papers? (If so fill out top of form)_____ [✓ YES] NO

6. Indicate the packing in cooler: (if other, describe)_____

☐ Bubble Wrap ☐ Foam blocks ☐ Bags ☐ None

☐ Cloth material ☑ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☐ Wet ☐ Blue/Gel ☑ None Temp(°C)_____

☐ Temperature blank(s) included? ☐ Thermometer#_____ ☐ IR Gun#_____

☐ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present?_____ YES [✓ NO]

If YES, what time were they transferred to freezer?_____

9. Did all bottles arrive unbroken/unopened?_____ [✓ YES] NO

10. Are there any missing / extra samples? _____ YES [✓ NO]

11. Are samples in the appropriate containers for indicated tests? _____ [✓ YES] NO

12. Are sample labels present, in good condition and complete? _____ [✓ YES] NO

13. Do the sample labels agree with custody papers? _____ [✓ YES] NO

14. Was sufficient amount of sample sent for tests requested? _____ [✓ YES] NO

15. Are the samples appropriately preserved? _____ YES NO [✓ N/A]

16. Did you check preservatives for all bottles for each sample? _____ YES NO [✓ N/A]

17. Did you document your preservative check? (pH strip lot#_____) YES NO [✓ N/A]

18. Did you change the hold time in LIMS for unpreserved VOAs? _____ YES NO [✓ N/A]

19. Did you change the hold time in LIMS for preserved terracores? _____ YES NO [✓ N/A]

20. Are bubbles > 6mm absent in VOA samples? _____ YES NO [✓ N/A]

21. Was the client contacted concerning this sample delivery? _____ YES [✓ NO]

If YES, Who was called?_____ By_____ Date:_____

COMMENTS

Detections Summary for 300421

Results for any subcontracted analyses are not included in this summary.

Client : P&D Environmental
Project : 0772
Location : 801 Pine Streets Oakland, Ca.

CASE NARRATIVE

Laboratory number:	**302994**
Client:	**P&D Environmental**
Project:	**0772**
Location:	**801 Pine Streets Oakland, Ca.**
Request Date:	**09/06/18**
Samples Received:	**09/06/18**

This data package contains sample and QC results for three air samples, requested for the above referenced project on 09/06/18. The samples were received cold and intact.

Volatile Organics in Air by MS (EPA TO-15):
High ICAL percent RSD (relative standard deviation) was observed for n-heptane in the calibration analyzed 08/28/18 16:53; affected data was qualified with "b". High responses were observed for acrolein and styrene in the ICV analyzed 08/29/18 12:27; affected data was qualified with "b". Low responses were observed for acrolein and styrene in the ICV analyzed 08/27/18 14:45; affected data was qualified with "b". High response was observed for 2-hexanone; affected data was qualified with "b". High responses were observed for many analytes in the CCV analyzed 09/12/18 21:58; affected data was qualified with "b". Low responses were observed for a number of analytes in the CCV analyzed 09/11/18 12:47; affected data was qualified with "b". Low recoveries were observed for a number of analytes in the BS/BSD for batch 263342; the associated RPDs were within limits, and these low recoveries were not associated with any reported results. High recoveries were also observed for a number of analytes in the BSD for batch 263342; the associated RPDs were within limits, and these analytes were not detected at or above the RL in the associated samples. High recoveries were observed for many analytes in the BS/BSD for batch 263397; the associated RPDs were within limits. High RPD was observed for acrolein; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Volatile Organics in Air GC (ASTM D1946-90):
No analytical problems were encountered.

REMARKS:

SAMPLE RECEIPT CHECKLIST

ENTHALPY

Section 1: Login # 302994 Client: PDE

Date Received: 09/06/18 Project: 0772

Section 2: Samples received in a cooler? o Yes, how many? ________ [✓ o No (skip Section 3 below)]

If no cooler Sample Temp (°C): ____________ using IR Gun # o A, or o B

o Samples received on ice directly from the field. Cooling process had begun

If in cooler: Date Opened ________ By (print) ____________________ (sign) ____________________

Shipping info (if applicable) ____

Are custody seals present? o No, or o Yes. If yes, where? o on cooler, o on samples, o on package

o Date: __________ How many ________ o Signature, o Initials, o None

Were custody seals intact upon arrival? o Yes o No o N/A

Section 3: Important: Notify PM if temperature exceeds 6°C or arrive frozen.

Packing in cooler: (if other, describe) Box

o Bubble Wrap, o Foam blocks, o Bags, o None, o Cloth material, [✓ o Cardboard], o Styrofoam, o Paper towels

o Samples received on ice directly from the field. Cooling process had begun

Type of ice used: o Wet, o Blue/Gel, o None Temperature blank(s) included? ☐ Yes, ☐ No

Temperature measured using o Thermometer ID: ______________, or IR Gun # o A o B

Cooler Temp (°C): #1: ______, #2: ______, #3: ______, #4: ______, #5: ______, #6: ______, #7: ______

Section 4:	YES	NO	N/A
Were custody papers dry, filled out properly, and the project identifiable	X		
Were Method 5035 sampling containers present?		X	
If YES, what time were they transferred to freezer? ________			
Did all bottles arrive unbroken/unopened?	X		
Are there any missing / extra samples?	X		
Are samples in the appropriate containers for indicated tests?	X		
Are sample labels present, in good condition and complete?	X		
Does the container count match the COC?	X		
Do the sample labels agree with custody papers?	X		
Was sufficient amount of sample sent for tests requested?	X		
Did you change the hold time in LIMS for unpreserved VOAs?			X
Did you change the hold time in LIMS for preserved terracores?			X
Are bubbles > 6mm absent in VOA samples?			X
Was the client contacted concerning this sample delivery?		X	
If YES, who was called? ____________ By ____________ Date: ________			

Section 5:	YES	NO	N/A
Are the samples appropriately preserved? (if N/A, skip the rest of section 5)			
Did you check preservatives for all bottles for each sample?			
Did you document your preservative check?			

pH strip lot# __________, pH strip lot# __________, pH strip lot# __________

Preservative added:

o H2SO4 lot# __________ added to samples ____________________ on/at __________

o HCL lot# __________ added to samples ____________________ on/at __________

o HNO3 lot# __________ added to samples ____________________ on/at __________

o NaOH lot# __________ added to samples ____________________ on/at __________

CASE NARRATIVE

Laboratory number:	**304310**
Client:	**P&D Environmental**
Project:	**0772**
Location:	**801 Pine Streets Oakland, Ca.**
Request Date:	**10/18/18**
Samples Received:	**10/18/18**

This data package contains sample and QC results for ten air samples, requested for the above referenced project on 10/18/18. The samples were received cold and intact.

Volatile Organics in Air by MS (EPA TO-15):
No analytical problems were encountered.

Volatile Organics in Air GC (ASTM D1946-90):
No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Curtis & Tompkins, Ltd.

Login # 304310 Date Received 10/18/18 Number of coolers 0
Client PDE Project 0772

Date Opened 10/18/18 By (print) BNL (sign)
Date Logged in ↓ By (print) ↓ (sign)
Date Labeled ↓ By (print) ↓ (sign)

1. Did cooler come with a shipping slip (airbill, etc) YES [✓ NO]
Shipping info

2A. Were custody seals present? .... ☐ YES (circle) on cooler on samples ☑ NO
How many Name Date

2B. Were custody seals intact upon arrival? YES NO [✓ N/A]

3. Were custody papers dry and intact when received? [✓ YES] NO

4. Were custody papers filled out properly (ink, signed, etc)? [✓ YES] NO

5. Is the project identifiable from custody papers? (If so fill out top of form) [✓ YES] NO

6. Indicate the packing in cooler: (if other, describe)

☐ Bubble Wrap ☐ Foam blocks ☐ Bags ☐ None
☐ Cloth material ☑ Cardboard ☐ Styrofoam ☐ Paper towels

7. Temperature documentation: * Notify PM if temperature exceeds 6°C

Type of ice used: ☐ Wet ☐ Blue/Gel ☑ None Temp(°C)

☐ Temperature blank(s) included? ☐ Thermometer# ☐ IR Gun#

☐ Samples received on ice directly from the field. Cooling process had begun

8. Were Method 5035 sampling containers present? YES [✓ NO]
If YES, what time were they transferred to freezer?

9. Did all bottles arrive unbroken/unopened? [✓ YES] NO

10. Are there any missing / extra samples? YES [✓ NO]

11. Are samples in the appropriate containers for indicated tests? [✓ YES] NO

12. Are sample labels present, in good condition and complete? [✓ YES] NO

13. Do the sample labels agree with custody papers? [✓ YES] NO

14. Was sufficient amount of sample sent for tests requested? [✓ YES] NO

15. Are the samples appropriately preserved? YES NO [✓ N/A]

16. Did you check preservatives for all bottles for each sample? YES NO [✓ N/A]

17. Did you document your preservative check? (pH strip lot#) YES NO [✓ N/A]

18. Did you change the hold time in LIMS for unpreserved VOAs? YES NO [✓ N/A]

19. Did you change the hold time in LIMS for preserved terracores? YES NO [✓ N/A]

20. Are bubbles > 6mm absent in VOA samples? YES NO [✓ N/A]

21. Was the client contacted concerning this sample delivery? YES [✓ NO]
If YES, Who was called? By Date:

COMMENTS

Detections Summary for 304310

Results for any subcontracted analyses are not included in this summary.

Client : P&D Environmental
Project : 0772
Location : 801 Pine Streets Oakland, Ca.

Client Sample ID : SG-2 Laboratory Sample ID : 304310-001

Analyte	Result	Flags	RL	Units	Basis	IDF	Method	Prep Method
Trichloroethene	110		1.0	ppbv	As Recd	2.050	EPA TO-15	METHOD
Tetrachloroethene	6.6		1.0	ppbv	As Recd	2.050	EPA TO-15	METHOD
Carbon Dioxide	19,000		2,100	ppmv	As Recd	2.050	ASTM D1946-90	METHOD

"When Quality Counts"

Analytical Report

WorkOrder: 1812906

Report Created for: P & D Environmental

55 Santa Clara Ave, Ste.240
Oakland, CA 94610

Project Contact: Paul King
Project P.O.:
Project: 0772; The Phoenix

Project Received: 12/17/2018

Analytical Report reviewed & approved for release on 12/27/2018 by:

Christine Askari
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix
WorkOrder: 1812906

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 μm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client:	P & D Environmental
Project:	0772; The Phoenix
WorkOrder:	1812906

Analytical Qualifiers

j1	See attached narrative

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.

Case Narrative

Client: P & D Environmental
Project: 0772; The Phoenix

Work Order: 1812906
December 27, 2018

j1:

TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Active Soil Gas Advisory of July 2015.

Analytical Report

Client: P & D Environmental
Date Received: 12/17/18 16:30

NOTES:
- **STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).**
- **MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.**

WorkOrder №:	**1812906** Matrix: SoilGas	Logged by:	Kena Ponce
Carrier:	Lorenzo Perez (MAI Courier)		

Chain of Custody (COC) Information

Chain of custody present?	Yes ☑	No ☐	
Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
Chain of custody agrees with sample labels?	Yes ☑	No ☐	
Sample IDs noted by Client on COC?	Yes ☑	No ☐	
Date and Time of collection noted by Client on COC?	Yes ☑	No ☐	
Sampler's name noted on COC?	Yes ☑	No ☐	
COC agrees with Quote?	Yes ☐	No ☐	NA ☑

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes ☐	No ☐	NA ☑
Shipping container/cooler in good condition?	Yes ☑	No ☐	
Samples in proper containers/bottles?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes ☑	No ☐	NA ☐
Samples Received on Ice?	Yes ☐	No ☑	
Sample/Temp Blank temperature	Temp:		NA ☑
Water - VOA vials have zero headspace / no bubbles?	Yes ☐	No ☐	NA ☑
Sample labels checked for correct preservation?	Yes ☑	No ☐	
pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)?	Yes ☐	No ☐	NA ☑
UCMR Samples:			
pH tested and acceptable upon receipt (200.8: ≤2; 525.3: ≤4; 530: ≤7; 541: <3; 544: <6.5 & 7.5)?	Yes ☐	No ☐	NA ☑
Free Chlorine tested and acceptable upon receipt (<0.1mg/L)?	Yes ☐	No ☐	NA ☑

McCampbell Analytical, Inc.
"When Quality Counts"

Analytical Report

WorkOrder: 1812907

Report Created for: P & D Environmental

55 Santa Clara Ave, Ste.240
Oakland, CA 94610

Project Contact: Paul King
Project P.O.:
Project: 0772; The Phoenix

Project Received: 12/17/2018

Analytical Report reviewed & approved for release on 12/27/2018 by:

Christine Askari
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

1534 Willow Pass Rd. Pittsburg, CA 94565 ♦ TEL: (877) 252-9262 ♦ FAX: (925) 252-9269 ♦ www.mccampbell.com

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix
WorkOrder: 1812907

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 μm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix
WorkOrder: 1812907

Analytical Qualifiers

j1	See attached narrative

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.

Case Narrative

Client: P & D Environmental
Project: 0772; The Phoenix
Work Order: 1812907
December 27, 2018

j1:

TO-15 ANALYSIS

All summa canisters are EVACUATED 5 days after the reporting of the results. Please call or email if a longer retention time is required.

Polymer (Tedlar) bags are not recommended for TO15 samples. The disadvantages are listed in Appendix B of the DTSC Active Soil Gas Advisory of July 2015.

APPENDIX F

ASTM USER QUESTIONNAIRE

ASTM E 1527-13 USER QUESTIONNAIRE

To qualify for the protection offered under the EPA All Appropriate Inquiry (AAI) Standard, the User (entities seeking to use the ASTM E1527-13 Practice to complete an environmental site assessment of the property; i.e. Lenders and/or Borrowers) must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that AAI is not complete. This information should be the collective knowledge of the entities relying on the Phase I. **Please note that you are not being asked to evaluate the property, but rather to provide your knowledge of information on the property.**

Site Name/Address: The Phoenix
Site bounded by 9th Street (north), Pine Street (east), Shorey Street (south), Frontage Road (west)
Property Owner (Name/Title/Company): Caltrans
Phone/Email: (510) 286-5393, renata.frey@dot.ca.gov
Key Site Personnel (Name/Title/Company): Renata Frey, Caltrans
Phone/Email: (510) 286-5393, renata.frey@dot.ca.gov
Past Owner (Name/Title/Company)
Phone/Email:

1. Environmental cleanup liens that are filed or recorded against the property (40 CFR 312.25).
Did a search of recorded land title records (or judicial records where appropriate, see NOTE 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

NOTE 1: In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

☒ Yes ☐ No If yes, please include an explanation in the space provided below:

Notice and Memorandum of Environmental Contamination

2. Activity and land use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi).
Did a search of recorded land title records (or judicial records where appropriate, see NOTE 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

Engineering Controls are defined as physical modifications to a site or facility to reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property). Institutional Controls are defined as a legal or administrative restriction on the use of, or access to, a site or facility to 1) reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property, or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment.

☐ Yes ☒ No If yes, please include an explanation in the space provided below:

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☐ Yes ☒ No If yes, please include an explanation in the space provided below:

4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).
Does the purchase price being paid for this property reasonably reflect the fair market value of the property?

☒ Yes ☐ No

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

☐ Yes ☐ No

Comments:

5. Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).
Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:

a. Do you know the past uses of the property?
☒ Yes ☐ No

b. Do you know of specific chemicals that are present or once were present at the property?
☒ Yes ☐ No

c. Do you know of spills or other chemical releases that have taken place at the property?
☒ Yes ☐ No

d. Do you know of any environmental cleanups that have taken place at the property?
☒ Yes ☐ No

If yes for questions above, please include an explanation in the space provided below:

See attached documentation from ACDEH.

6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

☒ Yes ☐ No If yes, please include an explanation in the space provided below:

See attached documentation from ACDEH.

Subject: Conditional Approval of Additional Site Investigation Activities for Site Cleanup Program Case No. RO0003269 and GeoTracker Global ID T10000011072, The Phoenix, located at 801 Pine Street, Oakland, CA 94601, APN: 6-47-1.

Dear Mr. Brown:

Alameda County Department of Environmental Health (ACDEH) staff has reviewed the email to ACDEH, dated Friday, November 9, 2018, presenting results of field investigation activities conducted in October 2018 and recommendations for additional subsurface investigation activities at the subject site to evaluate vapor intrusion to onsite receptors as well as offsite receptors (east of Pine Street) and north of existing soil gas wells SG10 and SG11 in the vicinity of proposed Parcel 3. On Wednesday November 7, 2018 ACDEH met with you and your environmental consultants to discuss the results of soil gas and grab groundwater investigations; including the advancement of five soil gas wells (SG10 through SG14), two grab groundwater samples (GW10 and GW11) and sampling of existing soil gas wells SG2, SG4, SG5, and SG6. Results of the October 2018 investigation indicate tetrachloroethylene (PCE) concentrations in soil gas have not been delineated offsite to the east in addition to the north and northeast of proposed Parcels 2 and 3. Trichloroethylene (TCE) concentrations in soil gas have not been delineated offsite east of proposed Parcel 2.

ACDEH understands the scope of work for the additional subsurface investigation activities will include the following:

1. Installation of **soil gas well SG15 to** evaluate potential offsite migration and delineation of TCE concentrations east of existing soil gas wells SG10 and SG14. The soil gas well will be advanced and sampled using previously ACDEH-approved methods outlined in the *Limited Subsurface Investigation Work Plan* (the Work Plan), dated March 23, 2018 and the *Limited Subsurface Investigation Work Plan Addendum* (the Addendum), dated May 15, 2018, submitted by P&D and approved by ACDEH on May 22, 2018.

2. Installation of **soil gas wells SG16 through SG20** to evaluate potential offsite migration east of Parcel 2 and 3 and delineation of soil gas north and northeast of SG10 and SG11. The soil gas well will be advanced and sampled using previously ACDEH-approved methods outlined in the *Limited Subsurface Investigation Work Plan* (the Work Plan), dated March 23, 2018 and the *Limited Subsurface Investigation Work Plan Addendum* (the Addendum), dated May 15, 2018, submitted by P&D and approved by ACDEH on May 22, 2018.

Based on our review, ACDEH conditionally approves the scope of work mentioned above and requests that you perform the proposed work. Please provide 72-hour advance written notification to this office (e-mail preferred to: andrew.york@acgov.org) prior to the start of field activities. In order to facilitate the proposed site redevelopment schedule for Parcel 1 (proposed permanent supportive housing), ACDEH requests that the reporting of all subsurface activities conducted at the site be used to complete the conceptual site model and included in the in Corrective Action Plan for the site.

ACDEH notes that although you are in the process of completing the additional data gap sampling discussed above to provide a complete assessment of the extent of volatile organic compounds (VOCs) in soil vapor, ACDEH agrees that the site can be redeveloped provided corrective actions are implemented at the site that will be protective of environmental risks to future building residents and workers. These measures may include excavation of lead-impacted soil and/or offsite disposal at a permitted landfill or onsite consolidation and capping to prevent direct contact exposure, and installation of vapor mitigation engineering controls underlying the structures and hardscape to reduce the inhalation risk of exposure to VOCs.

ACDEH understands that the project is scheduled to be reviewed and approved by the City of Oakland Planning Commission on December 19, 2018 and Holliday Development will be submitting a funding application to the Alameda County Housing and Community Development agency for Proposition A1 funds. That funding program requires the project to have local approvals and environmental clearances by the end of 2018.

Based on our November 7th meeting with you, ACDEH understands that Holliday anticipates completion of the data gap investigation field activities and submittal of a corrective action plan to ACDEH before the end of 2018. ACDEH is committed to working with you on this important project and will expedite review of submittals to the extent practicable during the upcoming holiday season.

Thank you for your cooperation. ACDEH looks forward to working with you in developing a corrective action plan that will provide long-term protection for potential environmental risk. If you have any questions, please call me at (510) 639-1276 or send me an email message at andrew.york@acgov.org

Sincerely,

Drew J. York

QUALIFICATIONS

Erik Brown – Associate Consultant

Education:

BS Environmental Toxicology, University of California at Davis, Davis, CA, 1994

Training/Licenses/Registrations:

Asbestos Hazard Emergency Response Act (AHERA) Building Inspector, 2015

Summary of Professional Experience:

Mr. Brown has over 20 years of experience in the environmental consulting industry and has worked in various disciplines, including environmental due diligence, human health risk assessment, site assessment and remediation, and construction management. He has significant experience in due diligence assessments for a variety of property types and the needs and requirements of various reporting standards, including ASTM International standards, EPA's All Appropriate Inquiry (AAI), and customized client formats. Mr. Brown has completed and reviewed thousands of Phase I Environmental Site Assessments (ESAs) on a variety of properties including multi-family apartment buildings, commercial office buildings, shopping centers, dry cleaners, auto repair shops, and gasoline stations.

Select project experience for Mr. Brown includes:

- Prepared or supervised over 100 Phase I ESAs for a variety of properties including multi-family properties, commercial buildings, industrial facilities, and agricultural land for a national homebuilder and real estate developer. Identified multiple recognized environmental conditions (RECs) requiring further assessment or investigation and consulted with corporate clientele and real estate counsel to determine appropriate courses of action. Managed field personnel and reviewed reports to provide client with a consistent report structure, writing style and quality.
- Performed or supervised over 50 Phase I ESAs for county courthouse facilities being transferred from individual counties to the State of California under the California Trial Court Facilities Act of 2002. Coordinated and managed personnel from various offices within California to complete multiple Phase I ESA reports within a challenging timeframe.
- Managed numerous multi-site Phase I ESA portfolios, including a 55-site fast food restaurant acquisition, which required coordinating and scheduling multiple staff and subcontractors, coordinating senior reviews, and ensuring report delivery within a 3-week timeframe.
- Prepared multiple vapor intrusion human health risk assessments in accordance with U.S. Environmental Protection Agency (EPA) and various state regulatory guidelines. Conducted fate and transport modeling using the Johnson and Ettinger (J&E) vapor intrusion model, developed site-specific indoor air attenuation factors, conducted sensitivity analyses, and documented findings in concise, well-written reports.
- Served as Project Manager for the ongoing technical and financial management of a portfolio of over 30 retail petroleum sites and bulk fuel terminals throughout Northern California. Provided technical support and management of quarterly groundwater monitoring and remediation progress reports, site investigation workplans and reports, corrective action plans, feasibility studies, and risk assessments.
- Performed and managed multiple human health risk assessments at Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA) sites throughout California. Managed and conducted all aspects of risk assessment including evaluation of analytical data, performing statistical analysis, evaluation of exposure pathways and development of exposure parameters, evaluation of toxicity criteria, and estimating cancer risks and noncancer health hazards from exposure to chemicals in a variety of media.

Richard D. Fehler – National Client Manager

B.S. – Zoology, University of California, Davis

California Registered Environmental Assessor (REA I)

Mr. Fehler has over twenty-five years of environmental management experience gained as an environmental consultant; in the chemical manufacturing industry; in the hazardous waste management industry; and as an environmental regulator. He specializes in all aspects of environmental due diligence, regulatory compliance and negotiations, hazardous waste management, and auditing. Mr. Fehler has also received training in Greenhouse Gas and Sustainability Verification.

Mr. Fehler has served as project principal on hundreds of projects with wide-ranging scopes, including peer reviews and desktop reviews; due diligence on large portfolios (200 sites+), as well as single assets; investigation and management of lead, asbestos, mold, and *Legionella*; investigation, remediation and management of contamination in groundwater, soil and soil vapor; regulatory compliance and auditing; and representing clients with regulators to negotiate site closure/No Further Action and/or to develop effective remediation strategies and budgets.

Project experience for Mr. Fehler includes:

- Multiple Site Due Diligence - Managed and designed projects for many large portfolios (100-plus) of varied properties spread across various states. The scopes of work frequently include Indoor Air Quality/mold issues, lead-based paint, asbestos, and radon testing. The design of appropriate Phase II sampling is frequently required to resolve and close issues.

- Environmental Compliance Reviews – Designed and managed many environmental compliance audits for single or multiple assets. Project activities usually involve inspections, interviews, reviewing environmental permits, past environmental reports, standard operating procedures, material safety data sheets (MSDS), and other information related to regulatory compliance in the areas of hazardous materials, hazardous and non-hazardous waste management, workplace health & safety, air permitting and emission reporting, waste water permitting and monitoring, storm water management, underground storage tanks, and aboveground storage tanks.

- Regulatory Negotiation – Managed many Phase II investigations conducted in response to regulatory requirements or to resolve issues and/or to obtain case closure or No Further Action. Represented clients with regulators to negotiate appropriate scopes of work and move projects to successful completion.

July 13, 2020
Report 0772.R6

Mr. Jamie Hiteshew
Urban Designs, LLC
1201 Pine Street, Suite 151
Oakland, CA94607

SUBJECT: LIMITED SUBSURFACE INVESTIGATION REPORT
(B1 Through B4, SG21 Installation, and Sampling SG1 Through SG21)
RO Number 0003269
The Phoenix
801 Pine Street
Oakland, CA

Dear Mr. Hiteshew:

P&D Environmental, Inc. (P&D) has prepared this report documenting a limited subsurface investigation of soil, soil gas and groundwater performed at 801 Pine Street in Oakland, California (historically known as 800 Cedar Street, however Cedar Street no longer exists). Historical documents have also identified the site address as 800 Pine Street.

The purpose of the investigation was to evaluate soil that was identified for excavation for preparation of an area for onsite consolidation of lead-impacted fill and soil at the site, to evaluate the extent of Volatile Organic Compounds (VOCs) in soil gas to the south of the property, and to evaluate the temporal variability of VOCs in soil gas at the site. The work was performed in accordance with a June 10, 2020 Limited Subsurface Investigation Work Plan (document 0772.W8) prepared by P&D, and an June 16, 2020 Alameda County Department of Environmental Health (ACDEH) email to the Alameda County Public Works Agency (ACPWA) authorizing ACPWA to issue the permits for drilling.

One borehole designated as SG21 was drilled to a depth of 7.0 feet below the ground surface (bgs) and a soil gas well was constructed in the borehole to evaluate the extent of VOCs in soil gas to the south of the subject site. A total of 4 boreholes designated as B1 through B4 were drilled on June 19, 2020 to a depth of 7.0 to 8.0 feet bgs for soil sample collection for characterization of the soil for re-use at the site. In addition, all of the soil gas wells at and near the site (SG1 through SG21) were sampled to evaluate temporal variability of soil gas at and near the site.

A Site Location Map is attached as Figure 1 and a site aerial photograph detail showing the locations of Boreholes B1 through B4 and soil gas well SG21 locations is attached as Figure 2. Tetrachloroethene (PCE) soil gas results are shown on Figure 3, and Trichloroethene (TCE) soil gas results are shown on Figure 4. All work was performed under the direct supervision of a professional geologist.

BACKGROUND

The property is presently a vacant lot that is entirely covered with a concrete slab. The property is presently divided into four parcels (see Figure 2) and is presently scheduled for residential development beginning with development at Parcel 1.

A search of the State Water Resources Control Board's (SWRCB) Geotracker website lists the subject site address as 888 Cedar Street and as an active Leaking Underground Storage Tank (LUST) site. There are no documents associated with the Geotracker case for the subject site, except for a directive letter from the Alameda County Department of Environmental Health (ACDEH) dated July 3, 2008 outlining Geotracker upload requirements for the site.

A search of the ACDEH Local Oversight Program's (LOP) website shows various miscellaneous historical documents and correspondence including the following documents:

- Preliminary Endangerment Assessment (PEA) Volume II for 800 Cedar Street dated November 1993 and prepared by On-Site Technologies (OST),
- Underground Storage Tank Closure Report for Cypress "B" Freeway Reconstruction Project - Phoenix 800 Area "T" dated November 27, 1995 and prepared by OGISO Environmental.

Review of the November 1993 PEA shows that OST reports that the site is located along a portion of the then proposed reconstruction of the I-880 Cypress structure by the California Department of Transportation (Caltrans). The original Cypress structure was demolished following its collapse during the Loma Prieta Earthquake in 1989. Additionally, the PEA identifies the following company names and past site activities:

- The Dunn Cracker Co. from approximately 1889 to 1902,
- California Bedding & Upholstery Co. from approximately 1902 to 1912,
- A soap factory from some period of time between 1912 and 1931,
- California Fireworks from approximately 1923 to 1927,
- Independent Iron Works from 1924 to approximately 1960,
- Pine Iron Works from some unknown time until 1990,
- J&A Machine shop from 1985 through at least the date of the PEA,
- Phoenix Iron Works from approximately 1970 through at least the date of the PEA,
- Michael Bondi Metal Design from 1985 through at least the date of the PEA,
- Cypress Auto Parts from 1970 through at least the date of the PEA, and
- Ivan's Auto Body, Unknown Plastic Bag Co., Vennell Steel, and Terminal Manufacturing were located at the subject site at unknown dates and for unknown durations.

A search of the Department of Toxic Substances Control (DTSC) Envirostor website shows that the site is listed as a Voluntary Cleanup site located at 800 Cedar Street and as an Inactive open case as of September 3, 2010. The Envirostor summary page for the site lists only diesel as a potential contaminant of concern and only soil for a potentially impacted media. The Envirostor summary page also states that the site is part of the Cypress Freeway Reconstruction Project as well as having been historically used as an iron works plant that occupied the entire block bounded by Shorey, 9th, Pine, and Cedar (no longer exists) Streets. When the iron works plant went out of business, the building was subdivided into 5 bays and subsequently leased to commercial tenants including machine shops, iron works, auto parts dismantlers, and other manufacturing. The subject site building is reported to have been demolished in July 1995. The former location of Cedar Street (west side of subject site) is shown on Figure 2.

Envirostor also references the approval of proposed excavation of 104 cubic yards of soil on January 13, 1998 and the last available activity listed is dated February 27, 2012 and states that sampling activities were complete and that results were expected in 60 days. Among the documents on Envirostor were the following:

- Site Investigation Report for Highway 880, Cypress Reconstruction - Area 4 dated August 28, 1992 and prepared by Geo/Resource Consultants, Inc.,
- Sampling and Analysis Plan Phase II Soil Investigation for 800 Cedar Street dated July 14, 2011 and prepared by Northgate Environmental Management, Inc. (Northgate)

Other documents obtained and reviewed by P&D are as follows:

- Site Investigation Report for 800 Cedar Street dated March 8, 2000 and prepared by IT Corporation,
- Phase II Soil Investigation Report for 800 Cedar Street dated November 9, 2011 and prepared by Northgate,
- Soil Stockpile Sampling Report for 800 Cedar Street dated December 31, 2013 and prepared by Geocon Consultants, Inc.

P&D's September 5, 2017 Limited Subsurface Investigation Report (document 0772.R1) documents the installation and sampling of soil gas wells SG1 through SG3 and the collection of two groundwater grab samples designated GW1 and GW2 at the site during August 2017.

Historical investigation sample results were summarized by P&D in a December 1, 2017 Soil and Groundwater Management Plan (SGMP) for the site. Soil, groundwater, and soil gas have been impacted at the Site from historical Site use and potentially from off-site sources. Tabulated results of analytical data with figures showing the sample collection locations are provided in Appendix B of P&D's December 1, 2017 SGMP. Appendix A of the SGMP also contains figures that summarize contaminants historically detected at concentrations exceeding San Francisco Bay Regional Water Quality Control Board (SFRWQCB) February 2016 revision 3 Tier 1 screening levels.

P&D's February 14, 2019 Limited Subsurface Investigation Report (document 0772.R4) documents the drilling of boreholes S1 through S9 for the collection of shallow soil samples to further evaluate for the presence and vertical extent of lead concentrations in soil at the subject site; drilled nine boreholes, designated as GW3 through GW11 for the collection of groundwater grab samples, and the installation of soil gas wells SG4 through SG20 and sampling of soil gas wells as follows:

- June 4 and 5, 2018 soil gas wells SG6 through SG9.
- September 6, 2018 soil gas wells SG4 and SG5. Based on the presence of water in soil gas wells SG4 and SG5 during the June 2018 sampling event, soil gas samples were not collected from these two soil gas wells.
- October 17 and 18, 2018 soil gas wells SG2, SG4, SG5, SG6, and SG10 through SG14
- December 10 and 15, 2018 soil gas wells SG15 through SG18, and SG20. Based on the presence of water in soil gas wells SG10, SG11 and SG19 during the December 2018 sampling event, soil gas samples were not collected from these soil gas wells.

FIELD ACTIVITIES

Prior to performing field activities, drilling permits W2020-0403 and W2020-0404 were obtained from ACPWA, permits were obtained from the City of Oakland for work in the public right-of-way, the drilling locations were marked with white paint, Underground Service Alert was notified for underground utility location, a health and safety plan was prepared, and notification of the drilling dates was provided to the ACDEH, ACPWA, and the City of Oakland.

Continuous Coring and Soil Sample Collection

P&D personnel oversaw drilling at locations B1 through B4 on June 19, 2020 for the collection of shallow soil samples to evaluate soil that was identified for excavation for preparation of an area for onsite consolidation of lead-impacted fill and soil at the site.

All drilling was performed by Cascade Drilling LP of Richmond, California (Cascade) using a 3.5-inch outside diameter hand auger to a depth of 5.0 feet bgs, and then using Geoprobe dual tube direct push methods with a Macrocore barrel sampler lined with transparent PVC sleeves to the total depth explored at each of the boreholes. Boreholes B1 through B4 were each drilled to a total depth of 8.0, 7.0, 7.0, and 7.0 feet bgs, respectively.

The soil from the boreholes was logged in the field in accordance with standard geologic field techniques and the Unified Soil Classification System (USCS), and was evaluated with a Photoionization Detector (PID) equipped with a 10.6 eV bulb that was calibrated with a 100 parts per million (ppm) isobutylene standard. The soil was also evaluated for other evidence of contamination such as odors, staining, and discoloration. No elevated PID values, odors, staining, or discoloration were detected in the boreholes. Copies of the boring logs for boreholes B1 through B4 are attached with this report in Appendix A.

Groundwater was encountered in borehole B1 at a depth of 7.0 feet bgs, and was not encountered during the drilling of boreholes B2 through B4. Soil samples were collected from borehole B1 at depths of 3.0, 4.0, and 5.0 feet bgs and in boreholes B2 through B4 at depths of 2.0 and 4.0 feet bgs using a steel sampler driven by a slide hammer. The sampler was lined with a 6.0-inch long 2.0-inch O.D. stainless steel tube to drive the tube into the relatively undisturbed soil. Additionally, for each soil sample one soil subsample was collected for VOC analysis into a 2-gram EnCore sampler using an EnCore sampler T-handle that was inserted into one end of the soil sample in the stainless steel tube. Following Encore sample collection, the Encore and the stainless steel tube were capped and labeled and placed in a cooler with ice pending delivery to the laboratory. Chain of custody procedures were observed for all sample handling.

All drilling and sampling equipment was cleaned with an Alconox solution followed by a clean water rinse prior to use in each borehole, and all temporary PVC casing and tubing used for sample collection was new and unused. All soil and rinse water generated during subsurface investigation was stored in labeled 55-gallon drums at the site pending characterization and proper disposal.

Soil Gas Well Construction and Soil Gas Sample Collection

One soil gas well, designated as SG21 was constructed at the location shown on Figure 2 on June 19, 2020.

The borehole for soil gas well SG21 was drilled to a depth of 7.0 feet bgs (see Figures 2 through 4) using a 3.5-inch outside diameter hand auger. The soil from the borehole was logged in the field in accordance with standard geologic field techniques and the USCS, and was evaluated with a PID equipped with a 10.6 eV bulb that was calibrated with a 100 ppm isobutylene standard. The soil was also evaluated for other evidence of contamination such as odors, staining, and discoloration. No elevated PID values, odors, staining, or discoloration were detected in the borehole. A copy of the boring log for the soil gas well borehole is attached with this report as Appendix A.

The soil gas well was constructed with a sand filter pack in the bottom of the borehole consisting of #2/12 CEMEX sack sand between the depths of 5.0 and 7.0 feet bgs. A 0.250-inch outside diameter (0.187-inch inside diameter) Teflon tube measuring 7.0 feet in length with a HDPE filter at the bottom of the tube was placed in the center of the borehole during placement of the sand so that the HDPE filter. Based on the shallow depth of groundwater encountered in the soil gas well boreholes the HDPE filter was placed at a depth of 5.5 feet bgs. The annular space above the sand was filled with hydrated bentonite to a height of 0.5 feet above the top of the sand, and the remaining borehole annular space was filled with neat cement to approximately 0.5 feet below the ground surface. The top of the tubing for the soil gas well was enclosed with a Swagelok nut and plug, and the top of each soil gas well was enclosed in a well box with a lid secured with bolts.

Following construction, the soil gas well was not sampled for a minimum of 48 hours. Additionally, not more than 0.5 inches of precipitation occurred during the five days prior to the sampling dates of June 17, 18, and 22, 2020 (see Appendix C).

All of the soil gas wells at or near the site (SG1 – SG21) were sampled on June 17, 18 and 22, 2020 using shrouds with helium tracer gas in accordance with procedures recommended in the following Department of Toxic Substances Control (DTSC) documents:

- July 2015 Advisory - Active Soil Gas Investigations.
- August 2015 - FAQ for the 2012 Active Soil Gas Investigations Advisory.

- July 2015 DTSC Active Soil Gas Investigations Advisory Appendix C Quantitative Leak Testing Using a Tracer Gas.
- September 2017 Enthalpy Analytical Field Guide for Use of the Helium Shrouds (see Appendix B).

Soil gas samples were collected from previously installed soil gas wells SG1 through SG9, SG11 through SG15, SG17 through SG20, and new soil gas well SG21 using a manifold that was enclosed in a shroud provided by the laboratory. Samples could not be collected from soil gas wells SG10 or SG16 due to the presence of water in the well tubing at these two locations.

A helium tracer gas was introduced and maintained at a concentration of approximately 20 percent in the shroud during soil gas well purging and sampling in accordance with procedures identified in Appendix B. A manifold in the shroud connected the soil gas well to a well purging source (vacuum pump) and to a sampling Summa canister. The manifold was isolated with valves from the soil gas well, the purging source, and from the sampling Summa canister. Different valves on the manifold were opened during different operations associated with purging and sampling. A flow restrictor located in the manifold limited air flow from the soil gas well into the manifold at a nominal rate of 150 cubic centimeters (cc) per minute. The calculated purge volume for the soil gas wells is provided in Appendix B. Vacuum gages in the manifold on each of the soil gas side of the flow restrictor and on the sampling Summa canister side of the flow restrictor allowed vacuum to be monitored in the soil gas well and in the manifold during soil gas sample collection.

The soil gas samples were collected in the following manner. A shroud with a new soil gas sampling manifold with a 1-liter Summa sampling canister for each location was assembled in the shroud. At the time that the sampling manifold was assembled, the vacuum for the sample canister was verified with a vacuum gauge and recorded. Duplicate samples were collected at locations SG4 and SG6 in a shroud with a manifold that was constructed for the simultaneous collection of two soil gas samples in the same shroud.

Because the laboratory provided pre-assembled manifolds in shrouds with a vacuum, it was not necessary to perform a shut in test prior to soil gas sampling. Following review of the manifold vacuum gage to verify that no unacceptable leaks were present in the manifold, a helium tracer gas was introduced into the shroud at a concentration of approximately 20 percent beginning a minimum of 5 minutes before purging the soil gas well. A default of three purge volumes of the tubing and filter pack were purged prior to sample collection. The purge time was calculated using a nominal flow rate provided by the manifold flow controller of 150 cc per minute. The shroud tracer gas concentration was monitored with a continuously operating helium detector and maintained at a concentration of approximately 20 percent and recorded during purging.

An in-line helium detector located between the shroud and the vacuum source used for purging was monitored and recorded during purging to determine if the helium tracer gas was detected in the manifold during purging. No elevated helium concentrations were detected during purging, indicating that no leaks were detected during the purging process.

Following the completion of the soil gas well purging, the valve to the purge source was closed and the valve to the 1-liter Summa canister was opened for sample collection. The shroud tracer gas concentration was maintained at a concentration of approximately 20 percent and monitored as described above. Once the vacuum for the sample canister valve had decreased to 5 inches of mercury, the sample canister valve was closed. The pressure gage on the inlet side of the flow controller was monitored during sample collection to ensure that the vacuum applied to the soil gas well did not exceed 100 inches of water column. Vacuum did not exceed 100 inches of water column at any of the locations where soil gas samples were collected.

Following soil gas sample collection, a PID was connected to the soil gas well tubing to obtain a preliminary field value for the sample collection location. The soil gas Summa canister samples were stored in a box and promptly shipped to the laboratory for extraction and analysis. Chain of custody procedures were observed for all sample handling.

Measurements of vacuums, purging and equilibration time intervals, helium shroud concentrations, in-line helium detector readings during purging, and PID readings following soil gas sample collection were recorded on Soil Gas Sampling Data Sheets (see Appendix B).

All hand augering equipment was cleaned with an Alconox solution wash followed by a clean water rinse prior to use at each location. New Teflon tubing and a new filter were used for construction of each soil gas well. Clean, unused vacuum gages and a stainless steel sampling manifold were used at each sample collection location. All soil and rinse water generated during soil gas well construction was stored in 55-gallon drums at the site and labeled pending characterization and proper disposal.

Investigation-Derived Waste

All soil and rinse water generated during subsurface investigation was stored in labeled 55-gallon drums at the site pending characterization and proper disposal.

GEOLOGY AND HYDROGEOLOGY

Review of regional geologic maps from U. S. Geological Survey Professional Paper 943, "Flatland Deposits - Their Geology and Engineering Properties and Their Importance to Comprehensive Planning," by E. J. Helley and K. R. Lajoie, 1979, indicates that the subject site is underlain by Pleistocene beach and dune sand deposits (Merrit Sand) (Qps), which is described as loose well-sorted fine to medium sand. Immediately to the west of the western property boundary the subsurface materials are identified as Bay Mud (Qhbm), which is described as unconsolidated water-saturated dark plastic carbonaceous clay and silty clay.

The subsurface materials encountered in boreholes S1 through S9, GW3 through GW11, and SG4 through SG20 consisted of silty sand and silty clayey sand to the maximum depths explored of 11.5 feet bgs. Geologic cross sections for the site are provided in P&D's March 23, 2018 Limited Subsurface Investigation Work Plan (document 0772.W2).

Site investigation by P&D has identified the depth to groundwater at the site as follows:

P&D's GW-Series boreholes have typically been drilled to depths of 10.0 to 11.5 feet bgs. Groundwater was first encountered during hand augering in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 at depths of 9.5, 9.5, 9.5, 11.0, 8.5, 9.0, 9.0, 9.0, and 9.0 feet bgs, respectively. The shallowest depth at which groundwater was subsequently measured in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 was at depths of 6.3, 7.0, 6.7, 6.9, 6.8, 6.8, 6.9, 9.0, and 9.4 feet bgs, respectively.

P&D's SG-Series boreholes have all been drilled to a depth of 7.0 feet bgs (see attached Figures 3 and 4). Boreholes SG4 through SG9 were drilled on May 24, 2018; SG10 through SG14 were drilled on October 13, 2018; and SG15 through SG20 were drilled on November 19, 2018.

Groundwater was not encountered during hand augering in the SG-Series boreholes with the exception of boreholes SG6, SG6A, and SG7 where groundwater was encountered at depths of 6.7, 5.0, and 6.8 feet bgs, respectively (borehole SG6A was located adjacent to borehole SG6). The shallowest depth at which groundwater was subsequently measured in the SG-Series boreholes was in boreholes SG4, SG5, SG6, SG6A, SG7, SG8 and SG9 at depths of 5.5, 5.4, 5.9, 5.7, 5.6, 6.1 and 6.1 feet bgs, respectively.

Historical boreholes and cross sections prepared by others from 1999 show a depth to water of approximately 10 feet bgs.

Review of Figure 1 shows that the ground surface elevation at the site is approximately 11 feet above sea level. The San Francisco Bay is located approximately 3,800 feet to the north and approximately 5,500 feet to the west of the subject site, and the Oakland Inner Harbor which is connected to the San Francisco Bay is located approximately 5,500 feet to the south of the subject site. Based on site vicinity topography and the proximity of surface water bodies the groundwater flow direction at the site is presumed to be westerly towards the San Francisco Bay.

WEATHER

No precipitation occurred for the 5 days preceding the dates of soil gas sampling (June 17, 18, and 22, 2020 or occurred on the days of soil gas sample collection.

Weather data, including precipitation and barometric pressure for June 1 through June 30, 2020, including the dates of soil gas sample collection, are provided in Appendix C.

The weather station is located south side of 7th Street west of Interstate I-880 in Oakland at an elevation of 3 feet above sea level, approximately 1,865 feet to the west-southwest of the subject site. The subject site is located at an elevation of approximately 11 feet above sea level. An internet link to the weather station information is provided in Appendix C.

LABORATORY ANALYSIS

All of the soil samples were analyzed at McCampbell Analytical, Inc. (McCampbell) in Pittsburg, California for the following analytes::

- Total lead using EPA Method 6020.
- Total Petroleum Hydrocarbons as Gasoline (TPH-G) using EPA Method 5035 in conjunction with EPA Methods 8021B and modified 8015B.
- Total Petroleum Hydrocarbons as Diesel (TPH-D) and Total Petroleum Hydrocarbons as Motor Oil (TPH-MO) using EPA Method 3550B in conjunction with EPA Method 8015B.
- VOCs including the petroleum compounds methyl-tert-butyl ether (MTBE), benzene, toluene, ethylbenzene, and xylenes (MBTEX), and naphthalene, and Halogenated Volatile Organic Compounds (HVOCs) including tetrachloroethene (PCE) and trichloroethene (TCE) using EPA Method 5035 in conjunction with EPA Method 8260B.
- Semi-Volatile Organic Compounds (SVOCs) using EPA Method 3550B in conjunction with EPA Method 8270C.
- Organochlorine Pesticides (OGPs) and Polychlorinated Biphenyls (PCBs) using EPA Method 8081A/8082.
- CAM 17 Metals using EPA Method 6020.
- Percent Moisture using ASTM D2216-05 in conjunction with EPA E8000.

The soil gas samples were shipped from Enthalpy Analytical in Berkeley, California (Enthalpy) to the Enthalpy laboratory in Orange, California to be analyzed for the following analytes:

- VOCs including the petroleum compounds MBTEX and naphthalene, and HVOCs including PCE and TCE using EPA TO-15.
- Oxygen, Carbon Dioxide, and the tracer gas Helium using ASTM D1946-90.

The borehole soil sample laboratory analytical results for TPH, VOCs, SVOCs, OCPs, and PCBs reported on a dry weight basis are summarized in Table 1A, the borehole soil sample laboratory analytical results for TPH, VOCs, SVOCs, OCPs, PCBs, and percent moisture reported on a wet weight basis are summarized in Table 1B, the borehole soil sample analytical results for metals reported on a dry weight basis are summarized in Table 1C, and the borehole soil sample analytical results for metals reported on a wet weight basis are summarized in Table 1D. The soil gas sample HVOC analytical results are summarized in Table 2A, non-halogenated non-petroleum VOC results are summarized in Table 2B, and petroleum VOC results are summarized in Table 2C. Copies of the laboratory analytical reports and chain of custody documentation for all of the samples are attached with this report in Appendix D.

DISCUSSION AND RECOMMENDATIONS

P&D recommends the re-use at the site of the soil characterized by boreholes B1 through B4 for soil that is excavated for onsite consolidation of lead-impacted fill or soil.

Soil gas concentrations generally increased in areas of higher concentration PCE and TCE during this sampling event, but were within normal variations due to seasonal variation. The soil gas concentrations reflect the previously measured underlying groundwater concentrations. Concentrations measured at sampling points SG-13 and SG-21, to the south of the site, confirmed that off-site vapor migration is not significant to the south of the site. Based on the soil gas sample results, P&D recommends that soil gas well SG16 be re-evaluated in 6 months to determine if water is still in the soil gas well, and that soil gas well SG15 be re-sampled in 6 months to evaluate variability of concentrations measured during the first and second sampling events. Additional sampling of soil gas wells outside of the Parcel 1 development will be required for evaluation of future site requirements.

DISTRIBUTION

A copy of this report will be uploaded to GeoTracker.

LIMITATIONS

This report was prepared solely for the use of Urban Designs, LLC. The content and conclusions provided by P&D in this assessment are based on information collected during our investigation, which may include, but not be limited to, visual site inspections; interviews with site owner, regulatory agencies and other pertinent individuals; review of available public documents; subsurface exploration and our professional judgment based on said information at the time of preparation of this document. Any subsurface sample results and observations presented herein are considered to be representative of the area of investigation; however, geological conditions may vary between boreholes and may not necessarily apply to the general site as a whole. If future subsurface or other conditions are revealed which vary from these findings, the newly revealed conditions must be evaluated and may invalidate the findings of this report.

This report is issued with the understanding that it is the responsibility of the owner, or his representative, to ensure that the information contained herein is brought to the attention of the appropriate regulatory agencies, where required by law. Additionally, it is the sole responsibility of the owner to properly dispose of any hazardous materials or hazardous wastes left onsite, in accordance with existing laws and regulations.

This report has been prepared in accordance with generally accepted practices using standards of care and diligence normally practiced by recognized consulting firms performing services of a similar nature. P&D is not responsible for the accuracy or completeness of information provided by other individuals or entities which is used in this report. This report presents our professional judgment based upon data and findings identified in this report and interpretation of such data based upon our experience and background, and no warranty, either express or implied, is made. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur.

Should you have any questions, please do not hesitate to contact us at (510) 658-6916.

Sincerely,

P&D Environmental, Inc.

NOTES:

Sb = Antimony; As = Arsenic; Ba = Barium; Be = Beryllium; Cd = Cadmium; Cr = Chromium; Co = Cobalt; Cu = Copper; Pb = Lead; Hg = Mercury; Mo = Molybdenu

Ni = Nickel; Se = Selenium; Ag = Silver; Tl = Thallium; V = Vanadium; Zn = Zinc

mg/L = milligrams per liter.

ft bgs = feet below ground surface.

ND = Not detected.

-- = Not analyzed.

N/A = Not applicable

*= July 2019 (Revision 2) Tier 1 Soil ESL for Cadmium is 1.9 mg/kg, but is based on Terrestrial Habitat Levels. The Direct Exposure Human Health Risk Levels Non-cancer Risk for Cadmium in a residential land use scenario (Table S-1) is 78 mg/kg.

**= July 2019 (Revision 2) Tier 1 Soil ESL for Vanadium is 18 mg/kg, but is based on Terrestrial Habitat Levels. The Direct Exposure Human Health Risk Levels Non-cancer Risk for Vanadium in a residential land use scenario (Table S-1) is 390 mg/kg.

*** = July 2019 (Revision 2) Tier 1 Soil ESL for Zinc is 340 mg/kg, but is based on Terrestrial Habitat Levels. The Direct Exposure Human Health Risk Levels Non-cancer Risk for Zinc in a residential land use scenario (Table S-1) is 23,000 mg/kg.

a = Laboratory Note: analyte detected in the associated method blank and in the sample.

ESL = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated July 2019 (Revision 2), Soil Tier 1 ESL from Summary of Soil ESLs.

TTLC = Total Threshold Limit Concentration.

Title 22 Hazardous Waste Criteria - Values given are 10 times the respective Soluble Threshold Limit Concentration (STLC).

= Value used is for hexavalent chromium.

Underlined results exceed their respective ESLvalues.

Results in BOLD exceed Title 22 Hazardous Waste Criteria.

Results and ESL values reported in milligrams per kilogram (mg/kg), unless otherwise indicated.

BORING NO.: B1	**PROJECT NO.:** 0772	**PROJECT NAME:** The Phoenix - 801 Pine Street, Oakland	
BORING LOCATION: Approximately 15 ft. east and 6 ft. north of southwest corner of property		**ELEVATION AND DATUM:** None	
DRILLING AGENCY: Cascade Drilling	**DRILLER:** Fernando	**DATE & TIME STARTED:** 6/19/20 0925	**DATE & TIME FINISHED:** 6/19/20 1055
DRILLING EQUIPMENT: 3.5-inch O.D. Hand Auger and Geoprobe DT			
COMPLETION DEPTH: 8.0 Feet	**BEDROCK DEPTH:** Not Encountered	**LOGGED BY:** LDF	**CHECKED BY:**
FIRST WATER DEPTH: 6.0 Feet	**NO. OF SAMPLES:** 3 Soil		

DEPTH (FT.)	DESCRIPTION	GRAPHIC COLUMN	BLOW COUNT PER 6"	WELL CONSTRUCTION LOG	PID	REMARKS
	0.0 to 0.3 ft. (3.0-inches) Asphalt (FILL)	FILL		No Well Constructed	1.6	Asphalt broken, then borehole hand augered from 0.3 to 5.0 ft. using a 3.5-inch O.D. hand auger and then continuously cored to 8.0 ft. using a Geoprobe DT dual tube sampling system where the smaller 5.0-foot long 1.5-inch O.D. rods were placed inside 5-foot long 2.25-inch O.D. outer casing. The smaller rod was lined with a 5.0-foot long 1.75-inch O.D. transparent PVC tube.
	0.3 to 3.0 ft. Brown gravelly sand (FILL); medium dry, with some metal and glass fragments. No Petroleum Hydrocarbon (PHC) or solvent odors. (30,60,10)				1.4	
5	3.0 to 6.5 ft. Yellow-brown silty sand (SM); medium dense, dry. No PHC or solvent odors. (0,60,40) X X X Moist at 6.0 ft.	SM		B1-3.0 B1-4.0 B1-5.0 ▽	0.6 0.9 0.4 0	The sand catcher was removed from the transparent PVC tube prior to soil sample collection.
	6.5 to 7.0 ft. Brown silty clay (CL/CH); medium stiff, wet. No PHC or solvent odors. (0,0,100)	CL/CH		▼	0	
	7.0 to 8.0 ft. Yellow-brown silty sand (SM); medium dense, wet. No PHC or solvent odors. (0,60,40)	SM				
10 15 20 25 30						Soil samples were collected using a steel sampler driven by a slide hammer. The sampler was lined with a 6.0-inch long 2.0-inch O.D. stainless steel tube. Water was encountered at 6.0 ft. at 0950. Temporary 1.0-inch diameter slotted PVC casing placed in borehole. Water level was measured at 7.0 ft. at 1027 and 1111. No water sample collected. Borehole terminated at 8.0 ft. and borehole grouted with neat cement grout and a tremie pipe on 6/19/20. Inspector Eneyew Amberber with Alameda County Public Works Agency onsite to observe and document grouting of the borehole. Drilling Notes: 1) Field estimates of percent gravel, sand, and fines are shown in parentheses. 2) Density determinations are qualitative and are not based on quantitative evaluation.

Enthalpy Analytical Field Guide For Use of the Helium Shrouds, Purge Volume Calculations, and Soil Gas Sampling Data Sheets

- **Enthalpy Analytical Field Guide For Use of the Helium Shrouds (9 pp)**
- **Soil Gas Purge Volume Calculations (1 p)**
- **June 17, 18, and 22, 2020 Soil Gas Sampling Data Sheets (21 pp)**

ENTHALPY ANALYTICAL

Field Guide for Use of the
HELIUM SHROUDS

Table of Contents

Figures & Diagrams

Introduction

Sampling soil gas wells using Helium leak tracer is not inherently difficult using Enthalpy Analytical's equipment, but it is relatively unforgiving of mistakes. The equipment has been field tested and through these tests we've learned that good results necessitate reviewing this document and following the procedures specified here. We strongly encourage our clients to practice set-up, Helium charging the shroud, using the detectors, and breakdown prior to sample collection. We've seen a very strong correlation between a thorough equipment orientation and successful sampling events. User errors related to a lack of orientation and preparation are the primary root cause of sampling errors and equipment failures.

The equipment supplied by Enthalpy Analytical's Berkeley laboratory has been cleaned, assembled, and leak tested using both pressurized Helium and vacuum decay methods. The preparation of all sampling equipment and media has been thoroughly documented.

If you suspect the sampling equipment is damaged or not functional, before using it please inform your laboratory Project Manager by calling the lab at 510-486-0900. Used and returned damaged equipment will be assessed cost for repair and replacement. Please do not disassemble and reassemble sampling trains and shrouds. They have been critically cleaned, assembled and leak checked for your use without further need for alteration. By breaking connections in sampling trains, users invalidate the lab's cleaning and prep effort.

Use of and Care for the EA-Berkeley Helium Detectors

When used properly, these diffusion cell He detectors provide real time measurement of Helium concentration in air from 1% to 99% Helium to accuracies of 0.1%. Prior to delivery, the He detectors are calibrated and performance verified. If, upon initial check, you discover the He gauge is apparently not working properly, call your C&T project manager immediately; repair and replacement costs will be assessed for all sensors returned damaged to the lab.

Figure 1: Diffusion Cell (left) and Flow-Through cell (right) Helium Detectors

Battery Charges last 4 hours: Helium Detectors using rechargeable NiCd batteries are fully charged before leaving the lab and hold a charge for 4 hours of use. Turn detectors on for use and off immediately after use and you'll make it through a day's sampling event without losing charge. The lab does not supply rechargers to users because the Diffusion and Flow-Through types require different voltages; using the wrong charger damages the detectors.

3 position switch: **On** is up, **Off** is neutral and down.

Required use technique for accurate Helium tracer measurements: These He detectors are sufficiently durable for portable field use; however they are precision measurement devices unforgiving of mistreatment or abuse, accordingly:

- Keep the He detector clean at all times, particularly around the white diffusion membrane cell opening. Dirt on, or in, the diffusion cell well will compromise calibration and result in extra fees for cleaning and recalibration.
- The He detectors are shock sensitive. Dropping the gauges onto a hard surface from a height of 2' or more can compromise calibration and may irreversibly damage the sensor and cause replacement or maintenance cost assessments. Please store and transport the gauges in the foam lined box provided.
- Helium detectors are moisture sensitive, don't get them wet

Accepting Enthalpy's Helium detectors binds your firm to the following conditions of use:

- Replacement costs are $900 + applicable shipping costs and sales tax.
- Minimum diagnostic, recalibration, and maintenance charges for damaged sensors are $120.

1. SETTING UP the Equipment

Equipment Supplied by EA-Berkeley

The following equipment should be present in the supply kit provided from the lab:

a. Integral shroud box and sampling train with 3 port valve
b. Helium supply components a) Helium bottle(s) (one bottle supplies enough for 4 wells), b) Braided steel Helium transfer tube with male QT connectors and; 3) Helium supply regulator with female QT connector
c. Helium Detector: Diffusion cell type (4 hours use on one charge)
d. Helium Detector: Flow-Through type (4 hours use on one charge)
e. Male QT ¼" OD Teflon tubing connector for connecting in port on flow through Helium detector to Purge port on Shroud
f. QT Vacuum gauge
g. 1.4 liter Sample canisters, one for each sample to be taken, some users request an extra to cover any aborted sampling events, well relocations etc…
h. Graphite or Ceramic ferules for joining ¼" OD Teflon tubing to well, one provided in each shroud/train inside the nut in the open port of the 3 port valve used to connect the soil gas well to the train.

Equipment NOT supplied by EA-Berkeley:

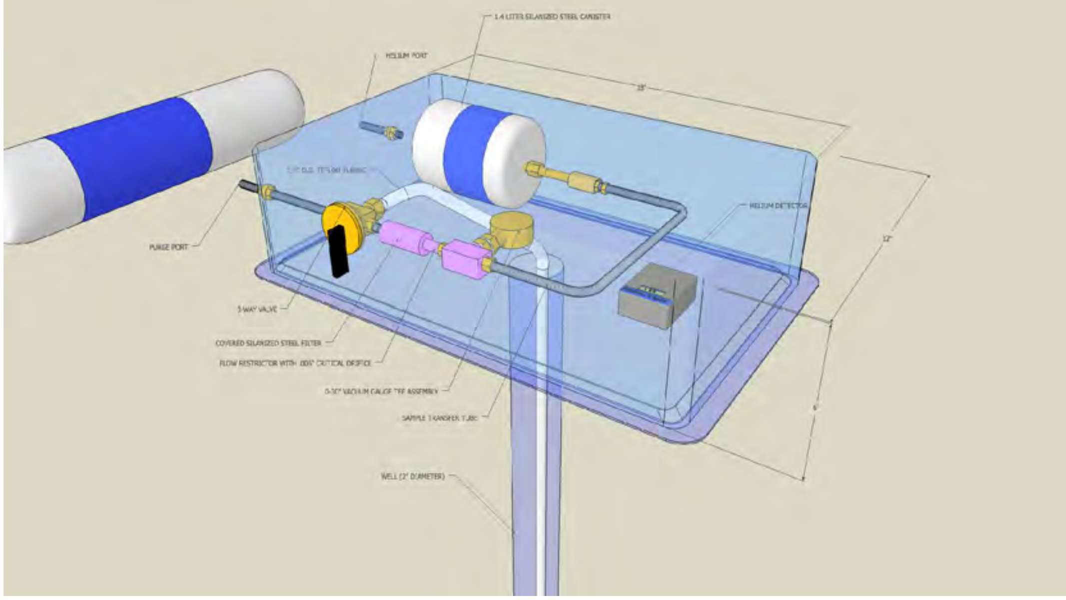
You will need the following items to complete your work; these items are not supplied by C&T unless specially requested:

a. Well purge suction source, alternatives available from the lab are: a) 50 ml disposable syringe with tubing adapters, b) evacuated 6 liter summa canister with 180 ml/min flow restrictor and filter, c) battery powered vacuum pump, d) 110V VAC powered vacuum pump
b. ½" x 9/16" open end combination wrench and one small crescent wrench. These are the tools needed to make compression fitting connections. C&T does not rent wrenches.
c. Extra Graphite or ceramic ferules as needed to insure you make a good well to train connection
d. ¼ OD Teflon tubing…Typically the well drillers have a lot of this stuff, if you need it
e. Knife (for cutting Teflon tubing)

1.1. **Position the shroud lid over the well.** Consistent Helium concentrations arise when the shrouds are used with the wellhead box lids provided. Some user protocols specify no box lid; in these cases, piling dirt around the edges of the box works to keep Helium inside the shroud. On windy days, a plastic windscreen employed either as a cover over the shroud or as an "air dam" has provided good results. We've experimented with using yoga mat material as "gaskets" for subslab sampling with mixed results.

If you're using the lid, and we recommend you do, position the lid over the wellhead with the tubing arising through the hole in the lid. There is an audible snap when the lid is optimally attached.

Figure 2: Helium Tracer Shroud Components



1.2. Once the shroud lid is positioned over the well, check that the 3-way valve is in the ***off*** position and the train pressure gauge showing a vacuum.

This is your indication that the train is leak-free since leaving the lab and all you need do is make a tight connection from the well to the open port on the 3-way valve. If the 3-way valve is not in the ***off*** position as a result of some error in shipment, there may be no vacuum on the gauge. At this point, your sampling protocols will determine whether the train can be used or not.

All trains leave the lab holding vacuum with decay rates less than 5” in 12 hours. Many shroud trains have inconsequentially slow leaks; trains are stored more than 3 days since being shipped from the lab may have no vacuum showing on the gauge. In these cases, you can check the vacuum decay rate by connecting an extra canister to the train and observing the vacuum decay rate.

2. CONNECTING the Well to the Train 3-port Valve

2.1. To connect the soil gas well to the sampling train, you will be joining ¼” Teflon tubing to the 3-port valve. Either a ceramic or graphite ferule has been provided inside the nut on the open port of the 3-port valve for you to make this connection. The most important component in a compression fitting is the ferrule, which is prone to damage. Care should be used when installing it although if ceramic or graphite ferules become defective, it is easy to install a replacement.

A “straight” even tubing end in the ¼” OD Teflon tubing from the well to the 3-port valve is important to making a “tight” connection. Use a knife rather than scissors to cut the tubing at a 90 degree angle to the tube axis. Remove any “burrs” or irregularities in the tubing end before attempting the connection. Slip the nut over the tubing, then the ferule. The ferule should “point” toward the 3-port valve. Usually, it is not possible to install ferules “backwards”.

2.2. Keeping the 3 way valve in the ***off*** position, attach the well tubing to the open 3 way valve port. Avoid excessive force when tightening the nut. Over-tightening is the most common cause of leaks in compression fittings. If the nut is over-tightened, the ceramic or graphite ferrule frequently deforms, improperly causing the joint to fail. A good way to make these connections is to tighten the nut first by hand, until it is too difficult to continue, and then use a 9/16” open end wrench to tighten the nut with a full 360 degree turn; no more than a 1 and 1/4 turn should be needed to create a leak tight connection.

3. ATTACHING the Sample Canister to the Train

3.1. **Check the vacuum** in the sample canister using the QT Vacuum gauge, it should read -30” of Hg (full vacuum) if it reads less, use another sample canister.

3.2. While keeping the 3 way valve in the off position, attach the canister to the female QT fitting at the rear of the sampling train as follows:

  3.2.1. Pull the external sleeve of the female QT connector back to its stop, then
  3.2.2. Insert the male valve stem and allow the sleeve to return to its spring loaded position. When the QT connection is made the canister (male) valve is open to the train.
  3.2.3. Try to pull the canister off the train without retracting the female QT sleeve. A correctly made QT connection cannot be broken without retracting the sleeve on the female valve stem.

A word about Micro QT Fittings: Micro Quick connect valves (QT) offer superior performance and ease of use compared to alternative tubing connections and valves. QT fittings provide highly reliable leak free connections without tools especially for fittings that are made and broken frequently.

Fine sand and/or grit (such as dry bentonite) damages male and female QT valves and connections. Keep both male and female QT valve components scrupulously clean. Please use the orange or red plastic caps provided for the male QT fittings, they protect the valve stem while shipping and protect your sample during return shipment to the lab.

When removing or replacing orange plastic protective caps on the male QT fittings, push them straight on and pull then straight off the valve stem. Twisting the cap counterclockwise while removing or replacing on the valve stem can dissemble the valve stem causing vacuum and/or sample loss.

4. POSITIONING the Shroud over the Well

4.1. Position the diffusion Helium gauge out of the way on a portion of the lid that allows you a good view of the display with the shroud in place. Then invert the shroud assembly over the lid and snap lid into position.

4.2. With the shroud assembled in place, you should be able to view the vacuum gauge well enough to verify that vacuum is holding and you can see the Helium detector display. Our apologies for the opaque portions of the boxes, if you know of hard plastic boxes, with clear panels we'd love to learn about them.

5. CHARGING the Shroud with Helium

Enthalpy provides Aluminum lecture bottles filled with 300 psi Helium; each bottle of Helium contains 48 liters at atmospheric pressure, enough to easily supply 20% Helium atmospheres to 6 single Shrouds and 3 double shrouds. The amount of Helium used depends predominantly on wind and time required to sample the well, with experience, you'll use less Helium. Your protocol will specify the Helium concentration in the shroud. The following guidance is based on sampling under a 20-25% Helium in air atmosphere. Regardless of your target helium concentration, your objective

should be to maintain a steady concentration of Helium during the sampling event at levels above 10% Helium in air.

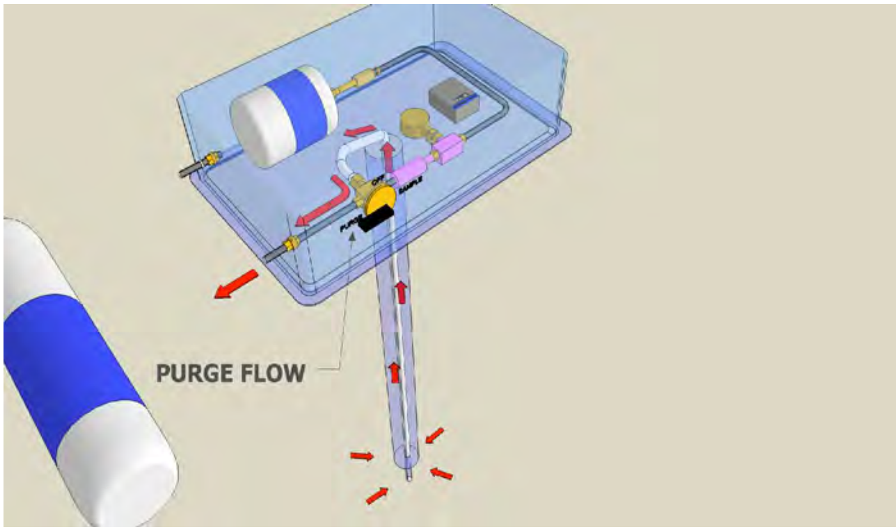
5.1. Locate and assemble the Lecture bottle, Helium transfer line, and the gas supply regulator. Tighten the brass nut attaching the regulator to the bottle one half turn past finger tight with a crescent or 9/16” open end wrench. The regulator is preset to deliver Helium at ideal pressure; ***you need not adjust the regulator***. Add Helium to the shroud by opening and closing the valve at the top of the bottle. Attach the Helium transfer line using the QT fittings at the regulator and at the Helium port on the shroud.

5.2. To provide Helium flow, slowly open the lecture bottle valve by twisting ***counterclockwise*** about ¼ turn.

5.3. Deliver 10 lbs of Helium at a time to the ***single*** shroud and 20 lbs to the ***double***. The diffusion cell Helium detector will respond in about 30 seconds to the new concentration. Unstable Helium detector readings reflect turbulent gas mixing inside the shroud. Plug holes between the shroud and the surface, use plastic sheeting to create an “air dam” or take other measures to air movement around the shroud and thus turbulence inside the shroud.

5.4. Monitor the Helium concentration displayed on the gauge in the shroud for about a minute in single shrouds, 90 seconds or longer in doubles. Under ideal conditions, 40 psi from the bottle will charge a single shroud to 25% helium concentration; double shrouds will require 80 psi. 25% Helium concentrations are maintained in the lab (zero wind) for 6-10 minutes. You may add more helium while purging and sampling. We suggest 10 psi increments for singles and 20 psi for doubles by opening the lecture bottle valve ¼ turn. We suggest users record/document the Helium concentration in the shroud at a minimum of 2 minute intervals during sampling.

Figure 3: Purge Flow Diagram



6. PURGE TESTING the Well under Helium

This test will help you establish the integrity of the well and the train to well connection. If no Helium is detected in the purge gas flow using this technique, one can assume the well is tight to breakthrough, and the train connections are all tight, and thus there will be no Helium detected in the sample that goes to the lab.

6.1. While getting the Helium concentration established, assemble the well purge train. Place the inline Helium detector between the shroud and whatever device (evacuated canister, syringe, or vacuum pump) that you're using to provide purge suction.

6.2. With the Helium atmosphere established in the shroud at 20% or more, and the purge system ready to operate, begin purging by moving the 3 way valve selector position to ***Purge*** and then establishing suction on the purge line.

6.3. Observe the inline Helium detector display while applying suction on the purge line. If you've purged enough vapors from the well to represent the entire volume of the path from the surface (under Helium atmosphere) to the distal end of the sampling tube and back up the tube and through the detector without detecting any Helium, your well shows signs of integrity and you may have a good leak free sample.

CA-DTSC guidance provides the opinion that a 5% ambient air dilution is inconsequential to sample integrity. When sampling under a 20% Helium in air atmosphere, 1% Helium detected in the purge gas represents a 5% ambient air sample dilution.

7. SAMPLING the Well under Helium

After you've completed purging the well, verify the reading on the Vacuum gauge of the train is -30 inches and that you have a steady state concentration of Helium between 20-25%, and then begin sampling by moving the 3 way selector valve to the ***Sample*** position.

Monitor the Helium concentration in the shroud by recording the reading on the diffusion cell detector inside the shroud every other minute or so. Add Helium from the bottle as needed to maintain a steady state concentration of Helium under the shroud.

Figure 4: Sampling Flow Diagram

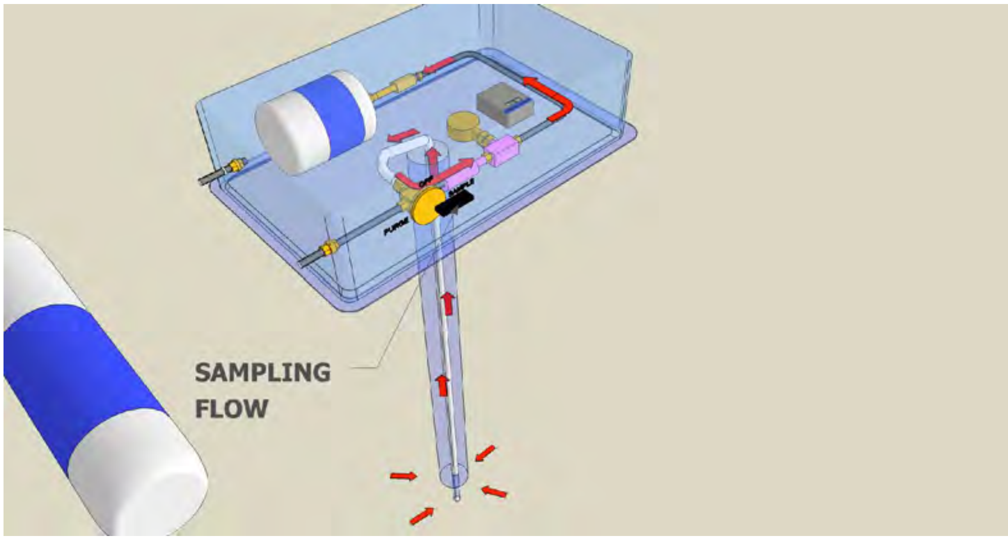


Figure 5: Dual Depth Well Sampling Shroud

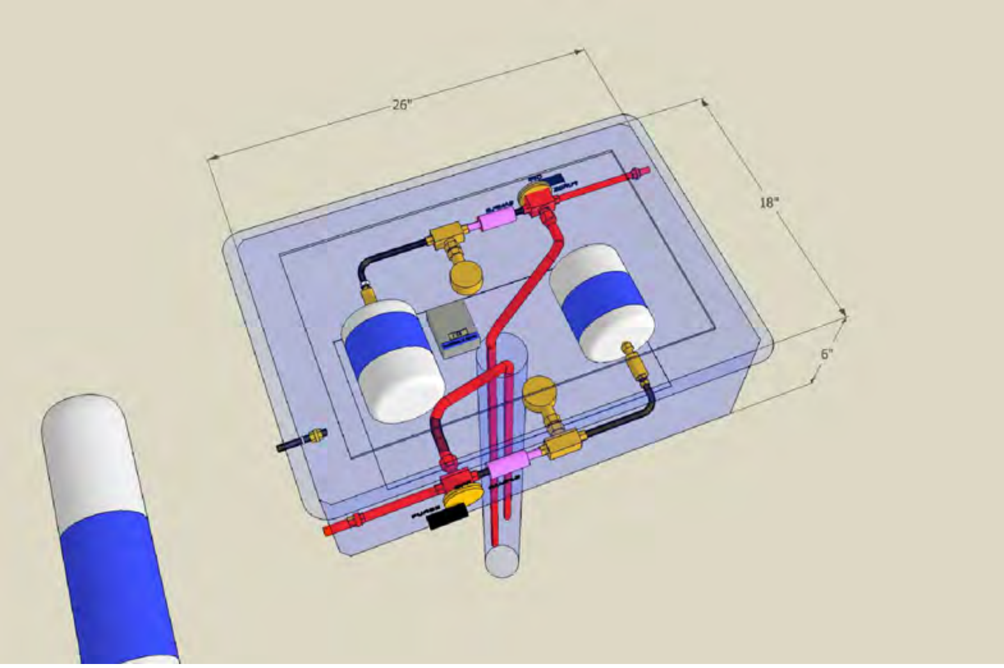

Report 0772.R6
7.0 feet tubing, 12 inch sand interval, 6 inches hydrated bentonite interval above sand

Soil Gas Purge Volume Calculations

One Purge Volume is calculated as the volume of the tubing interior plus the volume of the sand interval of the borehole.

The tubing interior volume is calculated as follows:

V tubing = pi x (r x r) x h, where pi = 3.14, r = 0.187 in/2, and h = 7.0 ft.

V tubing = 3.14 x (0.0935 x 0.0935) x (7 ft. x 12 in./ft) = 2.31 cubic inches.

The sand interval volume is calculated as follows:

V sand interval = pi x (r x r) x h x porosity, where pi = 3.14, r = 3.5 in./2, h = 12 in., and porosity = 0.35

V sand interval = 3.14 x (1.75 x 1.75) x 12 x 0.35 40.39 cubic inches.

The total volume for one purge volume is V tubing + V sand interval, where

V total = 2.31 cubic inches + 40.39 cubic inches = 42.69 cubic inches.

To convert to cubic centimeters:

V total = 42.69 cubic inches x 16.39 cubic centimeters/cubic inches = 699.8 cubic centimeters.

The total volume to be purged is 3 purge volumes.

V purge total = 699.8 cubic centimeters x 3 2099 cubic centimeters.

The flow controller has a nominal flow rate of 150 cubic centimeters per minute.

The purge time is calculated as follows:

T purge = 2099 cubic centimeters/ 150 cubic centimeters per minute = 14.00 minutes.

Converting the purge time to seconds, 14.00 minutes x 60seconds/ minute = 840 seconds.

Notes:

🟨 Yellow hi-lite indicates data entry required.
🟦 Blue hi-lite indicates values are calculated or automatically updated.

Sand interval is 1 ft from 5 to 6 ft bgs, filter is at center of sand pack, 0.5 ft hydrated bentonite above sand, then neat cement to surface.

APPENDIX D

Laboratory Analytical Reports and Chain of Custody Documentation

- **McCampbell Workorder #2006A30 - Soil Samples from Boreholes B1 Through B4**
- **Enthalpy Analytical Workorder #429907 - Soil Gas Samples SG1 Through SG4, SG4-DUP, SG5, SG6, SG6-DUP, SG7 Through SG9, SG11 Through SG15, and SG17 Through SG21 Results**

McCampbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder: 2006A30

Report Created for: P & D Environmental

55 Santa Clara Ave, Ste.240
Oakland, CA 94610

Project Contact: Paul King
Project P.O.:
Project: 0772; The Phoenix 801 Pine Street Oakland, CA

Project Received: 06/19/2020

Analytical Report reviewed & approved for release on 06/29/2020 by:

Jennifer Lagerbom
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine Street Oakland, CA
WorkOrder: 2006A30

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: P & D Environmental
Project: 0772; The Phoenix 801 Pine Street Oakland, CA
WorkOrder: 2006A30

Analytical Qualifiers

A	The reported value is determined using a "single point" calibration by GC-ECD as allowed by the method.
J	Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
S	Spike recovery outside accepted recovery limits
a9	Reporting limit near, but not identical to, our standard reporting limit due to variable Encore/Solid sample weight
c2	Surrogate recovery outside of the control limits due to matrix interference.
e2	Diesel range compounds are significant; no recognizable pattern
e7	Oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD is out of acceptance criteria; LCS validates the prep batch.
F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.
F10	MS/MSD outside control limits. Physical or chemical interferences exist due to sample matrix.
F13	Indigenous sample results too high for a representative matrix spike analysis.

Case Narrative

Client: P & D Environmental
Work Order: 2006A30
Project: 0772; The Phoenix 801 Pine Street Oakland, CA
June 25, 2020

Percent Moisture

In accordance with SW-846, EPA 8000, percent moisture is reported as:

$$\frac{\textit{Moisture Weight (g)}}{\textit{Sample Wet Weight (g)}} \quad x100$$

Project Manager: Angela Rydelius **Prepared by: Tina Perez**

The following SampIDs: 001B, 002B, 003B, 004B, 005B, 006B, 007B, 008B, 009B contain testgroup Multi Range_S.

Comments: Always send reports to: lab@pdenviro.com; Paul.King@pdenviro.com; pdking0000@aol.com. P&D always gets charged $67 multi range price despite the extra analytes

NOTE: Soil samples are discarded 60 days after results are reported unless other arrangements are made (Water samples are 30 days).
Hazardous samples will be returned to client or disposed of at client expense.

NOTES:

- **STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).**
- **MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.**

Case Narrative

P&D Environmental	Lab Job Number:	429907
55 Santa Clara Ave.	Project No:	0772
Suite 240	Location:	The Phoenix 801 Pine St. Oakland, Ca
Oakland, CA 94610	Date Received:	06/22/20
Michael Bass-Deschenes		

This data package contains sample and QC results for twenty one air samples, requested for the above referenced project on 06/23/20. The samples were received intact.

Volatile Organics in Air by MS (EPA TO-15):
High ICAL percent RSD (relative standard deviation) was observed for 1,3,5-trimethylbenzene in the calibration analyzed 06/05/20 18:09; affected data was qualified with "b". No other analytical problems were encountered.

Volatile Organics in Air GC (ASTM D1946):
No analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: P&D ENVIRONMENTAL

Project:

Date Received: 6/24/2

Sampler's Name Present: ☐ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☐ Yes, How many? ______ ☑ No (skip section 2)

Sample Temp (°C) (No Cooler): AMBIENT

Sample Temp (°C), One from each cooler: #1: ______ #2: ______ #3: ______ #4: ______

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: GLS

Section 3

Was the cooler packed with: ☐ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other ______

Cooler Temp (°C): #1: ______ #2: ______ #3: ______ #4: ______

Section 4	YES	NO	N/A
Was a COC received?	✓		▨
Are sample IDs present?	✓		▨
Are sampling dates & times present?	✓		▨
Is a relinquished signature present?	✓		▨
Are the tests required clearly indicated on the COC?	✓		▨
Are custody seals present?		✓	▨
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		▨
Did all bottle labels agree with COC? (ID, dates and times)	✓		▨
Were the samples collected in the correct containers for the required tests?	✓		▨
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		▨

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: ______ Date/Time ______

☐ Email (email sent to/on): ______ / ______

Project Manager's response:

Completed By: ______

Date: 6/24/2

Delivery Instructions:

Signature Type: STANDARD

22410431

ORC CA927-CI1

Print Date: 6/23/2020 1:38 PM

LABEL INSTRUCTIONS:

Do not copy or reprint this label for additional shipments - each package must have a unique barcode.
Step 1: Use the "Print Label" button on this page to print the shipping label on a laser or inkjet printer.
Step 2: Fold this page in half.
Step 3: Securely attach this label to your package and do not cover the barcode.

TERMS AND CONDITIONS:

By giving us your shipment to deliver, you agree to all of the General Logistics Systems US, Inc. (GLS) service terms & conditions including, but not limited to; limits of liability, declared value conditions, and claim procedures which are available on our website at www.gls-us.com.

1.0 INTRODUCTION

This Corrective Action Plan (CAP) has been prepared by P&D Environmental, Inc. of Oakland, California (P&D) on behalf of Urban Designs, LLC (Owner) for activities associated with the redevelopment of the property identified for this project as The Phoenix at 801 Pine Street in Oakland, California (see ***Figure 1***). The site is bounded on the east by Pine Street, on the north by 9th Street, on the west by the sound barrier wall for the frontage road for Route 880 (The Nimitz Freeway), and on the south by 8th Street. The site is currently covered with concrete. No structures are located on the concrete at the site. The site is divided into four parcels (see ***Figure 2***).

The redevelopment project ("Project") consists of the removal of the existing concrete cover for the entire site and the construction of slab-on-grade multi-story mixed-use residential buildings (see ***Figure 2 and Appendix A***). No underground parking is proposed for development of the Site. This CAP presents proposed corrective actions associated with the Project. The proposed corrective actions include mitigation measures and were developed based on the conditions described in the Site Conceptual Model (SCM) which is included as ***Appendix B***.

Mitigation measures are intended to reduce exposure to workers and occupants at the Site and surrounding area by controlling potential exposure to contaminated environmental media and consist of engineering, institutional, and administrative controls.

Mitigation measures proposed as part of this CAP include the following:

Engineering Controls

1. Vapor Intrusion Mitigation System (VIMS) consisting of a vapor barrier, a vapor collection system with vents, and trench plugs (where necessary).

2. Onsite consolidation and capping in place.

Administrative Controls

3. Site Management Plan

Institutional Controls

4. Land use covenants / Deed restriction

In addition to the proposed corrective actions summarized above, this CAP proposes the following additional activities to (1) evaluate the effectiveness of the proposed corrective actions and (2) evaluate potential exposure risks to off-site receptors.

- Destruction of existing soil gas wells, installation of replacement wells, and monitoring and sampling of the replacement wells.

Offsite contamination will be addressed separately from the proposed corrective actions associated with this CAP.

1.1 Lead Regulatory Oversight Agency for Environmental Site Cleanup

Soil and groundwater at the Site has been impacted from historical onsite land use practices. Alameda County Department of Environmental Health's (ACDEH) Local Oversight Program for Hazardous Materials Releases (LOP) is the lead regulatory oversight agency for the environmental investigation and cleanup actions at the Site under Site Cleanup Program Case (SCP) No. RO0003269.

Following submittal of acceptable documentation of the implementation of corrective actions for development of the Site, ACDEH will document that the Site is suitable for the proposed residential use.

2.0 SUMMARY OF SITE CONCEPTUAL MODEL

This section provides a brief summary of site conditions. A detailed description of the physical setting, contaminant source, distribution, transport mechanisms, exposure pathways and receptors are provided in the SCM in ***Appendix B***.

2.1 Site History

The property is presently a vacant lot that is entirely covered with a concrete slab. The property is presently divided into four parcels (see Figure 2) and is presently scheduled for residential development beginning with development at Parcel 1.

A search of the State Water Resources Control Board's (SWRCB) Geotracker website lists the subject site address as 888 Cedar Street and as an active Leaking Underground Storage Tank (LUST) site. There are no documents associated with the Geotracker case for 888 Cedar Street, except for a directive letter from the Alameda County Department of Environmental Health (ACDEH) dated July 3, 2008 outlining Geotracker upload requirements for the site.

A search of the ACDEH Local Oversight Program's (LOP) website shows various miscellaneous historical documents and correspondence including the following documents:

- Preliminary Endangerment Assessment (PEA) Volume II for 800 Cedar Street dated November 1993 and prepared by On-Site Technologies (OST),
- Underground Storage Tank Closure Report for Cypress "B" Freeway Reconstruction Project - Phoenix 800 Area "T" dated November 27, 1995 and prepared by OGISO Environmental.

Review of the November 1993 PEA shows that On-Site Technologies reported that the site is located along a portion of the then proposed reconstruction of the I-880 Cypress structure by the California Department of Transportation (Caltrans). The original Cypress structure was demolished following its collapse during the Loma Prieta Earthquake in 1989. Additionally, the PEA identifies the following company names and past site activities:

- The Dunn Cracker Co. from approximately 1889 to 1902,
- California Bedding & Upholstery Co. from approximately 1902 to 1912,
- A soap factory from some period of time between 1912 and 1931,
- California Fireworks from approximately 1923 to 1927,
- Independent Iron Works from 1924 to approximately 1960,
- Pine Iron Works from some unknown time until 1990,
- J&A Machine shop from 1985 through at least the date of the PEA,
- Phoenix Iron Works from approximately 1970 through at least the date of the PEA,
- Michael Bondi Metal Design from 1985 through at least the date of the PEA,
- Cypress Auto Parts from 1970 through at least the date of the PEA, and
- Ivan's Auto Body, Unknown Plastic Bag Co., Vennell Steel, and Terminal Manufacturing were located at the subject site at unknown dates and for unknown durations.

A search of the Department of Toxic Substances Control (DTSC) Envirostor website shows that the site is listed as a Voluntary Cleanup site located at 800 Cedar Street and as an Inactive open case as of September 3, 2010. The Envirostor summary page for the site lists only diesel as a potential contaminant of concern and only soil for a potentially impacted media. The Envirostor summary page also states that the site is part of the Cypress Freeway Reconstruction Project as well as having been historically used as an iron works plant that occupied the entire block bounded by Shorey, 9th, Pine, and Cedar (no longer exists) Streets. When the iron works plant went out of business, the building was subdivided into 5 bays and subsequently leased to commercial tenants including machine shops, iron works, auto parts dismantlers, and other manufacturing. The subject site building is reported to have been demolished in July 1995.

Envirostor also references the approval of proposed excavation of 104 cubic yards of soil on January 13, 1998 and the last available activity listed is dated February 27, 2012 and states that sampling activities were complete and that results were expected in 60 days. Among the documents on Envirostor were the following:

- Site Investigation Report for Highway 880, Cypress Reconstruction - Area 4 dated August 28, 1992 and prepared by Geo/Resource Consultants, Inc.,
- Sampling and Analysis Plan Phase II Soil Investigation for 800 Cedar Street dated July 14, 2011 and prepared by Northgate Environmental Management, Inc. (Northgate)

Other documents obtained and reviewed by P&D are as follows:

- Site Investigation Report for 800 Cedar Street dated March 8, 2000 and prepared by IT Corporation,

- Phase II Soil Investigation Report for 800 Cedar Street dated November 9, 2011 and prepared by Northgate,
- Soil Stockpile Sampling Report for 800 Cedar Street dated December 31, 2013 and prepared by Geocon Consultants, Inc.

Historical investigation sample results were summarized by P&D in a December 1, 2017 Soil and Groundwater Management Plan (SGMP) for the site. Soil, groundwater, and soil gas have been impacted at the Site from historical Site use and potentially from off-site sources. Tabulated results of analytical data with figures showing the sample collection locations are provided in Appendix B of P&D's December 1, 2017 SGMP. Appendix A of the SGMP also contains figures that summarize contaminants historically detected at concentrations exceeding San Francisco Bay Regional Water Quality Control Board (SFRWQCB) February 2016 revision 3 Tier 1 screening levels.

P&D's September 5, 2017 Limited Subsurface Investigation Report (document 0772.R1) documents the installation and sampling of soil gas wells SG1 through SG3 and the collection of two groundwater grab samples designated GW1 and GW2 at the site during August 2017. P&D's February 14, 2019 Limited Subsurface Investigation Report documents subsequent delineation of the extent of Volatile Organic Compounds (VOCs) including tetrachloroethene (PCE) and trichloroethene (TCE) in soil, groundwater, and soil gas at the site.

2.2 Geology and Hydrogeology

Review of regional geologic maps from U. S. Geological Survey Professional Paper 943, "Flatland Deposits - Their Geology and Engineering Properties and Their Importance to Comprehensive Planning," by E. J. Helley and K. R. Lajoie, 1979, indicates that the subject site is underlain by Pleistocene beach and dune sand deposits (Merrit Sand) (Qps), which is described as loose well-sorted fine to medium sand. Immediately to the west of the western property boundary the subsurface materials are identified as Bay Mud (Qhbm), which is described as unconsolidated water-saturated dark plastic carbonaceous clay and silty clay.

The subsurface materials encountered in boreholes S1 through S9, GW3 through GW11, and SG4 through SG20 consisted of silty sand and silty clayey sand to the maximum depths explored of 11.5 feet bgs. Geologic cross sections for the site are provided in P&D's March 23, 2018 Limited Subsurface Investigation Work Plan (document 0772.W2).

Groundwater was not encountered during drilling in boreholes S1 through S9 or during hand augering boreholes SG4, SG5, SG8, SG9, and SG15 through SG20. Groundwater was first encountered during hand augering in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 at depths of 9.5, 9.5, 9.5, 11.0, 8.5, 9.0, 9.0, 9.0, and 9.0 feet bgs, respectively. Groundwater was not encountered during hand augering in soil gas well boreholes SG4, SG5, and SG8 through SG14, and was encountered during hand augering in soil gas well boreholes SG6, SG6A, and SG7 at depths of 6.7, 5.0, and 6.8 feet bgs, respectively. The shallowest depth at which groundwater was subsequently encountered in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 was at depths of 6.3, 7.0, 6.7, 6.9, 6.8, 6.8, 6.9, 9.0, and 9.4 feet bgs, respectively. The shallowest depth at which groundwater was subsequently encountered in soil gas well boreholes SG4, SG5, SG6, SG6A (no soil gas well was constructed in borehole SG6A), SG7, SG8 and SG9 was 5.5, 5.4, 5.9, 5.7, 5.6, 6.1 and 6.1 feet bgs, respectively.

The ground surface elevation at the site is approximately 11 feet above sea level. The San Francisco Bay is located approximately 3,800 feet to the north and approximately 5,500 feet to the west of the subject site, and the Oakland Inner Harbor which is connected to the San Francisco Bay is located approximately 5,500 feet to the south of the subject site. Based on site vicinity topography and the proximity of surface water bodies the groundwater flow direction at the site is presumed to be westerly towards the San Francisco Bay.

2.3 Chemicals of Potential Concern and Contaminant Distribution

Chemicals of Potential Concern (COPCs) detected at the Site include lead in surface soil and fill; petroleum hydrocarbons in soil, groundwater, and soil gas; chlorinated solvents in groundwater; and the chlorinated solvents tetrachloroethene (PCE) and trichloroethene (TCE) in soil gas.

Sample results associated with historical investigation of the site are summarized in ***Tables 1 through 3B of the SCM in Appendix B***, and the collection locations for the samples summarized in the tables are provided in ***Figures 6 through 12 of the SCM***. The distribution of metals, petroleum, and PCE in soil and groundwater at the site, and the distribution of PCE in soil gas at the Site are shown in ***6 through 12 of Appendix B of the SCM***.

2.4 Contaminant Fate and Transport

The COPCs can be grouped into three families as follows:

- Metals
- Petroleum Hydrocarbons
- Non-Petroleum Volatile Organic Compounds

Metals are not volatile and do not naturally degrade or attenuate. Metals can be transported in air attached to dust. Metals are soluble and can be transported in groundwater.

Petroleum hydrocarbons and the non-petroleum Volatile Organic Compounds (VOCs) are volatile, soluble, and will degrade or attenuate in the subsurface with appropriate conditions for degradation. Petroleum hydrocarbons will degrade with or without oxygen in the subsurface, but will degrade more quickly with greater amounts of oxygen in the subsurface. Non-petroleum VOCs will degrade in the subsurface with the appropriate conditions for degradation if the proper types of bacteria are present. The detected presence of PCE decomposition products at the Site indicates that the appropriate conditions and bacteria are present for subsurface PCE degradation.

Compounds that are volatile can move as vapors in soil gas. Because the petroleum hydrocarbons and the non-petroleum VOCs are soluble, they can also move in groundwater.

2.5 Receptors and Exposure Pathways

The receptors associated with the Project include the following:

- Onsite construction workers.
- Onsite post-construction site occupants and visitors.
- Neighbors.

Exposure pathways include the following:

- Inhalation of airborne dust and vapors during construction.
- Direct exposure to soil or groundwater during construction.
- Ingestion of soil or groundwater during construction.
- Post-construction inhalation of vapors resulting from vapor intrusion.
- Inhalation of vapors resulting from vapor intrusion migrating along preferential pathways.

During construction, exposure to metals may occur at the Site from direct exposure to lead in soil or at the Site or surrounding locations from inhalation of lead or cadmium in dust. Following the completion of construction and implementation of the proposed corrective actions there will be no complete pathways for exposure to metals.

During construction, exposure to petroleum hydrocarbons and non-petroleum VOCs may occur at the Site from direct exposure to these COPCs in soil at the Site or at surrounding locations from inhalation of these COPCs. Following the completion of construction and implementation of the proposed corrective actions there will be no complete pathways for exposure to these COPCs at the Site or at nearby locations other than from potential vapor intrusion.

3.0 PROPOSED CLEANUP GOALS

Cleanup goals for the proposed corrective actions are as follows:

3.1 Soil

Soil cleanup goals for COPCs detected in onsite soil are to remove or consolidate and encapsulate soil with COPC concentrations exceeding SFRWQCB July 2019 (revision 2) Table S-1 Soil Direct Exposure Human Health Risk Screening Levels for residential land use. The proposed corrective actions will eliminate exposure to COPCs in soil by capping the Site and subsequently implementing the post-construction Site Management Plan (SMP) administrative controls and institutional controls.

3.2 Groundwater

There are no cleanup goals for COPCs in onsite groundwater for the proposed corrective actions because exposure to COPCs in groundwater will be removed by capping the site and subsequent implementation of the post-construction SMP administrative and institutional controls.

3.3 Soil Gas

Post-construction exposure to COPCs in soil gas will be controlled by implementation of engineering and administrative controls. Soil gas cleanup goals will be assumed to have been achieved if (1) post-construction indoor air quality at the Site meets or exceeds the SFRWQCB July 2019 2016 (revision 2) Tier I Environmental Screening Levels (ESLs) for indoor air and (2) the migration of on-Site soil vapor is sufficiently controlled so as not to represent an unacceptable risk to indoor air quality at off-site locations.

4.0 PROPOSED CORRECTIVE ACTIONS

Detailed methods for implementation of proposed corrective actions identified in the CAP will be provided in a Corrective Action Implementation Plan (CAIP) for ACDEH review and approval prior to implementation of the CAP.

The proposed corrective actions are identified as follows.

4.1 Preliminary Activities

Prior to the implementation of the corrective actions identified in the CAP, preliminary activities that will be performed will include but not be limited to the following:

- Preparation and submittal for ACDEH review and approval of a construction Soil and Groundwater Management Plan (SGMP) as part of the CAIP.
- Preparation and submittal for ACDEH review and approval of a construction Demolition Plan for existing structures at the site as part of the CAIP.
- Preparation of a site-specific Health and Safety Plan (HASP).
- Obtain any necessary permits.
- Provide notifications to any permitting or regulatory agencies that require notification.
- Contractor pre-construction meetings to define contractor work scope and coordinate contractor schedule with inspectors, regulators, and other onsite contractors.

4.2 Mitigation Measures

The proposed remedial measures consist of excavation and on-Site consolidation of lead-impacted soil. Soil will be managed in accordance with the construction SGMP. The depth of removal for onsite consolidation of lead-impacted soil will be from the bottom of the existing concrete cover at the site to the bottom of the lead-impacted soil layer, which is approximately one to two feet thick.

Prior to implementation of remedial measures, a CAIP that includes detailed dimensions and drawings will be provided to the ACDEH for review and approval. Soil will be managed in accordance with the construction SGMP.

4.2.1 General Excavation Procedures

It is anticipated that excavation activities will be conducted using conventional earthmoving equipment (e.g., track- or tire-mounted excavators and scrapers), however, equipment selection and the means to implement the soil excavation will be at the discretion of the selected excavation contractor. All excavation and earth-work conducted as part of implementation of corrective actions or as part of the Project will be conducted in accordance with the requirements of the SGMP. The SGMP includes procedures and protocols to control and limit potential on-site and off-site exposure to contaminated environmental media during excavation and earth-moving activities. These exposure-limiting protocols include (1) procedures for handling, staging, and disposal of contaminated soil and groundwater; (2) dust and odor control and suppression measures; (3) air and dust monitoring requirements; and (4) storm water management policies.

The SGMP will also contain contingency measures in the event that unexpected conditions are encountered during excavation or earthmoving activities

4.2.2 Verification Sampling

Post-excavation confirmation soil samples will be collected from the bottom of the excavated area for the lead-impacted soil excavation area in accordance with a Sampling and Analysis Plan (SAP) that will be an attachment to the CAIP. The soil samples will be collected to document post-excavation lead soil concentrations and to verify that removal of lead-impacted soil has occurred. Groundwater encountered in the soil excavation areas will be managed in accordance with procedures identified in the SGMP. The SAP will include Standard Operating Procedures (SOPs) for collection of soil and groundwater samples during implementation of the proposed remedial corrective actions.

4.2.3 Over-Excavation Sampling

Additional lead-impacted soil excavation will be performed at locations where post-excavation confirmation soil samples indicate that cleanup goals have not been met. The area of impacted soil excavations will be expanded until subsequent verification sampling confirms that cleanup goals are met or until further excavation is no longer practicable.

4.2.4 Soil and Groundwater Transportation and Disposal

Procedures for transportation and disposal of any soil or groundwater that are removed from the site will be included in the SGMP and referenced in the CAIP. The waste management procedures will include but not be limited to the following:

- Stockpiled soil management.

- Procedures for minimizing the spread of contaminated soil during remedial solution implementation.
- Groundwater containerization methods.
- Decontamination procedures.
- Transportation plan.
- Recording dates and weights or volumes of waste disposed of.
- Assembling and summarizing documentation of waste disposal such as manifests or flow meter totalizer logs.

4.2.5 Excavation Backfill and Soil Import

Following the completion of excavation of lead-impacted soil the excavated area will be backfilled and compacted using material that satisfies the requirements for imported material identified in a construction a Soil Import Management Plan (SIMP). The SIMP will be included as an element of the CAIP for evaluation of imported fill.

Elements of the SIMP will include but not be limited to the following:

- Sample collection frequency.
- Composite or discrete sample analysis.
- Sample analytical methods.
- Soil acceptance criteria.
- Documentation of the acceptability of soil for import to the Site.

Procedures for use of any soil from the Site that is used for backfilling the impacted areas of excavation will be identified in the SGMP.

Procedures for mitigating the spread of contaminated soil associated with trucks bringing clean fill to the site will be addressed in the SGMP.

Prior to initiation of foundation construction for the Project, the following document will be submitted for ACDEH review and approval:

1) Remedial Action Implementation Report (including imported soil acceptability documentation).

4.3 Engineering Controls

Engineering controls will consist of the installation of a Vapor Intrusion Mitigation System (VIMS) in conjunction with onsite consolidation of lead-impacted soil and capping of the site. Each of these is discussed below.

4.3.1 Vapor Intrusion Mitigation System

A VIMS will be designed to mitigate potential vapor intrusion and associated potential inhalation exposure. The Vapor Mitigation Engineering Controls (VMECs) will consist of a vapor barrier, a vapor collection system with a passive vent system that includes vents that extend to the roof and that can be converted to an active system in the future if necessary (see ***Figure 2***), and trench plugs to prevent preferential vapor migration in utility trenches. The VIMS will include subslab vapor sampling points, and the VIMS design will include placement of the vapor barrier beneath inhabited first floor structures, elevator pits, and first floor storage and utility rooms. A vapor recovery system will be placed beneath portions of the proposed site improvements where the vapor barrier is not installed (see ***Figure 2***). Sample specifications and drawings of the vapor barrier materials are provided in ***Appendix C***.

The locations of underground utilities for the Project have not yet been identified. Trench plugs will be installed at the time of site development in utility trenches at the Project property boundary or where potential utility trench vapor intrusion concerns are identified to mitigate potential preferential vapor intrusion along utilities in utility trenches.

Engineering design and supporting engineering calculations for each of the elements of the VIMS will be provided as an element of the VMEC Basis of Design Report, Plan & Specifications which will be an element of the CAIP or will be provided to the ACDEH for review and approval under separate cover. The VMEC Basis of Design Report will include a Construction Quality Assurance Quality Control (CQA/QC) plan that will contain elements that will include but not be limited to the following:

- Procedures used for verification of VMEC construction in accordance with the VMEC design.
- Dates of inspections and documentation of testing performed.
- Results of inspections and testing.

Prior to initiation of foundation construction for the Project, the following documents will be submitted to the ACDEH for review and approval:

1) VMEC Basis of Design Report, Plans, & Specifications (including CQA/QC plan).
2) VMEC Record Report of Construction and Performance Evaluation.

After installation of the VIMS, but before occupancy of the site, the following document will be prepared and submitted to ACDEH for review and approval.

3) VIMS Operations and Maintenance Plan.

The elements in the VIMS Operations and Maintenance Plan will include but not be limited to the following:

- VIMS monitoring procedures.
- VIMS monitoring frequency.
- Analysis to be performed for performance evaluation samples.
- Criteria for amendments to the VIMS based on the performance monitoring results.
- Record keeping and reporting requirements.

4.3.2 Onsite Consolidation and Capping In Place

Following the completion of lead-impacted soil excavation, on-Site consolidation of lead-impacted soil, excavated area backfilling, and installation of the VIMS, the area of onsite consolidation of lead-impacted soil will be capped with the roadway and parking area surface cover to mitigate exposure to subsurface lead at the Site.

Direct exposure to lead will be controlled by installation of the hardscape roadway and parking area surface cover cap at the Site. Non-biodegradable woven geotextile fabric will be placed below, around, and above soil that is consolidated onsite as an excavation marker. Procedures associated with work below the excavation marker will be identified in the SMP.

The proposed locations of consolidated soils and hardscape will be described in the CAIP. Implementation of proposed remedial actions will not be conducted prior to ACDEH's review and approval of the CAIP.

4.4 Administrative Controls

Prior to occupancy of the Site, a SMP will be developed and submitted to ACDEH for review and approval. The SMP will be implemented as an administrative control. The elements of the SMP will include but not be limited to the following:

- Procedures for penetrating and repairing the vapor barrier.
- Procedures for excavation beneath the vapor barrier or the consolidated soil marker woven geotextile fabric.
- Procedures and frequency for vapor monitoring associated with the VIMS.
- Criteria for changing the VIMS from a passive system to an active system.
- Record keeping and reporting requirements associated with administration of the SMP.

4.5 Institutional Controls

Land use covenants will be summarized in a deed restriction document that will be prepared for review and approval by the ACDEH. The land use covenants will identify land use restrictions based on Site conditions identified in a Remedial Action Implementation Report documenting implementation of the CAP, and will provide conditions that will be required to be satisfied for future amendment of the land use restrictions. Upon approval of the land use restriction document by the ACDEH the land use restriction document will be recorded at the County

Recorder's Office and copies of the recorded document along with documentation of the recordation will be provided to the ACDEH.
Prior to occupancy, the following documents will be submitted for ACDEH review and approval:

1) Record Report of Construction for Hardscape Cap
2) VMEC Operations and Maintenance Plan
3) SMP, including documentation of Institutional Controls

4.6 Additional CAP-Related Activities

The following additional CAP-related activities are proposed to (1) evaluate the effectiveness of the proposed corrective actions and (2) evaluate potential exposure risks to off-site receptors:

4.6.1 Destruction of Existing Wells and Installation of Replacement Wells

All of the existing groundwater monitoring wells and soil gas wells at the Site will be destroyed and replacement groundwater monitoring wells and soil gas wells will be installed in accordance with Alameda County Public Works Agency (ACPWA) requirements. A work plan identifying proposed replacement well locations will be provided to the ACDEH for review and approval prior to destruction and replacement of the existing soil gas wells.

5.0 PERFORMANCE EVALUATION AND OFFSITE EXPOSURE EVALUATION

The performance of remediation and mitigation measures will be evaluated as they relate to (1) closure of exposure pathways identified in the SCM and (2) cleanup goals. Monitoring and results evaluation will be performed as follows:

5.1 Dust and Vapors During Construction

Perimeter monitoring and monitoring of onsite personnel with instruments and sample collection for quantitative analysis will be performed for dust and vapors in accordance with the construction SGMP and the site-specific HASP for Site development. In addition, visual monitoring for dust will be performed.

Monitoring results exceedance criteria will be identified in the SGMP and site-specific HASP, and monitoring results exceedances will be addressed in accordance with procedures set forth in the SGMP and the site-specific HASP.

5.2 Groundwater Monitoring Evaluation Criteria

Groundwater monitoring well groundwater sample results from any groundwater monitoring wells will be compared with SFRWQCB July 2019 (revision 2) Table GW-3 Groundwater Vapor Intrusion Screening Levels for groundwater for residential land use.

Sample results exceeding screening levels for locations where a VIMS is not present will be further evaluated for evidence of potential vapor intrusion concerns.

5.3 Indoor Air and Vapor Verification Sampling

Post-construction indoor air and subsurface vapor monitoring will be performed in accordance with the post-construction SMP. Exceedance of monitoring criteria set forth in the SMP may include but not be limited to verification re-sampling or conversion of the passive vent system to an active vent system with subsequent confirmation sampling to ensure that the mitigation solution was effective.

6.0 PUBLIC NOTIFICATION

A Public Notice (fact sheet) describing the proposed corrective actions will be prepared and submitted for review and approval to the ACDEH. Upon approval by the ACDEH, the Public Notice will be distributed to the surrounding community within a 300-foot radius of the property (see ***Figure 1***) for a 30-day public comment period.

7.0 REPORTING

A project construction and reporting schedule will be submitted to ACDEH for review and approval and an updated schedule will be submitted as appropriate.

Prior to initiation of construction activities, the following documents will be submitted for ACDEH review and approval:

1) Corrective Action Implementation Plan (including a SGMP, SAP and SIMP)
2) HASP

Prior to initiation of foundation work, the following documents will be submitted for ACDEH review and approval:

1) Remedial Action Implementation Report (including soil import documentation)
2) VMEC Basis of Design Report, Plans, & Specifications (including CQA/QC plan)
3) VMEC Record Report of Construction and Performance Evaluation

Prior to occupancy, the following documents will be submitted for ACDEH review and approval:

1) Record Report of Construction for Hardscape Cap
2) VMEC Operations and Maintenance Plan
3) SMP, including documentation of Institutional Controls

Post occupancy, routine Operations and Maintenance Reports for the engineering controls, 5-year evaluations for the engineering controls, and as-needed updates to the SMP will be issued to ACDEH for review and approval as required in the SMP.

SURVEYOR'S NOTES

THIS SURVEY WAS MADE ON THE GROUND AND CORRECTLY SHOWS THE AREA OF THE SUBJECT PROPERTY, THE LOCATION AND TYPE OF ALL BUILDINGS, STRUCTURES AND OTHER IMPROVEMENTS SITUATED ON THE SUBJECT PROPERTY.

EXCEPT AS SHOWN ON THIS SURVEY, THERE ARE NO VISIBLE OR RECORDED EASEMENTS OR RIGHTS-OF-WAY ACROSS THE SUBJECT PROPERTY OF WHICH THE UNDERSIGNED HAS BEEN ADVISED.

EXCEPT AS SHOWN ON THE SURVEY, THERE ARE NO ENCROACHMENTS ONTO ADJOINING PREMISES, STREETS, OR ALLEYS BY ANY BUILDING, STRUCTURES OR OTHER IMPROVEMENTS AT THE SUBJECT PROPERTY, AND NO ENCROACHMENTS ONTO THE SUBJECT PROPERTY BY BUILDINGS, STRUCTURES OR OTHER IMPROVEMENTS SITUATED ON ADJOINING PREMISES.

THE LOCATION OF EACH EASEMENT, RIGHT-OF-WAY, SERVITUDE OR OTHER MATTER AFFECTING THE SUBJECT PROPERTY AND LISTED IN THE PRELIMINARY TITLE REPORT UPDATE "C" ISSUED BY CHICAGO TITLE COMPANY, ORDER NUMBER 58209977-582-LE-DP, DATED AS OF MARCH 14, 2019 WITH RESPECT TO THE SUBJECT PROPERTY, HAS BEEN SHOWN ON THIS SURVEY, TOGETHER WITH APPROPRIATE RECORDING REFERENCES, TO THE EXTENT SUCH MATTERS CAN BE LOCATED. THE PROPERTY SHOWN ON THIS SURVEY IS THE SAME AS THE PROPERTY DESCRIBED IN THE TITLE REPORT.

LEGAL DESCRIPTION

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF OAKLAND, IN THE COUNTY OF ALAMEDA, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

A PORTION OF THAT CERTAIN PARCEL OF LAND DESCRIBED IN "PARCEL 2 (50106-1)" OF THAT FINAL ORDER OF CONDEMNATION NO. 731654-0, RECORDED OCTOBER 10, 1997, UNDER SERIAL NO. 97266530, OFFICIAL RECORDS OF ALAMEDA COUNTY, MORE PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT THE INTERSECTION OF THE SOUTHEASTERLY LINE OF CEDAR STREET WITH THE SOUTHWESTERLY LINE OF 9TH STREET, DESCRIBED IN SAID PARCEL 2 (50106-1); THENCE SOUTHEASTERLY ALONG SAID LINE OF 9TH STREET S. 56° 32' 27" E., 361.97 FEET TO THE NORTHWESTERLY LINE OF PINE STREET; THENCE SOUTHWESTERLY ALONG SAID LINE OF PINE STREET S. 33° 26' 33" W., 602.77 FEET TO THE NORTHEASTERLY LINE OF SHOREY STREET; THENCE NORTHWESTERLY ALONG SAID LINE OF SHOREY STREET N. 73° 20' 49" W., 186.51 FEET; THENCE N. 01° 53' 13" W., 57.65 FEET; THENCE ALONG A TANGENT CURVE TO THE RIGHT WITH A RADIUS OF 1788.00 FEET, THROUGH AN ANGLE OF 11° 28' 37", AN ARC LENGTH OF 358.16 FEET TO THE SOUTHEASTERLY LINE OF CEDAR STREET; THENCE ALONG SAID LINE OF CEDAR STREET N. 33° 26' 33" E., 285.07 FEET TO THE POINT OF BEGINNING.

THERE SHALL BE NO ABUTTER'S RIGHTS OF ACCESS APPURTENANT TO THE ABOVE DESCRIBED REAL PROPERTY IN AND TO THE ADJACENT STATE FREEWAY.

THE BEARINGS AND DISTANCES USED IN THE ABOVE DESCRIPTION ARE ON THE CALIFORNIA COORDINATE SYSTEM, ZONE 3. MULTIPLY THE ABOVE DISTANCES BY 1.0000720 TO OBTAIN GROUND LEVEL DISTANCES.

BOUNDARY TIES

NOTES

NO WARRANTY IS GIVEN OR IMPLIED BY THE SURVEYOR OF THIS MAP. THIS MAP WAS CREATED BY THE SURVEYOR FOR THE EXCLUSIVE USE FOR THE CLIENT OF CONTRACT AND THE CITY OF OAKLAND FOR PERMITTING PURPOSES. ANY OTHER USE OF THIS INFORMATION IS AT THE SOLE RESPONSIBILITY OF ITS USER.

THERE ARE NO EXISTING OR PROPOSED DRIVEWAYS

PUBLIC ADVISORY

THIS MAP IS BASED ON PRIVATE SURVEYS PERFORMED BY LICENSED PROFESSIONALS AND WILL NOT BE UPDATED OR CORRECTED BY THE CITY OF OAKLAND AFTER ITS FILING. NO WARRANTY, EITHER EXPRESSED OR IMPLIED, IS MADE BY THE CITY OF OAKLAND THAT THIS MAP AND THE SURVEY INFORMATION ON WHICH IT IS BASED IS CORRECT, ACCURATE, AND CURRENT, NOR THAT THE CITY WILL RETAIN FOR PUBLIC INSPECTION ANY RELATED INFORMATION WHICH MAY BE SUBSEQUENTLY SUBMITTED TO THE CITY, INCLUDING ALLEGED OR ACTUAL DISCREPANCIES, INACCURACIES, DEFICIENCIES, AND ERRORS.

BASIS OF SURVEY

THIS SURVEY IS BASED ON LINES AND DIMENSIONS AND FOUND MONUMENTS SHOWN ON THAT CERTAIN RECORD OF SURVEY R/S 1687, FILED IN BOOK 25 OF RECORDS OF SURVEY, AT PAGES 58-69, ALAMEDA COUNTY RECORDS AND THE LEGAL DESCRIPTION IN GRANT DEED DOCUMENT 2019090488, RECORDED MAY 16, 2019, OFFICIAL RECORDS OF ALAMEDA COUNTY.

SURVEYOR'S STATEMENT

THIS MAP CORRECTLY REPRESENTS A SURVEY MADE BY ME OR UNDER MY DIRECTION AT THE REQUEST OF VIRGINIA HAMILTON AT OAKLAND ROSE FOUR, LLC.

I HEREBY STATE THAT ALL EXISTING GRADES UPON THIS PLAT ARE BASED UPON CITY OF OAKLAND DATUM.

I HEREBY FURTHER STATE THAT TO THE BEST OF MY KNOWLEDGE ALL PROVISIONS OF APPLICABLE STATE LAWS AND LOCAL ORDINANCES HAVE BEEN COMPLIED WITH.

I HEREBY FURTHER STATE THAT THE PARCEL DESIGNATED BY MY SURVEY AND SHOWN ON THIS MAP IS THE SAME AS DESCRIBED IN THAT GRANT DEED RECORDED DECEMBER 24, 2014, IN DOCUMENT NO. 2014313804, OFFICIAL RECORDS OF ALAMEDA COUNTY.

I FURTHER STATE THAT IN ACCORDANCE WITH THE PROFESSIONAL LAND SURVEYORS ACT THE PERFORMANCE OF THIS SURVEY DOES NOT REQUIRE A CORNER RECORD OR RECORD OF SURVEY TO BE FILED.

I HEREBY ACKNOWLEDGE THAT THIS SURVEY SHALL BE A PUBLIC RECORD AND MAY BE AVAILABLE FOR INSPECTION AND DISTRIBUTION TO THE GENERAL PUBLIC.

ENGINEER'S STATEMENT–GEOTECHNICAL DESIGN

INITIAL STATEMENT OF THE ENGINEER (DIVIDED RESPONSIBILITY)

I HAVE BEEN RETAINED BY HOLIDAY DEVELOPMENT TO BE IN RESPONSIBLE CHARGE OF THE PORTIONS OF GRADING WORK ENUMERATED BELOW. I WILL ASSUME FULL RESPONSIBILITY AS RESPONSIBILITY IS DEFINED IN SECTION 2-6.075 OF THE OAKLAND MUNICIPAL CODE FOR CARRYING OUT THE FOLLOWING TO THE BEST OF MY KNOWLEDGE AND ABILITY:

(A) ASSURING THAT TESTING AND INSPECTION REQUIRED FOR THE WORK IN PROGRESS AND THE COMPLETED WORK SHALL BE ACCOMPLISHED IN A PROFESSIONAL MANNER TO DETERMINE WHETHER ALL THE WORK IS BEING/WAS DONE IN ACCORDANCE WITH THE PLANS AND SPECIFICATIONS APPROVED BY THE DIRECTOR OF PUBLIC WORKS.

(B) NOTIFYING THE APPLICANT, VERBALLY AND IN WRITING (WITH A COPY TO THE DIRECTOR OF PUBLIC WORKS), OF ANY WORK NOT BEING PERFORMED IN ACCORDANCE WITH THE APPROVED PLANS AND SPECIFICATIONS.

(C) NOTIFYING THE APPLICANT, VERBALLY AND IN WRITING (WITH A COPY TO THE DIRECTOR OF PUBLIC WORKS), OF ANY WORK NOT MEETING THE REQUIREMENTS OF THE APPROVED PLANS AND SPECIFICATIONS.

(D) NOTIFYING THE APPLICANT, VERBALLY AND IN WRITING, OF THE MODIFICATION(S) REQUIRED IN HIS PERFORMANCE AND THE NECESSARY CORRECTIVE MEASURES TO BE TAKEN TO CURE ALL DEFICIENCIES.

(E) (BY PROJECT CIVIL ENGINEER)

(F) (BY PROJECT CIVIL ENGINEER)

(G) (BY PROJECT CIVIL ENGINEER)

(H) (BY PROJECT CIVIL ENGINEER)

IF MY SERVICES ON THE JOB ARE TERMINATED, I WILL, AT SAID TIME OF TERMINATION, SUBMIT TO THE DIRECTOR OF PUBLIC WORKS, A STATEMENT OF PARTIAL COMPLETION ADDRESSING THE PROGRESS AND CONDITIONS OF ALL OF THE APPLICABLE ITEMS ABOVE AND ATTACH THERETO THE RESULTS OF SUCH INSPECTIONS AND TESTS WHICH HAVE BEEN COMPLETED.

ESTIMATED EARTHWORK QUANTITIES

CUBIC YARDS	WITHIN BUILDING FOOTPRINT	OUTSIDE BUILDING FOOTPRINT	TOTAL CUBIC YARDS
CUT	0	0	0
FILL	2,040 CY		2,040 CY
IMPORT			2,040 CY

(1) EARTHWORK REPRESENTS IMPORT TO BACKFILL (E) FOUNDATIONS. SLABS ASSUMED AT 12" THICK.

NOTE:

GRADING QUANTITIES REPRESENT BANK YARDAGE. IT DOES NOT INCLUDE ANY SWELLING OR SHRINKAGE FACTORS AND IS INTENDED TO REPRESENT IN-SITU CONDITIONS. QUANTITIES DO NOT INCLUDE OVER-EXCAVATION, TRENCHING, STRUCTURAL FOUNDATIONS OR PIERS, OR POOL EXCAVATION (IF ANY). NOTE ADDITIONAL EARTHWORKS, SUCH AS KEYWAYS OR BENCHING MAY BE REQUIRED BY THE GEOTECHNICAL ENGINEER IN THE FIELD AT TIME OF CONSTRUCTION. CONTRACTOR TO VERIFY QUANTITIES.

DESIGNER'S STATEMENT

THIS PLOT PLAN CORRECTLY REPRESENTS A PLOT PLAN MADE BY ME OR UNDER MY DIRECTION.

I HEREBY STATE THAT TO THE BEST OF MY KNOWLEDGE ALL PROVISIONS OF APPLICABLE STATE LAWS AND LOCAL ORDINANCES HAVE BEEN COMPLIED WITH.

I HEREBY FURTHER STATE THAT ALL PROPOSED GRADES, ELEVATIONS, AND CONTOURS DELINEATED UPON THIS PLOT PLAN ARE BASED UPON A SURVEY BY LEA AND BRAZE ENGINEERING, DATED NOVEMBER 2017 AND, SUPPLEMENTAL INFORMATION BY OWNER, THAT WAS INDICATED THEREON BY THE SURVEYOR THEREOF AS BEING BASED UPON CITY OF OAKLAND DATUM.

SIGNED: PETER CARLINO
REGISTERED CIVIL ENGINEER NO. C79555 (EXP. 09-30-20)

ENGINEER'S STATEMENT – CIVIL DESIGN

INITIAL STATEMENT OF THE ENGINEER (DIVIDED RESPONSIBILITY)

I HAVE BEEN RETAINED BY HOLIDAY DEVELOPMENT TO BE IN RESPONSIBLE CHARGE OF THE PORTIONS OF GRADING WORK ENUMERATED BELOW. I WILL ASSUME FULL RESPONSIBILITY AS RESPONSIBILITY IS DEFINED IN SECTION 2-6.075 OF THE OAKLAND MUNICIPAL CODE FOR CARRYING OUT THE FOLLOWING TO THE BEST OF MY KNOWLEDGE AND ABILITY:

(A) (BY PROJECT GEOTECHNICAL CONSULTANT

(B) (BY PROJECT GEOTECHNICAL CONSULTANT)

(C) (BY PROJECT GEOTECHNICAL CONSULTANT)

(D) (BY PROJECT GEOTECHNICAL CONSULTANT)

(E) SUBMITTING AN AMENDED GRADING PLAN (THROUGH THE APPLICANT) TO THE DIRECTOR OF PUBLIC WORKS FOR HIS REVIEW AND APPROVAL FOR ANY SIGNIFICANT CHANGES CAUSED BY UNFORESEEN CONDITIONS, ALONG WITH A REPORT SETTING FORTH THE REASONS FOR THESE CHANGES AND THE RECOMMENDED CHANGES TO THE IMPROVEMENT PLANS ENGENDERED AS A RESULT OF THE AMENDED GRADING PLAN.

(F) NOTIFYING THE APPLICANT, VERBALLY AND IN WRITING (WITH A COPY TO THE DIRECTOR OF PUBLIC WORKS), OF ANY PORTION OF THE GRADING WORK AFFECTED BY THE AMENDED PLANS AND SHALL RECOMMEND WHETHER OR NOT THE APPLICANT SHOULD PROCEED WITH THE WORK BEFORE THE AMENDED PLANS ARE APPROVED BY THE DIRECTOR OF PUBLIC WORKS.

(G) SUBMITTING UPON THE APPLICANT'S SATISFACTORY COMPLETION OF WORK UNDER THE PERMIT, A STATEMENT OF COMPLETION PURSUANT TO SECTION 2-6.111 OF THE OAKLAND MUNICIPAL CODE WITH THE RESULTS OF ALL TESTS AND INSPECTIONS ATTACHED THERETO.

(H) STATING IN WRITING, ALONG WITH THE STATEMENT OF COMPLETION, THAT THE INTERIM EROSION CONTROL AND SEDIMENT CONTROL MEASURES APPEAR TO BE ADEQUATE IF PROPERLY MAINTAINED UNTIL THE PERMANENT EROSION CONTROL MEASURES ARE FULLY ESTABLISHED, IF ANY ARE REQUIRED.

IF MY SERVICES ON THE JOB ARE TERMINATED, I WILL, AT SAID TIME OF TERMINATION, SUBMIT TO THE DIRECTOR OF PUBLIC WORKS, A STATEMENT OF PARTIAL COMPLETION ADDRESSING THE PROGRESS AND CONDITIONS OF ALL OF THE APPLICABLE ITEMS ABOVE AND ATTACH THERETO THE RESULTS OF SUCH INSPECTIONS AND TESTS WHICH HAVE BEEN COMPLETED.

CAUTION:

1. CONTRACTOR SHALL CONTACT UNDERGROUND SERVICE ALERT FOR LOCATION OF UNDERGROUND UTILITIES AT LEAST 48 HOURS PRIOR TO COMMENCEMENT OF CONSTRUCTION– PHONE (800) 642–2444. CONTRACTOR SHALL VERIFY ALL EXISTING UTILITIES PRIOR TO BEGINNING ANY WORK ON THIS SITE.
2. THE LOCATION, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS PLAN WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). CONTRACTOR SHALL VERIFY LOCATION AND DEPTH PRIOR TO ANY EXCAVATION OR IMPROVEMENT.

GENERAL SITE NOTES:

1. CONTRACTOR SHALL VISIT THE SITE PRIOR TO BIDDING ON THIS WORK AND CONSIDER THE EXISTING CONDITIONS AND SITE CONSTRAINTS IN THE BID. CONTRACTOR SHALL BE IN THE POSSESSION OF AND FAMILIAR WITH ALL APPLICABLE GOVERNING AGENCIES STANDARD DETAILS AND SPECIFICATIONS PRIOR TO SUBMITTING OF A BID.
2. ALL WORK IN THE PUBLIC RIGHT–OF–WAY SHALL CONFORM TO ALL APPLICABLE GOVERNING AGENCIES STANDARD DETAILS & SPECIFICATIONS.
3. PRIOR TO BEGINNING WORK, AND AFTER INITIAL HORIZONTAL CONTROL STAKING, CONTRACTOR SHALL FIELD CHECK ALL ELEVATIONS MARKED WITH (E) AND REPORT ANY DISCREPANCIES GREATER THAN 0.05' TO OWNER'S PROJECT MANAGER AND CIVIL ENGINEER.
4. ALL GENERAL NOTES, SHEET NOTES, AND LEGEND NOTES FOUND IN THESE DOCUMENTS SHALL APPLY TYPICALLY THROUGHOUT. IF INCONSISTENCIES ARE FOUND IN THE VARIOUS NOTATIONS, NOTIFY THE ENGINEER IMMEDIATELY IN WRITING REQUESTING CLARIFICATION.
5. THESE DRAWINGS AND THEIR CONTENT ARE AND SHALL REMAIN THE PROPERTY OF LEA AND BRAZE ENGINEERING, INC. WHETHER THE PROJECT FOR WHICH THEY ARE PREPARED IS EXECUTED OR NOT. THEY ARE NOT TO BE USED BY ANY PERSONS ON OTHER PROJECTS OR EXTENSIONS OF THE PROJECT EXCEPT BY AGREEMENT IN WRITING AND WITH APPROPRIATE COMPENSATION TO THE ENGINEER.
6. ALL WORK SHALL COMPLY WITH APPLICABLE CODES AND TRADE STANDARDS WHICH GOVERN EACH PHASE OF WORK INCLUDING, BUT NOT LIMITED TO, CALIFORNIA MECHANICAL CODE, CALIFORNIA PLUMBING CODE, CALIFORNIA ELECTRICAL CODE, CALIFORNIA FIRE CODE, CALTRANS STANDARDS AND SPECIFICATIONS, AND ALL APPLICABLE STATE AND/OR LOCAL CODES AND/OR LEGISLATION.
7. COMMENCEMENT OF WORK BY THE CONTRACTOR AND/OR ANY SUBCONTRACTOR SHALL INDICATE KNOWLEDGE AND ACCEPTANCE OF ALL CONDITIONS DESCRIBED IN THESE CONSTRUCTION DOCUMENTS, OR EXISTING ON SITE, WHICH COULD AFFECT THEIR WORK.
8. DAMAGE TO ANY EXISTING SITE IMPROVEMENTS, UTILITIES AND/OR SERVICES TO REMAIN SHALL BE RESPONSIBLE OF THE CONTRACTOR. CONTRACTOR SHALL REPAIR AND/OR REPLACE IN KIND.
9. CONTRACTOR SHALL REPLACE ALL STRUCTURES AND GRATE LIDS FOR VAULTS, CATCH BASINS, ETC.., WITH VEHICULAR–RATED STRUCTURES IN ALL TRAFFIC ACCESSIBLE AREAS.
10. THE CONTRACTOR SHALL ADJUST TO FINAL GRADE ALL EXISTING AND/OR NEW MANHOLES, CURB INLETS, CATCH BASIN, VALVES, MONUMENT COVERS, AND OTHER CASTINGS WITHIN THE WORK AREA TO FINAL GRADE IN PAVEMENT AND LANDSCAPE AREAS UNLESS NOTED OTHERWISE.
11. CONTRACTOR AGREES THAT HE SHALL ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THIS PROJECT INCLUDING SAFETY OF ALL PERSONS AND PROPERTY THAT THIS REQUIREMENT SHALL APPLY CONTINUOUSLY AND NOT TO BE LIMITED TO NORMAL WORKING HOURS AND THAT THE CONTRACTOR SHALL DEFEND INDEMNIFY AND HOLD THE OWNER, THE CONSULTING ENGINEER AND THE CITY HARMLESS FROM ANY AND ALL LIABILITY, REAL OR ALLEGED, IN CONNECTION WITH THE PERFORMANCE OF WORK ON THIS PROJECT. EXCEPTING FOR LIABILITY ARISING FROM THE SOLE NEGLIGENCE OF THE OWNER OR THE CONSULTING ENGINEER.
12. EXISTING PEDESTRIAN WALKWAYS. BIKE PATHS AND ACCESSIBLE ACCESS PATHWAYS SHALL BE MAINTAINED, WHERE FEASIBLE, DURING CONSTRUCTION.
13. IF A CONFLICT ARISES BETWEEN THE SPECIFICATIONS AND THE PLANS NOTES, THE MORE STRINGENT REQUIREMENT SHALL GOVERN.
14. IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICES, THE CONTRACTOR WILL BE SOLELY AND COMPLETELY RESPONSIBLE FOR CONDITIONS OF THE JOB SITE. INCLUDING SAFETY OF ALL PERSONS AND PROPERTY DURING PERFORMANCE OF THE WORK. THIS REQUIREMENT WILL APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS.
15. THE DUTY OF THE ENGINEERS TO CONDUCT CONSTRUCTION REVIEW OF THE CONTRACTOR'S PERFORMANCE IS NOT INTENDED TO INCLUDE REVIEW OF THE ADEQUACY OF THE CONTRACTOR'S SAFETY MEASURES, IN, ON OR NEAR THE CONSTRUCTION SITE.
16. NEITHER THE FINAL PAYMENT, NOR THE PROVISIONS IN THE CONTRACT, NOR PARTIAL, NOR ENTIRE USE OR OCCUPANCY OF THE PREMISES BY THE OWNER SHALL CONSTITUTE AN ACCEPTANCE OF THE WORK NOT DONE IN ACCORDANCE WITH THE CONTRACT OR RELIEVES THE CONTRACTOR OF LIABILITY IN RESPECT TO ANY EXPRESS WARRANTIES OR RESPONSIBILITY FOR FAULTY MATERIAL OR WORKMANSHIP.
17. THE CONTRACTOR SHALL REMEDY ANY DEFECTS IN WORK AND PAY FOR ANY DAMAGE TO OTHER WORK RESULTING THERE FROM WHICH SHALL APPEAR WITHIN A PERIOD OF ONE (1) CALENDAR YEAR FROM THE DATE OF FINAL ACCEPTANCE OF THE WORK.
18. ALL WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE GEOTECHNICAL REPORT BY ROCKRIDGE GEOTECHNICAL, DATED 12–29–17, JOB # 17–1404

SITE FENCING NOTES:

1. CONTRACTOR SHALL PROVIDE A CONSTRUCTION FENCE AROUND THE ENTIRE AREA OF DEMOLITION AND CONSTRUCTION, INCLUDING ALL STAGING, STORAGE, CONSTRUCTION OFFICE AND LAYDOWN AREAS.
2. FENCE LOCATION MAY BE ADJUSTED FROM TIME TO TIME AS CONSTRUCTION PROCEEDS TO EXCLUDE SOME AREAS WHERE CONSTRUCTION WORK IS NOT BEING ONE AND THE AREA IS NOT OBJECTIONABLE IN VISUAL APPEARANCE, AT THE DISCRETION AND APPROVAL OF THE DISTRICT STAFF.
3. CONSTRUCTION FENCE SHALL BE A MINIMUM OF A 6' HIGH GALVANIZED CHAIN LINK FENCE WITH GREEN WINDSCREEN FABRIC ON THE OUTSIDE OF THE FENCE.
4. CONTRACTOR SHALL REPLACE THE GREEN FABRIC AT LEAST ONCE A YEAR OR AT SUCH A TIME AS IT BECOMES TATTERED AND UNSIGHTLY DUE TO WIND OR CONSTRUCTION ACTIVITIES.

DEMOLITION NOTES:

1. CONTRACTOR IS TO COMPLY WITH ALL GENERAL AND STATE REQUIREMENTS INVOLVING THE REMOVAL AND DISPOSAL OF HAZARDOUS MATERIAL(S).
2. THE CONTRACTOR SHALL LOCATE AND CLEARLY MARK (AND THEN PRESERVE THESE MARKERS) FOR THE DURATION OF CONSTRUCTION OF ALL TELEPHONE, DATA, STREET LIGHT, SIGNAL LIGHT AND POWER FACILITIES THAT ARE IN OR NEAR THE AREA OF CONSTRUCTION.
3. CONTRACTOR'S BID IS TO INCLUDE ALL VISIBLE SURFACE AND ALL SUBSURFACE FEATURES IDENTIFIED TO BE REMOVED OR ABANDONED IN THESE DOCUMENTS.
4. THE CONTRACTOR SHALL BE RESPONSIBLE FOR A SITE INSPECTION TO FULLY ACKNOWLEDGE THE EXTENT OF THE DEMOLITION WORK.
5. THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING ANY AND ALL PERMITS NECESSARY FOR ENCROACHMENT, GRADING, DEMOLITION, AND STATE JURISDICTIONS.
6. THE CONTRACTOR SHALL PAY ALL FEES ASSOCIATED WITH DISPOSAL OF MATERIALS.
7. BACKFILL ALL DEPRESSIONS AND TRENCHES FROM DEMOLITION OF FOUNDATIONS & UTILITIES TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER.
8. WITHIN LIMITS OF WORK, REMOVE CURBS, GUTTERS, LANDSCAPING, SIGNAGE, TREES, SCRUBS, ASPHALT, UNDERGROUND PIPES, ETC. AS INDICATED ON THE PLANS AND SPECIFICATIONS.
9. REMOVAL OF LANDSCAPING SHALL INCLUDE ROOTS AND ORGANIC MATERIALS TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER.
10. PRIOR TO BEGINNING DEMOLITION WORK ACTIVITIES, CONTRACTOR SHALL INSTALL EROSION CONTROL MEASURES OUTLINED IN THE EROSION PLAN & DETAILS.
11. CONTRACTOR SHALL BE RESPONSIBLE FOR DISPOSING ALL DEMOLITION MATERIALS, OR STORING SELECTED ITEMS BY OWNER'S REPRESENTATIVE AT DESIGNATED LOCATIONS.
12. THE CONTRACTOR SHALL MAINTAIN ALL SAFETY DEVICES, AND SHALL BE RESPONSIBLE FOR CONFORMANCE TO ALL LOCAL, STATE AND FEDERAL SAFETY AND HEALTH STANDARDS LAWS AND REGULATIONS.
13. THE CONTRACTOR SHALL PROTECT FROM DAMAGE ALL EXISTING IMPROVEMENTS FACILITIES AND STRUCTURES WHICH ARE TO REMAIN. ANY ITEMS DAMAGED BY THE CONTRACTOR OR HIS AGENTS OF ANY ITEMS REMOVED FOR HIS USE SHALL BE REPLACED IN EQUAL OR BETTER CONDITION AS APPROVED BY THE ARCHITECT OR OWNER'S REPRESENTATIVE.
14. COORDINATE WITH ELECTRICAL, MECHANICAL, LANDSCAPING AND ARCHITECTURAL DRAWINGS FOR UTILITY SHUT–DOWN / DISCONNECT LOCATIONS. CONTRACTOR IS TO SHUT OFF ALL UTILITIES AS NECESSARY PRIOR TO DEMOLITION. CONTRACTOR IS TO COORDINATE SERVICE INTERRUPTIONS WITH THE DEVELOPER / OWNER. DO NOT INTERRUPT SERVICES ADJACENT OFF–SITE OWNERS. ALSO SEE ARCHITECTURAL PLANS FOR ADDITIONAL DEMOLITION SCOPE OF WORK.
15. DEMOLITION INCLUDES REMOVAL OF ALL ITEMS ASSOCIATED WITH THE UTILITY, RETAINING WALL, FENCE, TREE OR BUILDING, INCLUDING BUT NOT LIMITED TO FOOTINGS, VALVES, ROOTS, BACKFILL, ETC. AND SHALL INCLUDE PREPARING THE SITE FOR NEW UTILITIES, BUILDINGS, RETAINING WALLS, ETC.
16. ALL MATERIALS TO BE DEMOLISHED AND REMOVED SHALL BECOME THE PROPERTY OF THE CONTRACTOR AND SHALL BE LAWFULLY DISPOSED OF OFF–SITE.
17. THE PLAN IS NOT INTENDED TO BE A COMPLETE CATALOGUE OF ALL EXISTING STRUCTURES AND UTILITIES. THIS PLAN INTENDS TO DISCLOSE GENERAL INFORMATION KNOWN BY THE ENGINEER AND TO SHOW THE LIMITS OF THE AREA WHERE WORK WILL BE PERFORMED. THIS PLAN SHOWS THE EXISTING FEATURES TAKEN FROM A FIELD SURVEY, FIELD INVESTIGATIONS AND AVAILABLE INFORMATION. THIS PLAN MAY OR MAY NOT ACCURATELY REFLECT THE TYPE OR EXTENT OF THE ITEMS TO BE ENCOUNTERED AS THEY ACTUALLY EXIST. WHERE EXISTING FEATURES ARE NOT SHOWN, IT IS IMPLIED THAT THEY ARE NOT TO BE DEMOLISHED OR REMOVED. THE CONTRACTOR SHALL PERFORM A THOROUGH FIELD INVESTIGATION AND REVIEW OF THE SITE WITHIN THE LIMIT OF WORK SHOWN IN THIS PLAN SET TO DETERMINE THE TYPE, QUANTITY AND EXTENT OF ANY AND ALL ITEMS. THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR DETERMINING THE EXTENT OF EXISTING STRUCTURES AND UTILITIES AND QUANTITY OR WORK INVOLVED IN REMOVING THESE ITEMS FROM THE SITE.
18. ALL ABANDONED BUILDINGS AND FOUNDATIONS, TREE (EXCEPT THOSE SPECIFIED TO REMAIN FOR LANDSCAPING PURPOSES), FENCES, VEGETATION AND ANY SURFACE DEBRIS SHALL BE REMOVED AND DISPOSED OF OFF THE SITE BY THE CONTRACTOR.
19. ALL ABANDONED SEPTIC TANKS AND ANY OTHER SUBSURFACE STRUCTURES EXISTING IN PROPOSED DEVELOPMENT AREAS SHALL BE REMOVED PRIOR TO ANY GRADING OR FILL OPERATION. ALL APPURTENANT DRAIN FIELDS AND OTHER CONNECTING LINES MUST ALSO BE TOTALLY REMOVED.
20. ALL ABANDONED UNDERGROUND IRRIGATION OR UTILITY LINES SHALL BE REMOVED OR DEMOLISHED. THE APPROPRIATE FINAL DISPOSITION OF SUCH LINES DEPEND UPON THEIR DEPTH AND LOCATION AND THE METHOD OF REMOVAL OR DEMOLITION SHALL BE DETERMINED BY THE SOILS ENGINEER. ONE OF THE FOLLOWING METHODS WILL BE USED:

A. EXCAVATE AND TOTALLY REMOVE THE UTILITY LINE FROM THE TRENCH.

B. EXCAVATE AND CRUSH THE UTILITY LINE IN THE TRENCH.

C. CAP THE ENDS OF THE UTILITY LINE WITH CONCRETE TO PREVENT THE ENTRANCE OF WATER. THE LOCATIONS AT WHICH THE UTILITY LINE WILL BE CAPPED WILL BE DETERMINED BY THE CITY ENGINEER. THE LENGTH OF THE CAP SHALL NOT BE LESS THAN FIVE FEET, AND THE CONCRETED MIX EMPLOYED SHALL HAVE MINIMUM SHRINKAGE.

EXISTING CONDITIONS:

1. EXISTING TOPOGRAPHIC SURVEY PERFORMED BY LEA & BRAZE ENGINEERING INC SURVEYING ON DECEMBER 2018 (JOB #2171135 SU) GRADES ENCOUNTERED ON–SITE MAY VARY FROM THOSE SHOWN. CONTRACTOR SHALL REVIEW THE PLANS AND CONDUCT FIELD INVESTIGATIONS AS REQUIRED TO VERIFY EXISTING CONDITIONS AT THE PROJECT SITE.

SURVEYOR'S NOTES:

THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY ARE APPROXIMATE AND WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES. HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF IT'S DELINEATE OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED. BUT WHICH ARE NOT SHOWN ON THIS SURVEY.

GRADING AND EARTHWORK NOTES:

1. ALL PAVED AREAS ARE TO SLOPE AT A MINIMUM OF 1 %. ACCESSIBLE STALLS AND LOADING ZONES ARE TO SLOPE AT A MAXIMUM OF 2% IN ANY DIRECTION AND ACCESSIBLE PATHWAYS ARE TO SLOPE AT A MAXIMUM OF 8.33% WITH A MAXIMUM CROSS SLOPE OF 2 %. ANY AREAS ON THE SITE NOT CONFORMING TO THESE BASIC RULES DUE TO EXISTING CONDITIONS OR DISCREPANCIES IN THE DOCUMENTS ARE TO BE REPORTED T OTHER ARCHITECT/ENGINEER PRIOR TO PROCEEDING WITH FORMWORK FOR CURBS AND/OR FLATWORK.
2. CONTRACTOR SHALL DETERMINE EARTHWORK QUANTITIES BASED ON THE TOPOGRAPHIC SURVEY, THE SOILS INVESTIGATION AND THE PROPOSED SURFACE GRADES AND BASE THE BID ACCORDINGLY. ANY DIFFERENCES BETWEEN THE STATE IN WHICH THE PROJECT SITE IS DELIVERED TO THE CONTRACTOR AND THESE DOCUMENTS SHOULD BE NOTED TO THE CIVIL ENGINEER.
3. ALL FILL SHALL BE COMPACTED PER THE CONSTRUCTION SPECIFICATIONS AND THE CONTRACTOR SHALL COORDINATE AND COMPLY WITH THE OWNERS TESTING AGENCY TO TAKE THE APPROPRIATE TEST TO VERIFY COMPACTION VALUES.
4. IMPORT SOILS MUST MEET THE REQUIREMENTS OF THE SOILS REPORT AND SPECIFICATIONS.
5. COORDINATE THE PLACEMENT OF ALL SLEEVES FOR LANDSCAPE IRRIGATION (WATER AND CONTROL WIRING) AND STREET LIGHTING PRIOR TO THE PLACEMENT OF ANY ASPHALT, BASEROCK, OR CONCRETE SURFACING. SEE LANDSCAPE AND SITE ELECTRICAL DRAWINGS.
6. DO NOT ADJUST GRADES ON THIS PLAN WITHOUT PRIOR WRITTEN APPROVAL OF ENGINEER
7. SPOT ELEVATIONS ARE TO FINISHED SURFACE.
8. TOP OF CONCRETE CURBS ARE 0.50" ABOVE TOP OF PAVING ELEVATIONS, U.N.O.
9. ROUGH GRADING TO BE WITHIN 0.1' AND FINISH GRADES ARE TO BE WITH IN 0.05'.
10. AFTER STAKING FOR HORIZONTAL CONTROL CONTRACTOR SHALL FIELD CHECK ALL ELEVATIONS MARKED WITH (E) AND REPORT ANY DISCREPANCIES GREATER THEN 0.05' TO ARCH/ENGR.
11. ALL EXISTING UTILITY STRUCTURES WITHIN THE AREA OF WORK SHALL HAVE THE LIDS, GRATES, COVERS, ETC. ADJUSTED TO BE FLUSH WITH FINISHED GRADES, CONTRACTOR SHALL IDENTIFY ALL SUCH ITEMS BY USE OF THESE PLANS AND THOROUGH FIELD INVESTIGATION.
12. GEOTECHNICAL CONSULTANT TO BE NOTIFIED OF DELIVERY OF ALL IMPORTED SOILS TO SITE FOR HIS/HER INSPECTION AND APPROVAL PRIOR TO PLACING BY CONTRACTOR.
13. THESE SPECIFICATIONS AND APPLICABLE PLANS PERTAIN TO AND INCLUDE ALL SITE GRADING AND EARTHWORK ASSOCIATED WITH THE PROJECT INCLUDING, BUT NOT LIMITED TO THE FURNISHING OF ALL LABOR, TOOLS AND EQUIPMENT NECESSARY FOR SITE CLEARING AND GRUBBING, SITE PREPARATION, DISPOSAL OF EXCESS OR UNSUITABLE MATERIAL, STRIPPING, KEYING, EXCAVATION, OVER EXCAVATION, RECOMPACTION PREPARATION FOR SOIL RECEIVING FILL, PAVEMENT, FOUNDATION OF SLABS, EXCAVATION, IMPORTATION OF ANY REQUIRED FILL MATERIAL, PROCESSING, PLACEMENT AND COMPACTION OF FILL AND SUBSIDIARY WORK NECESSARY TO COMPLETE THE GRADING TO CONFORM TO THE LINES, GRADING AND SLOPE SHOWN ON THE PROJECT GRADING PLANS.
14. ALL FILL MATERIALS SHALL BE DENSIFIED SO AS TO PRODUCE A DENSITY NOT LESS THAN 90% RELATIVE COMPACTION BASED UPON ASTM TEST DESIGNATION D1557. FIELD DENSITY TEST WILL BE PERFORMED IN ACCORDANCE WITH ASTM TEST DESIGNATION 2922 AND 3017. THE LOCATION AND FREQUENCY OF THE FIELD DENSITY TEST WILL BE AS DETERMINED BY THE SOIL ENGINEER. THE RESULTS OF THESE TEST AND COMPLIANCE WITH THE SPECIFICATIONS WILL BE THE BASIS UPON WHICH SATISFACTORY COMPLETION OF THE WORK WILL BE JUDGED BY THE SOIL ENGINEER. ALL CUT AND FILL SLOPES SHALL BE CONSTRUCTED AS SHOWN ON PLANS, BUT NO STEEPER THAN TWO (2) HORIZONTAL TO ONE (1) VERTICAL.
15. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE SATISFACTORY COMPLETION OF ALL THE EARTHWORK IN ACCORDANCE WITH THESE PLANS AND SPECIFICATIONS. NO DEVIATION FROM THESE SPECIFICATIONS SHALL BE MADE EXCEPT UPON WRITTEN APPROVAL BY THE SOILS ENGINEER. BOTH CUT AND FILL AREAS SHALL BE SURFACE COMPLETED TO THE SATISFACTION OF THE SOILS ENGINEER AT THE CONCLUSION OF ALL GRADING OPERATIONS AND PRIOR TO FINAL ACCEPTANCE. THE CONTRACTOR SHALL NOTIFY THE SOILS ENGINEER AT LEAST TWO (2) WORKING DAYS PRIOR TO DOING ANY SITE GRADING AND EARTHWORK INCLUDING CLEARING.

STORM DRAIN NOTES:

1. ALL STORM DRAIN PIPE SHALL BE PVC SDR 35, SLOPED AT 2% UNLESS OTHERWISE SPECIFIED ON THE PLANS. PIPE SHALL BE SIZED AS SPECIFIED ON THE PLANS. ALL DIRECTION CHANGES SHALL BE MADE WITH A WYE CONNECTION OR LONG SWEEP ELBOWS, REGULAR ELBOWS, AND TEE'S SHOULD BE AVOIDED.
2. USE DETECTABLE METALIZED WARNING TAPE APPROXIMATE 6" BELOW THE SURFACE. TAPE SHALL BE A BRIGHT COLOR AND IMPRINTED WITH "CAUTION– STORM DRAIN LINE BELOW", CALPICO TYPE 2 OR EQUAL.
3. PAINT THE TOP OF THE CURBS ADJACENT TO EACH CATCH BASIN INSTALLED UNDER THE WORK OR ADJACENT TO THIS SITE WITH THE WORDS "NO DUMPING". WORDING TO BE BLUE 4" HIGH LETTERS ON A PAINTED WHITE BACKGROUND.
4. ALL AREA DRAINS AND CATCH BASINS GRATES WITHIN PEDESTRIAN ACCESSIBLE AREAS SHALL MEET ADA REQUIREMENTS.
5. ALL TRENCHES SHALL BE BACKFILLED PER THE SPECIFICATIONS WITH APPROPRIATE TEST BY THE GEOTECHNICAL ENGINEER TO VERIFY COMPACTION VALUES.
6. FOR GRAVITY FLOW SYSTEMS CONTRACTOR SHALL VERIFY (POTHOLE IF NECESSARY) SIZE, MATERIAL, LOCATION AND DEPTH OF ALL SYSTEMS ARE TO BE CONNECTED TO OR CROSSED PRIOR TO TRENCHING OR INSTALLATION OF ANY GRAVITY FLOW SYSTEM.
7. COMPLETE SYSTEMS; ALL UTILITY SYSTEMS ARE DELINEATED IN SCHEMATIC MANNER ON THESE PLANS. CONTRACTOR IS TO PROVIDE ALL FITTINGS, ACCESSORIES, AND WORK NECESSARY TO COMPLETE THE UTILITY SYSTEM SO THAT IT IS FULLY FUNCTIONING FOR THE PURPOSE INTENDED.
8. PRIVATE STORM DRAIN LINE 4–INCH THROUGH 12– INCH WITH A MINIMUM OF TWO (2) FEET OF COVER IN NON–TRAFFIC AREAS SHALL BE POLYVINYL CHLORIDE (PVC) SDR 35.
9. PRIVATE STORM DRAIN LINE 6–INCH THROUGH 12–INCH WITH LESS THAN 3 FEET OF COVER IN VEHICULAR TRAFFIC AREAS SHALL BE POLYVINYL CHLORIDE (PVC) C900, RATED 150 PSI CLASS PIPE.

10 ALL DOWN SPOUTS SHALL DISCHARGE DIRECTLY ON TO ADJACENT IMPERVIOUS SURFACES OR SPLASH BLOCKS UNLESS OTHERWISE NOTED ON PLANS. SEE ARCHITECTURE PLANS FOR EXACT LOCATION OF THE DOWN SPOUTS.

STORM WATER POLLUTIONS PREVENTION REQUIREMENTS:

1. STORE, HANDLE, AND DISPOSE OF CONSTRUCTION MATERIALS AND WASTES PROPERLY, SO AS TO PREVENT THEIR CONTACT WITH STORMWATER.
2. CONTROL AND PREVENT THE DISCHARGE OF ALL POTENTIAL POLLUTANTS, INCLUDING SOLID WASTES, PAINTS, CONCRETE, PETROLEUM PRODUCTS, CHEMICALS, WASH WATER OR SEDIMENT, AND NON–STORMWATER DISCHARGES TO STORM DRAINS AND WATER COURSES.
3. USE SEDIMENT CONTROL OR FILTRATION TO REMOVE SEDIMENT FROM DEWATERING EFFLUENT.
4. AVOID CLEANING, FUELING, OR MAINTAINING VEHICLES ON SITE, EXCEPT IN A DESIGNATED AREA IN WHICH RUNOFF IS CONTAINED AND TREATED.
5. DELINEATE CLEARING LIMITS, EASEMENTS, SETBACKS, SENSITIVE OR CRITICAL AREAS, BUFFER ZONES, TREES AND DISCHARGE COURSE WITH FIELD MARKERS.
6. PROTECT ADJACENT PROPERTIES AND UNDISTURBED AREAS FROM CONSTRUCTION IMPACTS USING VEGETATIVE BUFFER STRIPS, SEDIMENT BARRIERS OF FILTERS, DIKES, MULCHING, OR OTHER MEASURES AS APPROPRIATE.
7. PERFORM CLEARING AND EARTH MOVING ACTIVITIES DURING DRY WEATHER TO THE MAXIMUM EXTENT PRACTICAL.
8. LIMIT AND TIME APPLICATIONS OF PESTICIDES AND FERTILIZERS TO PREVENT POLLUTED RUNOFF.
9. LIMIT CONSTRUCTION ACCESS ROUTES AND STABILIZE DESIGNATED ACCESS POINTS.
10. AVOID TRACKING DIRT OR MATERIALS OFF–SITE; CLEAN OFF–SITE PAVED AREAS AND SIDEWALKS USING DRY SWEEPING METHODS TO THE MAXIMUM EXTENT PRACTICAL.
11. ALL CONSTRUCTION ON OFF–SITE IMPROVEMENTS SHALL ADHERE TO BEST MANAGEMENT PRACTICES TO PREVENT DELETERIOUS MATERIALS OR POLLUTANTS FROM ENTERING THE CITY OR COUNTY STORM DRAIN SYSTEM.
12. SWEEP ALL GUTTERS AT THE END OF EACH WORKING DAY. GUTTERS SHALL BE KEPT CLEAN AFTER LEAVING CONSTRUCTION SITE.

SUPPLEMENTAL MEASURES:

A. THE PHRASE "NO DUMPING – DRAINS TO BAY" OR EQUALLY EFFECTIVE PHRASE MUST BE LABELED ON STORM DRAIN INLETS (BY STENCILING, BRANDING, OR PLAQUES) TO ALERT THE PUBLIC TO THE DESTINATION OF STORM WATER AND TO PREVENT DIRECT DISCHARGE OF POLLUTANTS INTO THE STORM DRAIN.

B. USING FILTRATION MATERIALS ON STORM DRAIN COVERS TO REMOVE SEDIMENT FROM DEWATERING EFFLUENT.

C. STABILIZING ALL DENUDED AREAS AND MAINTAINING EROSION CONTROL MEASURES CONTINUOUSLY FROM OCTOBER 15 AND APRIL 15.

D. REMOVING SPOILS PROMPTLY, AND AVOID STOCKPILING OF FILL MATERIALS, WHEN RAIN IS FORECAST. IF RAIN THREATENS, STOCKPILED SOILS AND OTHER MATERIALS SHALL BE COVERED WITH A TARP OR OTHER WATERPROOF MATERIAL.

E. STORING, HANDLING, AND DISPOSING OF CONSTRUCTION MATERIALS AND WASTES SO AS TO AVOID THEIR ENTRY TO THE STORM DRAIN SYSTEMS OR WATER BODY.

F. AVOIDING CLEANING, FUELING, OR MAINTAINING VEHICLES ON–SITE, EXCEPT IN AN AREA DESIGNATED TO CONTAIN AND TREAT RUNOFF.

SITE MAINTENANCE:

1. REMOVE ALL DIRT, GRAVEL, RUBBISH, REFUSE, AND GREEN WASTE FROM STREET PAVEMENT AND STORM DRAINS ADJOINING THE SITE. LIMIT CONSTRUCTION ACCESS ROUTES ONTO THE SITE AND PLACE GRAVEL PADS AT THESE LOCATIONS. DO NOT DRIVE VEHICLES AND EQUIPMENT OFF THE PAVED OR GRAVELED AREAS DURING WET WEATHER.
2. SWEEP OR VACUUM THE STREET PAVEMENT AND SIDEWALKS ADJOINING THE PROJECT SITE AND THE ON–SITE PAVED AREAS ON A DAILY BASIS. SCRAPE C CAKED–ON MUD AND DIRT FROM THESE AREAS BEFORE SWEEPING. CORNERS AND HARD TO REACH AREAS SHALL BE SWEPT MANUALLY.
3. CONTRACTOR SHALL: GATHER ALL CONSTRUCTION DEBRIS ON A REGULAR BASIS AND PLACE IT IN A DUMPSTER OR OTHER CONTAINER WHICH IS EMPTIED OR REMOVED ON A REGULAR BASIS. WHEN APPROPRIATE, USE TARPS ON THE GROUND TO COLLECT FALLEN DEBRIS OR SPLATTERS THAT COULD CONTRIBUTE TO STORM WATER RUNOFF POLLUTION.
4. IF THE STREET, SIDEWALKS AND/OR PARKING LOT ARE PRESSURE WASHED, DEBRIS MUST BE TRAPPED AND COLLECTED TO PREVENT ENTRY INTO THE STORM DRAIN SYSTEM. NO CLEANING AGENT MAY BE DISCHARGED INTO THE STORM DRAIN. IF ANY CLEANING AGENT OR DEGREASER IS USED, WASHED WATER MUST BE COLLECTED AND DISCHARGED TO THE SANITARY SEWER, SUBJECT TO THE APPROVAL OF THE OWNER'S PROJECT MANAGER, OR OTHERWISE DISPOSED OF THROUGH APPROVED DISPOSAL METHODS.
5. CREATE A CONTAINED AND COVERED AREA ON THE SITE FOR THE STORAGE OF BAGS, CEMENT, PAINTS, OILS, FERTILIZERS, PESTICIDES, OR OTHER MATERIAL USED ON THE SITE THAT HAVE THE POTENTIAL OF BEING WIND–BLOWN OR IN THE EVENT OF A MATERIAL SPILL.
6. NEVER CLEAN MACHINERY, EQUIPMENT OR TOOLS INTO A STREET, GUTTER OR STORM DRAIN.
7. ENSURE THAT CEMENT TRUCKS, PAINTERS, OR STUCCO/PLASTER FINISHING CONTRACTORS DO NOT DISCHARGE WASH WATER FROM EQUIPMENT, TOOLS OR RINSE CONTAINERS INTO GUTTERS OR DRAINS.
8. THE ON–SITE STORM DRAIN FACILITIES SHALL BE CLEANED A MINIMUM OF TWICE A YEAR AS FOLLOWS: IMMEDIATELY PRIOR TO OCTOBER 15TH AND ONCE IN JANUARY. ADDITIONAL CLEANING MAY BE REQUIRED IF FOUND NECESSARY BY THE CITY ENGINEER/INSPECTOR. CONTRACTOR SHALL BE RESPONSIBLE FOR COST ASSOCIATED WITH CLEANING.
9. PREVENT DUST FROM LEAVING THE SITE AND ACCUMULATING ON ADJACENT AREAS AS REQUIRED IN THE DUST CONTROL NOTES ON THIS SHEET.
10. PREVENT SEDIMENT LADEN STORM RUN–OFF FROM LEAVING THE SITE OR ENTERING STORM DRAIN OR SANITARY SEWER SYSTEMS AS REQUIRED IN THE EROSION AND SEDIMENTATION CONTROL NOTES ON THIS SHEET.
11. MAINTAIN EXISTING TREES AND PLANTS THAT ARE TO REMAIN AS REQUIRED BY THE TREE AND PLANT PROTECTION NOTES ON THE SHEET.

NOTE:
THESE NOTES ARE INTENDED TO BE USED AS A GENERAL GUIDELINE. THE REFERENCED SOILS REPORT FOR THE PROJECT AND GOVERNING AGENCY GRADING ORDINANCE SHALL SUPERSEDE THESE NOTES. THE SOILS ENGINEER MAY MAKE ON–SITE RECOMMENDATIONS DURING GRADING OPERATIONS.

DUST CONTROL NOTES:

1. WATER TRUCKS SHALL BE PRESENT AND IN USE AT THE CONSTRUCTION SITE. ALL PORTIONS OF THE SITE SUBJECT TO BLOWING DUST SHALL BE WATERED AS OFTEN AS DEEMED NECESSARY BY THE APPROPRIATE GOVERNMENTAL AGENCY IN ORDER TO ENSURE PROPER CONTROL OF BLOWING DUST FOR THE DURATION OF THE PROJECT.
2. WATERING ASSOCIATED WITH ON-SITE CONSTRUCTION ACTIVITY SHALL TAKE PLACE BETWEEN THE ESTABLISHED CONSTRUCTION HOURS AND SHALL INCLUDE AT LEAST ONE LATE-AFTERNOON WATERING TO MINIMIZE THE EFFECTS OF BLOWING DUST.
3. ALL PUBLIC STREETS AND MEDIANS SOILED OR LITTERED DUE TO THIS CONSTRUCTION ACTIVITY SHALL BE CLEANED AND SWEPT ON A DAILY BASIS DURING THE WORK WEEK, OR AS OFTEN AS DEEMED NECESSARY BY THE OWNER'S ENGINEER/INSPECTOR, TO THE SATISFACTION OF THE CITY'S DEPARTMENT OF PUBLIC WORKS.
4. WATERING ON PUBLIC STREETS OR POWER WASHING SEDIMENTATION ON STREETS SHALL NOT OCCUR, UNLESS CONTRACTOR COLLECTS AND FILTERS THE WASH WATER PRIOR TO ITS ENTERING THE CITY'S STORM DRAIN SYSTEM.
5. ON-SITE PAVED ACCESS ROADS, PARKING AREAS AND STAGING AREAS SHALL BE SWEPT DAILY WITH A WATER SWEEPER.
6. WHEEL WASHERS SHALL BE INSTALLED AND USED TO CLEAN ALL TRUCKS AND EQUIPMENT LEAVING THE CONSTRUCTION SITE. IF WHEEL WASHERS CANNOT BE INSTALLED, TIRES OR TRACKS OF ALL TRUCKS AND EQUIPMENT SHALL BE WASHED OFF BEFORE LEAVING THE CONSTRUCTION SITE.
7. GRADING OR ANY OTHER OPERATIONS THAT CREATES DUST SHALL BE STOPPED IMMEDIATELY IF DUST AFFECTS ADJACENT PROPERTIES. THE CONTRACTOR SHALL PROVIDE SUFFICIENT DUST CONTROL FOR THE ENTIRE PROJECT SITE IN ACCORDANCE WITH THE PROJECT SWPPP AT ALL TIMES. THE SITE SHALL BE SPRINKLERED AS NECESSARY TO PREVENT DUST NUISANCE. IN THE EVENT THAT THE CONTRACTOR NEGLECTS TO USE ADEQUATE MEASURES TO CONTROL DUST. THE CITY RESERVES THE RIGHT TO TAKE WHATEVER MEASURES ARE NECESSARY TO CONTROL DUST AND CHARGE THE COST TO THE CONTRACTOR.
8. THE PERMITEE IS RESPONSIBLE FOR DUST CONTROL MEASURES AND FOR OBTAINING ALL REQUIRED PERMITS AND APPROVALS. ALL GRADING OPERATIONS SHALL BE SUSPENDED DURING SECOND (OR WORSE) STAGE SMOG ALERTS.
9. ALL TRUCKS HAULING SOIL, SAND, AND OTHER LOOSE MATERIALS SHALL BE COVERED WITH TARPAULINS OR OTHER EFFECTIVE COVERS.

EARTHWORK QUANTITY NOTES:

1. THE CONTRACTOR IS RESPONSIBLE FOR DETERMINING THE QUANTITIES OF ALL FORMS OF EARTHWORK ON THIS PROJECT AND BASING THE BID ON THOSE QUANTITIES WITH FULL KNOWLEDGE THAT ADDITIONAL PROCESSES – INCLUDING ENGINEERING – AND QUANTITIES ARE ALSO TO BE INCLUDED IN THE BID PER THE FOLLOWING NOTES.
2. THE CONTRACTOR SHALL MAKE AN INITIAL DETERMINATION OF THE QUANTITIES, BASED ON A DETAILED SITE VISIT. THE TOPOGRAPHIC SURVEY, THE GEOTECHNICAL REPORT, THE FINISH GRADES SHOWN ON THESE DRAWINGS, THE SIZE AND EXTENT OF FOOTINGS, THE PREPARATION AND MATERIALS USED FOR BUILDING SLABS, PAVEMENT SECTIONS, AND THE SIZE AND DEPTH OF UTILITY TRENCHES, INCLUDING THE UTILITY CONTRACTORS ANTICIPATED RE-USE OF EXISTING MATERIAL FOR BACKFILL IF ANY.
3. THE CONTRACTOR SHALL MEET THE GRADES SHOWN ON THE DRAWINGS, ADJUSTING THE AMOUNT OF IMPORT OR EXPORT AS REQUIRED TO DO SO. NO ASSUMPTIONS SHOULD BE MADE ABOUT THE SITE BALANCING. NO ADJUSTMENTS TO THE GRADE SHALL BE PERMITTED UNLESS SPECIFICALLY APPROVED BY THE ARCH/ENGR IN WRITING AFTER THE IMPACT OF ANY GRADE CHANGES (IMPACT TO RAMPS, STAIRS, WORK BY OTHERS, ETC.) HAS BEEN THOROUGHLY REVIEWED BY THE ARCH/ENGR. WHEN PREPARING THE EARTHWORK BIDS, DO NOT ASSUME ANY CHANGES TO THE FINISHED GRADES SHOWN ON THESE DRAWINGS WILL BE PERMITTED.

RECORD DRAWINGS:

1. THE CONTRACTOR SHALL KEEP UP-TO-DATE AND ACCURATE A COMPLETE RECORD SET OF PRINTS OF THE CONTRACT DRAWINGS SHOWING EVERY CHANGE FROM THE ORIGINAL DRAWINGS MADE DURING THE COURSE OF CONSTRUCTION INCLUDING EXACT FINAL LOCATION, ELEVATION, SIZES, MATERIALS, AND DESCRIPTION OF ALL WORK. RECORDS SHALL BE "REDLINED" ON A SET OF CONSTRUCTION PLAN DRAWINGS. PRINTS SHALL BE SUBMITTED TO THE CITY ENGINEER AND DEVELOPERS CIVIL ENGINEER PRIOR TO FINAL ACCEPTANCE FOR REVIEW AND APPROVAL BY THE CITY/TOWN ENGINEER AND DEVELOPER'S CIVIL ENGINEER.

SIGNING & STRIPING NOTES:

1. ALL SIGNING AND STRIPING TO BE PER CALTRANS STANDARDS UNLESS NOTED TO BE PER CITY STANDARDS.
2. ALL SIGNS FOR MOTORIST DIRECTIONS SHALL BE METAL WITH BEADED REFLECTIVE PAINT. SUPPORTING POSTS SHALL BE 2-1/2" DIAMETER GALVANIZED PIPE CAST INTO A 10" DIAMETER BY 24" DEEP CONCRETE FOOTING BOTTOM OF SIGN SHALL BE 72" ABOVE FINISH GRADE, UNLESS NOTED OTHERWISE.
3. WHERE THE FOLLOWING SYMBOLS OCCUR ON THE DRAWINGS PROVIDE THE SPECIFIED SIGNING AND/OR STRIPING.

A. PROVIDE A VAN ACCESSIBLE STALL WITH BOTH PAVEMENT MARKINGS AND FREE-STANDING SIGN AS IDENTIFIED IN DETAIL:

B. PROVIDE CALTRANS TYPE IV(L) (RSP A24A)

C. PROVIDE CALTRANS TYPE IV(R) (RSP A24A)

D. PROVIDE 1' WIDE x 10' LONG WHITE LINE W/ CALTRANS A24D STOP MARKER

E. FIRE LANE – MUST BE PAINTED RED WITH "FIRE LANE NO PARKING". 3" HEIGHT WHITE LETTER EVERY 25'.

F. LOADING AND UNLOADING ZONE – MUST BE PAINTED YELLOW WITH "LOADING / UNLOADING NO PARKING". 3" HEIGHT LETTER EVERY 25'.

4. TRAFFIC SHALL BE MAINTAINED AT ALL TIMES AND SHALL BE PROTECTED WITH ADEQUATE BARRICADES, LIGHTS, SIGNS AND WARNING DEVICES AS PER THE CURRENT STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION, MANUAL OF TRAFFIC CONTROLS AND TO THE DIRECTION OF THE CITY'S INSPECTOR.

GENERAL UTILITY SYSTEM NOTES:

1. ALL TRENCHES SHALL BE BACKFILLED PER THE GEOTECHNICAL ENGINEER RECCOMMENDATIONS.
2. CLEAN OUTS, CATCH BASINS AND AREA DRAINS ARE TO BE ACCURATELY LOCATED BY THEIR RELATIONSHIP TO THE BUILDING, FLATWORK, ROOF DRAINS, AND/OR CURB LAYOUT, NOT BY THE LENGTH OF PIPE SPECIFIED IN THE DRAWINGS (WHICH IS APPROXIMATE).
3. CONTRACTOR SHALL STAKE LOCATION OF ABOVE GROUND UTILITY EQUIPMENT (BACKFLOW PREVENTOR, SATELLITE DISH, TRANSFORMER, GAS METER, ETC.) AND MEET WITH OWNER TO REVIEW LOCATION PRIOR TO INSTALLATION. PLANNING DEPARTMENT MUST SPECIFICALLY AGREE WITH LOCATION PRIOR TO PROCEEDING WITH THE INSTALLATION.
4. CONTRACTOR SHALL PREPARE AN ACCURATE COMPOSITE UTILITY PLAN THAT TAKES INTO ACCOUNT THE ACTUAL LOCATION OF EXISTING UTILITIES AS DETERMINED DURING THE DEMOLITION WORK. THE UTILITIES SHOWN ON THE CIVIL DRAWINGS, AND THE SITE POWER, CONDUITS AND LIGHTING SHOWN ON THE ELECTRICAL PLANS. THE FIRE SPRINKLER SYSTEM SHALL BE INCLUDED AS DESIGNED BY THE DESIGN/BUILD UNDERGROUND FIRE SPRINKLER CONTRACTOR.
5. CATHODIC PROTECTION MAY BE REQUIRED ON ALL METALLIC FITTINGS AND ASSEMBLIES THAT ARE IN CONTACT WITH SOIL, IF RECOMMENDED BY THE GEOTECHNICAL REPORT. CONTRACTOR IS RESPONSIBLE TO FULLY ENGINEER AND INSTALL THIS SYSTEM AND COORDINATE ANODE AND TEST STATION LOCATIONS WITH THE OWNER'S PROJECT MANAGER.
6. COMPLETE SYSTEMS: ALL UTILITY SYSTEMS ARE DELINEATED IN A SCHEMATIC MANNER ON THESE PLANS. CONTRACTOR IS TO PROVIDE ALL FITTINGS, ACCESSORIES, AND WORK NECESSARY TO COMPLETE THE UTILITY SYSTEM SO THAT IT IS FULLY FUNCTIONING FOR THE PURPOSE INTENDED.
7. UNDERGROUND UTILITIES OR STRUCTURES ARE SHOWN IN THEIR APPROXIMATE LOCATIONS AND EXTENT BASED UPON RECORD INFORMATION. LOCATIONS MAY NOT HAVE BEEN VERIFIED IN THE FIELD AND NO GUARANTEE IS MADE ON THE ACCURACY OR COMPLETENESS FOR THE INFORMATION SHOWN. THE OWNER, BY ACCEPTING THESE PLANS OR PROCEEDING WITH IMPROVEMENTS PURSUANT THERETO, AGREES TO ASSUME LIABILITY AND TO HOLD THE UNDERSIGNED HARMLESS FOR ANY DAMAGES RESULTING FROM THE EXISTENCE OF UNDERGROUND UTILITIES OR STRUCTURES NOT REPORTED TO THE UNDERSIGNED; NOT INDICATED ON THE PUBLIC RECORDS EXAMINED, LOCATED AT VARIANCE WITH THOSE REPORTED OR SHOWN ON RECORDS EXAMINED.
8. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING ALL UTILITIES FROM DAMAGE DURING COMPACTION OF ROADWAY SUBGRADE AND PRIOR TO PLACEMENT OF FINAL PAVEMENT SECTIONS.
9. CONTRACTOR SHALL VERIFY ALL EXISTING INVERT ELEVATIONS FOR STORM DRAIN AND SANITARY SEWER CONSTRUCTION PRIOR TO COMMENCEMENT OF ANY WORK. ALL WORK FOR STORM AND SANITARY SEWER INSTALLATION SHALL BEGIN AT THE DOWNSTREAM CONNECTION POINT. THIS WILL ALLOW FOR ANY NECESSARY ADJUSTMENTS TO BE MADE PRIOR TO THE INSTALLATION OF THE ENTIRE LINE. IF THE CONTRACTOR FAILS TO BEGIN AT THE DOWNSTREAM CONNECTION POINT AND WORKS UP STREAM, HE SHALL PROCEED AT HIS OWN RISK AND BE RESPONSIBLE FOR ANY ADJUSTMENTS NECESSARY. CONTRACTOR SHALL VERIFY LOCATION OF SANITARY SEWER LATERAL WITH OWNER PRIOR TO CONSTRUCTION.
10. EXISTING UTILITY CROSSINGS OF THE NEW PIPELINE ARE SHOWN ACCORDING TO THE BEST AVAILABLE INFORMATION. GAS, WATER AND SEWER, SERVICE LATERALS ARE SHOWN ACCORDING TO THE BEST AVAILABLE INFORMATION. THE CONTRACTOR SHALL VERIFY THE TYPE, SIZE, LOCATION, AND DEPTH OF ALL EXISTING UTILITIES (BOTH MAINS AND LATERALS) ARE CORRECT AS SHOWN. NO GUARANTEE IS MADE THAT ALL EXISTING UTILITIES (BOTH MAINS AND LATERALS) ARE SHOWN. THE CONTRACTOR SHALL EXERCISE CAUTION WHEN EXCAVATING AND SHALL PROTECT ALL EXISTING UTILITIES (BOTH MAINS AND LATERALS) FROM DAMAGE DUE TO HIS OPERATION.
11. CONTRACTOR SHALL UNCOVER AND EXPOSE ALL EXISTING UTILITY AND SEWER LINES WHERE THEY ARE TO BE CROSSED ABOVE OR BELOW BY THE NEW FACILITY BEING CONSTRUCTED IN ORDER TO VERIFY THE GRADE AND TO ENSURE THAT THERE IS SUFFICIENT CLEARANCE.

    VERTICAL SEPARATION REQUIREMENTS:
    A MINIMUM OF SIX (6) INCHES VERTICAL CLEARANCE SHALL BE PROVIDED BETWEEN CROSSING UTILITY PIPES, EXCEPT THAT THE MINIMUM VERTICAL CLEARANCE BETWEEN WATER AND SANITARY SEWER PIPELINES SHALL BE 12 INCHES AND ALL NEW WATER PIPES SHALL BE TYPICALLY INSTALLED TO CROSS ABOVE/OVER EXISTING SANITARY SEWER PIPELINES.

    WHERE NEW WATER PIPELINES ARE REQUIRED TO CROSS UNDER EXISTING AND/OR NEW SANITARY SEWER PIPELINES, THE MINIMUM VERTICAL SEPARATION SHALL BE 12 INCHES. WATER LINE PIPE ENDS SHALL BE INSTALLED NO CLOSER THAN 10' MINIMUM HORIZONTAL DISTANCE FROM CENTERLINE OF UTILITY CROSSINGS WHERE FEASIBLE.

    HORIZONTAL SEPARATION REQUIREMENTS:
12. A MINIMUM HORIZONTAL SEPARATION BETWEEN NEW PIPELINES AND ANY EXISTING UTILITIES SHALL BE 5' FEET EXCEPT THAT THE MINIMUM HORIZONTAL SEPARATION FOR WATER AND SANITARY SEWER PIPELINES SHALL BE 10' MINIMUM, UNLESS OTHERWISE NOTED.

    A MINIMUM HORIZONTAL SEPARATION BETWEEN NEW PIPELINES AND JOINT TRENCH SHALL BE 5 FEET.

    THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTACTING APPROPRIATE UTILITIES AND REQUESTING VERIFICATION OF SERVICE POINTS, FIELD VERIFICATION OF LOCATION, SIZE, DEPTH, ETC. FOR ALL THEIR FACILITIES AND TO COORDINATE WORK SCHEDULES.

GENERAL UTILITY SYSTEM NOTES:

1. THE UNDERGROUND FIRE PROTECTION SYSTEM SHOWN ON THIS DRAWING IS SCHEMATIC AND IS NOT INTENDED TO BE AN INSTALLATION DRAWING. THE UTILITY DRAWING IN THIS SET OF DOCUMENTS SHALL NOT BE USED AS A BASE SHEET FOR SHOP DRAWINGS WITHOUT WRITTEN APPROVAL FROM THE CIVIL ENGINEER.
2. THE UNDERGROUND FIRE PROTECTION SYSTEM INSTALLER SHALL PREPARE SHOP DRAWINGS SHOWING ALL INFORMATION REQUIRED BY THE LOCAL FIRE MARSHALL, INCLUDING LOCATION, TYPE AND NUMBER OF ANGLES, THRUST BLOCKS, VALVES, FIRE HYDRANTS, PIV'S, FDC'S, BACKFLOW ASSEMBLIES, FLEXIBLE CONNECTIONS, VAULTS, AND FLOW CALCULATIONS TO FIRE HYDRANTS, AND SPRINKLER RISERS PER THE FIRE FLOW REQUIRED BY LOCAL FIRE DEPARTMENT.
3. SHOP DRAWINGS SHALL BE SUBMITTED TO THE LOCAL FIRE MARSHALL, THE RATING AGENCY, AND THE CIVIL ENGINEER, ALLOWING TIME TO REVIEW AND ACCEPTANCE, PRIOR TO START OF WORK.
4. THE UNDERGROUND FIRE PROTECTION INSTALLER SHALL OBTAIN ALL APPROVALS AND PERMITS PRIOR TO ORDERING MATERIALS, FABRICATING SYSTEMS OR ANY INSTALLATION.
5. BOTTOM OF BACKFLOW PREVENTOR OR ASSEMBLY TO BE INSTALLED NO GREATER OR LESS THEN 12" FROM FINISH GRADE UNLESS APPROVED BY CIVIL ENGINEER.
6. GENERAL CONTRACTOR IS RESPONSIBLE FOR VERIFICATION OF ALL DIMENSIONS AND EQUIPMENT LOCATIONS. RISER LOCATIONS ARE SHOWN ON ARCHITECTURAL AND PLUMBING DRAWINGS AND ARE TO BE COORDINATED WITH THE ACTUAL FIELD CONDITIONS.
7. INSTALL MONITORED TAMPER SWITCHES AT ALL PIV'S AND VALVES ON DECTOR CHECK ASSEMBLIES.
8. INSTALL DETECTABLE METALIZED WARNING TAPE APPROXIMATELY 6" -12" BELOW THE SURFACE, BLUE, IMPRINTED WITH "CAUTION– FIRE SERVICE LINE BELOW", CALPICO TYPE 2 OR EQUAL.
9. MIN. 5 FEET CLEARANCE FROM BACK OF CURB TO FH'S, PIV'S, AND FDC'S.
10. UNDERGROUND FIRE PROTECTION SYSTEM INCLUDING HYDRANT ASSEMBLY, P.I.V., F.D.C., FITTING PIPE AND THRUSTBLOCKES TO BE IN ACCORDANCE WITH LOCAL FIRE PROTECTION DISTRICT SPECIFICATIONS, REQUIREMENTS AND NOTES.

WATER NOTES:

1. WHERE WATER LINES HAVE TO CROSS SANITARY SEWER LINES, DO SO AT A 90 DEGREE ANGLE AND WATER LINES SHALL BE MINIMUM OF 12" ABOVE THE TOP OF THE SANITARY SEWER LINES.
2. WATER LINES ARE SHOWN SCHEMATICALLY; CONTRACTOR SHALL IDENTIFY EACH ANGLE AND/ OR BEND THAT MAY BE REQUIRED TO ACCOMPLISH THE INTENDED DESIGN.
3. USE DETECTABLE METALIZED WARNING TAPE APPROXIMATELY 6" BELOW THE SURFACE, TAPE SHALL BE A BRIGHT COLOR AND IMPRINTED WITH "CAUTION–WATER LINE BELOW", CALPICO TYPE 2 OR EQUAL.
4. ALL WATER SERVICE CONNECTIONS SHALL BE INSTALLED IN ACCORDANCE WITH THE CITY/TOWN OR APPLICABLE WATER DISTRICT STANDARDS. .
5. PUBLIC AND PRIVATE WATER MAIN AND WATER SERVICE LINE 4-INCH THROUGH 12-INCH SHALL BE POLYVINYL CHLORIDE (PVC) AND SHALL MEET AWWA C900, RATED FOR 200 PSI CLASS PIPE WITH EPOXY COATED DUCTILE IRON FITTINGS AND FUSION EPOXY COATED GATE VALVES. ALL JOINTS SHALL FACTORY MANUFACTURED WITH BEL AND SPIGOT ENDS AND RUBBER GASKETS. NONMETALLIC WATER LINES HAVE TRACER WIRE INSTALLED PER CITY/TOWN STANDARDS
6. CONNECTION TO THE EXISTING WATER MAIN SHALL BE APPROVED BY THE CITY/TOWN. THE DEVELOPER SHALL PAY THE ACTUAL COSTS OF CONSTRUCTION. THE CONTRACTOR SHALL PERFORM ALL EXCAVATION PREPARE THE SITE, FURNISH ALL MATERIALS, INSTALL TAPPING TEE VALVE AND ALL THRUST BLOCKS. BACKFILL, RESTORE THE SURFACE, AND CLEANUP. THE CITY WILL PROVIDE THE DEVELOPER WITH A LIST OF APPROVED CONTRACTORS FOR MAKING WET TAPS. NONMETALLIC WATER LINES SHALL HAVE TRACER WIRES INSTALLED.
7. ALL WATER LINES 3" OR SMALLER SHALL BE TYPE K COPPER WITH SILVER BRAZED JOINTS. CONTRACTOR TO VERIFY PRESSURES FROM EXISTING LINES ARE ADEQUATE TO SERVICE BUILDINGS AS SPECIFIED BY THE PLUMBING PLANS.
8. ALL WATER LINES SHALL BE INSTALLED WITH 3' MINIMUM COVER.
9. ALL WATER VALVES SHALL BE PER CITY\WATER DISTRICT STANDARD.
10. ALL TEMPORARY AND/OR PERMANENT AIR-RELEASE AND BLOW-OFF VALVES SHALL BE PER CITY STANDARD AND AS DIRECTED BY THE CITY ENGINEER.
11. CONCRETE THRUST BLOCKS SHALL BE INSTALLED AT ALL TEES, CROSSES, BENDS (HORIZONTAL AND VERTICAL), AT SIZE CHANGES AND AT FIRE HYDRANTS PER CITY STANDARD. AWWA C600, SECTION 3.8 UNLESS NOTED OTHERWISE.
12. MECHANICALLY RESTRAINED JOINTS SHALL BE INSTALLED AT VERTICAL BENDS IN ACCORDANCE WITH CITY STANDARDS AND AS APPROVED BY THE CITY ENGINEER.
13. ALL WATER VALVES SHALL BE CLUSTERED, UNLESS OTHERWISE DIRECTED BY THE CITY ENGINEER OR WATER DISTRICT.
14. THE CONTRACTOR SHALL BE RESPONSIBLE FOR COLLECTING AND DELIVERING WATER SAMPLES FOR ANALYSIS TO A CITY APPROVED LAB.
15. ALL ON AND OFF-SITE LANDSCAPE IRRIGATION SYSTEMS SHALL BE IN ACCORDANCE WITH THE LANDSCAPE ARCHITECTURAL PLANS AND SPECIFICATIONS AND SHALL BE CONNECTED TO THE EXISTING AND/OR NEW WATER SYSTEM AND METERED ACCORDINGLY.
16. INSTALL CITY/TOWN APPROVED PRESSURE REGULATOR AND REDUCED BACKFLOW PREVENTOR ON WATER LINE AT ENTRANCE TO BUILDING REFERENCE PLUMBING PLANS FOR MORE DETAIL.

SANITARY SEWER NOTES:

1. INSTALL DETECTABLE METALIZED WARNING TAPE APPROXIMATELY 6"-12" BELOW THE SERVICE IN NON-PAVED AREAS, AND AT THE BOTTOM OF BASEROCK FOR PAVED AREAS. GREEN IMPRINTED WITH "CAUTION– SANITARY SEWER LINE BELOW", CALPICO TYPE 2 OR EQUAL.
2. ALL SEWER WORK SHALL BE IN CONFORMANCE WITH THE CITY/TOWN OR APPROPRIATE SANITARY SEWER DISTRICT.
3. PUBLIC AND PRIVATE SANITARY SEWER MAIN AND SERVICE LINE 4-INCH THROUGH 8-INCH SHALL BE POLYVINYL CHLORIDE (PVC) SDR 26 SEWER PIPE.
4. WHERE CONNECTION IS TO BE MADE TO AN EXISTING SEWER OR STRUCTURE, SAID EXISTING SEWER OR STRUCTURE SHALL BE UNCOVERED AND CHECKED FOR LOCATION AND ELEVATION PRIOR TO STAKING NEW SEWER DEPTH AND LOCATION. ANY DISCREPANCY BETWEEN THE PLANS AND THE FIELD INFORMATION SHALL BE REPORTED IMMEDIATELY TO THE ENGINEER.
5. MINIMUM SLOPE FOR SITE SANITARY SEWER PIPES SHALL BE CURRENT UPC REQUIREMENTS:
    - 4" 0 2%
    - 6" 0 1%
    - 8" & LARGER 0 0.5%
6. ALL LATERALS SHALL HAVE A CLEANOUT AT THE FACE OF THE BUILDING AND AT THE PROPERTY LINE, AS SHOWN ON THE PLANS AND PER THE CITY/TOWN STANDARDS OR APPROPRIATE SANITARY SEWER DISTRICT.

TREE/PLANT PROTECTION NOTES:

1. PRIOR TO BEGINNING CONSTRUCTION ON SITE, CONTRACTOR SHALL IDENTIFY, CONFIRM WITH OWNER AND PROTECT EXISTING TREES AND PLANTS DESIGNED AS TO REMAIN.
2. PROVIDE 6 FOOT TALL TREE PROTECTION FENCE WITH DISTINCTIVE MARKING VISIBLE TO CONSTRUCTION EQUIPMENT, ENCLOSING DRIP LINES OF TREES DESIGNED TO REMAIN.
3. WORK REQUIRED WITHIN FENCE LINE SHALL BE HELD TO A MINIMUM, AVOID USE OF HEAVY EQUIPMENT WITHIN FENCED AREA AND DO NOT PARK ANY VEHICLES UNDER DRIP LINE OF TREES. DO NOT STORE EQUIPMENT OR MATERIALS WITHIN FENCE LINE.
4. PRIOR TO REMOVING ROOTS AND BRANCHES LARGER THAN 2" IN DIAMETER OF TREES OR PLANTS THAT IS TO REMAIN, CONSULT WITH THE OWNER'S PROJECT MANAGER.
5. ANY GRADE CHANGES GREATER THAN 6" WITHIN THE DRIPLINE OF EXISTING TREES SHALL NOT BE MADE WITHOUT FIRST CONSULTING THE LANDSCAPE ARCHITECT / CIVIL ENGINEER.
6. PROTECT EXISTING TREES TO REMAIN FROM SPILLED CHEMICALS, FUEL OIL, MOTOR OIL, GASOLINE AND ALL OTHER CHEMICALLY INJURIOUS MATERIALS; AS WELL AS FROM PUDDLING OR CONTINUOUSLY RUNNING WATER. SHOULD A SPILL OCCUR, STOP WORK IN THAT AREA AND CONTACT THE CITY'S ENGINEER / INSPECTOR IMMEDIATELY. CONTRACTOR SHALL BE RESPONSIBLE TO MITIGATE DAMAGE FROM SPILLED MATERIAL AS WELL AS MATERIAL CLEAN UP.
7. PROVIDE TEMPORARY IRRIGATION TO ALL TREES AND PLANTS THAT ARE IN OR ADJACENT TO CONSTRUCTION AREAS WHERE EXISTING IRRIGATION SYSTEMS MAY BE AFFECTED BY THE CONSTRUCTION. ALSO PROVIDE TEMPORARY IRRIGATION TO RELOCATE TREES.
8. CONTRACTOR SHALL BE RESPONSIBLE FOR ONGOING MAINTENANCE OF ALL TREES AND PLANTS DESIGNED TO REMAIN AND FOR MAINTENANCE OF RELOCATED TREES STOCKPILED DURING CONSTRUCTION. CONTRACTOR WILL BE REQUIRED TO REPLACE TREES OR PLANTS THAT DIE DUE TO LACK OF MAINTENANCE.
    WORK INCLUDING CLEARING.

HORIZONTAL CONTROL NOTES:

1. CONTRACTOR SHALL LAYOUT THE CONTROL FOR THE SITE AS SPECIFIED ON HORIZONTAL CONTROL SHEET. CONTRACTOR SHALL CLEARLY SET AND MARK EACH OF THE CONTROL POINTS. PROTECTING THE POINTS THROUGHOUT CONSTRUCTION.
2. ALL DIMENSIONS ON THE PLANS ARE IN FEET OR DECIMALS THERE OF UNLESS SPECIFICALLY CALLED OUT AS FEET AND INCHES.
3. ALL BUILDINGS, DRIVEWAYS AND PARKING LOTS ARE TO BE PARALLEL AND RIGHT ANGLES TO THE BASIS OF BEARINGS UNLESS IDENTIFIED OR CLEARLY SHOWN AS A DIFFERENT ANGLE.
4. ALL RETURN RADII AND CURB DATA ARE TO FACE OF CURB, UNLESS OTHERWISE SHOWN OR INDICATED.

PAVEMENT SECTION:

1. SEE SHEET C-3 FOR ALL PAVEMENT SECTIONS.
2. SEE STRUCTURAL DRAWINGS FOR BUILDING SLAB SECTIONS AND PAD PREPARATIONS.
3. SEE GRADING AND DETAIL SHEETS FOR FLATWORK SECTIONS AND BASE REQUIREMENTS.
4. EXISTING PAVEMENT SHALL BE TACK COATED PRIOR TO CONSTRUCTING NEW PAVEMENT.
5. THE FINAL OR SURFACE LAYER OF ASPHALT CONCRETE SHALL NOT BE PLACED UNTIL ALL ON-SITE IMPROVEMENTS HAVE BEEN COMPLETED, INCLUDING ALL GRADING, AND ALL UNACCEPTABLE CONCRETE WORK HAS BEEN REMOVED AND REPLACED. UNLESS OTHERWISE APPROVED BY THE CITY ENGINEER AND/OR DEVELOPER'S CITY ENGINEER.
6. ALL PAVING SHALL BE IN CONFORMANCE WITH THE LATEST EDITION OF CALTRAN STANDARD SPECIFICATIONS.

<u>NOTE:</u>
THESE NOTES ARE INTENDED TO BE USED AS A GENERAL GUIDELINE. THE REFERENCED SOILS REPORT FOR THE PROJECT AND GOVERNING AGENCY GRADING ORDINANCE SHALL SUPERSEDE THESE NOTES. THE SOILS ENGINEER MAY MAKE ON-SITE RECOMMENDATIONS DURING GRADING OPERATIONS.

Nov 14, 2019 - 3:25pm - USER dyancy
N:\projects\2017_JOBS\2171535 C\dwg\P4 - Parcel 1 oniste package\2171535 STE PH4.dwg

SEE SHEET C-3.2

STORM DRAIN KEYNOTES ⟨20⟩ TO ⟨28⟩

⟨20⟩ INSTALL (N) ON-SITE STORM DRAIN SYSTEM. USE MINIMUM 6" PVC (SDR 35) OR HDPE (ADS N-12 W/ SMOOTH INTERIOR WALLS). MAINTAIN 24" MINIMUM COVER AND SLOPED AT 1% MINIMUM AT ALL TIMES UNLESS OTHERWISE NOTED. PROVIDE CLEAN OUT TO GRADE AT MAJOR CHANGES IN DIRECTION. AVOID USING 90° BENDS AND INSTEAD USE (2) 45° BENDS AND WYE CONNECTIONS. SEE DETAIL 4 ON SHEET C-6.0.

⟨21⟩ INSTALL (N) SUBDRAIN. USE PERFORATED 4" PVC (SDR-35) WITH HOLES DOWN AND SLOPED AT 1% MINIMUM SURROUND WITH 3/4" DRAIN ROCK WRAPPED IN FILTER FABRIC (MIRAFI 140N). MIRADRAIN OR OTHER LEA & BRAZE PREAPPROVED DRAINAGE SYSTEM MAY ALSO BE USED. AVOID USING 90° BENDS AND INSTEAD USE (2) 45° BENDS AND WYE CONNECTIONS. PROVIDE CLEANOUT TO GRADE AT MAJOR CHANGES IN DIRECTION AND AT 100' MAXIMUM INTERVALS. SUBDRAIN SHALL REMAIN A DEDICATED SEPARATE SYSTEM UNTIL IT CONNECTS TO STORM DRAIN SYSTEM OR OUTFALL AS SHOWN. SEE DETAIL 4 ON C-6.0.

⟨22⟩ (N) SLOT DRAINS SHALL BE FILCOTEN PAVE SLOT TOP NW100 (4"). CONNECT TO NEAREST STORM DRAIN LINE. USE 6" PVC (SDR-35) OR HDPE (ADS N-12 W/ SMOOTH INTERIOR WALLS). SEE SHEET C-5.1.

⟨23⟩ INSTALL (N) 4" DIAMETER BRASS ATRIUM GRATE IN LANDSCAPE OR PLANTER AREAS (NDS PART 78B OR 90B FOR 6" DIAMETER BRASS ATRIUM GRATE). DO NOT USE PLASTIC GRATES. SEE DETAIL 2 ON C-6.0.

⟨24⟩ INSTALL (N) "CHRISTY V-24" CATCH BASIN W/ CONCRETE BOTTOM FLUSH W/ LOWEST OUTGOING INVERT. PLACE BOX ON 6" CLASS 2 AGGREGATE BASE MATERIAL. SEE DETAIL 3 ON SHEET C-6.0.

⟨25⟩ INSTALL (N) BUBBLER IN C.3 STORMWATER BIO-RETENTION PLANTER. SEE DETAIL 4 ON C-5.1.

⟨26⟩ (N) STORMWATER MECHANICAL UNIT (VSHS TYPTBL). SEE STORMWATER TREATMENT PLAN AND DETAILS, ON SHEETS C-5.0 & C-5.1.

⟨27⟩ (N) C.3 STORMWATER BIO-RETENTION PLANTER FOR (N) PRIVATE STREET & PARKING IMPROVEMENTS. SEE DETAIL 4 ON SHEET C-5.1.

⟨28⟩ (N) C.3 STORMWATER FLOW THROUGH PLANTERS. PROVIDE DEEPENED FOUNDATION ADJACENT FOR (N) BUILDING ADJACENT TO PLANTER. SEE DETAIL 2 ON SHEET C-5.1.

UTILITIES KEYNOTES ⟨40⟩ TO ⟨48⟩

⟨40⟩ INSTALL (N) SANITARY SEWER LATERALS. USE 8" PVC (SDR-26) SLOPED AT 2% MINIMUM. CONNECT TO (E) SEWER MAIN AS SHOWN. PROVIDE CLEANOUT TO GRADE AT BUILDING AND BEHIND PROPERTY LINE AND AT MAJOR CHANGES IN DIRECTION AS SHOWN. REUSE (E) LATERAL IF POSSIBLE. SEE DETAIL 6 ON SHEET C-6.0. CONNECT PER DISTRICT STANDARDS.

⟨41⟩ INSTALL (N) 4" DOMESTIC WATER SERVICE WITH BACK FLOW PREVENTION DEVICE. CONNECT PER DISTRICT STANDARDS.

⟨42⟩ INSTALL (N) 6" MINIMUM FIRE SERVICE LINE TO. DESIGN BY OTHERS OR AS DIRECTED BY FIRE SPRINKLER DESIGNER. CONNECT PER DISTRICT STANDARDS.

⟨43⟩ INSTALL (N) JOINT TRENCH FOR SERVICES INCLUDING GAS, CATV & ELECTRIC FROM NEAREST POINT OF CONNECTION. DESIGN BY OTHERS.

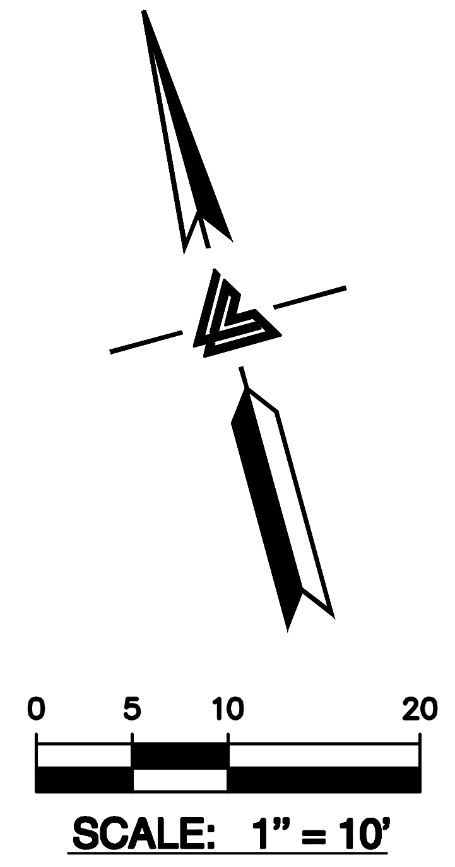
⟨44⟩ CONTRACTOR TO POTHOLE AND VERIFY POINT OF CONNECTIONS AND INVERT ELEVATIONS AS NESSESARY. CONTRACTOR TO POTHOLE & CONFIRM LOCATIONS & DEPTHS OF (E) UTILITIES PRIOR TO CONSTRUCTION & DOCUMENT INFORMATION FOR POTENTIAL CONFLICTS W/ PROPOSED LATERALS. SEE POTHOLING EXHIBIT, SHEET EX-1.

⟨45⟩ (E) FIRE HYDRANT TO REMAIN. CONTRACTOR TO PROTECT IN PLACE DURING CONSTRUCTION.

⟨46⟩ INSTALL (N) FIRE HYDRANT PER FIRE DEPARTMENT STANDARDS.

⟨47⟩ (N) FIRE DEPARTMENT CONNECTION (FDC) TO BE INSTALLED. REFER TO FIRE SPRINKLER PLANS FOR POINT OF CONNECTION AND BUILDING DESIGN.

⟨48⟩ INSTALL (N) 1 ½" COPPER IRRIGATION WATER SERVICE WITH 1 ½" METER. CONNECT PER DISTRICT STANDARDS.



NOTE:
FOR CONSTRUCTION STAKING SCHEDULING OR QUOTATIONS PLEASE CONTACT ALEX ABAYA AT LEA & BRAZE ENGINEERING (510)887-4086 EXT 116. aabaya@leabraze.com

STORM DRAIN KEYNOTES ⟨20⟩ TO ⟨28⟩

⟨20⟩ INSTALL (N) ON-SITE STORM DRAIN SYSTEM. USE MINIMUM 6" PVC (SDR 35) OR HDPE (ADS N-12 W/ SMOOTH INTERIOR WALLS). MAINTAIN 24" MINIMUM COVER AND SLOPED AT 1% MINIMUM AT ALL TIMES UNLESS OTHERWISE NOTED. PROVIDE CLEAN OUT TO GRADE AT MAJOR CHANGES IN DIRECTION. AVOID USING 90° BENDS AND INSTEAD USE (2) 45° BENDS AND WYE CONNECTIONS. SEE DETAIL 4 ON SHEET C-6.0.

⟨21⟩ INSTALL (N) SUBDRAIN. USE PERFORATED 4" PVC (SDR-35) WITH HOLES DOWN AND SLOPED AT 1% MINIMUM SURROUND WITH 3/4" DRAIN ROCK WRAPPED IN FILTER FABRIC (MIRAFI 140N). MIRADRAIN OR OTHER LEA & BRAZE PREAPPROVED DRAINAGE SYSTEM MAY ALSO BE USED. AVOID USING 90° BENDS AND INSTEAD USE (2) 45° BENDS AND WYE CONNECTIONS. PROVIDE CLEANOUT TO GRADE AT MAJOR CHANGES IN DIRECTION AND AT 100' MAXIMUM INTERVALS. SUBDRAIN SHALL REMAIN A DEDICATED SEPARATE SYSTEM UNTIL IT CONNECTS TO STORM DRAIN SYSTEM OR OUTFALL AS SHOWN. SEE DETAIL 4 ON C-6.0.

⟨22⟩ (N) SLOT DRAINS SHALL BE FILCOTEN PAVE SLOT TOP NW100 (4"). CONNECT TO NEAREST STORM DRAIN LINE. USE 6" PVC (SDR-35) OR HDPE (ADS N-12 W/ SMOOTH INTERIOR WALLS). SEE SHEET C-5.1.

⟨23⟩ INSTALL (N) 4" DIAMETER BRASS ATRIUM GRATE IN LANDSCAPE OR PLANTER AREAS (NDS PART 78B OR 90B FOR 6" DIAMETER BRASS ATRIUM GRATE). DO NOT USE PLASTIC GRATES. SEE DETAIL 2 ON C-6.0.

⟨24⟩ INSTALL (N) "CHRISTY V-24" CATCH BASIN W/ CONCRETE BOTTOM FLUSH W/ LOWEST OUTGOING INVERT. PLACE BOX ON 6" CLASS 2 AGGREGATE BASE MATERIAL. SEE DETAIL 3 ON SHEET C-6.0.

⟨25⟩ INSTALL (N) BUBBLER IN C.3 STORMWATER BIO-RETENTION PLANTER. SEE DETAIL 4 ON C-5.1.

⟨26⟩ (N) STORMWATER MECHANICAL UNIT (VSHS TYPTBL). SEE STORMWATER TREATMENT PLAN AND DETAILS, ON SHEETS C-5.0 & C-5.1.

⟨27⟩ (N) C.3 STORMWATER BIO-RETENTION PLANTER FOR (N) PRIVATE STREET & PARKING IMPROVEMENTS. SEE DETAIL 4 ON SHEET C-5.1.

⟨28⟩ (N) C.3 STORMWATER FLOW THROUGH PLANTERS. PROVIDE DEEPENED FOUNDATION ADJACENT FOR (N) BUILDING ADJACENT TO PLANTER. SEE DETAIL 2 ON SHEET C-5.1.

UTILITIES KEYNOTES ⟨40⟩ TO ⟨48⟩

⟨40⟩ INSTALL (N) SANITARY SEWER LATERALS. USE 8" PVC (SDR-26) SLOPED AT 2% MINIMUM. CONNECT TO (E) SEWER MAIN AS SHOWN. PROVIDE CLEANOUT TO GRADE AT BUILDING AND BEHIND PROPERTY LINE AND AT MAJOR CHANGES IN DIRECTION AS SHOWN. REUSE (E) LATERAL IF POSSIBLE. SEE DETAIL 6 ON SHEET C-6.0. CONNECT PER DISTRICT STANDARDS.

⟨41⟩ INSTALL (N) 4" DOMESTIC WATER SERVICE WITH BACK FLOW PREVENTION DEVICE. CONNECT PER DISTRICT STANDARDS.

⟨42⟩ INSTALL (N) 6" MINIMUM FIRE SERVICE LINE TO. DESIGN BY OTHERS OR AS DIRECTED BY FIRE SPRINKLER DESIGNER. CONNECT PER DISTRICT STANDARDS.

⟨43⟩ INSTALL (N) JOINT TRENCH FOR SERVICES INCLUDING GAS, CATV & ELECTRIC FROM NEAREST POINT OF CONNECTION. DESIGN BY OTHERS.

⟨44⟩ CONTRACTOR TO POTHOLE AND VERIFY POINT OF CONNECTIONS AND INVERT ELEVATIONS AS NESSESARY. CONTRACTOR TO POTHOLE & CONFIRM LOCATIONS & DEPTHS OF (E) UTILITIES PRIOR TO CONSTRUCTION & DOCUMENT INFORMATION FOR POTENTIAL CONFLICTS W/ PROPOSED LATERALS. SEE POTHOLING EXHIBIT, SHEET EX-1.

⟨45⟩ (E) FIRE HYDRANT TO REMAIN. CONTRACTOR TO PROTECT IN PLACE DURING CONSTRUCTION.

⟨46⟩ INSTALL (N) FIRE HYDRANT PER FIRE DEPARTMENT STANDARDS.

⟨47⟩ (N) FIRE DEPARTMENT CONNECTION (FDC) TO BE INSTALLED. REFER TO FIRE SPRINKLER PLANS FOR POINT OF CONNECTION AND BUILDING DESIGN.

⟨48⟩ INSTALL (N) 1 ½" COPPER IRRIGATION WATER SERVICE WITH 1 ½" METER. CONNECT PER DISTRICT STANDARDS.

LEGEND:

—— SD ——	STORM DRAIN
▨	FLOW THOUGH PLANTER OR AT GRADE TREATMENT AREA (TA)
○CDS	(N) CDS STORM WATER TREATMENT SYSTEM (MECHANICAL TREATMENT)

GENERAL NOTES:

THIS PROJECT IS CONSIDERED A C.3. REGULATED PROJECT, AND WILL CREATE/ REPLACE APPROX 64,237 S.F. OF IMPERVIOUS AREA FROM THE TOTAL 76,817 S.F. OF PARCEL 1 AND PRIVATE DRIVE AREA.

SITE DESIGN MEASURES:

MINIMIZE LAND DISTURBANCE AND IMPERVIOUS SURFACES (ESPECIALLY PARKING LOTS)

SOURCE CONTROL MEASURES:

A. INSTALL STENCILING AT STORM DRAIN INLETS, SUCH AS "NO DUMPING – DRAINS TO BAY".

B. PLUMB INTERIOR FLOOR DRAINS TO SANITARY SEWER.

C. PLUMB INTERIOR PARKING GARAGE FLOOR DRAINS TO SANITARY SEWER.

D. INCORPORATE SUSTAINABLE LANDSCAPING PRACTICES, USE EFFICIENT IRRIGATION SYSTEMS TO MINIMIZE RUNOFF, PROMOTE SURFACE INFILTRATION, MINIMIZE THE USE OF PESTICIDES AND FERTILIZERS, AND OTHER PRACTICES OF BAY AREA FRIENDLY LANDSCAPING.

E. DISCHARGE FIRE SPRINKLER TEST WATER TO ON–SITE VEGETATED AREAS OR TO THE SANITARY SEWER IF DISCHARGE ON–SITE VEGETATED AREAS IS NOT FEASIBLE.

PLAN NOTES:

① (N) FLOW THROUGH PLANTER OR AT GRADE BIO–RETENTION TREATMENT AREA FOR C.3 STORM WATER TREATMENT.

② PROPOSED ROOF DRAINS SHOWN CONCEPTUALLY AND ARE TO BE COORDINATED WITH ARCHITECTURAL ROOF PLANS. ROOF PLANS TO BE DIRECTED TO DESIGNATED FLOW THROUGH PLANTER AREAS.

③ PROPOSED STORM WATER RUN–OFF TO BE DIRECTED TO ROOF DRAINS AND TO THE MECHANICAL TREATMENT UNIT.

CONCEPTUAL STORMWATER TREATMENT AND MANAGEMENT PLAN

DRAWN BY: Author
PROJECT NUMBER: 18-010
SHEET ISSUE DATE: 10/14/19
SHEET TITLE:

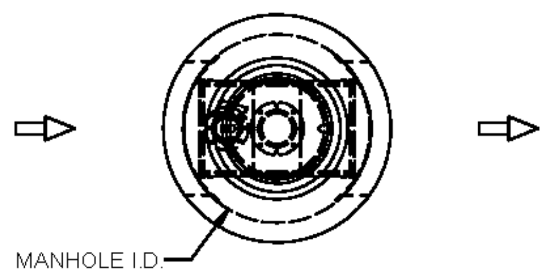
SHEET NUMBER AS NOTED

C-5.0

SUBMITTAL SET 11-15-19

This CADD file is for the purpose of specifying stormwater treatment equipment to be furnished by CONTECH Stormwater Solutions and may only be transferred to other documents exactly as provided by CONTECH Stormwater Solutions. Title block information, **excluding** the CONTECH Stormwater Solutions logo and the VortSentry HS Stormwater Treatment System designation and patent number, may be deleted if necessary. Revisions to any part of this CADD file without prior coordination with CONTECH Stormwater Solutions shall be considered unauthorized use of proprietary information.

THE VORTSENTRY HS CONTROL SECTION SHALL BE STENCILED WITH THE CONTECH STORMWATER SOLUTIONS NAME AND LOGO. PIPE OPENINGS SHALL BE STENCILED "INLET" OR "OUTLET" AS APPROPRIATE



PLAN

NOTES:

1. STORMWATER TREATMENT SYSTEM (SWTS) SHALL REMOVE 80% OF A SEDIMENT GRADATION WITH AN AVERAGE PARTICLE SIZE OF 240 MICRONS AT THE DESIGNATED TREATMENT FLOW RATE LISTED IN THE TABLE FOR EACH CORRESPONDING MODEL.
2. SWTS REMOVAL EFFICIENCY CLAIM SHALL BE CORROBORATED BY FULL SCALE LABORATORY TEST PERFORMANCE DATA.
3. SWTS MAINTENANCE RECOMMENDATION SHALL BE SUPPORTED BY FULL SCALE WASH-OUT TESTING.
4. SWTS SHALL PROVIDE INTERNAL BYPASS OF FLOWS THAT EXCEED THE TREATMENT FLOW RATE.
5. SWTS MAXIMUM HYDRAULIC CAPACITY MAY VARY DEPENDING UPON THE INLET PIPE DIAMETER, MATERIAL AND SLOPE.
6. SWTS INVERTS IN AND OUT SHALL BE AT THE SAME ELEVATION. INLET AND OUTLET PIPES MUST BE 180° FROM EACH OTHER.
7. MINIMUM RIM TO INVERT DISTANCE MAY BE REDUCED DEPENDING UPON ACTUAL PIPE DIAMETER. CONTACT CONTECH STORMWATER SOLUTIONS FOR SITE SPECIFIC INFORMATION.
8. PIPE SIZE MAY BE SMALLER THAN THE MAXIMUM PIPE SHOWN ON THE TABLE; SEE SITE PLAN FOR PIPE SIZE.
9. PURCHASER SHALL NOT BE RESPONSIBLE FOR ASSEMBLY OF INTERNAL COMPONENTS.
10. ACCESS FRAME AND COVER SUPPLIED WITH SYSTEM, NOT INSTALLED. SWTS MAY ALSO HAVE A GRATED INLET COVER (NOT SHOWN).
11. PURCHASER TO PREPARE EXCAVATION AND PROVIDE LIFTING EQUIPMENT.
12. VORTSENTRY HS BY CONTECH STORMWATER SOLUTIONS; PORTLAND, OR (800) 548-4667; SCARBOROUGH, ME (877) 907-8676; LINTHICUM, MD (866) 740-3318.

CITY OF OAKLAND | DESIGN AND CONSTRUCTION SERVICES DEPARTMENT

CURB RAMP DETAILS
SHEET 4 OF 6
TYPICAL SECTIONS

ENGINEERING DESIGN MANAGER
DATE: OCTOBER 2002
DWG. S-6

1. Curb ramps shall have 4 ft by 2 ft long detectable warning border centered and squared at the ramp bottom.

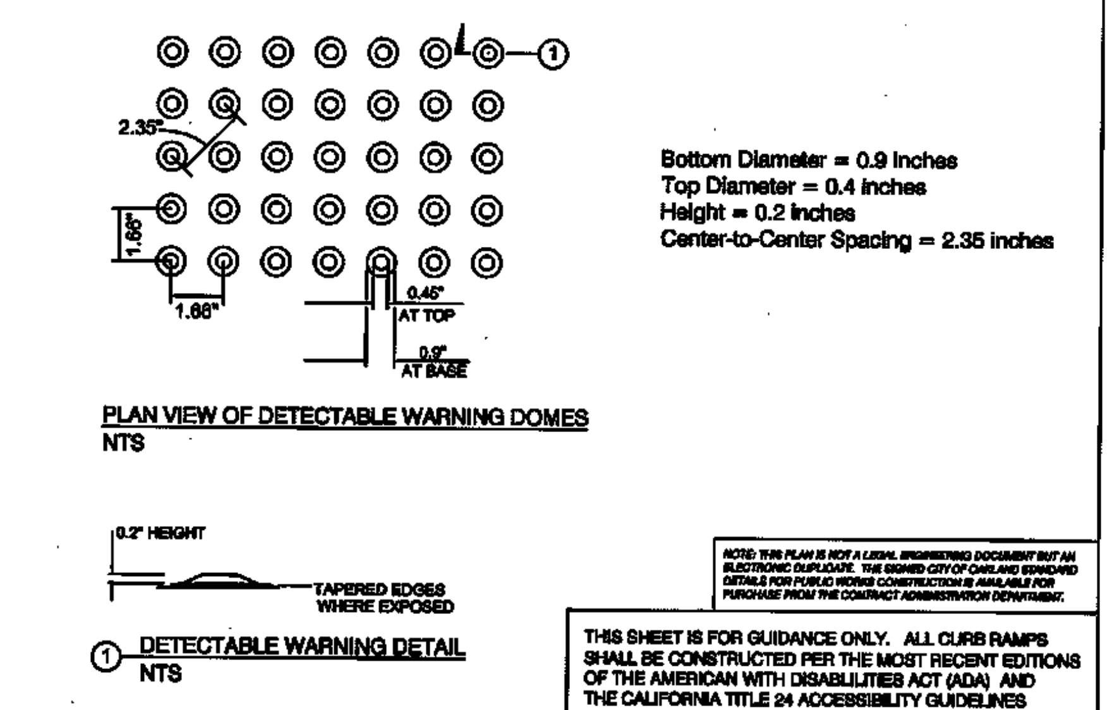
2. The detectable warning border shall contrast visually with the adjoining surfaces, either light or dark. The material used to provide contrast shall be an integral part of the walking surface and shall contrast by at least 70 percent. A fully cured 2 ft x 2 ft sample of both the cast-in-place detectable warning border and the adjacent curb ramp shall be submitted to the Engineer for review and approval, prior to installation.

3. Dome orientation shall conform to the latest ADA / Title 24 regulations.

4. The closest corner of the truncated dome tile to the street shall be set 6" from the flowline.

5. Detectable dome warning tiles or strips made of materials other than concrete shall only be used with the written approval of the Director of Public Works.

6. Precast concrete detectable warning dome pavers shall be installed on top of a 4 inch thick concrete pad. Mortared joints shall be flush with top surface and finished to provide a smooth surface. Pavers shall be laid such that joints are level with adjoining joints to provide a smooth transition from paver to paver and from paver to concrete surface.



Bottom Diameter = 0.9 Inches
Top Diameter = 0.4 Inches
Height = 0.2 Inches
Center-to-Center Spacing = 2.35 inches

THIS SHEET IS FOR GUIDANCE ONLY. ALL CURB RAMPS SHALL BE CONSTRUCTED PER THE MOST RECENT EDITIONS OF THE AMERICAN WITH DISABILITIES ACT (ADA) AND THE CALIFORNIA TITLE 24 ACCESSIBILITY GUIDELINES

CURB RAMP DETAILS
SHEET 5 OF 6
DETECTABLE WARNINGS

ENGINEERING DESIGN MANAGER
DATE: OCTOBER 2002
DWG. S-7

CASE "C" CURB RAMP NOTES

1. If site conditions do not accommodate a Case E ramp, a Case "C" Curb Ramp shall be constructed.

2. If the sidewalk is less than 5-feet wide, a Case C ramp shall be installed.

3. The maximum slope of the lower landing of a Case C ramp shall be 2%. In all cases the lower landing shall be sloped to drain.

4. No vertical obstructions shall be allowed within a Case C curb ramp.

CASE "E" CURB RAMP NOTES:

5. Two ramps shall be provided at each corner of an intersection, unless otherwise allowed by the plans or by the Engineer. The centerline and path of travel of both curb ramps must be perpendicular to the gutter.

6. A level landing (4-ft deep with 2% max. slope) shall be provided at the upper end of each Case E curb ramp over its full width to permit safe exit from the ramp surface. If a level landing cannot be installed, then the side flares of the ramp shall slope less than or equal to 8.33%.

GENERAL CURB RAMP NOTES:

7. When constructing curb ramps, construct concrete gutter to match existing gutter widths. The new gutter shall be flush with the bottom of the curb ramp and the new gutter shall be considered part of the curb ramp construction.

8. Each curb ramp shall be bounded by a 12- inch border band with 1/4 inch deep grooves scored 3/4 inches apart except in the curb and gutter area.

9. Vertical obstructions, such as utility poles and traffic signals, shall only be allowed with the approval of the Engineer.

10. Existing utility boxes and covers shall be adjusted to conform flush with the curb ramp surface. All utility boxes and covers located within the detectable warning border area shall be relocated.

CITY OF OAKLAND | DESIGN AND CONSTRUCTION SERVICES DEPARTMENT

TRENCH DETAIL

ENGINEERING DESIGN MANAGER
DATE: JANUARY 2002
DWG. D-22.0

NOTES:

1. Excavated material shall not be used to fill voids caused by overexcavation; such voids shall be filled with compacted bedding material. Unless directed by the Engineer, no separate payment will be made for overexcavation.
2. Import backfill material shall conform to Subsection 306-1.31
3. Aggregate base shall conform to crushed miscellaneous base (Section 200-2.4) or better. The base material must be approved by the Engineer.
4. The streets of Oakland are generally paved with either AC, PCC, or a combination of the two. The existing pavement may differ from the replacement Pavement Type (A to F) indicated on the plans.
5. Compaction by jetting is not permitted.
6. When flexible pipe (HDPE, etc.) is used, pipe shall be backfilled to the spring line, compacted and backfill tested prior to completing initial backfill.
7. The compacted temporary resurfacing shall be a minimum of 2" thick placed on the required base, and shall be removed prior to placing the permanent paving.
8. Backfill testing is required and results shall be approved by the Engineer prior to paving.
9. No longitudinal joints or seams are allowed in bike lanes. If a longitudinal joint is constructed due to the Contractor's work or this requirement, the Contractor shall remove a minimum of 2" of asphalt from the pavement across the entire bike lane using a method approved by the City and then resurface the bike lane to the Engineer's satisfaction.
10. During backfill operations, the trench shall be backfilled, compacted, and tested to the spring line of any utilities crossing the trench before proceeding with further backfill.
11. Unless specified otherwise, measurement for payment of additional bedding, imported backfill and temporary paving (when listed as separate pay items) shall be based upon the trench widths defined on this detail. The lower trench width for 8" pipe shall be 30".
12. Clean and tackcoat sides of excavation and between paving courses with spray application of SS-1 emulsion before placing asphalt-concrete pavement section.
13. If the distance to the edge of gutter is less than 3' from one trench edge, the pavement replacement shall extend to the edge of existing gutter.
14. In areas where existing paving consists of rubberized AC, the trench area should be repaved with the equivalent pavement section of rubberized AC. As an alternate, a dense graded AC section equivalent to two-times the the thickness of the rubberized AC may be substituted.

October 30, 2015
PLANS APPROVAL DATE

THE STATE OF CALIFORNIA OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF SCANNED COPIES OF THIS PLAN SHEET.

Hector David Cordova
C41957
3-31-16

NOTES:

1. As site conditions dictate, Case A through Case G curb ramps may be used for corner installations similar to those shown in Detail A and Detail B. The case of curb ramps used in Detail A do not have to be the same. Case A through Case G curb ramps also may be used at mid block locations, as site conditions dictate.
2. If distance from curb to back of sidewalk is too short to accommodate ramp and 4'-2" platform (landing) as shown in Case A, the sidewalk may be depressed longitudinally as in Case B or C or may be widened as in Case D.
3. When ramp is located in center of curb return, crosswalk configuration must be similar to that shown for Detail B.
4. As site conditions dictate, the retaining curb side and the flared side of the Case G ramp shall be constructed in reversed position.
5. If located on a curve, the sides of the ramp need not be parallel, but the minimum width of the ramp shall be 4'-2".
6. Side slope of ramp flares vary uniformly from a maximum of 9.0% at curb to conform with longitudinal sidewalk slope adjacent to top of the ramp, except in Case C and Case F.
7. Transitions from ramps and landing to walks, gutters or streets shall be flush (no lip) and free of abrupt changes.
8. Counter slopes of adjoining gutters and road surfaces immediately adjacent to and within 24 inches of the curb ramp shall not be steeper than 1V:20H (5.0%). Gutter pan slope shall not exceed 1" of depth for each 2'-0" of width.
9. Curb ramps shall have a detectable warning surface that extends the full width and 3'-0" depth of the ramp. A 4'-0" wide detectable warning surface may be used on a 4'-2" wide curb ramp. Detectable Warning Surfaces shall conform to the requirements in the Standard Specifications.
10. Sidewalk and ramp thickness, "T", shall be 3½" minimum.
11. Utility pull boxes, manholes, vaults and all other utility facilities within the boundaries of the curb ramp will be relocated or adjusted to grade by the owner prior to, or in conjunction with, curb ramp construction.
12. Detectable warning surface may have to be cut to allow removal of utility covers while maintaining full detectable warning width and depth.

DRAWN BY: Author
PROJECT NUMBER: 18-010
SHEET ISSUE DATE: 10/14/19
SHEET TITLE:

DETAILS

SHEET NUMBER
C-6.1

PURPOSE:

THE PURPOSE OF THIS PLAN IS TO STABILIZE THE SITE TO PREVENT EROSION OF GRADED AREAS AND TO PREVENT SEDIMENTATION FROM LEAVING THE CONSTRUCTION AREA AND AFFECTING NEIGHBORING SITES, NATURAL AREAS, PUBLIC FACILITIES OR ANY OTHER AREA THAT MIGHT BE AFFECTED BY SEDIMENTATION. ALL MEASURES SHOWN ON THIS PLAN SHOULD BE CONSIDERED THE MINIMUM REQUIREMENTS NECESSARY. SHOULD FIELD CONDITIONS DICTATE ADDITIONAL MEASURES, SUCH MEASURES SHALL BE PER CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD'S FIELD MANUAL FOR EROSION AND SEDIMENTATION CONTROL AND THE CALIFORNIA STORM WATER QUALITY ASSOCIATION BEST MANAGEMENT PRACTICES HANDBOOK FOR CONSTRUCTION. LEA & BRAZE ENGINEERING SHOULD BE NOTIFIED IMMEDIATELY SHOULD CONDITIONS CHANGE.

EROSION CONTROL NOTES:

1. IT SHALL BE THE OWNER'S/CONTRACTOR'S RESPONSIBILITY TO MAINTAIN CONTROL OF THE ENTIRE CONSTRUCTION OPERATION AND TO KEEP THE ENTIRE SITE IN COMPLIANCE WITH THIS EROSION CONTROL PLAN.
2. THE INTENTION OF THIS PLAN IS FOR INTERIM EROSION AND SEDIMENT CONTROL ONLY. ALL EROSION CONTROL MEASURES SHALL CONFORM TO CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD'S FIELD MANUAL FOR EROSION AND SEDIMENTATION CONTROL, THE CALIFORNIA STORM WATER QUALITY ASSOCIATION BEST MANAGEMENT PRACTICES HANDBOOK FOR CONSTRUCTION, AND THE LOCAL GOVERNING AGENCY FOR THIS PROJECT.
3. OWNER/CONTRACTOR SHALL BE RESPONSIBLE FOR MONITORING EROSION AND SEDIMENT CONTROL MEASURES PRIOR TO, DURING, AND AFTER STORM EVENTS. PERSON IN CHARGE OF MAINTAINING EROSION CONTROL MEASURES SHOULD WATCH LOCAL WEATHER REPORTS AND ACT APPROPRIATELY TO MAKE SURE ALL NECESSARY MEASURES ARE IN PLACE.
4. SANITARY FACILITIES SHALL BE MAINTAINED ON THE SITE AT ALL TIMES.
5. DURING THE RAINY SEASON, ALL PAVED AREAS SHALL BE KEPT CLEAR OF EARTH MATERIAL AND DEBRIS. THE SITE SHALL BE MAINTAINED SO AS TO MINIMIZE SEDIMENT–LADEN RUNOFF TO ANY STORM DRAINAGE SYSTEM, INCLUDING EXISTING DRAINAGE SWALES AND WATERCOURSES.
6. CONSTRUCTION OPERATIONS SHALL BE CARRIED OUT IN SUCH A MANNER THAT EROSION AND WATER POLLUTION WILL BE MINIMIZED. COMPLIANCE WITH FEDERAL, STATE AND LOCAL LAWS CONCERNING POLLUTION SHALL BE MAINTAINED AT ALL TIMES.
7. CONTRACTOR SHALL PROVIDE DUST CONTROL AS REQUIRED BY THE APPROPRIATE FEDERAL, STATE AND LOCAL AGENCY REQUIREMENTS.
8. ALL MATERIALS NECESSARY FOR THE APPROVED EROSION CONTROL MEASURES SHALL BE IN PLACE BY OCTOBER 15TH.
9. EROSION CONTROL SYSTEMS SHALL BE INSTALLED AND MAINTAINED THROUGHOUT THE RAINY SEASON, OR FROM OCTOBER 15TH THROUGH APRIL 15TH, WHICHEVER IS LONGER.
10. IN THE EVENT OF RAIN, ALL GRADING WORK IS TO CEASE IMMEDIATELY AND THE SITE IS TO BE SEALED IN ACCORDANCE WITH THE APPROVAL EROSION CONTROL MEASURES AND APPROVED EROSION CONTROL PLAN.
11. THE CONTRACTOR SHALL BE RESPONSIBLE FOR CHECKING AND REPAIRING EROSION CONTROL SYSTEMS AFTER EACH STORM.
12. ADDITIONAL EROSION CONTROL MEASURES MAY BE REQUIRED BY LOCAL JURISDICTION'S ENGINEERING DEPARTMENT OR BUILDING OFFICIALS.
13. MEASURES SHALL BE TAKEN TO COLLECT OR CLEAN ANY ACCUMULATION OR DEPOSIT OF DIRT, MUD, SAND, ROCKS, GRAVEL OR DEBRIS ON THE SURFACE OF ANY STREET, ALLEY OR PUBLIC PLACE OR IN ANY PUBLIC STORM DRAIN SYSTEMS. THE REMOVAL OF AFORESAID SHALL BE DONE BY STREET SWEEPING OR HAND SWEEPING. WATER SHALL NOT BE USED TO WASH SEDIMENTS INTO PUBLIC OR PRIVATE DRAINAGE FACILITIES.
14. EROSION CONTROL MEASURES SHALL BE ON–SITE FROM SEPTEMBER 15TH THRU APRIL 15TH.
15. ALL EROSION CONTROL MEASURES SHALL BE INSTALLED AND MAINTAINED THROUGHOUT THE RAINY SEASON OR FROM OCTOBER 1ST THROUGH APRIL 30TH, WHICHEVER IS GREATER.
16. PLANS SHALL BE DESIGNED TO MEET C3 REQUIREMENTS OF THE MUNICIPAL STORMWATER REGIONAL PERMIT("MRP") NPDES PERMIT CAS 612008.
17. THE CONTRACTOR TO NPDES (NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM) BEST MANAGEMENT PRACTICES (BMP) FOR SEDIMENTATION PREVENTION AND EROSION CONTROL TO PREVENT DELETERIOUS MATERIALS OR POLLUTANTS FROM ENTERING THE TOWN OR COUNTY STORM DRAIN SYSTEMS.
18. THE CONTRACTOR MUST INSTALL ALL EROSION AND SEDIMENT CONTROL MEASURES PRIOR TO THE INCEPTION OF ANY WORK ONSITE AND MAINTAIN THE MEASURES UNTIL THE COMPLETION OF ALL LANDSCAPING.
19. THE CONTRACTOR SHALL MAINTAIN ADJACENT STREETS IN A NEAT, CLEAN DUST FREE AND SANITARY CONDITION AT ALL TIMES AND TO THE SATISFACTION OF THE TOWN INSPECTOR. THE ADJACENT STREET SHALL AT ALL TIMES BE KEPT CLEAN OF DEBRIS, WITH DUST AND OTHER NUISANCE BEING CONTROLLED AT ALL TIMES. THE CONTRACTOR BE RESPONSIBLE FOR ANY CLEAN UP ON ADJACENT STREETS AFFECTED BY THE BY THEIR CONSTRUCTION, METHOD OF STREET CLEANING SHALL BE BY DRY SWEEPING OF ALL PAVED AREAS. NO STOCKPILING OF BUILDING MATERIALS WITHIN THE TOWN RIGHT–OF–WAY.
20. SEDIMENTS AND OTHER MATERIALS SHALL NOT BE TRACKED FROM THE SITE BY VEHICLE TRAFFIC. THE CONTRACTOR SHALL INSTALL A STABILIZED CONSTRUCTION ENTRANCE PRIOR TO THE INSPECTION OF ANY WORK ONSITE AND MAINTAIN IT FOR THE DURATION OF THE CONSTRUCTION PROCESS SO AS TO NOT INHIBIT SEDIMENTS FROM BEING DEPOSITED INTO THE PUBLIC RIGHT–OF–WAY UNTIL THE COMPLETION OF ALL LANDSCAPING.
21. THE CONTRACTOR SHALL PROTECT DOWN SLOPE DRAINAGE COURSES, STREAMS AND STORM DRAINS WITH ROCK FILLED SAND BAGS, TEMPORARY SWALES, SILT FENCES, AND EARTH PERMS IN CONJUNCTION OF ALL LANDSCAPING.
22. STOCKPILED MATERIALS SHALL BE COVERED WITH VISQUEEN OR A TARPAULIN UNTIL THE MATERIAL IS REMOVED FROM THE SITE. ANY REMAINING BARE SOIL THAT EXISTS AFTER THE STOCKPILE HAS BEEN REMOVED SHALL BE COVERED UNTIL A NATURAL GROUND COVER IS ESTABLISHED OR IT IS SEEDED OR PLANTED TO PROVIDE GROUND COVER PRIOR TO THE FALL RAINY SEASON.
23. EXCESS OR WASTE CONCRETE MUST NOT BE WASHED INTO THE PUBLIC RIGHT–OF–WAYOR ANY OTHER DRAINAGE SYSTEM. PROVISIONS SHALL BE MADE TO RETAIN CONCRETE WASTES ON SITE UNTIL THEY CAN BE DISPOSED OF AS SOLID WASTE.
24. TRASH AND CONSTRUCTION RELATED SOLID WASTES MUST BE DEPOSITED INTO A COVERED RECEPTACLE TO PREVENT CONTAMINATION AND DISPERSAL BY WIND FUELS, OILS, SOLVENTS AND OTHER TOXIC MATERIALS MUST BE STORED IN ACCORDANCE WITH THEIR LISTING AND ARE NOT TO CONTAMINATE THE SOIL AND SURFACE WATERS. ALL APPROVED STORAGE CONTAINERS ARE TO BE PROTECTED FROM THE WEATHER. SPILLS MUST BE CLEANED UP IMMEDIATELY AND DISPOSED OF IN A PROPER MANNER. SPILLS MUST NOT BE WASHED INTO THE DRAINAGE SYSTEM,
25. DUST CONTROL SHALL BE DONE BY WATERING AND AS OFTEN AS REQUIRED BY THE TOWN INSPECTOR.
26. SILT FENCE(S) AND/OR FIBER ROLL(S) SHALL BE INSTALLED PRIOR TO SEPTEMBER 15TH AND SHALL REMAIN IN PLACE UNTIL THE LANDSCAPING GROUND COVER IS INSTALLED. CONTRACTOR SHALL CONTINUOUSLY MONITOR THESE MEASURES, FOLLOWING AND DURING ALL RAIN EVENTS,TO PUBLIC OWNED FACILITIES.

EROSION CONTROL MEASURES:

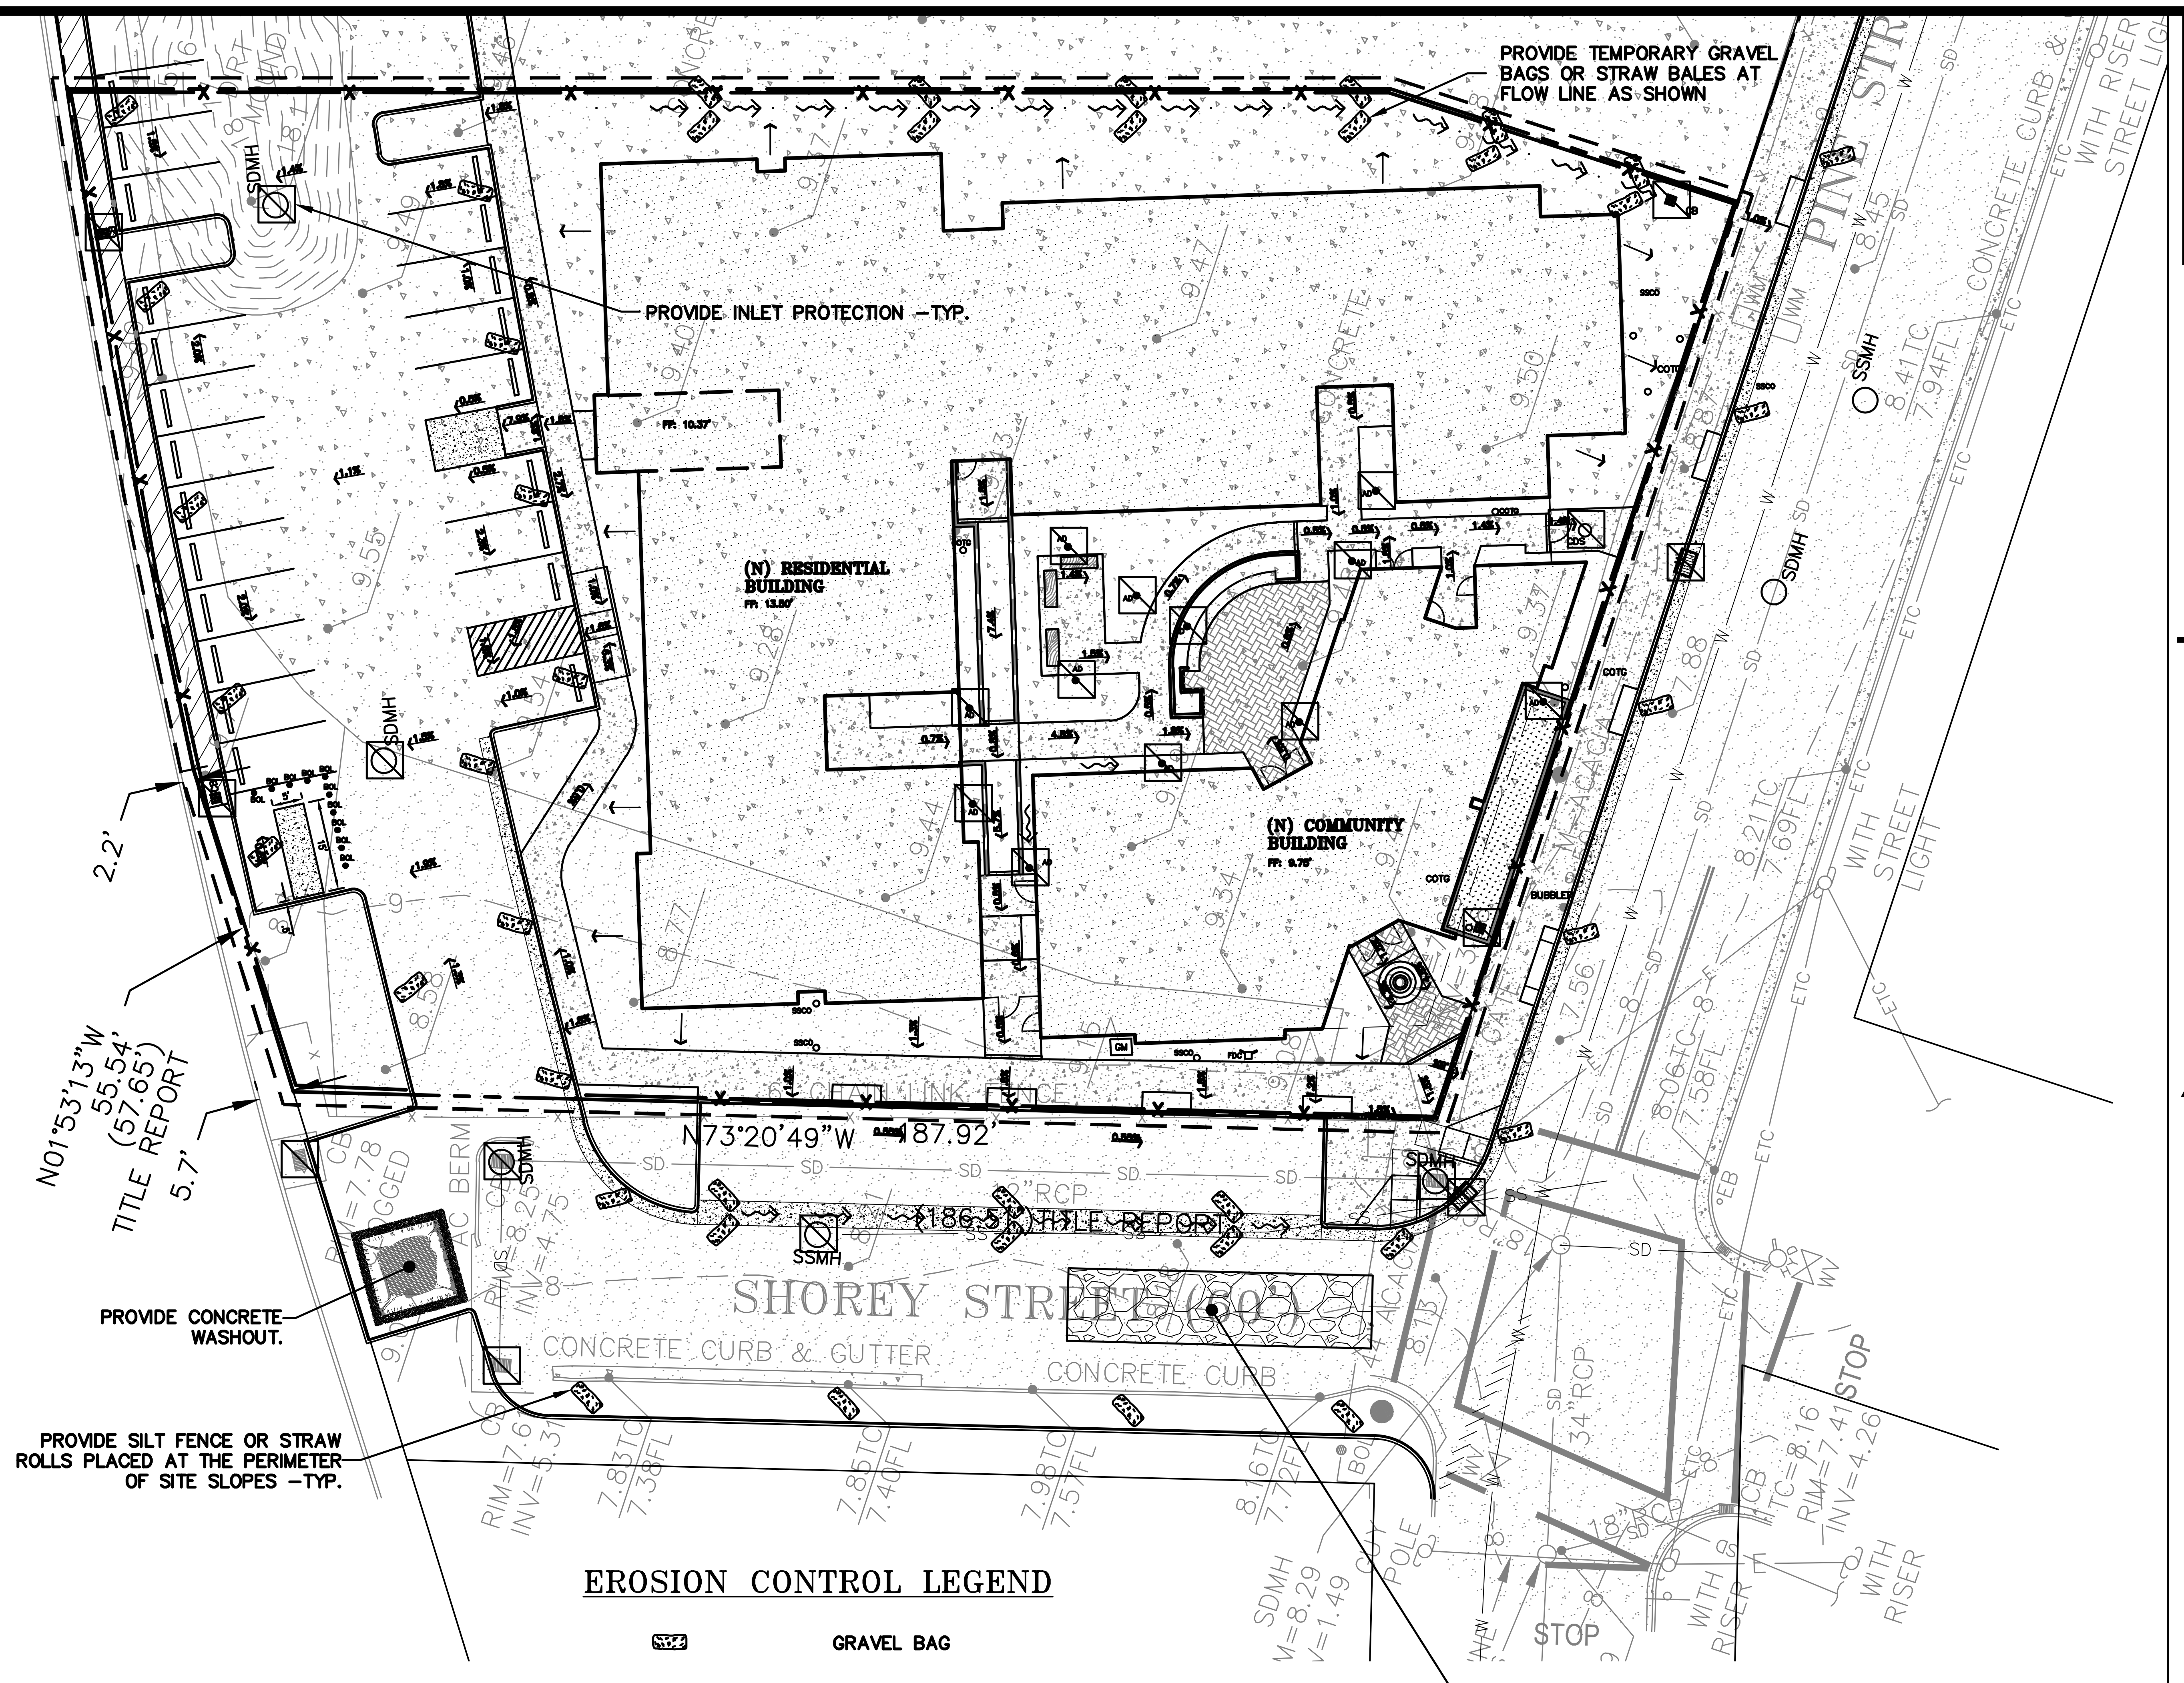
1. THE FACILITIES SHOWN ON THIS PLAN ARE DESIGNED TO CONTROL EROSION AND SEDIMENT DURING THE RAINY SEASON, OCTOBER 15TH TO APRIL 15. EROSION CONTROL FACILITIES SHALL BE IN PLACE PRIOR TO OCTOBER 15TH OF ANY YEAR. GRADING OPERATIONS DURING THE RAINY SEASON WHICH LEAVE DENUDED SLOPES SHALL BE PROTECTED WITH EROSION CONTROL MEASURES IMMEDIATELY FOLLOWING GRADING ON THE SLOPES.
2. SITE CONDITIONS AT TIME OF PLACEMENT OF EROSION CONTROL MEASURES WILL VARY. APPROPRIATE ACTION INCLUDING TEMPORARY SWALES, INLETS, HYDROSEEDING, STRAW BALES, ROCK SACKS, ETC. SHALL BE TAKEN TO PREVENT EROSION AND SEDIMENTATION FROM LEAVING SITE. EROSION CONTROL MEASURES SHALL BE ADJUSTED AS THE CONDITIONS CHANGE AND THE NEED OF CONSTRUCTION SHIFT.
3. CONSTRUCTION ENTRANCES SHALL BE INSTALLED PRIOR TO COMMENCEMENT OF GRADING. ALL CONSTRUCTION TRAFFIC ENTERING ONTO THE PAVED ROADS MUST CROSS THE STABILIZED CONSTRUCTION ENTRANCES. CONTRACTOR SHALL MAINTAIN STABILIZED ENTRANCE AT EACH VEHICLE ACCESS POINT TO EXISTING PAVED STREETS. ANY MUD OR DEBRIS TRACKED ONTO PUBLIC STREETS SHALL BE REMOVED DAILY AND AS REQUIRED BY THE GOVERNING AGENCY.
4. ALL EXPOSED SLOPES THAT ARE NOT VEGETATED SHALL BE HYDROSEEDED. IF HYDROSEEDING IS NOT USED OR IS NOT EFFECTIVE BY OCTOBER 15, THEN OTHER IMMEDIATE METHODS SHALL BE IMPLEMENTED, SUCH AS EROSION CONTROL BLANKETS, OR A THREE–STEP APPLICATION OF 1) SEED, MULCH, FERTILIZER 2) BLOWN STRAW 3) TACKIFIER AND MULCH. HYDROSEEDING SHALL BE IN ACCORDANCE WITH THE PROVISIONS OF SECTION 20" EROSION CONTROL AND HIGHWAY PLANTING" OF THE STANDARD SPECIFICATION OF THE STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION, AS LAST REVISED. REFER TO THE EROSION CONTROL SECTION OF THE GRADING SPECIFICATIONS THAT ARE A PART OF THIS PLAN SET FOR FURTHER INFORMATION.
5. INLET PROTECTION SHALL BE INSTALLED AT OPEN INLETS TO PREVENT SEDIMENT FROM ENTERING THE STORM DRAIN SYSTEM. INLETS NOT USED IN CONJUNCTION WITH EROSION CONTROL ARE TO BE BLOCKED TO PREVENT ENTRY OF SEDIMENT. MINIMUM INLET PROTECTION SHALL CONSIST OF A ROCK SACKS OR AS SHOWN ON THIS PLAN
6. THIS EROSION AND SEDIMENT CONTROL PLAN MAY NOT COVER ALL THE SITUATIONS THAT MAY ARISE DURING CONSTRUCTION DUE TO UNANTICIPATED FIELD CONDITIONS. VARIATIONS AND ADDITIONS MAY BE MADE TO THIS PLAN IN THE FIELD. A REPRESENTATIVE OF LEA & BRAZE ENGINEERING SHALL PERFORM A FIELD REVIEW AND MAKE RECOMMENDATIONS AS NEEDED. CONTRACTOR IS RESPONSIBLE TO NOTIFY LEA & BRAZE ENGINEERING AND THE GOVERNING AGENCY OF ANY CHANGES.
7. THE EROSION CONTROL MEASURES SHALL CONFORM TO THE LOCAL JURISDICTION'S STANDARDS AND THE APPROVAL OF THE LOCAL JURISDICTION'S ENGINEERING DEPARTMENT.
8. STRAW ROLLS SHALL BE PLACED AT THE TOE OF SLOPES AND ALONG THE DOWN SLOPE PERIMETER OF THE PROJECT. THEY SHALL BE PLACED AT 25 FOOT INTERVALS ON GRADED SLOPES. PLACEMENT SHALL RUN WITH THE CONTOURS AND ROLLS SHALL BE TIGHTLY END BUTTED. CONTRACTOR SHALL REFER TO MANUFACTURES SPECIFICATIONS FOR PLACEMENT AND INSTALLATION INSTRUCTIONS.

REFERENCES:

1. CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD'S FIELD MANUAL FOR EROSION AND SEDIMENTATION CONTROL
2. CALIFORNIA STORM WATER QUALITY ASSOCIATION BEST MANAGEMENT PRACTICES HANDBOOK FOR CONSTRUCTION

PERIODIC MAINTENANCE:

1. MAINTENANCE IS TO BE PERFORMED AS FOLLOWS:
   - A. DAMAGES CAUSED BY SOIL EROSION OR CONSTRUCTION SHALL BE REPAIRED AT THE END OF EACH WORKING DAY.
   - B. SWALES SHALL BE INSPECTED PERIODICALLY AND MAINTAINED AS NEEDED.
   - C. SEDIMENT TRAPS, BERMS, AND SWALES ARE TO BE INSPECTED AFTER EACH STORM AND REPAIRS MADE AS NEEDED.
   - D. SEDIMENT SHALL BE REMOVED AND SEDIMENT TRAP RESTORED TO ITS ORIGINAL DIMENSIONS WHEN SEDIMENT HAS ACCUMULATED TO A DEPTH OF 1' FOOT.
   - E. SEDIMENT REMOVED FROM TRAP SHALL BE DEPOSITED IN A SUITABLE AREA AND IN SUCH A MANNER THAT IT WILL NOT ERODE.
   - F. RILLS AND GULLIES MUST BE REPAIRED.
2. GRAVEL BAG INLET PROTECTION SHALL BE CLEANED OUT WHENEVER SEDIMENT DEPTH IS ONE HALF THE HEIGHT OF ONE GRAVEL BAG.
3. STRAW ROLLS SHALL BE PERIODICALLY CHECKED TO ASSURE PROPER FUNCTION AND CLEANED OUT WHENEVER THE SEDIMENT DEPTH REACHED HALF THE HEIGHT OF THE ROLL.
4. SILT FENCE SHALL BE PERIODICALLY CHECKED TO ASSURE PROPER FUNCTION AND CLEANED OUT WHENEVER THE SEDIMENT DEPTH REACHES ONE FOOT IN HEIGHT.
5. CONSTRUCTION ENTRANCE SHALL BE REGRAVELED AS NECESSARY FOLLOWING SILT/SOIL BUILDUP.
6. ANY OTHER EROSION CONTROL MEASURES SHOULD BE CHECKED AT REGULAR INTERVALS TO ASSURE PROPER FUNCTION



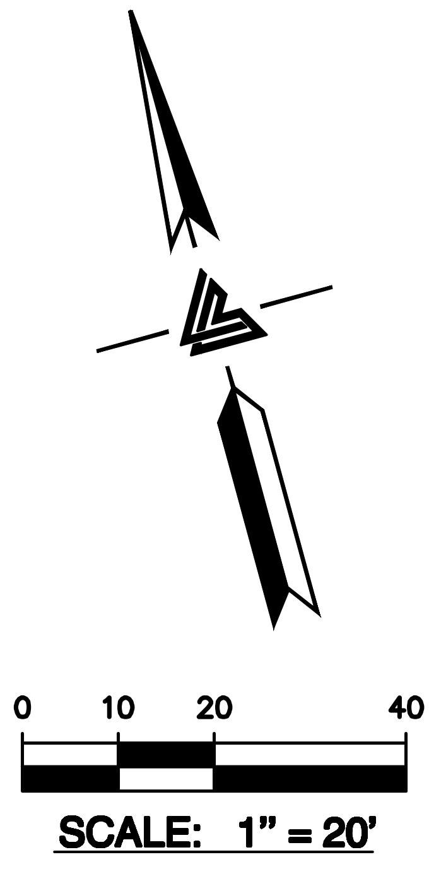
PROVIDE TEMPORARY GRAVEL BAGS OR STRAW BALES AT FLOW LINE AS SHOWN

PROVIDE INLET PROTECTION –TYP.

PROVIDE CONCRETE WASHOUT.

PROVIDE SILT FENCE OR STRAW ROLLS PLACED AT THE PERIMETER OF SITE SLOPES –TYP.

PROVIDE ROCKED CONSTRUCTION ENTRANCE. RELOCATE DURING CONSTRUCTION AS REQUIRED AT THE END OF PAVEMENT.



SCALE: 1" = 20'

SHEET TITLE:

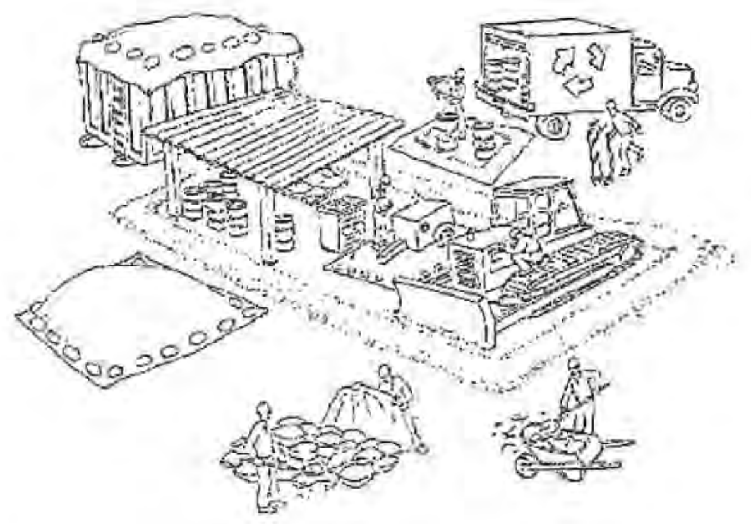
EROSION CONTROL DETAILS

SHEET NUMBER
C-7.1

Pollution Prevention - It's Part of the Plan



Make sure your crews and subs do the job right!

Runoff from streets and other paved areas is a major source of pollution and damage to creeks and the San Francisco Bay. Construction activities can directly affect the health of creeks and the Bay unless contractors and crews plan ahead to keep dirt, debris, and other construction waste away from storm drains and local creeks. Following these guidelines and the project specifications will ensure your compliance with County of Alameda requirements.

Materials storage & spill cleanup

Non-hazardous materials management

- Sand, dirt, and similar materials must be stored at least 10 feet (3 meters) from catch basins. All construction material must be covered with a tarp and contained with a perimeter control during wet weather or when rain is forecasted or when not actively being used within 14 days.
- Use (but don't overuse) reclaimed water for dust control as needed.
- Sweep or vacuum streets and other paved areas daily. Do not wash down streets or work areas with water!
- Recycle all asphalt, concrete, and aggregate base material from demolition activities. Comply with Alameda County Ordinances for recycling construction materials, wood, gyp board, pipe, etc.
- Check dumpsters regularly for leaks and to make sure they are not overfilled. Repair or replace leaking dumpsters promptly.
- Cover all dumpsters with a tarp at the end of every work day or during wet weather.

Hazardous materials management

- Label all hazardous materials and hazardous wastes (such as pesticides, paints, thinners, solvents, fuel, oil, and antifreeze) in accordance with city, county, state, and federal regulations.
- Store hazardous materials and wastes in water tight containers, store in appropriate secondary containment, and cover them at the end of every work day or during wet weather or when rain is forecasted.
- Follow manufacturer's application instructions for hazardous materials and be careful not to use more than necessary. Do not apply chemicals outdoors when rain is forecasted within 24 hours.
- Be sure to arrange for appropriate disposal of all hazardous wastes.

Spill prevention and control

- Keep a stockpile of spill cleanup materials (rags, absorbents, etc.) available at the construction site at all times.
- When spills or leaks occur, contain them immediately and be particularly careful to prevent leaks and spills from reaching the gutter, street, or storm drain. Never wash spilled material into a gutter, street, storm drain, or creek!
- Dispose of all containment and cleanup materials properly.
- Report any hazardous materials spills immediately! Dial 911 or Alameda

[[== Insert Agency Name and phone number ==]]

Construction Entrances and Perimeter

- Establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from site and tracking off site.
- Sweep or vacuum any street tracking immediately and secure sediment source to prevent further tracking.

Vehicle and equipment maintenance & cleaning

- Inspect vehicles and equipment for leaks frequently. Use drip pans to catch leaks until repairs are made; repair leaks promptly.
- Fuel and maintain vehicles on site only in a bermed area or over a drip pan that is big enough to prevent runoff.
- If you must clean vehicles or equipment on site, clean with water only in a bermed area that will not allow rinse water to run into gutters, streets, storm drains, or creeks.
- Do not clean vehicles or equipment on-site using soaps, solvents, degreasers, steam cleaning equipment, etc.

Earthwork & contaminated soils

- Keep excavated soil on the site where it will not collect in the street.
- Transfer to dump trucks should take place on the site, not in the street.
- Use fiber rolls, silt fences, or other control measures to minimize the flow of silt off the site.

- Earth moving activities are only allowed during dry weather by permit and as approved by the County Inspector in the Field.
- Mature vegetation is the best form of erosion control. Minimize disturbance to existing vegetation whenever possible.
- If you disturb a slope during construction, prevent erosion by securing the soil with erosion control fabric, or seed with fast-growing grasses as soon as possible. Place fiber rolls down-slope until soil is secure.
- If you suspect contamination (from site history, discoloration, odor, texture, abandoned underground tanks or pipes, or buried debris), call the Engineer for help in determining what should be done, and manage disposal of cntaminated soil according to their instructions.

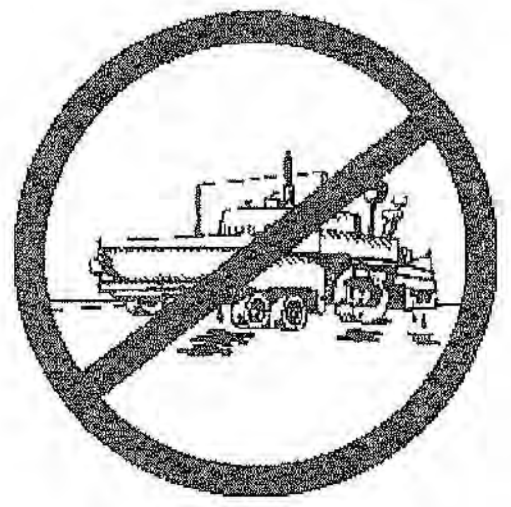
Dewatering operations

- Effectively manage all run-on, all runoff within the site, and all runoff that discharges from the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance.
- Reuse water for dust control, irrigation, or another on-site purpose to the greatest extent possible.
- Be sure to notify and obtain approval from the Engineer before discharging water to a street, gutter, or storm drain. Filtration or diversion through a basin, tank, or sediment trap may be required.
- In areas of known contamination, testing is required prior to reuse or discharge of groundwater. Consult with the Engineer to determine what testing is required and how to interpret results. Contaminated groundwater must be treated or hauled off-site for proper disposal.

Saw cutting

- Always completely cover or barricade storm drain inlets when saw cutting. Use filter fabric, catch basin inlet filters, or sand/gravel bags to keep slurry out of the storm drain system.
- Shovel, absorb, or vacuum saw-cut slurry and pick up all waste as soon as you are finished in one location or at the end of each work day (whichever is sooner!).
- If saw cut slurry enters a catch basin, clean it up immediately.

Paving/asphalt work



- Always cover storm drain inlets and manholes when paving or applying seal coat, tack coat, slurry seal, or fog seal.
- Protect gutters, ditches, and drainage courses with sand/gravel bags, or earthen berms.
- Do not sweep or wash down excess sand from sand sealing into gutters, storm drains, or creeks. Collect sand and return it to the stockpile, or dispose of it as trash.
- Do not use water to wash down fresh asphalt concrete pavement.

Concrete, grout, and mortar storage & waste disposal

- Store concrete, grout, and mortar under cover, on pallets, and away from drainage areas. These materials must never reach a storm drain.
- Wash out concrete equipment/trucks off-site or into contained washout areas that will not allow discharge of wash water onto the underlying soil or onto the surrounding areas.

- Collect the wash water from washing exposed aggregate concrete and remove it for appropriate disposal off site.

Painting

- Never rinse paint brushes or materials in a gutter or street!
- Paint out excess water-based paint before rinsing brushes, rollers, or containers in a sink.
- Paint out excess oil-based paint before cleaning brushes in thinner.
- Filter paint thinners and solvents for reuse whenever possible. Dispose of oil-based paint sludge and unusable thinner as hazardous waste.

Landscape Materials

- Contain, cover, and store on pallets all stockpiled landscape materials (mulch, compost, fertilizers, etc.) during wet weather or when rain is forecasted or when not actively being used within 14 days.
- Discontinue the application of any erodible landscape material within 2 days of forecasted rain and during wet weather.

Storm drain polluters may be liable for fines of $10,000 or more per day!

STRUCTURAL - GENERAL NOTES

GENERAL REQUIREMENTS

GOVERNING CODE: The design and construction of this project is governed by the **"California Building Code (CBC)", 2016 Edition**, hereafter referred to as the CBC, as adopted and modified by the City of **Oakland, CA** understood to be the Authority Having Jurisdiction (AHJ).

REFERENCE STANDARDS: Refer to Chapter 35 of 2016 CBC. Where other Standards are noted in the drawings, use the latest edition of the standard unless a specific date is indicated. Reference to a specific section in a code does not relieve the contractor from compliance with the entire standard.

DEFINITIONS: The following definitions cover the meanings of certain terms used in these notes:

"**Architect/Engineer**" – The Architect of Record and the Structural Engineer of Record.

- "**Structural Engineer of Record" (SER)** – The structural engineer who is licensed to stamp & sign the structural documents for the project. The SER is responsible for the design of the Primary Structural System.
- "**Submit for review**" - Submit to the Architect/Engineer for review prior to fabrication or construction.
- "**Per Plan**" – Indicates references to the structural plans, elevations and structural general notes.
- **"Specialty Structural Engineer" (SSE) –** A professional engineer (PE or SE), licensed in the State where the project is located, (typically not the SER), who performs specialty structural engineering services for selected specialty-engineered elements identified in the Contract Documents, and who has experience and training in the Specialty. Documents stamped and signed by the SSE shall be completed by or under the direct supervision of the SSE.
- **"Bidder-designed" –** Components of the structure that require the general contractor, subcontractor, or supplier who is responsible for the design, fabrication and installation of specialty-engineered elements identified in the Contract Documents to retain the services of an SSE. Submittals of "Bidder-designed" elements shall be stamped and signed by the SSE.

SPECIFICATIONS: Refer to the project specifications issued as part of the contract documents for information supplemental to these drawings.

OTHER DRAWINGS: Refer to the architectural, mechanical, electrical, civil and plumbing drawings for additional information including but not limited to: dimensions, elevations, slopes, door and window openings, non-bearing walls, stairs, finishes, drains, waterproofing, railings, curtain walls, elevators, curbs, depressions, mechanical unit locations, and other nonstructural items.

STRUCTURAL DETAILS: The structural drawings are intended to show the general character and extent of the project and are not intended to show all details of the work. Use entire detail sheets and specific details referenced in the plans as "typical" wherever they apply. Similarly, use details on entire sheets with "typical" in the name wherever they apply.

STRUCTURAL RESPONSIBILITIES: The structural engineer (SER) is responsible for the strength and stability of the primary structure in its completed form.

COORDINATION: The Contractor is responsible for coordinating details and accuracy of the work; for confirming and correlating all quantities and dimensions; for selecting fabrication processes; for techniques of assembly; and for performing work in a safe and secure manner.

PRE-CONSTRUCTION MEETINGS: The Contractor is responsible for coordinating pre-construction meetings prior to commencing work. Pre-con meetings, scheduled approximately two weeks prior to the start of the relevant work, are required for the following phases of construction: **Wood Modular Installation**. Attendees for pre-construction meeting are to include contractor, relevant subcontractors, fabricators, inspectors, architect/engineer, and representative of the Authority Having Jurisdiction where required. Meeting agendas are to include review of the work scope, project schedule relevant to the work, contact information of responsible parties, inspection points, review of materials and any special cases or issues, procedures for clarifications if required, testing and acceptance, etc.

MEANS, METHODS and SAFETY REQUIREMENTS: The contractor is responsible for the means and methods of construction and all job related safety standards such as OSHA and DOSH (Department of Occupational Safety and Health).

BRACING/SHORING DESIGN ENGINEER: The contractor shall at his discretion employ an SSE, a registered professional engineer for the design of any temporary bracing and shoring. Submit construction sequence to Architect/Engineer for review.

TEMPORARY SHORING, BRACING: The contractor is responsible for the strength and stability of the structure during construction and shall provide temporary shoring, bracing and other elements required to maintain stability until the structure is complete. It is the contractor's responsibility to be familiar with the work required in the construction documents and the requirements for executing it properly.

CONSTRUCTION LOADS: Loads on the structure during construction shall not exceed the design loads as noted in DESIGN CRITERIA & LOADS below or the capacity of partially completed construction as determined by the Contractor's SSE for Bracing/Shoring.

CHANGES IN LOADING: The contractor has the responsibility to notify the SER of any architectural, mechanical, electrical, or plumbing load imposed onto the structure that differs from, or that is not documented on the original Contract Documents (architectural / structural / mechanical / electrical or plumbing drawings). Provide documentation of location, load, size and anchorage of all undocumented loads in excess of **400** pounds. Provide marked-up structural plan indicating locations of any new equipment or loads. Submit plans to the Architect/Engineer for review prior to installation.

NOTE PRIORITIES: Plan and detail notes and specific loading data provided on individual plans and detail drawings supplements information in the Structural General Notes.

DISCREPANCIES: In case of discrepancies between the General Notes, Specifications, Plans/Details or Reference Standards, the Architect/Engineer shall determine which shall govern. Discrepancies shall be brought to the attention of the Architect/Engineer before proceeding with the work. Should any discrepancy be found in the Contract Documents, the Contractor will be deemed to have included in the price the most expensive way of completing the work, unless prior to the submission of the price, the Contractor asks for a decision from the Architect as to which shall govern. Accordingly, any conflict in or between the Contract Documents shall not be a basis for adjustment in the Contract Price.

SITE VERIFICATION: The contractor shall verify all dimensions and conditions at the site. Conflicts between the drawings and actual site conditions shall be brought to the attention of the Architect/Engineer before proceeding with the work.

ADJACENT UTILITIES: The contractor shall determine the location of all adjacent underground utilities prior to earthwork, foundations, shoring, and excavation. Any utility information shown on the drawings and details is approximate and not necessarily complete.

ALTERNATES: Alternate products of similar strength, nature and form for specified items may be submitted with adequate technical documentation (proper test report, etc.) to the Architect/Engineer for review. Alternate materials that are submitted without adequate technical documentation or that significantly deviate from the design intent of materials specified may be returned without review. Alternates that require substantial effort to review will not be reviewed unless authorized by the Owner.

DESIGN CRITERIA AND LOADS

OCCUPANCY:	Risk Category of Building per 2016 CBC Table 1604.5 =	**II**

WIND DESIGN:	**MAIN WIND FORCE RESISTING SYSTEM**	
	Ultimate Design Wind Speed, V_{ULT} (MPH)	**110**
	Exposure Category	**C**
	Internal Pressure Coefficient **Cpi =**	**+/- 0.18**
	Topographic Factor **Kzt =**	**1.0**
	Wind Analysis procedure used:	**Directional**
	COMPONENT & CLADDING PRESSURES for DESIGN (Ultimate)	**PSF**
	Wall Cladding, Typical Zone	**33**
	Wall Cladding, Edge Zone within **18** feet of corners	**41**
	Roof Cladding, Middle Zone	**34**
	Roof Cladding, Edge Zone within **18** feet of edge	**56**
	Roof Cladding, Corner Zone within **18** feet of corners	**85**
	Uplift Load Net	**10**

SEISMIC DESIGN:	Seismic Design Category: SDC =	D
	Basic Structural System	Bearing Wall
	Seismic Force Resisting System	Light Frame Wood Shear Walls
	Response Modification Factor: R =	6.5
	System Over Strength Factor Omega =	2.5
	Deflection Amplification Factor Cd =	4
	Site Classification per CBC 1613.3.2 & ASCE 7-10, Ch. 20 Site Class =	D
	Seismic Importance Factor per ASCE 7-10 Table 1.5-2 Ie =	1.0
	Spectral Response Acceleration (Short Period) S_s =	1.501g
	Spectral Response Acceleration (1-Second Period) S_1 =	0.600
	Spectral Design Response Coefficient (Short Period) S_{DS} =	1.001 g
	Spectral Design Response Coefficient (1-Second Period) S_{DI} =	0.600 g
	Seismic response coefficient(s) Cs =	0.154
	Redundancy Factor (North/South Direction) N/S rho=	1.0
	Redundancy Factor (East / West Direction) E/W rho=	1.0
	Design Base Shear (North/South Direction) (KIPS)	217
	Design Base Shear (East / West Direction) (KIPS)	217
	Base shear governed by:	Seismic
	Seismic Analysis procedure used:	Equivalent Lateral Force (ELF)

DESIGN LIVE LOADS	**AREA**	**LIVE LOADS (PSF) UNO**	**REMARKS & FOOTNOTES**
	Handrails & Pedestrian Guardrails	50 PLF or 200 LB	(1)
	Stairs & Exits	100 PSF or 300 LB	Stair treads per note (2)
	Corridors above first Floor	----	Same as occupancy served
	Residential, Hotel Rooms	40	
	Balconies & Decks	----	Same as Occupancy served
	Mechanical Rooms	150	
	Light Storage Area	125	
	Roofs	20 PSF or 300 LB	Area load is reducible. Point load per note (2).

(1) Top rail shall be designed to resist 50 PLF line load or 200 lb. point load applied in any direction at any point. Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to withstand a horizontally applied normal load of 50 LB on an area not to exceed 1 ft. square. These three loads are to be considered separately with worst case used for design.

(2) Place 300 lb. concentrated load over 2"x2" area at any point to produce maximum stress. Area load and concentrated load are to be considered separately with worst case used for design.

DESIGN DEAD LOADS	BIDDER DESIGN	DEAD LOADS (PSF) UNO	REMARKS & FOOTNOTES
	Roof Dead Load, Total Top Chord Bottom Chord	20 PSF **15** PSF **5** PSF	For Pre-Fabricated Wood Roof Truss design, Site-Installed (1)
	Floor Dead Load, Total Top Chord Bottom Chord	**12** PSF **8** PSF **4** PSF	For Pre-Fabricated Wood Floor Truss design, Factory-Installed (1)
	Floor Dead Load, Total Top Chord Bottom Chord	**17** PSF **10** PSF **7** PSF	For Pre-Fabricated Wood Floor Joist design with (2) Layers Gyp, Factory-Installed (1)

(1) Per NFPA 13, Section 9.2.1.3, building structures supporting sprinkler piping shall be designed with the added weight of water-filled pipes plus a minimum 250 lb point load applied at the point of hanging. This point load shall be considered a live load and does not act concurrently with other live loads imposed on the structural element. The additional weight of water-filled pipes is already included in the distributed design dead load

SUBMITTALS

SUBMIT FOR REVIEW: SUBMITTALS of shop drawings, and product data and mill tests are required for items noted in the individual materials sections and for *bidder designed* elements.

SUBMITTAL REVIEW PERIOD: Submittals shall be made in time to provide a minimum of TWO WEEKS or 10 WORKING DAYS for review by the Architect/Engineer prior to the onset of fabrication.

GENERAL CONTRACTOR'S PRIOR REVIEW: Prior to submission to the Architect/Engineer, the Contractor shall review the submittal for completeness. Dimensions and quantities are not reviewed by the SER, and therefore, must be verified by the General Contractor. Contractor shall provide any necessary dimensional details requested by the Detailer and provide the Contractor's review stamp and signature before forwarding to the Architect/Engineer.

SHOP DRAWING REVIEW: Once the contractor has completed his review, the SER will review the submittal for general conformance with the design concept and the contract documents of the building and will stamp the submittal accordingly. Markings or comments shall not be construed as relieving the contractor from compliance with the project plans and specifications, nor departures there from. The SER will return submittals in the form they are submitted in (either hard copy or electronic). For hard copy submittals, the contractor is responsible for submitting the required number of copies to the SER for review.

SHOP DRAWING DEVIATIONS: When shop drawings (component design drawings) differ from or add to the requirements of the structural drawings they shall be designed and stamped by the responsible SSE.

DEFERRED SUBMITTALS

BIDDER-DESIGNED ELEMENTS

Submit "Bidder-Designed" deferred submittals to the Architect and SER for review. The deferred submittals shall also be submitted to the city for approval, if required by the city.

Design of prefabricated, "bidder designed", manufactured, pre-engineered, or other fabricated products shall comply with the following requirements:

1) Design considers tributary dead, live, wind and earthquake loads in combinations required by CBC.
2) Design within the Deflection Limits noted herein and as specified or referenced in the CBC.
3) Design shall conform to the specifications and reference standards of the governing code.
4) Submittal shall include:
   a. Calculations prepared, stamped and signed by the SSE demonstrating code conformance.
   b. Engineered component design drawings are prepared, stamped and signed by the SSE.
   c. Product data, technical information and manufacturer's written requirements and Agency approvals as applicable.
   d. SSE may submit to the Architect/Engineer, a request to utilize relevant alternate design criteria of similar nature and generally equivalency which is recognized by the Code and acceptable to the Authority Having Jurisdiction. Submit adequate documentation of design.

DEFLECTION LIMITS FOR SSE / BIDDER DESIGNED ELEMENTS:	**VERTICAL**	**LIMIT**
	Roof Members, Dead + Live or Snow or Wind, Total Load (TL) Deflection	L / 240, where (L is span length,inches)
	Roof, Live or Snow or Wind Load (RLL)	L / 360
	Floor Members, Total Load (TL) uno	L / 360
	Floor Live Load (LL) uno	L / 480
	HORIZONTAL	**LIMIT and FOOTNOTE**
	Members Supporting Brittle Finishes	L / 240 (1)
	Members Supporting Flexible Finishes	L / 180 (1)

(1) Wind Load is reducible to 0.42 times the Component and Cladding Loads per Table 1604.3 footnote f.

GENERAL CONTRACTOR'S PRIOR REVIEW: Once the contractor has completed his review of the SSE component drawings, the SER will review the submittal for general conformance with the design of the building and will stamp the submittal accordingly. Review of the Specialty Structural Engineer's (SSE) shop drawings (component design drawings) is for compliance with design criteria and compatibility with the design of the primary structure and does not relieve the SSE of responsibility for that design. All necessary bracing, ties, anchorage, proprietary products shall be furnished and installed per manufacturer's instructions or the SSE's design drawings and calculations. These elements include but are not limited to:

- Handrails, Guardrails and Balcony Rail Anchorages
- Roof Mounted Components: Skylights, hatches
- Window Washing System Tie-down Anchorage
- Mechanical, Electrical, Plumbing & Sprinkler Hanger Plans
- Temporary Shoring Systems
- Prefabricated Wood Roof Trusses (Site-Installed)
- Prefabricated Wood Roof & Floor Trusses (Factory Installed by Modular Manufacturer)

INSPECTIONS, QUALITY ASSURANCE VERIFICATIONS AND TEST REQUIREMENTS

INSPECTIONS: Foundations, footings, under slab systems and framing are subject to inspection by the Building Official in accordance with CBC 110.3. Contractor shall coordinate all required inspections with the Building Official.

SPECIAL INSPECTIONS, VERIFICATIONS and TESTS: Special Inspections, Verifications and Testing shall be done in accordance with CBC Chapter 17 and the STATEMENT OF SPECIAL INSPECTIONS herein per CBC Sections 1704 and 1705 as applicable.

SPECIAL INSPECTION AGENCY and SPECIAL INSPECTORS: Owner shall retain an "approved agency" per CBC 1703 to provide Special Inspections for the project. Special Inspectors shall be qualified persons per CBC 1704.2.1.

STATEMENT OF SPECIAL INSPECTIONS. Special Inspections and Testing per CBC Sections 1704 and 1705 are required for the following:

FABRICATION SHOP INSPECTION: Where off-site Fabrication of gravity LOAD BEARING MEMBERS & ASSEMBLIES is performed, Special Inspector shall verify that the fabricator complies with CBC 1704.2.5 which includes the following:

- **Prior to the start of fabrication**, Special Inspector(s), representing the Owner, shall visit the Fabricator's shop(s) where the work is to be performed, and verifies that the Fabricator maintains detailed Fabrication and Quality Control procedures that provide a basis for inspection, control of workmanship, material control and fabricator's ability to conform to approved Construction Documents and referenced Standards.
- **Fabricator shall have available** for Inspector's review, detailed procedures for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and applicable test reports for primary load-carrying members, are capable of being determined.

WOOD CONSTRUCTION per CBC Section 1705.5, 1705.10.1, & 1705.11.2:

- **Periodic** inspection required for verification of:
  - Shear Walls: Anchor Bolts, Hold-downs (HD) and Continuous Rod Tie-Down Systems (TDS) including squash blocks, LPT shear connectors, strap connectors, boundary edge nailing, plate nailing and panel edge shear nailing for size & spacing **where fastener spacing of the sheathing is 4 inches or less.**
  - Diaphragms: blocking, strap connections, boundary edge and panel shear nailing size & spacing **where fastener spacing of the sheathing is 4 inches or less.**
  - Moisture content of wood studs, plates, beams and joists.
  - Proper bottom plates sizes (2x and 3x) and plate washers.
  - Roof truss 'hurricane' clips.

POST-INSTALLED ANCHORS TO CONCRETE AND MASONRY**:** shall comply with CBC Section 1703. Inspections shall be in accordance with the requirements set forth in the approved ICC Evaluation Report and as indicated by the design requirements specified on the drawings. Refer to the POST INSTALLED ANCHORS section of these notes for anchors that are the basis of the design. Special inspector shall verify anchors are as specified in the POST INSTALLED ANCHORS section of these notes or as otherwise specified on the drawings. Substitutions require approval by the SER and require substantiating calculations and current 2013 CBC recognized ICC Evaluation Services (ES) Report. Special Inspector shall document in their Special Inspection Report compliance with each of the elements required within the applicable ICC Evaluation Services (ES) Report.

INSPECTION SUBMITTALS: Special inspection reports shall be provided on a weekly basis. Final special inspection reports will be required by each special inspection firm per CBC 1704.2.4. Submit copies of all inspection reports to the Architect/Engineer and the Authority Having Jurisdiction for review.

STRUCTURAL OBSERVATION: Structural Observation shall be provided for structures classified as Seismic Design Category D, E and F in accordance with CBC Section 1704.5 and Section 107.3.4. Structural observation site visits will be as follows: **first level of wood modular installation and soon after substantial completion of modular units before structural connections are hidden away.** Contractor shall notify the SER in a timely manner to allow scheduled Observations to occur. Field (Observation) Reports will be distributed to the Architect, the Contractor, Special Inspector and the Authority Having Jurisdiction.

CONTRACTOR RESPONSIBILITY: Prior to issuance of the building permit, the Contractor is required to provide the Authority Having Jurisdiction a signed, written acknowledgement of the Contractor's responsibilities associated with the above Statement of Special Inspections addressing the requirements listed in CBC Section 1704.4. Contractor is referred to CBC Sections 1705.11.5 and 1705.11.6 for architectural and MEP building systems that may be subject to additional inspections (based on the building's designated Seismic Design Category listed in the CRITERIA), including anchorage of HVAC ductwork containing hazardous materials, piping systems and mechanical units containing flammable, combustible or highly toxic materials, electrical equipment used for emergency or standby power, exterior wall panels and suspended ceiling systems.

PREFABRICATED CONSTRUCTION: All prefabricated construction shall conform to CBC Section 1703.

WOOD FRAMING

REFERENCE STANDARDS: Conform to:

(1) CBC Chapter 23 "WOOD"
(2) NDS - "2015 National Design Specification (NDS) for Wood Construction"
(3) ANSI/AF&PA – SDPWS-15: Special Design Provisions for Wind and Seismic
(4) APA PDS—04 Plywood Design Specification
(5) ANSI/TPI 1-2007 "National Design Standard for Metal-Plate-Connected Wood Truss Construction"
(6) BCSI "Guide to Good Practice for Handling, Installing & Bracing of Metal Plated Connected Wood Trusses"
(7) TPI DSB "Recommended Design Specification for Temporary Bracing of Metal Plate Connected Wood Trusses"
(8) APA Report TT-045B "Minimum Nail Penetration for Wood Structural Panel Connections Subject to Lateral Loads"

SUBMITTALS: Submit shop drawings to the Architect/Engineer for review. Shop drawings shall include member size, spacing, camber, material type, grade, shop and field assembly details and connections, types and location of bolts and other fasteners. Supply shop drawings for the following:

(1) Prefabricated Wood Roof & Floor Trusses
(2) LSL members
(3) Tapered & Parallel Wood I Joists (Solid web-wood joists)
(4) Panelized wood walls & connection details
(5) Wood Tie-Down Systems

DEFERRED SUBMITTALS: Submit product data and proof of ICC approval for framing members and fasteners that have been designed by others. Submit calculations prepared by the SSE in the state of **California** for all members and connections designed by others along with shop drawings. All necessary bridging, blocking, blocking panels and web stiffeners shall be detailed and furnished by the supplier. Temporary and permanent bridging shall be installed in conformance with the manufacturer's specifications. Deflection limits shall be as noted under DEFFERRED SUBMITTLALS section specific details. Products included are:

- Metal plate connected trusses (prefabricated trusses) Conform to CBC Section 2303.4. Truss Supplier to provide design and materials for all permanent truss bracing. Shop drawings shall provide for shapes, bearing points, intersections, hips, and valleys shown on the drawings. The manufacturer shall provide special hip, valley and intersection areas (step down trusses, jack trusses and girder trusses) unless specifically indicated on the plans. Provide all truss-to-truss and truss-to-support connection details and required connection materials. Specify temporary and permanent bracing and connections on the shop drawings. Provide all truss reactions on shop drawings.
- Wood Tie Down Systems: Continuous rod hold-down systems, with take-up devices, shall be as specified. Take-up devices are required at each framing level. Additional framing members shall be provided per the system requirements. Refer to details and loading on the structural drawings.

IDENTIFICATION: All sawn lumber and pre-manufactured wood products shall be identified by the grade mark or a certificate of inspection issued by the certifying agency.

MATERIALS:

- Sawn Lumber: Conform to grading rules of WWPA, WCLIB or NLGA and Table below. Finger jointed studs acceptable at interior walls only.

TABLE of SOLID SAWN LUMBER

Member Use	Size	Species	Grade
Wall Stud	2x4, 3x4, 2x6, 3x6	Doug Fir Larch	No. 2
Sill Plate	2x4, 3x4, 2x6, 3x6	PT Doug Fir Larch	No. 2
Post	4x4, 4x6, 4x8	Doug Fir Larch	No. 2
Floor or Roof Joist	2x6 through 2x12	Doug Fir Larch	No. 2
Beam	4x8 through 4x12	Doug Fir Larch	No. 2
Beam	6x8 through 6x12	Doug Fir Larch	No. 1
Post or Timber	6x6, 8x8	Doug-Fir Larch	No. 1

- Glued Laminated Timber: Conform to AITC 117**-2004** "Standard Specifications for Structural Glue-laminated Timber of Softwood Species, Manufacturing and Design" and ANSI/AITC A190.1 "Structural Glued Laminated Timber." Camber all glued laminated beams, except cantilevered and continuous beams, to 3000' radius, unless shown otherwise on the plans.

TABLE of GLULAM and GRADE

Member	Sizes	Species	Comb. Symbol	Uses
Beams	All	DF/DF	24F–V4	Simple Spans
Beams	All	DF/DF	24F–V8	Continuous or with Cantilever Spans
Columns	All	DF	L2	Post, Truss Member

- Wood Structural Sheathing (Plywood): Wood APA-rated structural sheathing includes: all veneer plywood, oriented strand board, waferboard, particleboard, T1-11 siding, and composites of veneer and wood based material with T&G joint. **Architect** may disallow OSB. Confirm with **Architect**. Conform to "Construction and Industrial Plywood" based on Product Standard PS 1-07 by the U.S. Dept. of Commerce, and "Performance Standard for Wood-Based Structural-Use Panels" based on Product Standard PS 2-04 by the U.S. Dept. of Commerce and "Plywood Design Specification" based on APA PDS—04 by the American Plywood Association. Unless noted otherwise, sheathing shall comply with the following table:

TABLE of SHEATHING - Use, Minimum Thickness and Minimum APA Rating

Location	Thickness	Span Rating	Plywood Grade	Exposure
Roof	15/32"	32/16	C-D	1
Floor	23/32" T&G	24 OC	STURD-I-FLOOR	1
Walls	7/16"	32/16	C-D	1

Unless noted otherwise on drawings, install roof and floor panels with long dimension across supports and with panel continuous over two or more spans. End joints shall occur over supports.

- Timber Connectors: Shall be "Strong Tie" by Simpson Company as specified in their latest catalog. Alternate connectors by other manufacturers may be substituted provided they have current ICC approval for equivalent or greater load capacities and are reviewed and approved by the SER prior to ordering. Connectors shall be installed per the manufacturer's instructions. Where connector straps connect two members, place one-half of the nails or bolts in each member. Where straps are used as hold-downs, nail straps to wood framing just prior to drywall application, as late as possible in the framing process to allow the wood to shrink and the building to settle. Premature nailing of the strap may lead to strap buckling and potential finish damage.

  Where connectors are in exposed exterior applications in contact with preservative treated wood (PT) other than CCA, connectors shall be either batch hot-dipped galvanized (HDG), mechanically galvanized (ASTM B695, Class 55 minimum) stainless steel, or provided with 1.85 oz/sf of zinc galvanizing equal to or better than Simpson ZMAX finish.

  Nail straps to wood framing as late as possible in the framing process to allow the wood to shrink and the building to settle. Premature nailing of the strap may lead to strap buckling and potential finish damage.

- Fasteners (nails, bolts, screws, etc) attaching timber connectors (joist hangers, post caps and bases, etc) to PT wood shall have similar corrosion resistance properties (matching protective treatments) as the protected connector. Fasteners (nails, bolts, screws, etc) attaching sawn timber members or sheathing (shear walls) to PT wood be corrosion resistant; nails and lag bolts shall be either HDG (ASTM A153) or stainless steel. Verify the suitability of the fastener protection/coating with the wood treatment chemical manufacturer/supplier.

  Provide washers under the heads and nuts of all bolts and lag screws bearing on wood.

- Lag Bolts/Bolts: Conform to ASTM A307 and CBC Section 2304.9.

- Engineered Wood Products (RedBuilt): The following materials are based on lumber manufactured by RedBuilt and were used for the design as shown on the plans. Alternate products by other manufacturers may be substituted provided they have current ICC approval for equivalent or greater load and stiffness properties and are reviewed and approved by the Structural Engineer. A HUD Material Release form is required for all manufactured wood products listed below

  a. Laminated Veneer Lumber (RedLam LVL): Conform to **ICC ES Report No. ESR-2993** or CCMC Report No. 12627–R.

SHEET TITLE:

General Notes

SHEET NUMBER
S1.00

b. Tapered and Parallel Chord I-JOISTS (Deferred Submittal): Conform to **ICC Report No. ESR-2994**. The manufacturer shall design the joists for the spans and conditions shown on the plans. Joists shall have LVL chords and solid wood webs. Joists shall be tapered or parallel as shown on the plans.

c. Open Web Wood Trusses: Conform to **ICC Report No ESR-1776**. The manufacturer shall design the joists for the spans and conditions shown on the plans. Trusses shall have wood chords and metal webs.

TABLE of ENGINEERED WOOD Requirements

Type	Use	Widths	**E(10⁶)**	**Fb**	**Fv**	**Fc//**
			PSI	PSI	PSI	PSI
RedLam LVL Rimboard	Site-Built Rim-board	1 ¼”,	1.6E	2,140	285	2,100
RedLam LVL Rimboard	Factoy-Built Floor/ Ceiling Rim-Board	1 ¼”,	1.6E	2,140	285	2,100
RedLam LVL	Bundled Beam, Stair Stringers	1 ½”, 1 ¾”, 3 ½”	2.0E	2,900	285	2,100
RedLam LVL	Header, Beam or Column	1 ¾”.3 ½”, 5 ¼”, 7”	2.0E	2,900	285	2,100

NAILING REQUIREMENTS: Conform to CBC Section 2304.9 “Connections and fasteners.” Unless noted on plans, nail per Table 2304.9.1. Nailing for roof/floor diaphragms/shear walls shall be per drawings. Nails shall be driven flush and shall not fracture the surface of sheathing. Alternate nails may be used but are subject to review and approval by the Structural Engineer. Substitution of staples for the nailing of rated sheathing is subject to review by the structural engineer prior to construction.

STANDARD LIGHT-FRAME CONSTRUCTION: Unless noted on the plans, construction shall conform to CBC Section 2308 “Conventional Light-Frame Construction.”

NAILERS ON STEEL COLUMNS and BEAMS: Wood 3x nailers are generally required on all HSS columns and steel beams abutting or embedded within wood framing. Unless noted otherwise, attach with 5/8” diameter bolts or welded studs at 16” on centers. Wood nailers on beams supporting joist hangers shall not overhang the beam flange by more than ¼”.

MOISTURE CONTENT: Wood material used for this project shall have maximum moisture content of 19% except for the pressure-treated wood sill plate. Refer to TESTING & INSPECTIONS for the verification of these limits. The maximum moisture content required may be less than 19% when based on a particular cladding/insulation system. Refer to the Architect’s drawings, and project specifications, or with cladding installer for maximum recommended moisture content.

SHRINKANGE COMPENSATION FOR MECHANICAL, ELECTRICAL, AND PLUMBING SYSTEMS: MEP systems, including ductwork, pipes, and other elements that run continuously between levels shall be installed/designed in such a manner to accommodate shrinkage in the wood framing. Wood shrinkage amounts will vary depending on the construction process and materials used. The anticipated shrinkage under typical conditions is expected to range between 1/8” and 1/4” per floor.

CLADDING COMPATIBILTY: The Architect/Owner shall review the cladding and insulation systems proposed for the project with respect to their performance over wood studs with moisture contents greater than 19%. EIFS systems should be avoided on wood-framed projects due to problems with moisture proofing.

PRESERVATIVE TREATMENT (PT): Wood materials are required to be “treated wood” in accordance with CBC Section 2304.11. “Decay and Termite Protection” shall conform to the appropriate standards of the American Wood-Preservers Association (AWPA) for sawn lumber, glued laminated timber, round poles, wood piles and marine piles. Follow American Lumber Standards Committee (ALSC) quality assurance procedures. Products shall bear the appropriate mark. Fasteners or anchors in treated wood shall be of stainless steel or hot-dipped galvanized or as per CBC 2304.9.5.

Mud sill plates in normally dry interior applications may be treated with Sodium Borate (DOT - Disodium Octaborate Tetrahydrate) as recent studies have noted less connector corrosion potential than other available wood treatments or the original CCA treated sill plates. Wood treated with Sodium Borate shall be protected during shipment, storage and installation to minimize leaching of the water-soluble preservative from the lumber. Sodium borate pressure treated plates do not require hot-dipped galvanized connectors.

If using sill plates other than CCA or sodium borate, fasteners must be hot dipped galvanized or stainless steel. Fasteners (nails, bolts, screws, washers & lag screws) attaching timber connectors (joist hangers, post caps and bases, etc) to PT wood shall have similar corrosion resistance properties (matching protective treatments) as the protected connector; that is, use hot dipped galvanized or stainless steel fasteners. Fasteners (nails, bolts, screws, washers & lag screws) attaching sawn timber members or sheathing (shear walls) to Pressure Treated wood be corrosion resistant (hot dipped galvanized or stainless steel.

Always verify the suitability of the fastener protection/coating with the wood treatment chemical manufacturer/supplier.

FOUNDATION PLAN

SCALE: 1/8" = 1'-0"

N

11/12/2019 2:43:09 PM

FOUNDATION NOTES:

1. STRUCTURAL GENERAL NOTES, DESIGN CRITERIA, ABBREVIATIONS AND LEGEND PER S1.00 AND S1.01.
2. VERIFY ALL DIMENSIONS AND ELEVATIONS WITH THE ARCHITECTURAL DRAWINGS.
3. CONTRACTOR SHALL LOCATE AND VERIFY THE FOLLOWING WITH OTHERS PRIOR TO POURING CONCRETE: ALL DOOR OPENINGS IN FOUNDATION WALLS; DRAINS AND SLOPES; BLOCKOUTS FOR COOLERS, PLUMBING, SPRINKLERS AND HVAC. ALL DUCTS, CHASES AND PIPES PER MECHANICAL, PLUMBING, ELECTRICAL AND SPRINKLER DRAWINGS. STAIR DETAILS AND GUARDRAILS PER ARCHITECTURAL DRAWINGS. CONCRETE CURBS AND LOCATIONS PER ARCHITECTURAL DRAWINGS.
4. TOP OF SLAB (T/SLAB) ELEVATION BASED OFF SEA LEVEL. FOR ACTUAL T/SLAB ELEVATION REFER TO CIVIL AND ARCHITECTURAL DRAWINGS. PROVIDE VAPOR BARRIER BELOW SLAB AT INTERIOR SPACES AND PROVIDE FREE-DRAINING GRANULAR FILL PER GEOTECH REPORT.
5. TYPICAL TOP OF INTERIOR (T/INTERIOR) FOOTING ELEVATION = 12'-1 1/2"", UNO. TYPICAL TOP OF EXTERIOR T/EXTERIOR) FOOTING ELEVATIONS = 8'-4", UNO.
6. ALL FOOTINGS AND SLABS TO BEAR ON COMPETENT NATIVE SOIL AND/OR STRUCTURAL FILL. SUBGRADE PREPARATION, STRUCTURAL FILL, FOOTING DRAINS, AND OTHER REQUIREMENTS PER GEOTECH REPORT AS NOTED IN THE STRUCTURAL GENERAL NOTES.
7. CJ INDICATES CONTROL JOINT PER PLAN.
8. ALL WOOD EXPOSED TO CONCRETE, WEATHER, OR WITHIN 8" OF FINISHED GRADE SHALL BE PRESSURE-TREATED.
9. MOISTURE PROOF ALL CONCRETE STEM AND BASEMENT WALLS PER ARCHITECT.
10. STEEL STAIRS SHALL BE BIDDER-DESIGNED, UNO. APPLICABLE DESIGN REQUIREMENTS PER STRUCTURAL GENERAL NOTES.
11. ELEVATOR STEEL AND CONNECTIONS ARE PROVIDED FOR BUDGET PURPOSES ONLY AND ARE PRELIMINARY. THE PROPOSED STRUCTURAL MEMBERS AND THEIR CONNECTIONS SHALL BE CONFIRMED ONCE FINAL ELEVATOR REACTIONS ARE PROVIDED TO THE STRUCTURAL ENGINEER OF RECORD.
12. TYPICAL DETAILS PER:

4/S4.01	STANDARD HOOKS AND BAR BENDS
12/S4.01	TYPICAL STEPPED FOOTING
7/S4.01	TYPICAL STAIR ON GRADE
8/S4.01	TYPICAL DEPRESSED SLAB DETAIL
11/S4.01	TYPICAL STEP AT SLAB ON GRADE
3/S4.01	TYPICAL CONCRETE WALL OPENING REINFORCEMENT
12/S4.02	TYPICAL BASEPLATE CONFIGURATIONS

Site Conceptual Model

Site Conceptual Model

The Phoenix
1/20/20

Sec No | **Section / Sub-Section Name** | **Details** | **References** | **Data Gap** | **Method to Address Data Gap**

1 Introduction

This Site Conceptual Model (SCM) was prepared by P&D Environmental, Inc. (P&D) on behalf of Urban Designs, LLC for The Phoenix case. Alameda County Department of Environmental Health (ACDEH) is the lead regulatory oversight agency for this case. Case identifiers are provided below:

Site Name:	The Phoenix	**GeoTracker ID:**	T10000011072
Site Address:	801 Pine Street, Oakland, CA 94607	**ACDEH Case No.:**	RO0003269

This SCM was prepared by or under the oversight of a licensed professional as certified in Attachment A in accordance with industry best practices and [Insert standards used to develop SCM (e.g. LUFT manual, ASTM Standard, EPA Guidance].

Attachment A

1.1 Change log

This document has been updated to reflect new data collected for the Site. A summary of previous versions of the SCM for the Site are listed below:

Prepared By	Date
P&D Environmental, Inc.	2/3/2020

Revisions the most recent previous version of this tabular SCM are indicated using ~~strikethrough~~ to denote deleted text and underline to denote added text.

1.2 Responsible Party Identification

Responsible Party Name	Relationship	Method of Identification
Urban Designs, LLC	[owner/operator/developer]	VRRA

NOR: Notice of Responsibility; VRAA: Voluntary Remedial Action Agreement

2.6 Other Hazardous Materials or Waste Infrastructure

System Component	Material Stored/Conveyed	Size/Quantity	Status	Installation Date	Removal Date
N/A					

2.7 Subsurface Fill and Excavations

Backfill Purpose	Description	Location	Date of Fill	Certified Clean Documentation on GeoTracker	Date of Certification
2,600-gallon Gasoline UST	The gasoline UST was removed and observed prior to disposal offsite. The tank showed signs of moderate corrosion, with no holes. The gasoline UST was buried between approximately 4 to 5 feet bgs and confirmation samples were collected underneath the east and west ends of the UST at a depth of 8 feet bgs. Approximately 200 cubic yards of soil were excavated from the gasoline UST excavation. No information regarding backfilling was found. Further excavation and characterization will occur prior to site redevelopment.	North-west edge of property	Unk.	No	N/A
1,000-gallon Diesel UST	The diesel UST was removed and observed prior to disposal offsite. The tank showed signs of severe corrosion and a hole at the bottom of it. The diesel UST was buried between approximately 4 to 5 feet bgs and confirmation samples were collected underneath the north and south ends of the UST at a depth of 8 feet bgs. Approximately 800 cubic yards of soil were excavated from the diesel UST excavation. A portion of the excavated soil from the diesel UST excavation was characterized as suitable for reuse as fill. Further excavation and characterization will occur prior to site redevelopment.	Just outside north-western edge of property (in former Cedar Street)	Unk.	No	N/A
250-gallon Solvent UST	The two solvent tanks were accidentally encountered and punctured with a backhoe while performing remedial excavation at the subject site. Tank was punctured by excavator and an estimated 80-gallons of the tank contents leaked into surrounding soil. Work was immediately halted, the tank was covered with 2 to 3 feet of clean soil and the area was isolated and barricaded. Soil and liquid samples identified the tank contents as diluted solvent (toluene, acetone, phenols, and dichlorobenzenes). No depth of burial information provided. Approximately 200 to 300 cubic yards of soil was excavated from the UST pit and soil samples were collected from the bottom of the tank excavation.	South-west area of property	Unk.	No	N/A

References: Reference #3

Data Gap: No

Sec No	Section / Sub-Section Name	Details	References	Data Gap	Method to Address Data Gap

25-gallon Solvent UST	The two solvent tanks were accidentally encountered while performing remedial excavation at the subject site. Tank was punctured by excavator and approximately 1-gallon of the tank contents leaked into surrounding soil. Work was immediately halted, the tank was covered with 2 to 3 feet of clean soil and the area was isolated and barricaded. Soil and liquid samples identified the tank contents as diluted solvent (toluene, acetone, phenols, dichlorobenzenes, and methyl ethyl ketone). No depth of burial information. Approximately 50 cubic yards of soil was excavated from the UST pit and one soil sample was collected from underneath the UST.	South-west area of property	Unk.	No	N/A

2.8 Other Recognized Environmental Conditions (RECs)

REC Type	Description
REC	Elevated lead in shallow soil has been detected during subsurface investigations.
REC	PCE and TCE have been identified in soil gas in specific portions of the site at concentrations exceeding July 2019 RWQCB soil gas screening levels.

2.9 Exposure Controls and Remediation Systems

		References
Engineering controls currently employed at the Site to control otherwise complete exposure pathways:	None	
Institutional controls currently employed at the Site to control otherwise complete exposure pathways or to protect identified engineering controls:	Soil and Groundwater Management Plan	References #4-8
Identify remediation systems and remediation system components at the Site:	None

The Phoenix
1/20/20

Sec No	Section / Sub-Section Name	Details	References	Data Gap	Method to Address Data Gap
3	**Physical Setting**				
3.1	**Regional Geology and Hydrogeology**	Review of regional geologic maps from U. S. Geological Survey Professional Paper 943, "Flatland Deposits - Their Geology and Engineering Properties and Their Importance to Comprehensive Planning," by E. J. Helley and K. R. Lajoie, 1979, indicates that the subject site is underlain by Pleistocene beach and dune sand deposits (Merrit Sand) (Qps), which is described as loose well-sorted fine to medium sand. Immediately to the west of the western property boundary the subsurface materials are identified as Bay Mud (Qhbm), which is described as unconsolidated water-saturated dark plastic carbonaceous clay and silty clay.	Reference #8	No	
3.2	**Local Geology and Hydrogeology**				
		Subsurface Lithology: The subsurface materials encountered in boreholes S1 through S9, GW3 through GW11, and SG4 through SG20 consisted of silty sand and silty clayey sand to the maximum depths explored of 11.5 feet bgs. Geologic cross sections for the site are provided in P&D's March 23, 2018 Limited Subsurface Investigation Work Plan (document 0772.W2).	References #6-8	No	

Water Bearing Zone ID	Media Type and Classification	Prevailing Hydraulic Gradient Direction and Magnitude	Top & Bottom of Zone [feet bgs]	Min & Max Static Depth to Groundwater in Wells [feet bgs]	Min & Max Depth to First Encountered Groundwater [feet bgs]
Shallow	Groundwater was first encountered in boreholes GW3, GW4, GW5, GW6, GW7, GW8, GW9, GW10, and GW11 at depths of approximately 9.5, 9.5, 9.5, 11.0, 8.5, 9.0, 9.0, 9.0, and 9.0 feet bgs, respectively.	Unk.	Unk.	N/A	N/A

		Data Gap
Groundwater Sources and Sinks:	None	No
Variations in Magnitude and Direction of Lateral and Vertical Groundwater Gradient Within Each Water Bearing Zone:	Unknown	

Sec No	Section / Sub-Section Name
3.3	**Monitoring Well Network Evaluation**

Monitoring Well ID	Screened Interval & Associated Water Bearing Zone ID(s)	Is the well appropriatly screened to evaluate LNAPL?	Is the well appropriatly sceened to evaluate DNAPL?	Is the well appropriatly developed and maintained?	Is the well location known, accessible and survey data is uploaded to GeoTracker?
No groundwater monitoring wells exist					

Identify wells that are routinely excluded from calculations of potentiometric surface or groundwater elevation:	N/A
Identify wells that are excluded from calculation of isoconcentration contours in for each water bearing zone:	N/A
Is the monitoring well network sufficient to delineate the lateral extents of the groundwater plume that exceeds water quality standards?	N/A

Sec No	Section / Sub-Section Name	Details			References	Data Gap	Method to Address Data Gap
		Is the monitoring well network sufficient to delineate the vertical extents of the groundwater plume that exceeds water quality standards?	N/A

4	**Release and Source**				

4.1 Release Occurrence

Releases Material:	Petroleum, chlorinated hydrocarbons, lead
Release Date:	unknown
Release Source:	Former USTs for petroleum. The PCE, TCE, chloroform, and lead sources are unknown. The detected cis-1,2-DCE, trans-1,2-DCE and vinyl chloride are interpreted to be TCE decomposition products. The chloroform is interpreted to
Description:	It is likely the petroleum release(s) occurred from the former USTs. The PCE, TCE and lead sources are unknown.

4.2 Constituents of Concern and Data Quality Objectives

		References
An evaluation summary table for potential constituents of concern (PCOCs) has been prepared:	Yes	Table 1
Data quality objectives (DQO) been clearly identified and reported for each PCOC and potentially impacted media:	Yes	References # 4 & 8
Data that does not meet data quality objectives is denoted as indefensible in summary tables and figures:	Yes	
Data that does not meet DQOs is not relied upon for the delineation or risk evaluation portions of this SCM:	Yes	

	PCOCs have been evaluate in the following media:			
Chemicals of Concern that drive risk and/or closure (COCs)	**Soil**	**Groundwater**	**Soil Vapor**	**Surface Water**
TPH-G	Yes	Yes	Yes	N/A
TPH-D	Yes	Yes	No	N/A
TPH-MO	Yes	Yes	No	N/A
TPH-BO	No	Yes	No	N/A

NAPL COCs	Location(s) and weathering	Source	Direct Evidence of NAPL	Indirect Evidence of NAPL	Mobility
	None Identified	N/A	None	None	N/A

Preferential pathways capable of intercepting and conveying mobile NAPL are present:	No
Preferential pathways within the extents of soil contamination that are capable of intercepting and conveying vapor phase COCs are present:	No
Preferential pathways located beneath the extents of soil contamination that are capable of intercepting and conveying leachate are present:	No

Describe any of the preferential pathways identified above:	N/A

4.4 Distribution and Transport of Contaminants of Concern: Groundwater

Details		References	Data Gap
Comprehensive groundwater analytical table(s)/figure(s) are provided for all COCs :	Yes	References # 4 & 8	
Groundwater analytical data used for delineation or risk assessment meets DQOs:	Yes		
Indicate COCs that are sufficiently delineated laterally:	TPH-G, TPH-D, TPH-MO, MTBE, Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene, PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, Vinyl Chloride, Chloroform, Lead	No Gap (bad cell)	No
Indicate COCs that are undelineated laterally:			
Indicate COCs that are sufficiently delineated vertically:	TPH-G, TPH-D, TPH-MO, MTBE, Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene, PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, Vinyl Chloride, Chloroform, Lead	No Gap (bad cell)	No
Indicate COCs that are undelineated vertically:			
Sufficient groundwater data has been collected to demonstrate that the groundwater plume is stable or decreasing in Size:	[Yes/No]	Yes(bad cell)	No
Hydro- and chemo-graphs have been provided for each monitoring well:	[Yes/No]	No Gap (bad cell)	No
Describe any observed patterns in groundwater concentrations (e.g. seasonal variations, effects of groundwater elevation, natural attenuation):	None		
Describe evidence to indicate that microbial communities capable of metabolizing aqueous phase COCs to a safe endpoint are present:	None		

Maximum concentration reported in stable groundwater for each water bearing zone (i.e., concentrations are in equilibrium and not undergoing rebound)	Water bearing Zone	Sample ID	Sample Date	Concentration (µg/L)
TPH-G	Shallow		All ND	
TPH-D	Shallow	GW11	10/13/2018	76

trans-1,2-DCE	Shallow		All ND	
Vinyl Chloride	Shallow		All ND	
Chloroform	Shallow	P-9	6/21/1999	23

NAPL COCs	Location(s) and weathering	Source	Direct Evidence of NAPL	Indirect Evidence of NAPL	Mobility
	None identified.	N/A	None	None	N/A

Submerged (fully, partially, or seasonally) preferential pathways capable of intercepting and conveying free phase, aqueous phase, or vapor phase COCs are present within the extents of the groundwater plume:	No

Sec No	Section / Sub-Section Name	Details		References	Data Gap	Method to Address Data Gap
		Preferential pathways capable of intercepting and conveying vapor phase COCs are present above the extents of the volatile groundwater contamination plume:	No			
		The lateral distribution of COCs in groundwater concurs with identified historic groundwater gradient direction:	No			
		The vertical distribution of COCs in groundwater concurs with identified historic groundwater gradient direction:	No			

4.5 Distribution and Transport of Contaminants of Concern: Soil Vapor

		References	Data Gap	Method to Address Data Gap
Vapor probe network adequacy:	The soil vapor probe network is adequate to **spatially** and **temporally** evaluate the lateral and vertical extent of COCs in the vapor phase.	References # 4 & 8	No	
Preferential pathways evaluation complete:	The soil vapor probe network is adequate to **spatially** and **temporally** evaluate the migration of COCs along identified preferential pathways.			
Comprehensive soil vapor analytical table(s) and figure(s) are provided for all COCs:	Yes			
Soil Vapor analytical data used for delineation or risk assessment meets DQOs:	Yes			
Indicate COCs that are sufficiently delineated laterally:	TPH-G, MTBE, Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene, PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, Vinyl Chloride, Chloroform			
Indicate COCs that are undelineated laterally:				
Indicate COCs that are sufficiently delineated vertically:	TPH-G, MTBE, Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene, PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, Vinyl Chloride, Chloroform			
Indicate COCs that are undelineated vertically:				
Soil vapor plumes for COCs are spatially and temporally stable or decreasing in Size:	Unknown			
Chemo-graphs for each soil vapor probe have been provided:	[Yes/No]	No Gap (bad cell)		
Describe any observed patterns in soil vapor concentrations (e.g. seasonal variations, effects of groundwater elevation, natural attenuation):	Unknown			
Describe evidence to indicate that microbial communities capable of metabolizing vapor phase COCs to a safe endpoint are present:	Oxygen was >4 % in all 19 soil gas wells indicating a bioattenuation zone.			
Identify the vapor intrusion scenario that is applicable for the Site:				

3.6 Distribution of Contaminants of Concern: Indoor Air

Comprehensive indoor air analytical table(s) and figure(s) are provided for all COCs:	N/A
Indoor air analytical data used to evaluate risk meets DQO :	No
A hazardous materials survey has been completed for the Site and updated during each indoor air sampling event:	No
Tenants and occupants have been provided with appropriate notification	N/A
Indoor air has been evaluated during HVAC on and HVAC off conditions:	No
COCs in indoor air are temporally stable:	Unknown
Sampling has been conducted to evaluate migration of subsurface contaminants into indoor air via identified preferential pathways:	No

Maximum concentration reported in Indoor Air	**Concentration ($\mu g/m^3$)**	**Sample Date**	**Building ID**	**Sample ID**
	N/A			
	N/A

SUBJECT: SITE CONCEPTUAL MODEL PREPARATION CERTIFICATION
RO Number 0003269
The Phoenix
801 Pine Street
Oakland, CA

Dear Mr. Hiteshew:

The attached tabular Site Conceptual Model has been prepared using a template prepared by the Alameda County Department of Environmental Health, and was prepared under the oversight of the appropriately licensed California professional Paul H. King of P&D Environmental, Inc.

If you have any questions, please do not hesitate to contact me at (510) 658-6916.

Sincerely,

P&D Environmental, Inc.

Paul H. King

APPENDIX C

Vapor Barrier Specifications

Land Science®
a division of REGENESIS®

Geo-Seal® Vapor Intrusion Barrier
02 56 19.13
Fluid-Applied Gas Barrier
Version 1.30

Note: If membrane will be subjected to hydrostatic pressure, please contact Land Science Technologies™ for proper recommendations.

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the contract, including general and supplementary conditions and Division 1 specification sections, apply to this section.

1.2 SUMMARY

A. This section includes the following:

1. Substrate preparation:
2. Vapor intrusion barrier components:
3. Seam sealer and accessories.

B. Related Sections: The following sections contain requirements that relate to this section:

1. Division 2 Section "Earthwork", "Pipe Materials", "Sub-drainage Systems", "Gas Collection Systems":
2. Division 3 Section "Cast-in-Place Concrete" for concrete placement, curing, and finishing:
3. Division 5 Section "Expansion Joint Cover Assemblies", for expansion-joint covers assemblies and installation.

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide a vapor intrusion barrier system that prevents the passage of methane gas and/or volatile organic compound vapors and complies with physical requirements as demonstrated by testing performed by an independent testing agency of manufacturer's current vapor intrusion barrier formulations and system design.

1.4 SUBMITTALS

A. Submit product data for each type of vapor intrusion barrier, including manufacturer's printed instructions for evaluating and preparing the substrate, technical data, and tested physical and performance properties.

B. Project Data - Submit shop drawings showing extent of vapor intrusion barrier, including details for overlaps, flashing, penetrations, and other termination conditions.

C. Samples – Submit representative samples of the following for approval:

1. Vapor intrusion barrier components.

D. Certified Installer Certificates – Submit certificates signed by manufacturer certifying that installers comply with requirements under the "Quality Assurance" article.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has been trained and certified in writing by the membrane manufacturer, Land Science Technologies™ for the installation of the Geo-Seal® System.

B. Manufacturer Qualification: Obtain vapor intrusion barrier materials and system components from a single manufacturer source Land Science Technologies.

C. Field Sample: Apply vapor intrusion barrier system field sample to 100 ft^2 (9.3 m^2) of field area demonstrate application, detailing, thickness, texture, and standard of workmanship.

1. Notify engineer or special inspector one week in advance of the dates and times when field sample will be prepared.

2. If engineer or special inspector determines that field sample, does not meet requirements, reapply field sample until field sample is approved.

3. Retain and maintain approved field sample during construction in an undisturbed condition as a standard for judging the completed methane and vapor intrusion barrier. An undamaged field sample may become part of the completed work.

D. Pre-installation Conference: A pre-installation conference shall be held prior to application of the vapor intrusion barrier system to assure proper site and installation conditions, to include contractor, applicator, architect/engineer, other trades influenced by vapor intrusion barrier installation and special inspector (if any).

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to project site as specified by manufacturer labeled with manufacturer's name, product brand name and type, date of manufacture, shelf life, and directions for storing and mixing with other components.

B. Store materials as specified by the manufacturer in a clean, dry, protected location and within the temperature range required by manufacturer. Protect stored materials from direct sunlight. If freezing temperatures are expected, necessary steps should be taken to prevent the freezing of the Geo-Seal CORE and Geo-Seal CORE Detail components.

C. Remove and replace material that cannot be applied within its stated shelf life.

1.7 PROJECT CONDITIONS

A. Protect all adjacent areas not to be installed on. Where necessary, apply masking to prevent staining of surfaces to remain exposed wherever membrane abuts to other finish surfaces.

B. Perform work only when existing and forecasted weather conditions are within manufacturer's recommendations for the material and application method used.

C. Minimum clearance of 24 inches is required for application of product. For areas with less than 24-inch clearance, the membrane may be applied by hand using Geo-Seal CORE Detail.

D. Ambient temperature shall be within manufacturer's specifications. (Greater than +45ºF/+7ºC.) Consult manufacturer for the proper requirements when desiring to apply Geo-Seal CORE below 45ºF/7ºC.

E. All plumbing, electrical, mechanical and structural items to be under or passing through the vapor intrusion barrier system shall be positively secured in their proper positions and appropriately protected prior to membrane application.

F. Vapor intrusion barrier shall be installed before placement of fill material and reinforcing steel. When not possible, all exposed reinforcing steel shall be masked by general contractor prior to membrane application.

G. Stakes used to secure the concrete forms **shall not penetrate** the vapor intrusion barrier system after it has been installed. If stakes need to puncture the vapor intrusion barrier system after it has been installed, the necessary repairs need to be made by a certified Geo-Seal applicator. To confirm the staking procedure is in agreement with the manufactures recommendation, contact Land Science Technologies.

1.8 WARRANTY

A. General Warranty: The special warranty specified in this article shall not deprive the owner of other rights the owner may have under other provisions of the contract documents, and shall be in addition to, and run concurrent with, other warranties made by the contractor under requirements of the contract documents.

B. Special Warranty: Submit a written warranty signed by vapor intrusion barrier manufacturer agreeing to repair or replace vapor intrusion barrier that does not meet requirements or that does not remain methane gas and/or volatile organic compound vapor tight within the specified warranty period. Warranty does not include failure of vapor intrusion barrier due to failure of substrate prepared and treated according to requirements or formation of new joints and cracks in the attached to structures that exceed 1/16 inch (1.58 mm) in width.

  1. Warranty Period: 1 year after date of substantial completion. Longer warranty periods are available upon request to the manufacturer.

C. Labor and material warranties are available upon request to the manufacturer.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Geo-Seal; Land Science Technologies™, San Clemente, CA. (949) 481-8118

  1. Geo-Seal BASE sheet layer
  2. Geo-Seal CORE spray layer and Geo-Seal CORE Detail
  3. Geo-Seal BOND protection layer

2.2 VAPOR INTRUSION BARRIER SPRAY MATERIALS

A. Fluid applied vapor intrusion barrier system – Geo-Seal CORE; a single course, high build, polymer modified, asphalt emulsion. Waterborne and spray applied at ambient temperatures. A nominal thickness of 60 dry mils, unless specified otherwise. Non-toxic and odorless. Geo-Seal CORE Detail has similar properties with greater viscosity and is roller or brush applied. Manufactured by Land Science Technologies.

B. Fluid applied vapor intrusion barrier physical properties.

Geo-Seal CORE – TYPICAL CURED PROPERTIES

Properties	**Test Method**	**Results**
Tensile Strength - CORE only	ASTM 412	32 psi
Tensile Strength - Geo-Seal System	ASTM 412	662 psi
Elongation	ASTM 412	4140%
Resistance to Decay	ASTM E 154 Section 13	4% Perm Loss
Accelerated Aging	ASTM G 23	No Effect
Moisture Vapor Transmission	ASTM E 96	.026 g/ft^2/hr
Hydrostatic Water Pressure	ASTM D 751	26 psi
Perm rating	ASTM E 96 (US Perms)	0.21
Methane transmission rate	ASTM D 1434	Passed
Adhesion to Concrete & Masonry	ASTM C 836 & ASTM C 704	11 lbf./inch
Hardness	ASTM C 836	80
Crack Bridging	ASTM C 836	No Cracking
Heat Aging	ASTM D 4068	Passed
Environmental Stress Cracking	ASTM D 1693	Passed
Oil Resistance	ASTM D543	Passed
Soil Burial	ASTM D 4068	Passed
Low Temp. Flexibility	ASTM C 836-00	No Cracking at –20°C
Resistance to Acids:		
Acetic		30%
Sulfuric and Hydrochloric		13%
Temperature Effect:		
Stable		248°F
Flexible		13°F

Geo-Seal CORE Detail – TYPICAL CURED PROPERTIES

Properties	**Test Method**	**Results**
Tensile Strength	ASTM 412	32 psi
Elongation	ASTM 412	3860%
Resistance to Decay	ASTM E 154 Section 13	9% Perm Loss
Accelerated Aging	ASTM G 23	No Effect
Moisture Vapor Transmission	ASTM E 96	.026 g/ft^2/hr
Hydrostatic Water Pressure	ASTM D 751	28 psi
Perm rating (US Perms)	ASTM E 96	0.17
Methane transmission rate	ASTM D 1434	Passed
Adhesion to Concrete & Masonry	ASTM C 836	7 lbf./inch
Hardness	ASTM C 836	85
Crack Bridging	ASTM C 836	No Cracking
Low Temp. Flexibility	ASTM C 836-00	No Cracking at –20ºC
Resistance to Acids:		
Acetic		30%
Sulfuric and Hydrochloric		13%
Temperature Effect:		
Stable		248°F
Flexible		13°F

2.3 VAPOR INTRUSION BARRIER SHEET MATERIALS

A. The Geo-Seal BASE layer and Geo-Seal BOND layer are chemically resistant sheets comprised of a 5 mil high density polyethylene sheet thermally bonded to a 3 ounce non woven geotextile.

B. Sheet Course Usage

1. As foundation base layer, use Geo-Seal BASE course and/or other base sheet as required or approved by the manufacturer.

2. As top protective layer, use Geo-Seal BOND layer and/or other protection as required or approved by the manufacturer.

C. Geo-Seal BOND and Geo-Seal BASE physical properties.

Properties	**Test Method**	**Results**
Film Thickness		5 mil
Composite Thickness		18 mil
Water Vapor Permeability	ASTM E 96	0.214
Adhesion to Concrete	ASTM D 1970	9.2 lbs/inch^2
Dart Impact	ASTM D 1790	>1070 gms, method A
		594 gms, method B
Puncture Properties Tear	ASTM B 2582 MD	11,290 gms
	ASTM B 2582 TD	13,150 gms

2.4 AXILLARY MATERIALS

A. Sheet Flashing: 60-mil reinforced modified asphalt sheet good with double-sided adhesive.

B. Reinforcing Strip: Manufacturer's recommended polypropylene and polyester fabric.

C. Gas Venting Materials: Geo-Seal Vapor-Vent HD or Geo-Seal Vapor-Vent Poly, and associated fittings.

D. Seam Detailing Sealant Mastic: Geo-Seal CORE Detail, a high or medium viscosity polymer modified water based asphalt material.

1. Back Rod: Closed-cell polyethylene foam.

PART 3 – EXECUTION

3.1 AUXILIARY MATERIALS

A. Examine substrates, areas, and conditions under which vapor intrusion barrier will be applied, with installer present, for compliance with requirements. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 SUBGRADE SURFACE PREPARATION

A. Verify substrate is prepared according to manufacturer's recommendations. On a horizontal surface, the substrate should be free from material that can potentially puncture the vapor intrusion barrier. Additional protection or cushion layers might be required if the earth or gravel substrate contains too many jagged points and edges that could puncture one or more of the system components. Contact manufacturer to confirm substrate is within manufactures recommendations.

B. Geo-Seal can accommodate a wide range of substrates, including but not limited to compacted earth, sand, aggregate, and mudslabs.

1. Compacted Earth: Remove pieces of debris, gravel and/or any other material that can potentially puncture the Geo-Seal BASE. Remove any debris from substrate that can potentially puncture the Geo-Seal system prior to application.

2. Sand: A sand subgrade requires no additional preparation, provided any material that can potentially puncture the Geo-Seal BASE layer is not present.

3. Aggregate: Contact the manufacturer to ensure the aggregate layer will not be detrimental to the membrane. **The gravel layer must be compacted and rolled flat.** Ideally a ¾" minus gravel layer with rounded edges should be specified; however the Geo-Seal system can accommodate a wide variety of different substrates. Contact Land Science Technologies if there are questions regarding the compatibility of Geo-Seal and the utilized substrate. Exercise caution when specifying pea gravel under the membrane, if not compacted properly, pea gravel can become an unstable substrate.

4. Mudslabs: The use of a mubslab under the Geo-Seal system is acceptable, contact Land Science Technologies for job specific requirements.

C. Mask off adjoining surface not receiving the vapor intrusion barrier system to prevent the spillage or over spray affecting other construction.

D. Earth, sand or gravel subgrades should be prepared and compacted to local building code requirements.

3.3 CONCRETE SURFACE PREPARATION

A. Clean and prepare concrete surface to manufacturer's recommendations. In general, only apply the Geo-Seal CORE material to dry, clean and uniform substrates. Concrete surfaces must be a light trowel, light broom or equivalent finish. Remove fins, ridges and other projections and fill honeycomb, aggregate pockets, grout joints and tie holes, and other voids with hydraulic cement or rapid-set grout. It is the applicator's responsibility to point out unacceptable substrate conditions to the general contractor and ensure the proper repairs are made.

B. When applying the Geo-Seal CORE or Geo-Seal CORE Detail material to concrete it is important to not apply the product over standing water. Applying over standing water will result in the membrane not setting up properly on the substrate

C. Surfaces may need to be wiped down or cleaned prior to application. This includes, but is not limited to, the removal of forming oils, concrete curing agents, dirt accumulation, and other debris. Contact form release agent manufacturer or concrete curing agent manufacturer for VOC content and proper methods for removing the respective agent.

D. Applying the Geo-Seal CORE to "green" concrete is acceptable and can be advantageous in creating a superior bond to the concrete surface. To help reduce blistering, apply a primer coat of only the asphalt component of the Geo-Seal CORE system. Some blistering of the membrane will occur and may be more severe on walls exposed to direct sunlight. Blistering is normal and will subside over time. Using a needle nose depth gauge confirm that the specified mil thickness has been applied.

3.4 PREPARATIONS AND TREATMENT OF TERMINATIONS

A. Prepare the substrate surface in accordance with Section 3.3 of this document. Concrete surfaces that are not a light trowel, light broom or equivalent finish, will need to be repaired.

B. Terminations on horizontal and vertical surfaces should extend 6" onto the termination surface. Job specific conditions may prevent a 6" termination. In these conditions, contact manufacturer for recommendations.

C. Apply 30 mils of Geo-Seal CORE to the terminating surface and then embed the Geo-Seal BASE layer by pressing it firmly into the Geo-Seal CORE layer. Next, apply 60 mils of Geo-Seal CORE to the BASE layer. When complete, apply the Geo-Seal BOND layer. After the placement of the Geo-Seal BOND layer is complete, apply a final 30 mil seal of the Geo-Seal CORE layer over the edge of the termination. For further clarification, refer to the termination detail provided by manufacturer.

D. The stated termination process is appropriate for terminating the membrane onto exterior footings, pile caps, interior footings and grade beams. When terminating the membrane to stem walls or vertical surfaces the same process should be used.

3.5 PREPARATIONS AND TREATMENT OF PENETRATIONS

A. All pipe penetrations should be securely in place prior to the installation of the Geo-Seal system. Any loose penetrations should be secured prior to Geo-Seal application, as loose penetrations could potentially exert pressure on the membrane and damage the membrane after installation.

B. To properly seal around penetrations, cut a piece of the Geo-Seal BASE layer that will extend 6" beyond the outside perimeter of the penetration. Cut a hole in the Geo-Seal BASE layer just big enough to slide over the penetration, ensuring the Geo-Seal BASE layer fits snug against the penetration, this can be done by cutting an "X" no larger than the inside diameter of the penetration. There should not be a gap larger than a 1/8" between the Geo-Seal BASE layer and the penetration. Other methods can also be utilized, provided, there is not a gap larger than 1/8" between the Geo-Seal BASE layer and the penetration.

C. Seal the Geo-Seal BASE layer using Geo-Seal CORE or Geo-Seal CORE Detail to the underlying Geo-Seal BASE layer.

D. Apply one coat of Geo-Seal CORE Detail or Geo-Seal CORE spray to the Geo-Seal BASE layer and around the penetration at a thickness of 30 mils. Penetrations should be treated in a 6-inch radius around penetration and 3 inches onto penetrating object.

E. Embed a fabric reinforcing strip after the first application of the Geo-Seal CORE spray or Geo-Seal CORE Detail material and then apply a second 30 mil coat over the embedded joint reinforcing strip ensuring its complete saturation of the embedded strip and tight seal around the penetration.

F. After the placement of the Geo-Seal BOND layer, a cable tie should then be placed around the finished penetration. The cable tie should be snug, but not overly tight so as to slice into the finished seal.

OPTION: A final application of Geo-Seal CORE may be used to provide a finishing seal after the Geo-Seal BOND layer has been installed.

NOTE: Metal or other slick penetration surfaces may require treatment in order to achieve proper adhesion. For plastic pipes, sand paper may be used to achieve a profile, an emery cloth is more appropriate for metal surfaces. An emery cloth should also be used to remove any rust on metal surfaces.

3.6 GEO-SEAL BASE LAYER INSTALLATION

A. Install the Geo-Seal BASE layer over substrate material in one direction with six-inch overlaps and the geotextile (fabric side) facing down.

B. Secure the Geo-Seal BASE seams by applying 60 mils of Geo-Seal CORE between the 6" overlapped sheets with the geotextile side down.

C. Visually verify there are no gaps/fish-mouths in seams.

D. For best results, install an equal amount of Geo-Seal BASE and Geo-Seal CORE in one day. Leaving unsprayed Geo-Seal BASE overnight might allow excess moisture to collect on the Geo-Seal BASE. If excess moisture collects, it needs to be removed.

NOTE: In windy conditions it might be necessary to encapsulate the seam by spraying the Geo-Seal CORE layer over the completed Geo-Seal BASE seam.

3.7 GEO-SEAL CORE APPLICATION

A. Set up spray equipment according to manufacturer's instructions.

B. Mix and prepare materials according to manufacturer's instructions.

C. The two catalyst nozzles (8001) should be adjusted to cross at about 18" from the end of the wand. This apex of catalyst and emulsion spray should then be less than 24" but greater than 12" from the desired surface when spraying. When properly sprayed the fan pattern of the catalyst should range between 65° and 80°.

D. Adjust the amount of catalyst used based on the ambient air temperature and surface temperature of the substrate receiving the membrane. In hot weather use less catalyst as hot conditions will quickly "break" the emulsion and facilitate the curing of the membrane. In cold conditions and on vertical surfaces use more catalyst to "break" the emulsion quicker to expedite curing and set up time in cold conditions.

E. To spray the Geo-Seal CORE layer, pull the trigger on the gun. A 42° fan pattern should form when properly sprayed. Apply one spray coat of Geo-Seal CORE to obtain a seamless membrane free from pinholes or shadows, with an average dry film thickness of 60 mils (1.52 mm).

F. Apply the Geo-Seal CORE layer in a spray pattern that is perpendicular to the application surface. The concern when spraying at an angle is that an area might be missed. Using a perpendicular spray pattern will limit voids and thin spots, and will also create a uniform and consistent membrane.

G. Verify film thickness of vapor intrusion barrier every 500 ft^2. (46.45 m^2), for information regarding Geo-Seal quality control measures, refer to the quality control procedures in Section 3.9 of this specification.

H. The membrane will generally cure in 24 to 48 hours. As a rule, when temperature decreases or humidity increases, the curing of the membrane will be prolonged. The membrane does not need to be fully cured prior the placement of the Geo-Seal BOND layer, provided mil thickness has been verified and a smoke test will be conducted.

I. **Do not penetrate** membrane after it has been installed. If membrane is penetrated after the membrane is installed, it is the responsibility of the general contractor to notify the certified installer to make repairs.

J. If applying to a vertical concrete wall, apply Geo-Seal CORE directly to concrete surface and use manufacturer's recommended protection material based on site specific conditions. If applying Geo-Seal against shoring, contact manufacturer for site specific installation instructions.

NOTE: Care should be taken to not trap moisture between the layers of the membrane. Trapping moisture may occur from applying a second coat prior to the membrane curing. Repairs and detailing may be done over the Geo-Seal CORE layer when not fully cured.

3.8 GEO-SEAL BOND PROTECTION COURSE INSTALLATION

A. Install Geo-Seal BOND protection course perpendicular to the direction of the Geo-Seal BASE course with overlapped seams over nominally cured membrane no later than recommended by manufacturer and before starting subsequent construction operations.

B. Sweep off any water that has collected on the surface of the Geo-Seal CORE layer, prior to the placement of the Geo-Seal BOND layer.

C. Overlap and seam the Geo-Seal BOND layer in the same manner as the Geo-Seal BASE layer.

D. To expedite the construction process, the Geo-Seal BOND layer can be placed over the Geo-Seal CORE immediately after the spray application is complete, provided the Geo-Seal CORE mil thickness has been verified.

3.9 QUALITY ASSURANCE

A. The Geo-Seal system must be installed by a trained and certified installer approved by Land Science Technologies.

B. For projects that will require a material or labor material warranty, Land Science Technologies will require a manufacturer's representative or certified 3rd party inspector to inspect and verify that the membrane has been installed per the manufacturer's recommendations.

The certified installer is responsible for contacting the inspector for inspection. Prior to application of the membrane, a notice period for inspection should be agreed upon between the applicator and inspector.

C. The measurement tools listed below will help verity the thickness of the Geo-Seal CORE layer. As measurement verification experience is gained, these tools will help confirm thickness measurements that can be obtained by pressing one's fingers into the Geo-Seal CORE membrane.

To verify the mil thickness of the Geo-Seal CORE, the following measurement devices are required.

1. Mil reading caliper: Calipers are used to measure the thickness of coupon samples. To measure coupon samples correctly, the thickness of the Geo-Seal sheet layers (18 mils each) must be taken into account. Mark sample area for repair.

2. Wet mil thickness gauge: A wet mil thickness gauge may be used to quickly measure the mil thickness of the Geo-Seal CORE layer. The thickness of the Geo-Seal sheet layers do not factor into the mil thickness reading.

   NOTE: When first using a wet mil thickness gauge on a project, collect coupon samples to verify the wet mil gauge thickness readings.

3. Needle nose digital depth gauge: A needle nose depth gauge should be used when measuring the Geo-Seal CORE thickness on vertical walls or in field measurements. Mark measurement area for repair.

To obtain a proper wet mil thickness reading, take into account the 5 to 10 percent shrinkage that will occur as the membrane fully cures. Not taking into account the thickness of the sheet layers, a freshly sprayed membrane should have a minimum wet thickness of 63 (5%) to 66 (10%) mils.

Methods on how to properly conduct Geo-Seal CORE thickness sampling can be obtained by reviewing literature prepared by Land Science Technologies.

D. It should be noted that taking too many destructive samples can be detrimental to the membrane. Areas where coupon samples have been removed need to be marked for repair.

E. Smoke Testing is highly recommended and is the ideal way to test the seal created around penetrations and terminations. Smoke Testing is conducted by pumping non-toxic smoke underneath the Geo-Seal vapor intrusion barrier and then repairing the areas where smoke appears. Refer to smoke testing protocol provided by Land Science Technologies. For projects that will require a material or labor material warranty, Land Science Technologies will require a smoke test.

F. Visual inspections prior to placement of concrete, but after the installation of concrete reinforcing, is recommended to identify any punctures that may have occurred during the installation of rebar, post tension cables, etc. Punctures in the Geo-Seal system should be easy to indentify due to the color contrasting layers of the system.

Vapor-Vent™
SOIL GAS COLLECTION SYSTEM
Version 1.5

SECTION 02 56 19 – GAS CONTROL

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Substrate preparation.
2. Vapor-Vent™ installation.
3. Vapor-Vent accessories.

B. Related Sections: The following Sections contain requirements that relate to this Section:

1. Division 2 Section “Earthwork”, “Pipe Materials”, “Sub-drainage systems”, ”Gas Control System”, “Fluid-Applied gas barrier”.
2. Division 3 Section “Cast-in-Place Concrete” for concrete placement, curing, and finishing.
3. Division 5 Section “Expansion Joint Cover Assemblies”, for expansion-joint covers assemblies and installation.

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide a gas venting material that collects gas vapors and directs them to discharge or to collection points as specified in the gas vapor collection system drawings and complies with the physical requirements set forth by the manufacturer.

1.4 SUBMITTALS

A. Submit Product Data for each type of gas venting system specified, including manufacturer’s specifications.

B. Sample – Submit representative samples of the following for approval:

1. Gas venting, Vapor-Vent.
2. Vapor-Vent accessories.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced Installer who is certified in writing and approved by vapor intrusion barrier manufacturer Land Science Technologies for the installation of the Geo-Seal® vapor intrusion barrier system.

B. Manufacturer Qualification: Obtain gas venting, vapor intrusion barrier and system components from a single manufacturer Land Science Technologies

C. Pre-installation Conference: A pre-installation conference shall be held prior to installation of the venting system, vapor intrusion barrier and waterproofing system to assure proper site and installation conditions, to include contractor, applicator, architect/engineer and special inspector (if any).

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to project site as specified by manufacturer labeled with manufacturer’s name, product brand name and type, date of manufacture, shelf life, and directions for handling.

B. Store materials as specified by the manufacturer in a clean, dry, protected location and within the temperature range required by manufacturer. Protect stored materials from direct sunlight.

C. Remove and replace material that is damaged.

PART 2 – PRODUCTS

2.1 MANUFACTURER

A. Land Science Technologies, San Clemente, CA. (949) 481-8118

1. Vapor-Vent™

2.2 GAS VENT MATERIALS

A. Vapor-Vent – Vapor-Vent is a low profile, trenchless, flexible, sub slab vapor collection system used in lieu or in conjunction with perforated piping. Vapor-Vent is offered with two different core materials, Vapor-Vent POLY is recommended for sites with inert methane gas and Vapor-Vent is recommended for sites with aggressive chlorinated volatile organic or petroleum vapors. Manufactured by Land Science Technologies

B. Vapor-Vent physical properties

VENT PROPERTIES	**TEST METHOD**	**VAPOR-VENT POLY**	**VAPOR-VENT**
Material		Polystyrene	HDPE
Comprehensive Strength	ASTM D-1621	9,000 lbs / ft^2	11,400 lbs / ft^2
In-plane flow (Hydraulic gradient-0.1)	ASTM D-4716	30 gpm / ft of width	30 gpm / ft of width
Chemical Resistance		N/A	Excellent
FABRIC PROPERTIES	**TEST METHOD**	**VAPOR-VENT POLY**	**VAPOR-VENT**
Grab Tensile Strength	ASTM D-4632	100 lbs.	110 lbs.
Puncture Strength	ASTM D-4833	65 lbs.	30 lbs.
Mullen Burst Strength	ASTM D-3786	N/A	90 PSI
AOS	ASTM D-4751	70 U.S. Sieve	50 U.S. Sieve

Roll Weight		65 lbs	68 lbs

2.3 AUXILIARY MATERIALS

A. Vapor-Vent End Out

B. Reinforced Tape.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions under which gas vent system will be installed, with installer present, for compliance with requirements. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 SUBSTRATE PREPARATION

A. Verify substrate is prepared according to project requirements.

3.3 PREPARATION FOR STRIP COMPOSITE

A. Mark the layout of strip geocomposite per layout design developed by engineer.

3.4 STRIP GEOCOMPOSITE INSTALLATION

A. Install Vapor-Vent over substrate material where designated on drawings with the flat base of the core placed down and shall be overlapped in accordance with manufacturer's recommendations.

B. At areas where Vapor-Vent strips intersect cut and fold back fabric to expose the dimpled core. Arrange the strips so that the top strip interconnects into the bottom strip. Unfold fabric to cover the core and use reinforcing tape, as approved by the manufacturer, to seal the connection to prevent sand or gravel from entering the core.

C. When crossing Vapor-Vent over footings or grade beams, **consult with the specifying environmental engineer and structural engineer for appropriate use and placement of solid pipe materials**. Place solid pipe over or through concrete surface and attach a Vapor-Vent End Out at both ends of the pipe before connecting the Vapor-Vent to the pipe reducer. Seal the Vapor-Vent to the Vapor-Vent End Out using fabric reinforcement tape. Refer to Vapor-Vent detail provided by Land Science Technologies.

D. Place vent risers per specifying engineer's project specifications. Connect Vapor-Vent to Vapor-Vent End Out and seal with fabric reinforced tape. Use Vapor-Vent End Out with the specified diameter piping as shown on system drawings.

3.5 PLACEMENT OF OVERLYING AND ADJACENT MATERIALS

A. All overlying and adjacent material shall be placed or installed using approved procedures and guidelines to prevent damage to the strip geocomposite.

B. Equipment shall not be directly driven over and stakes or any other materials may not be driven through the strip geocomposite.

Land Science
a division of REGENESIS®

Product Data
Sheet

Geo-Seal® CORE

Geo-Seal® CORE is an elastic water-based co-polymer modified asphaltic membrane spray applied to a minimum dry thickness of 60 mils. The CORE material has exceptional bonding to a wide variety of substrates and will build up to the specified thickness in a single application. Since the CORE material is water-based, there is little or no odor during or after product application, making it safe for use in sensitive areas. This material can also be applied to green concrete as it exhibits exceptional bonding capability that will not delaminate from the intended substrate. The seamless application of the CORE material makes for easy installation around penetrations, uneven surfaces and oddly shaped areas.

COVERAGES	TEST METHOD	UNITS
Application to BASE Layer		60 mils (17 ft^2/gal)
Typical Uncured Properties		
Specific Gravity	ASTM D 244	1.00
Viscosity	ASTM D 1200	>25 centipoise
PH		12.3
Flammability	ASTM D 3143	500^0 F
Color		Brown to Black
Non-Toxic		No Solvents
Shelf Life		6 months
Typical Cured Properties		
Tensile Strength	ASTM 412	32 psi
Elongation	ASTM 412	4140%
Resistance to Decay	ASTM E 125 Section 13	4% Perm Loss
Accelerated Aging	ASTM G 23	No Effect
Moisture Vapor Transmission	ASTM E 96	0.026 g / ft^2 per hour
Hydraulic Water Pressure	ASTM D 751	26 psi
Perm Rating	ASTM E 96 (US Perms)	0.21
Methane Transmission Rate	ASTM D 1434	Passed
Adhesion to Concrete & Masonry	ASTM C 836 & ASTM C 704	11 lbf / inch
Hardness	ASTM C 836	80
Crack Bridging	ASTM C 836	No Cracking
Low Temp Flexibility	ASTM C 836-00	No Cracking at -20^0 C
Resistance to Acids		
Acetic		30%
Sulfuric and Hydrochloric		13%
Temperature Effect:		
Stable		248^0 F
Flexible		13^0 F
Packaging: 330 gal. totes or 55 gal. drums		

Approvals: City of Los Angeles RR# 25478, NSF

Geo-Seal® CORE DETAIL

Geo-Seal® CORE DETAIL is ideally used to perform detailing and repairs to the Geo-Seal system. It is also ideal for those areas where the necessary clearance is not available for the application of the Geo-Seal spray. This proprietary and unique material can be used all at once or over a period of a few days without breaking down or hardening. Geo-Seal CORE DETAIL is water-based and can be applied to green concrete with exceptional bonding capability that will not delaminate from the intended substrate. Geo-Seal CORE DETAIL's viscosity allows high build applications to be done easily due to its ability to set quickly and get jobs done fast.

PROPERTIES	TEST METHOD	UNITS
TYPICAL UNCURED PROPERTIES		
Specific Gravity		1.034
Viscosity		9m-13m centipoise
PH		11.5
Flammability		270^0 F

Sheet

Geo-Seal® BASE Layer

The Geo-Seal™ BASE layer is comprised of a high strength laminated HDPE membrane that is thermally bonded to a polypropylene geotextile giving the BASE layer a high puncture resistance (Class A Rating) as well as high chemical resistance. The BASE layer is installed over the substrate with the HDPE side facing up and provides the ideal surface for the application of the Geo-Seal CORE component.

PROPERTIES	TEST METHOD	Geo-Seal BASE

Geo-Seal® BOND Layer

The Geo-Seal™ BOND layer is comprised of a high strength laminated HDPE membrane that is thermally bonded to a polypropylene geotextile giving the BASE layer a high puncture resistance (Class A Rating) as well as high chemical resistance. The BOND layer is installed as a protection course over the BASE and CORE layers with the geotextile side facing up. The BOND layer also provides an excellent substrate and friction surface for concrete to adhere to.

Geo-Seal® Reinforcement Fabric

The Geo-Seal™ Reinforcement Fabric is a textile material composed of staple fibers hydraulically entangled, which is composed of 100% polyester. The basic use of the Geo-Seal Reinforcement Fabric is designed to act as reinforcement when used in conjunction with Geo-Seal CORE spray applied membrane.

Product Data Sheet

Vapor-Vent™

Vapor-Vent™ is a low profile, trenchless, flexible, sub slab vapor collection system used in lieu of perforated piping. Installation of Vapor-Vent increases construction productivity as it eliminates time consuming trench digging and costly gravel importation. Vapor-Vent is offered with two different core materials, Vapor-Vent POLY is recommended for sites with inert methane gas and Vapor-Vent is recommended for sites with aggressive chlorinated volatile organic or petroleum vapors.

GEOSEAL CORE MATERIAL SAFETY DATA SHEET

LAND SCIENCE TECHNOLOGIES
1011 Calle Sombra
San Clemente, CA 92673
949.366.8000

1. PRODUCT IDENTIFICATION

Trade Names: Geo-Seal CORE, Geo-Seal CORE Detail
Chemical Name: Asphalt Emulsion
Synonyms: N/A
Hazardous Ingredients/OSHA: CHEMICAL FAMILIES:

A. Bitumen/Asphalt
B. Synthetic rubber
C. Fatty acids
D. Polymers

Hazard: No evidence of serious health hazards exists.
Carcinogenic ingredients/OSHA/NTP: Bitumen IARC: None

Ingredient	Percentage	C. A. S. #
Asphalt	50-60%	8052-42-4
Water	20-40%	7732-18-5
Latex:		9003-55-8
Styrene Latex	0-15%	100-42-5
Butadiene Latex	0-15%	106-99-0
Sodium Hydroxide	.1-1%	1310-73-2
Amino Ethanol	.01-.1%	34375-28-5

2. WARNING STATEMENTS

Avoid prolonged or frequent skin contact, as the presence of emulsifying and de-emulsifying agents during application may irritate the skin.

3. PHYSICAL AND CHEMICAL DATA

Appearance: Brown to black
Specific Gravity: (H_2O = 1): 1.028 (S) 1.034 (R) 1.13 (T)
Solubility in Water: Insoluble
Percent Volatiles: None
Boiling Point: N/A
Vapor Pressure (mm Hg): N/A
Vapor Density (Air = 1): N/A
Evaporation Rate: N\A

4. FIRE PROTECTION

Bitumen emulsions are water based products and as such will not burn. In cases of fire in the vicinity of drums, cool with water.

5. REACTIVITY DATA

Contact with strong oxidizing agents may create geling and water condensation.

6. HEALTH HAZARD DATA

Exposure Limits: Avoid prolonged or frequent skin contact.

7. PHYSIOLOGICAL EFFECTS SUMMARY

Acute: Skin irritation and rash
Chronic: Dermatitis

8. PRECAUTIONS FOR SAFE HANDLING

Avoid contact with eyes.
Avoid inhalation.
Avoid prolonged or frequent skin contact.
Avoid ingestion.

9. PROTECTION AND CONTROL MEASURES

Protective Equipment: Use of clothing, gloves, and/or barrier cream is recommended for skin protection.
Respiratory Protection: Inhalation should be avoided, but is not considered to be hazardous.
Ventilation: Use local exhaust ventilation when applying in an enclosed area.

10. EMERGENCY AND FIRST AID PROCEDURES

For ingestion: DO NOT induce vomiting. Keep at rest and get prompt medical attention.
For eye contamination: Irrigate eyes with water.
For skin contact: Wash affected areas of the body with proprietary hand cleaner, then wash with soap and water.

Contact physician as needed for any of the above occurrences.

11. SPILL AND DISPOSAL PROCEDURES

Contain spillages with sand or earth and remove by normal methods. Dispose of according to State and Local regulations. If the Bitumen enters a water course or sewer, advise respective water authority. The non-cured and cured material is non-toxic and non-flammable and can be disposed of in land fill sites.

Other Precautions: For Additional Information Contact:

1. PRODUCT IDENTIFICATION

Trade Name: Geo-Seal BASE, Geo-Seal BOND
Chemical Name: POLYMERIC COMPONENTS, GEOTEXTILE FABRIC
Synonyms: N/A
Hazardous Ingredients/OSHA: NO HAZARDOUS INGREDIENTS

THIS PRODUCT IS SUPPLIED IN COMPLIANCE WITH THE TSCA REPORTING REUQIREMENTS.

Carcinogenic Ingredients/OSHA/NTP: NONE
IARC: NONE
Transportation information: CONTAINS NO HAZARDOUS INGREDIENTS
Transportation emergency: Land Science Technologies, 949-366-8000

2. PHYSICAL AND CHEMICAL DATA

Appearance and Odor: White Solid Sheet, Odorless
Specific Gravity (Water = 1): 0.90
Vapor Pressure (mm Hg): Not Determined
Vapor Density (Air = 1): Not Determined
Evaporation Rate: (Butyl Acetate - 1): N/A
Auto Ignition Temperature: Not Determined

Solubility in Water: Negligible, below 0.1%
Percent Volatiles: None
Boiling Point: Degrees: Not Determined
Melting Point: 320° F

3. FIRE AND EXPLOSION DATA

Flash Point: N/A
Flammable limits %: Lower N/A Upper N/A
Extinguishing Media: Agents approved for Class A hazards (e.g. foam, steam) or water fog.
Special Fire Fighting Procedures: Firefighters should wear full bunker gear, including a positive pressure self-contained breathing apparatus.
Unusual Fire and Explosion Hazards: None identified.

4. REACTIVITY DATA

Stability: Stable Conditions to avoid: Keep away from ignition sources (e.g. heat, sparks and open flames).
Incompatibility (materials to avoid): None Identified
Hazardous Decomposition or Byproducts: Incomplete burning can produce carbon monoxide and/or carbon dioxide and other harmful products.
Hazardous Polymerization: Will not occur

5. HEALTH HAZARD DATA

Route(s) of Entry: Inhalation: No Skin: No Ingestion: No
Health Hazards (Acute & Coronic): Will not present any health hazards under normal processing conditions.
Eye & Skin Contact: None Identified.
Skin Absorption: Non-toxic.
Inhalation: No significant irritation expected.
Ingestion: No significant health hazards identified.
Carcinogenicity: Unrelated NTP: No IARC: No OSHA Regulated: No

6. PROTECTION AND CONTROL MEASURES

Precautions to be taken in handling and storing: Store away from heat, ignition sources and open flame in accordance with applicable regulations.
Respiratory Protection: Not required under normal process conditions.
Ventilation: Local Exhaust

Protective Gloves: Not required.
Eye Protection: Not required.
Other Protective clothing or equipment: Not required.
Work/Hygienic Practices: Wash hands after handling and before eating.

7. EMERGENCY AND FIRST AID PROCEDURES

In Case of Combustion (550°)" Eye Contamination: Flush with large amounts of water for 20 minutes lifting upper and lower lids occasionally. Get medical attention.
Skin contact: Thoroughly wash exposed area with soap and water. Remove contaminated clothing. Launder contaminated clothing before reuse.
Inhalation: If overexposure occurs, remove individual to fresh air. If breathing stops, administer artificial respiration. Get medical attention.
Ingestion: If a large amount of material is swallowed **DO NOT INDUCE VOMITING**. If vomiting begins lower victim's head in an effort to prevent vomit from entering lungs and get medical attention.

8. SPILL AND DISPOSAL PROCEDURES

Spill is not applicable. Material is normally in solid form.

Geo-Seal® Quality Control

Certified Applicator

Authorized installation of Geo-Seal can only be accomplished by one of Land Science Technologies Certified Applicators.

Membrane Inspections

For projects that will require a material or system (workmanship and material) warranty, Land Science Technologies will require a manufacturer's representative or certified 3rd party inspector to inspect and verify that the membrane has been installed per the manufacturer's recommendations.

The applicator is responsible for contacting the inspector for inspection. Prior to application of the membrane, a notice period for inspection should be agreed upon between the applicator and inspector.

Material Yield

Material yield is one of the first indicators in determining if the Geo-Seal CORE layer has been installed correctly. A baseline standard for yield is as follows:

Material Container	60 dry mils	80 dry mils	100 dry mils
55 Gallon Drum	935 ft^2	660 ft^2	550 ft^2
275 Gallon Tote	4,675 ft^2	3,300 ft^2	2,750 ft^2
330 Gallon Tote	5,610 ft^2	3,960 ft^2	3,300 ft^2

The estimated yield is 17 ft^2 per gallon for a 60 dry mil application using the recommended thickness, unless otherwise noted by a specified engineer or regulatory agency.

Yields can decrease based on the complexity of the foundation. Projects containing many penetrations and areas where a lot of detailing is required might reduce the material yield to 16 ft^2 or 15 ft^2 per gallon for a 60 mil membrane.

Millage Verification

The measurement tools listed below will help verify the thickness of the Geo-Seal CORE layer. As measurement verification experience is gained, these tools will help confirm thickness measurements that can be obtained by pressing one's fingers into the Geo-Seal CORE membrane.

To verify the mil thickness of the Geo-Seal CORE, the following measurement devices are required:

Mil reading caliper: Calipers are used to measure the thickness of coupon samples. To measure coupon samples correctly, the thickness of the Geo-Seal sheet layers must be taken into account (This is best done by obtaining a sample of the Geo-Seal BASE layer and then zeroing out the caliper to the Geo-Seal BASE layer). Mark sample area for repair.

Wet mil thickness gauge: A wet mil thickness gauge may be used to quickly measure the mil thickness of the Geo-Seal CORE layer. The thickness of the Geo-Seal sheet layers do not factor into the mil thickness reading, but the softness of the subgrade might result in inaccurate readings.

NOTE: When first using a wet mil thickness gauge on a project, collect coupon samples to verify the wet mil gauge thickness readings.

Needle nose digital depth gauge: A needle nose depth gauge can be used when measuring the Geo-Seal CORE thickness on vertical walls or in field measurements. Mark measurement area for repair.

To obtain a proper wet mil thickness reading, take into account the 5 to 10 percent shrinkage that will occur as the membrane fully cures. Not taking into account the thickness of the sheet layers, a freshly sprayed membrane should have a minimum wet thickness of 63 (5%) to 66 (10%) mils.

Visual Inspections

The guidelines outlined in this section provide ways to quantify and observe the proper installation of the Geo-Seal system. However, a visual inspection should also be done to ensure any visual imperfections are not present, i.e. fish-mouths, punctures, voids, etc. During a visual inspection, punctures in the Geo-Seal system should be easy to indentify due to the color contrasting layers of the system.

Membrane Testing Log

To aid in the inspection process and properly document the Geo-Seal membrane inspection, create a membrane testing log. We recommend creating the log by using the foundation plan (plan view) of the structure and then creating a 500 square foot grid over the foundation. If this is not able to be done, enclosed is a membrane testing log template that can also be used. (Appendix E)

Wet Mil Thickness Readings

A wet mil thickness gauge is one method to verify the mil thickness of the Geo-Seal CORE layer. An advantage to this method is the ability to verify the Geo-Seal CORE thickness by minimizing destructive coupon sampling.

1. Create a membrane testing log by obtaining a copy of the foundation plan and then draw a 500 square foot grid over the foundation plan. Make two copies of the membrane testing log; one should be used when collecting coupon samples and the other should be used when conducting the smoke test.

2. Note time, date, project name, inspector name, temperature and weather conditions on testing log.

3. Number each quadrant and inspect sequentially.

4. When arriving at each quadrant quickly assess if there are any conditions that might present any challenges in establishing a proper seal. Note areas and discuss with applicator.

5. Conduct a visual inspection of the membrane. Look for areas where a proper seal was not created, i.e. a fish-mouth at the termination and areas where the membrane might be sprayed thin. Mark areas needed for repair in the field with florescent paint or with chalk. Also make a note on the testing log.

6. Conduct a thickness sample in the area that is suspected to be sprayed thin and take three readings within 3” of one another. **When beginning a project, verify the wet mil gauge thickness reading by cutting a coupon sample and measuring the thickness with a caliper.** Once wet mil thickness readings have been confirmed and established, confirm wet mil thickness periodically by taking a coupon sample and caliper measurement.

7. After sampling 5 quadrants it is at the discretion of the inspector to continue collecting samples every 500 ft^2 or 1,000 ft^2.

8. This method will verify the thickness of the Geo-Seal CORE layer prior to it fully curing. Observed shrinkage of the Geo-Seal CORE layer during the curing process ranges from 5% to 10%. When taking uncured samples assume a minimum of 10% loss for horizontal surfaces and 5% for vertical surfaces. Assuming a 10% loss, the gauge should read a mil thickness between 65 and 70 mils (≥66 mils).

9. If using a wet mil gauge to verify a fully cured membrane the gauge should read 60 mils.

10. When testing is complete, send a copy of the membrane testing log to Land Science Technologies. Keep the coupon samples for the file, or send them to Land Science Technologies.

Coupon Sampling

Coupon sampling is the most accurate way to verify the Geo-Seal CORE thickness. However, please note that taking too many coupon samples, or destructive samples, can be counter-productive. To collect a coupon sample the following steps should be followed:

1. Create a membrane testing log by obtaining a copy of the foundation plan and then draw a 500 square foot grid over the foundation plan. Make two copies of the membrane testing log, one should be used when collecting coupon samples and the other should be used when conducting the smoke test.

2. Note time, date, project name, inspector name, temperature and weather conditions on testing log.

3. Number each quadrant and inspect sequentially.

4. When arriving at each quadrant quickly assess if there are any conditions that might present any challenges in establishing a proper seal. Note areas and discuss with applicator.

5. Conduct a visual inspection of the membrane. Look for areas where a proper seal was not created, i.e. a fish-mouth at the termination and areas where the membrane might be sprayed thin. Mark areas needed for repair in the field with florescent paint or with chalk. Also make a note on the testing log.

6. Calibrate mil reading caliper to account for the thickness of the Geo-Seal BASE layer. This is best done by obtaining a sample of the Geo-Seal BASE layer and then zeroing out the caliper to the Geo-Seal BASE layer.

7. Collect a coupon sample in the area that is suspected to be sprayed thin. Use a box cutter to cut a 3 square inch sample from the membrane. Measure each side to confirm the specified minimum thickness has been obtained. Number each sample and save in the job file. Mark the area for repair in the field and on the site plan.

8. After sampling 5 quadrants it is at the discretion of the inspector to continue collecting samples every 500 ft^2 or 1,000 ft^2.

9. Samples may be collected prior to the Geo-Seal CORE layer fully curing. Observed shrinkage of the Geo-Seal CORE layer during the curing process for horizontal surfaces is 10%. Assuming a 10% loss, a minimum of 66 mills thickness should be measured for a cured measurement of 60 mils.

10. When testing is complete, send a copy of the membrane testing log to Land Science Technologies. Keep the coupon samples for the file, or send them to Land Science Technologies.

Smoke Testing

This test is intended to visually verify and confirm the proper installation of the Geo-Seal system. Land Science Technologies requires a smoke test on all projects in order to obtain a warranty. The smoke test will be performed by the applicator.

Smoke testing should occur after the Geo-Seal CORE layer has been installed and mil thickness verified. Smoke testing may occur after the Geo-Seal BOND layer is installed, if preferred by the applicator. Upon completion of the original smoke test, additional smoke tests can be conducted per the membrane manufacturer's, specifying engineer or regulatory agency's request. To conduct a smoke test follow these steps:

1. One smoke test can cover between 2000-3000 square feet per test. However, coverage will greatly depend on the sub grade under the membrane. On sites where multiple smoke tests will be needed, use the first two smoke tests to estimate the coverage area per test.

2. Visual verification of soundness of seams, terminations and penetrations should be performed. Identify/correct any apparent deficiencies and/or installation problems.

3. Note time, date, project name, inspector name, temperature and weather conditions on testing log. In addition, record humidity, barometric pressure, and wind speed/direction. Confirm wind speed is below 15 mph. Visual identification of leaks becomes more difficult with increasing wind speed.

4. Cap other vent outlet(s) not being used. If the installation has no sub-slab vent system or the membrane is isolated from the vent system, connect the smoke testing system directly to the membrane using a temporary boot collar or other method. Insert the smoke test hose into coupon sampling locations, creating a seal around the smoke test hose with a rag.

5. Activate the smoke generator/blower system and connect to sub-slab vent riser or directly to the membrane.

6. To confirm the adequate flow of smoke under the membrane cut a 2” vent in the membrane to facilitate the purging of air pockets under it. If working properly, smoke will consistently flow though the 2” vent. If a low rate of smoke flow is observed it is an indication of poor smoke flow under the membrane. If low flow does occur, insert the smoke testing hose into the 2” membrane vent.

7. Mark sampling locations with fluorescent paint or chalk. Repair sampling locations per Land Science Technologies recommendations

8. Maintain operation of smoke generator/blower system for at least 15 minutes following purging of membrane. Thoroughly inspect entire membrane surface. Use fluorescent paint or chalk to mark/label any leak locations. Mark/label leak locations on testing log. NOTE: The duration of the smoke test will vary depending on the size of the area being tested. To help determine the duration, monitor the pressure building up under the membrane. If excessive lifting of the membrane occurs, decrease the duration or pressure of the smoke test.

9. Prepare membrane inspection log. Identify the type of leak found, i.e. poor seal around penetration, fish-mouth, puncture, etc.

10. Repair leak locations marked in step 7 and step 8 per procedures outlined in “Geo-Seal Repair Procedures” section using Geo-Seal CORE or Geo-Seal DETAIL.

11. Repeat steps 4 through 10 as necessary to confirm the integrity of the membrane.

12. Complete the smoke testing inspection form indicating the successful completion of the smoke test.

Post Installation Inspection

After a manufacturer’s representative or 3rd party inspector signs off on the membrane installation and the steel workers begin to install the rebar, it is recommended to conduct a visual inspection prior to the pouring of concrete. Damages are most likely to occur during this time and it is imperative that punctures are indentified prior to the placement of the slab. The system configuration of Geo-Seal, the top white Geo-Seal BOND layer with a middle black layer, will make rebar punctures easy to identify when conducting a visual inspection.

THE PHOENIX REDEVELOPMENT CORRECTIVE ACTION PLAN

801 Pine Street
Oakland, CA 94607
Cleanup Program Site Case No. RO0003269

Summary – Alameda County Department of Environmental Health (ACDEH) is providing oversight of environmental investigation and cleanup activities in support of The Phoenix redevelopment project at 801 Pine Street in Oakland (Site). This fact sheet provides information on proposed actions to cleanup contamination at the Site and engineering controls that will be used to protect the health of the community and workers during Site development.

Site Background – The 4.6-acre Site consists of a vacant lot covered with a concrete slab. Historically, the Site has been used for industrial operations including iron fabrication, fireworks manufacturing, and auto parts manufacturing. In 1994, the property was purchased by Caltrans and used for storage of construction material. Construction activities were also conducted in the southwestern corner of the Site to support the realignment of I-880 and the associated frontage road.

Site Redevelopment – Urban Designs LLC owns the Site and Holliday Development is the developer. Holliday Development has received entitlements to subdivide the Site into four parcels and develop it into multi-story mixed-use affordable housing.

Community Meeting

If you are interested in this project, you are invited to attend an electronic public meeting to learn more about Site conditions and the cleanup actions, discuss community protection measures, and answer questions.

When: Tuesday, March 8, 2022
Time: 6:30 to 7:30 p.m.
Join via Zoom: https://tinyurl.com/801Pine
Join by Phone: Dial 1-669-900-9128 and enter meeting 844 1198 8357#

(Please contact Tracy Craig at 510-334-4866 or tracy@craig-communications.com if you need assistance accessing the meeting.)

Development will begin with Parcel 1, which will provide 101 units of affordable housing with 50 units for formerly unsheltered families. The development will also include offices for supportive services and laundry facilities for future residents. Construction at Parcel 1 is anticipated to begin in May 2022.

Site Investigations – Environmental investigations have found elevated levels of lead in shallow soil and solvent vapors in soil gas (the air in between soil particles) at the Site. Holliday Development did not contaminate the Site but is responsible for cleaning up the property to support development.

Site Cleanup Plan – In 2020, Holliday Development prepared a *Corrective Action Plan* (CAP) which included the following measures to address contamination found at the Site:

- Excavating shallow soils across the site to remove shallow lead impacts and prepare for redevelopment construction
- Placing lead-impacted soil into the bottom of an excavation adjacent to the Frontage Road sound wall and backfilling the remaining excavation with clean soil
- Capping the area of lead-impacted soil with asphalt/concrete roadways to act as a protective cover over the impacted soil
- Installing vapor intrusion mitigation and migration engineering controls including a sub-slab vapor barrier and venting system beneath the planned buildings to prevent petroleum products and solvents from entering indoor air
- Installing plugs in new utility trenches to prevent off-Site migration of impacted soil vapor
- Implementing administrative and institutional controls including long-term monitoring and management of the vapor barriers and the cover material for the lead-impacted soil.

Community Protection Measures – Before environmental work can begin, ACDEH requires the preparation of a *Corrective Action Implementation Plan* (CAIP) that describes construction activities and engineering techniques to protect the health of the community and workers from exposure to contaminated soil and dust during Site development. Measures that will be implemented for this Site include:

- Implementation of a Soil and Groundwater Management Plan with protocols for handling and management of contaminated soil during Site development
- Controlling dust during soil moving activities by using water and covering soil stockpiles
- Monitoring noise levels during Site development activity and reducing equipment speeds or using noise mufflers, as needed
- Performing real-time perimeter air monitoring during soil disturbing work
- Cleaning truck tires and undercarriages to prevent track out of contaminated soil for any soil that is removed from the Site
- Following the City of Oakland approved truck route for any soil that is removed from the Site
- Using flaggers and traffic signage to safely manage construction-related traffic
- Installing signage that includes a phone number for more information on existing Site fencing

Next Steps – ACDEH will host a community meeting on March 8, 2022 to provide an overview of the environmental cleanup work in the CAP and the community and worker protection measures being developed for the CAIP. Please see the Community Meeting information box on the first page for more information on the meeting. ACDEH will incorporate input from the meeting into the Site development plans, as appropriate.

Environmental work will not begin until ACDEH has approved the CAP and CAIP. The developer anticipates that work will begin at Parcel 1 in May 2022 and environmental work will be performed at the same time as redevelopment construction. ACDEH will send out a work notice prior to environmental work starting.

For More Information – The CAP, investigation results and additional documents associated with the cleanup of this Site can be viewed online at the State Water Resources Control Board's GeoTracker website at:

https://geotracker.waterboards.ca.gov/profile_report?global_id=T10000011072

For more information about the corrective action process or related documents, how to access the virtual community meeting or general Site questions, please contact the following individuals:

GENERAL NOTES

1. THE TERM "SITE" AS USED IN THESE DRAWINGS, REFERS TO THE PROPERTY LOCATED AT 801 PINE STREET IN OAKLAND, CALIFORNIA.
2. REMEDIATION CONTRACTOR (HEREIN REFERRED TO AS "CONTRACTOR") REFERS TO ALL CONTRACTORS RESPONSIBLE FOR COMPLETION OF THE ACTIVITIES SHOWN HEREIN. "ENGINEER" REFERS TO TERRAPHASE ENGINEERING, INC. "ENVIRONMENTAL CONSULTANT" REFERS TO P&D ENVIRONMENTAL, INC.
3. IN ADDITION TO THE REQUIREMENTS PROVIDED ON THESE DRAWINGS, THE CONTRACTOR SHALL ADHERE TO THE REQUIREMENTS SET FORTH IN THE 2022 SOIL AND GROUNDWATER MANAGEMENT PLAN (SGMP) FOR THE SITE (P&D 2022). ALL SUPERVISORS AND FOREMEN SHALL SIGN A CERTIFICATION STATEMENT INDICATING THAT THEY HAVE READ THE SGMP, UNDERSTAND ITS CONTENTS, AND SHALL ADHERE AND HAVE ALL PERSONNEL UNDER THEIR SUPERVISION ADHERE TO ALL PROCEDURES CONTAINED THEREIN.
4. THE DECEMBER 1, 2017 SGMP THAT IS AVAILABLE ON GEOTRACKER IS SUPERSEDED BY THE 2022 SGMP.
5. ALL WORK IS TO BE DONE IN ACCORDANCE WITH THE CITY OF OAKLAND DESIGN GUIDELINES AND STANDARDS AND THE STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION (CALTRANS) 2018 STANDARD SPECIFICATIONS ("STATE STANDARD SPECIFICATIONS") AND STANDARD PLANS, WHICH ARE HEREBY INCORPORATED INTO THESE PLANS BY RERFERENCE, UNLESS SPECIFIED OTHERWISE.
6. CONTRACTOR SHALL ADHERE TO THE TRAFFIC SEQUENCING PLAN THAT IS PROVIDED AS AN APPENDIX TO THE 2022 SGMP AND ANY APPLICABLE REQUIREMENTS SET FORTH IN THE MANUAL OF UNIFORM TRAFFIC DEVICES (MUTCD) AND AS DIRECTED BY THE CITY ENGINEER. CONTRACTOR SHALL ADHERE TO THE SGMP DURING SITE REMEDIATION AND ASSOCIATED PREPARATION AND DEMOBILIZATION.
7. CAUTION IS TO BE EXERCISED FOR THE PRESENCE AND SAFETY OF HOMELESS PEOPLE LOCATED AT THE PERIMETER OF AND IN THE IMMEDIATE VICINITY OF THE SITE.
8. CONTRACTOR MUST ADHERE TO ALL PERMIT REQUIREMENTS.
9. CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING ALL FIELD DIMENSIONS AND ALL SITE CONDITIONS BEFORE STARTING WORK.
10. MEASURES SHALL BE TAKEN BY THE CONTRACTOR TO PROTECT ADJACENT AREAS AND PROPERTIES, PUBLIC AND PRIVATE, AT ALL TIMES DURING REMEDIATION ACTIVITIES.
11. CONTRACTOR TO NOT EXCAVATE BELOW FOOTING OF SOUND BARRIER WALL THAT IS LOCATED ON THE WEST SIDE OF THE SITE.
12. CONTRACTOR SHALL USE REASONABLE MITIGATION MEASURES TO MINIMIZE IMPACTS TO ADJACENT PROPERTIES TO THE EXTENT PRACTICABLE. POTENTIAL IMPACTS THE CONTRACTOR MUST ADDRESS INCLUDE IMPACTS FROM DUST, NOISE, CONSTRUCTION VIBRATIONS, AND ODORS. CONTRACTOR MUST NOT RESTRICT ACCESS TO NEIGHBORING PROPERTIES.
13. CONTRACTOR SHALL CONFIRM A CONSTRUCTION SCHEDULE WITH THE GENERAL CONTRACTOR AND ENVIRONMENTAL CONSULTANT AT LEAST 72-HOURS PRIOR TO ANY WORK AT THE SITE. THE PROPOSED SCHEDULE SHALL INCLUDE ESTIMATED START DATE, DURATION, AND COMPLETION TIMES FOR EACH INCLUDED ACTIVITY. CHANGES TO THIS SCHEDULE SHALL BE COMMUNICATED TO THE ENVIRONMENTAL CONSULTANT AT LEAST 24 WORKING HOURS (MONDAY THROUGH FRIDAY) BEFORE PROPOSED START OF WORK.
14. CONTRACTOR SHALL ADHERE TO HOURS OF OPERATION FOR CONSTRUCTION PERMITTED BY THE CITY OF OAKLAND.
15. CONTRACTOR SHALL PHOTO DOCUMENT ALL STRUCTURES LOCATED WITHIN 100 FEET OF ANY EXCAVATION PRIOR TO THE BEGINNING OF EXCAVATION AND PROVIDE COPIES OF PHOTO DOCUMENTATION TO THE GENERAL CONTRACTOR.

GENERAL SCOPE OF WORK

1. THE WORK SCOPE IN THESE DRAWINGS AND IN THE 2022 SGMP SUPERSEDES THE WORK SCOPE IDENTIFIED IN THE CORRECTIVE ACTION PLAN FOR THE SITE (P&D 2/4/20).
2. SITE TO BE PREPARED PRIOR TO REMEDIATION BY OTHERS BY INSTALLING A PERIMETER FENCE AND TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES.
3. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) EROSION AND SEDIMENT CONTROLS, FIBER ROLLS AND OTHER SWPPP ELEMENTS TO BE MAINTAINED BY GENERAL CONTRACTOR DURING SITE REMEDIATION IN ACCORDANCE WITH THE PROJECT DRAWINGS AND ANY OTHER STATE AND LOCAL REGULATIONS.
4. PERIMETER FENCE TO BE MAINTAINED BY GENERAL CONTRACTOR DURING SITE REMEDIATION.
5. ANY EXISTING SOIL GAS WELLS LOCATED WITHIN THE AREA OF THE SITE REMEDIATION WILL BE DESTROYED BY THE ENVIRONMENTAL CONSULTANT PRIOR TO THE BEGINNING OF SITE REMEDIATION. ANY EXISTING SOIL GAS WELLS THAT HAVE NOT BEEN DESTROYED THAT ARE LOCATED ON PARCELS 2, 3 OR 4 WILL BE MARKED WITH A RISER OR OTHER SIMILAR METHOD FOR EASY IDENTIFICATION AND WILL BE PROTECTED DURING SITE REMEDIATION.
6. PERIMETER AIR MONITORING FOR DUST IS REQUIRED FOR EXCAVATION OF LEAD-IMPACTED MATERIAL LOCATED BENEATH THE CONCRETE SURFACE COVER AND ALL CONSOLIDATION OF LEAD-IMPACTED MATERIAL AND ANY REMEDIATION-RELATED ACTIVITIES THAT EXPOSE LEAD-IMPACTED MATERIALS TO THE ATMOSPHERE. AIR MONITORING WILL BE PERFORMED IN ACCORDANCE WITH THE SGMP. AIR MONITORING CAN BE DISCONTINUED UPON COMPLETION OF EXCAVATION AND COMPLETION OF OFFSITE DISPOSAL OR ONSITE CONSOLIDATION AND COMPLETE COVERING OF LEAD-IMPACTED SOIL.
7. GENERAL CONTRACTOR TO PROVIDE A CONSULTANT TO PROVIDE PERIMETER AIR MONITORING DURING SITE REMEDIATION.
8. IN THE EVENT THAT A WATER SUPPLY WELL IS LOCATED AT THE SITE DURING EXCAVATION, STOP EXCAVATION IN THE IMMEDIATE VICINITY OF THE WELL AND NOTIFY THE GENERAL CONTRACTOR AND THE ENVIRONMENTAL CONSULTANT. DO NOT PERFORM ADDITIONAL EXCAVATION IN THE IMMEDIATE VICINITY (10-FOOT RADIUS) OF THE WATER SUPPLY WELL UNTIL AUTHORIZED BY THE GENERAL CONTRACTOR AND THE ENVIRONMENTAL CONSULTANT. EXCAVATION CAN CONTINUE AT OTHER LOCATIONS PENDING A RESPONSE FROM THE GENERAL CONTRACTOR AND THE ENVIRONMENTAL CONSULTANT.
9. LOCATE EXISTING UTILITIES IN AND AROUND THE CONSOLIDATION TRENCH. VERIFY THAT ALL UTILITIES HAVE BEEN DE-ENERGIZED OR CUT-OFF FROM THEIR SUPPLY, AS APPROPRIATE. ALL CONDUITS SHOULD BE PLUGGED OR CAPPED IN ACCORDANCE WITH THE 6/16/20 GEOTECHNICAL REPORT FOR THE SITE. UTILITIES WILL NOT BE RECONNECTED.
10. REMOVE SITE FEATURES AND UTILITIES AS NEEDED TO ALLOW SAFE EXCAVATION OF THE SOILS. REMOVE UTILITIES WITHIN THE EXCAVATION AREAS BEFORE OR DURING EXCAVATION OF SITE SOILS.
11. THE WORK DESCRIBED HEREIN INCLUDES THE FOLLOWING:
    a. REMOVE AND RECYCLE OFFSITE THE CONCRETE FROM THE PROPOSED FIRE LANE SHOWN ON THE FIGURES REFERENCED ABOVE (26 FEET WIDE), PLUS AN ADDITIONAL 12 FEET ON EITHER SIDE OF THE FIRE LANE (A TOTAL WIDTH OF APPROXIMATELY 50 FEET).
    b. EXCAVATE LEAD-IMPACTED MATERIAL THAT IS LOCATED DIRECTLY BENEATH THE CONCRETE COVER AND STOCKPILE IT TEMPORARILY ON PARCEL 1.
    c. EXCAVATE A TRENCH FROM SHOREY STREET TO PARCEL 2 IN THE FOOTPRINT OF THE FIRE LANE TO A DEPTH OF APPROXIMATELY 8 FEET FOR ONSITE LEAD-IMPACTED MATERIAL CONSOLIDATION. SOIL REMOVED FROM THE TRENCH HAS PREVIOUSLY BEEN SAMPLED WITH SOIL BORING SAMPLES AND HAS BEEN IDENTIFIED BY ACDEH AS MATERIAL THAT CAN BE REUSED ONSITE. THE SOIL THAT IS REMOVED FROM THE TRENCH WILL BE TEMPORARILY STORED ON PARCEL 2. THE ENDS OF THE TRENCH WILL BE LOCATED APPROXIMATELY 10 FEET FROM THE PROPERTY LINE AT SHOREY STREET AND APPROXIMATELY 10 FEET FROM THE BOUNDARY WITH PARCEL 2.
    d. ALL STOCKPILES ARE TO BE COVERED AT THE END OF EACH DAY IN ACCORDANCE WITH THE SGMP.
    e. PLACE THE LEAD-IMPACTED SOIL THAT WAS TEMPORARILY STORED ON PARCEL 1 INTO THE TRENCH AND COMPACT IT IN ACCORDANCE WITH THE REQUIREMENTS OF THE GEOTECHNICAL REPORT. PLACE ORANGE DEMARCATION MATERIAL OVER THE COMPACTED SOIL WHEN LEAD-IMPACTED MATERIAL CONSOLIDATION IS COMPLETED.
    f. ONCE THE TEMPORARILY STORED LEAD-IMPACTED MATERIAL IS CONSOLIDATED IN THE TRENCH, REMOVE THE REMAINING CONCRETE COVER FOR PARCEL 1. RECYCLE THE CONCRETE OFFSITE, AND CONSOLIDATE THE UNDERLYING LEAD-IMPACTED MATERIAL IN THE ONSITE TRENCH AS THE LEAD-IMPACTED MATERIAL BECOMES EXPOSED. THE EXTENT OF CONCRETE REMOVAL IS DEFINED AS FOLLOWS:
        i. NORTH - THE BOUNDARY WITH PARCEL 2.
        ii. EAST – THE PARCEL 1 PROPERTY LINE ALONG PINE STREET.
        iii. SOUTH – THE PARCEL 1 PROPERTY LINE ALONG SHOREY STREET.
        iv. WEST - THE WESTERN PROPERTY LINE FOR PARCEL 1, WHICH IS LOCATED APPROXIMATELY 5.7 FEET FROM THE SOUND BARRIER WALL AT THE SOUTHWEST CORNER OF THE PROPERTY AND WHICH NARROWS TO APPROXIMATELY 2.2 FEET FROM THE SOUND BARRIER WALL AT A LOCATION APPROXIMATELY 55 FEET NORTH OF THE SOUTHWESTERN PROPERTY BOUNDARY.
    g. ANY LEAD-IMPACTED MATERIALS THAT ARE PLACED INTO THE TRENCH FOR ONSITE CONSOLIDATION WILL BE COVERED AT THE END OF EACH DAY PENDING FINAL COVER WITH CLEAN SOIL.
    h. DEMOLISH AND REMOVE CONCRETE IN A MANNER TO KEEP CONCRETE DEMOLITION AND REMOVAL EQUIPMENT AND TRUCKS ON CONCRETE SURFACES AT ALL TIMES.
    i. CONCRETE FOOTINGS AND STRUCTURES AND UTILITIES THAT ARE ENCOUNTERED BENEATH THE SITE CONCRETE SLAB THAT EXTEND BELOW THE DEPTH OF LEAD-IMPACTED SOIL REMOVAL WILL REMAIN IN PLACE FOR REMOVAL AND RECYCLING BY THE PROJECT GRADING CONTRACTOR FOLLOWING THE COMPLETION OF LEAD-IMPACTED SOIL REMEDIATION.
    j. WHEN ALL OF THE LEAD-IMPACTED MATERIAL IS CONSOLIDATED IN THE TRENCH, PLACE ORANGE DEMARCATION MATERIAL OVER IT AND COVER IT WITH THE CLEAN MATERIAL THAT WAS STOCKPILED ON PARCEL 2. THE REMAINING CLEAN MATERIAL ON PARCEL 2 WILL BE TEMPORARILY LEFT ON PARCEL 2 PENDING POST-REMEDIATION SITE COMPACTION AND GRADING.
12. STOCKPILING OF LEAD-IMPACTED MATERIALS, WITH THE EXCEPTION OF THE LEAD-IMPACTED MATERIALS THAT ARE TEMPORARILY STOCKPILED DURING TRENCH EXCAVATION BENEATH THE PROPOSED FIRE LANE, IS NOT ALLOWED.

AIR MONITORING AND SURVEYS

1. GENERAL CONTRACTOR SHALL RETAIN A THIRD-PARTY AIR MONITORING SPECIALIST TO MONITOR DUST AT THE SITE PERIMETER DURING IMPLEMENTATION OF SOIL REMEDIATION AND MITIGATION ACTIVITIES AT LOCATIONS SHOWN ON THE DRAWINGS. MONITORING SHALL BE CONDUCTED DAILY DURING EXCAVATION, BACKFILLING, AND OTHER EARTHWORK ACTIVITIES INVOLVING LEAD-IMPACTED SOIL. SITE REMEDIATION WORK SHALL BE STOPPED IMMEDIATELY AND MITIGATION MEASURES SHALL BE IMPLEMENTED IN ACCORDANCE WITH THE 2022 SGMP IF THE ACTION LEVELS PROVIDED IN THE SGMP ARE EXCEEDED. THE MONITORING SPECIALIST SHALL SUBMIT DAILY MONITORING REPORTS TO THE ENVIRONMENTAL CONSULTANT.
2. THE GENERAL CONTRACTOR SHALL CONDUCT SURVEYS TO DEFINE THE BOUNDARIES OF EXCAVATED AREAS ASSOCIATED WITH SITE REMEDIATION AND THE HORIZONTAL AND VERTICAL LOCATIONS OF CONSOLIDATION FOR ANY LEAD-IMPACTED MATERIALS THAT ARE CONSOLIDATED ONSITE.
3. NO EXCAVATION SHALL BE CONDUCTED IF SUSTAINED WINDS EXCEED 20 MILES PER HOUR DURING ANY 1-MINUTE PERIOD, OR IF ANY GUST WITHIN THE HOUR EXCEEDS 40 MILES PER HOURS.
4. THE AIR MONITORING SUBCONTRACTOR WILL MONITOR WIND SPEEDS AT 5 FEET ABOVE THE GROUND SURFACE.
5. IF VISIBLE DUST IS PRESENT AT THE PROPERTY BOUNDARY, ALL WORK WILL STOP UNTIL THE VISIBLE DUST IS MITIGATED.

EXCAVATION REQUIREMENTS

1. SITE SOILS WILL BE EXCAVATED IN CLOSE PROXIMITY TO ADJACENT PROPERTIES. TO REDUCE THE POTENTIAL FOR LATERAL DEFORMATIONS IN THE SOILS AND SETTLEMENT OF ADJACENT AREAS, THE CONTRACTOR WILL BE REQUIRED TO EITHER SHORE, SLOPE, OR BENCH THE EXCAVATION.
2. SLOPING WILL BE REQUIRED AT 1.5:1 OR AS DETERMINED AND DIRECTED BY OSHA EXCAVATION COMPETENT PERSON AND THE GEOTECHNICAL ENGINEER.
3. GROUNDWATER WILL LIKELY BE ENCOUNTERED AT AN APPROXIMATE DEPTH OF 10 FEET BELOW EXISTING GRADE, BUT GROUNDWATER LEVELS MAY BE HIGHER OR LOWER. CONTRACTOR SHALL EXCAVATE AN EXPLORATORY POTHOLE WITHIN THE FOOTPRINT OF THE FIRE LANE TO DETERMINE THE DEPTH TO GROUNDWATER AND WILL EXCAVATE THE TRENCH FOR ONSITE LEAD-IMPACTED MATERIAL CONSOLIDATION TO A DEPTH OF ONE FOOT ABOVE THE STATIC WATER LEVEL THAT IS ENCOUNTERED IN THE EXPLORATORY POTHOLE.
4. LOAD DEMOLISHED CONCRETE DIRECTLY INTO TRUCKS FOR TRANSPORT AND OFFSITE RECYCLING.
5. LOAD SOIL FOR OFFSITE DISPOSAL DIRECTLY INTO TRUCKS FOR TRANSPORT AND OFFSITE DISPOSAL.
6. ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIALS WILL BE NO DEEPER THAN 8 FEET BELOW EXISTING GRADE, AND WILL BE NO SHALLOWER THAN 1 FOOT BELOW PROJECT FINISH GRADE. AT LOCATIONS WHERE NEW UTILITIES OR NEW FOUNDATION FEATURES MIGHT ENCOUNTER LEAD-IMPACTED MATERIALS THAT ARE CONSOLIDATED ONSITE, A MINIMUM HORIZONTAL AND A MINIMUM VERTICAL DISTANCE OF 1 FOOT OF CLEAN BACKFILL MATERIAL WILL BE MAINTAINED BETWEEN THE NEW UTILITY OR NEW FOUNDATION FEATURE AND LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE.
7. ALL LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE WILL BE PLACED ON ORANGE DEMARCATION CONSTRUCTION FENCE, INCLUDING ON THE SIDES OF THE EXCAVATION WHERE THE LEAD-IMPACTED MATERIALS ARE PLACED. ALL LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE WILL BE COVERED WITH ORANGE DEMARCATION CONSTRUCTION FENCE AT THE COMPLETION OF ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIAL.
8. AREAS IN THE CONSOLIDATION TRENCH WHERE FUTURE UTILITIES WILL CROSS THE CONSOLIDATION TRENCH WILL BE FILLED USING CLEAN FILL. THE CLEAN FILL IN THE CONSOLIDATION TRENCH WILL MEET THE FOLLOWING REQUIREMENTS:
    a. TRENCHES WILL BE LINED ON THE BOTTOM AND SIDES ONLY WITH ORANGE DEMARCATION CONSTRUCTION FENCE (NOT ON THE TOP).
    b. DETECTABLE METALIZED WARNING TAPE (CALPICO TYPE 2, SETON, OR EQUIVALENT) WILL BE PLACED APPROXIMATELY 6 TO 12 INCHES BELOW THE FINAL ROUGH GRADED SURFACE ON EACH SIDE OF TRENCHES FOR THE ENTIRE LENGTH OF THE CLEAN FILL PORTION OF THE TRENCH.
    c. MARK WITH PAINT ON CONCRETE SURFACES AT THE ENDS OF TRENCHES WHERE CONCRETE IS NOT DEMOLISHED FOR FUTURE TRENCH LOCATION.
    d. CLEAN FILL TRENCH LOCATIONS AND DEPTHS WILL BE SURVEYED BY THE GENERAL CONTRACTOR TO CONFIRM PROPER FUTURE PLACEMENT FOR UTILITIES.
9. THE LOCATIONS WHERE LEAD-IMPACTED MATERIAL IS CONSOLIDATED ONSITE WILL BE SURVEYED HORIZONTALLY AND VERTICALLY BY THE GENERAL CONTRACTOR AND THE SURVEYED LOCATIONS RECORDED ON A SITE MAP THAT WILL BE PROVIDED TO THE ENVIRONMENTAL CONSULTANT.
10. TRANSPORT AND DISPOSE OF EXCAVATED SOIL AND OTHER WASTE IN ACCORDANCE WITH STATE AND FEDERAL LAWS, AT DISPOSAL FACILITIES APPROVED BY THE ENVIRONMENTAL CONSULTANT.
11. BACKFILL AND COMPACT EXCAVATION AREAS AS SPECIFIED IN THE 6/16/20 GEOTECHNICAL REPORT FOR THE PROJECT.
12. ALL STOCKPILES ARE TO BE COVERED AT THE END OF EACH DAY IN ACCORDANCE WITH THE SGMP.
13. ANY LEAD-IMPACTED MATERIALS THAT ARE PLACED INTO THE TRENCH FOR ONSITE CONSOLIDATION WILL BE COVERED AT THE END OF EACH DAY PENDING FINAL COVER WITH CLEAN SOIL.
14. FOLLOWING EXCAVATION OF THE TRENCH FOR ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIALS, REMOVE CONCRETE STARTING AT PINE STREET AND THEN WORKING NORTHWARDS. KEEP CONCRETE DEMOLITION AND REMOVAL EQUIPMENT AND TRUCKS ON CONCRETE SURFACES AT ALL TIMES.
15. REMOVAL OF FOOTINGS THAT ARE LOCATED OUTSIDE THE FOOTPRINT OF THE TRENCH FOR LEAD-IMPACTED SOIL CONSOLIDATION AND THAT EXTEND BELOW THE DEPTH OF LEAD-IMPACTED SOIL REMOVAL WILL BE MANAGED BY THE GENERAL CONTRACTOR OUTSIDE THE SCOPE OF THE 2022 SGMP AND THIS REMEDIAL SOIL EXCAVATION PLAN FOLLOWING THE COMPLETION OF SITE SOIL REMEDIATION.

HEALTH AND SAFETY

1. PRIOR TO CONTRACTOR MOBILIZATION, THE CONTRACTOR SHALL PREPARE A SITE-SPECIFIC HEALTH AND SAFETY PLAN AND ASSURE THAT ALL CONTRACTOR PERSONNEL HAVE REVIEWED THE PLAN AND WILL ABIDE BY IT. THE CONTRACTOR IS SOLELY RESPONSIBLE FOR THE SAFETY OF THEIR PERSONNEL. ALL PERSONNEL ON SITE SHALL HAVE 'STOP WORK AUTHORITY' AND SHALL BE INFORMED OF THEIR AUTHORITY.
2. ALL CONTRACTORS AND SUBCONTRACTORS SHALL SIGN A CERTIFICATION STATEMENT INDICATING THAT THEY HAVE READ THE SGMP, UNDERSTAND ITS CONTENTS, AND SHALL ADHERE TO ALL PROCEDURES CONTAINED THEREIN.
3. CONTRACTOR SHALL MAINTAIN A COPY OF THE HASP ONSITE DURING ALL PHASES OF THE WORK AND SHALL BE RESPONSIBLE FOR ALL WORKER SAFETY DURING ALL ON-SITE ACTIVITIES.
4. IN THE EVENT AN UNSAFE CONDITION IS DETECTED BY THE CONTRACTOR, SUBCONTRACTOR OR THE ENGINEER, ALL WORK IN THE AREA OF THE UNSAFE CONDITION SHALL BE STOPPED IMMEDIATELY. THE UNSAFE CONDITION SHALL BE RESOLVED BASED ON THE PROVISIONS OF THE HASP.
5. ALL PERSONNEL PERFORMING REMEDIATION WORK AT THE SITE WILL BE 40-HOUR HAZWOPER TRAINED WITH A CURRENT REFRESHER CERTIFICATE AND HAVE HAD A WORK PHYSICAL WITHIN THE PAST 12 MONTHS.
6. THE CONTRACTOR, SUBCONTRACTORS, AND THEIR EMPLOYEES SHALL BE FAMILIAR WITH AND COMPLY WITH OSHA SAFETY REQUIREMENTS FOR HAZWOPER SET FORTH IN THE CODE OF FEDERAL REGULATIONS, TITLE 29, PARTS 1910 AND 1926, AND ALL FEDERAL, STATE, AND LOCAL REGULATIONS, AS APPLICABLE. THE CONTRACTOR SHALL BEAR SOLE RESPONSIBILITY FOR COMPLIANCE WITH THESE REGULATIONS.
7. THE CONTRACTOR SHALL ABIDE BY THE RULES AND REGULATIONS OF THE STATE OF CALIFORNIA CONSTRUCTION SAFETY ORDERS PERTAINING TO EXCAVATIONS AND TRENCHES.
8. GENERATORS, IF USED, SHALL BE PLACED AT A REASONABLE DISTANCE AWAY FROM THE NEIGHBORING PROPERTIES TO MINIMIZE DISTURBANCE.

UTILITIES

1. CONTRACTOR SHALL BE RESPONSIBLE FOR THE PROTECTION OF ALL EXISTING UTILITIES THAT ARE NOT REQUIRED TO BE DEMOLISHED.
2. CONTRACTOR IS RESPONSIBLE FOR REMOVAL OF EXISTING UTILITIES TO BE REMOVED WITHIN THE EXCAVATIONS.
3. IT IS THE CONTRACTOR'S RESPONSIBILITY TO LOCATE UTILITIES WITHIN THE EXCAVATION AREAS AND ADJACENT AREAS PRIOR TO START OF SITE REMEDIATION.
4. LOCATE EXISTING UTILITIES IN AND AROUND THE SITE AND DE-ENERGIZE ELECTRICAL LINES. PLUG OR CAP ALL OTHER UTILITIES WITHIN EXCAVATION AREAS. PLUG OR CAP UTILITY PIPES THAT CONVEY FLUIDS OUTSIDE OF THE EXCAVATION FOOTPRINTS IN ACCORDANCE WITH THE 6/16/20 GEOTECHNICAL REPORT REQUIREMENTS.
5. THE LOCATIONS OF THE UTILITIES SHOWN ON THESE DRAWINGS ARE APPROXIMATE. THE ENGINEER ASSUMES NO RESPONSIBILITY FOR THEIR ACCURACY OR ACTUAL LOCATIONS. ADDITIONAL UTILITIES MAY EXIST. THE CONTRACTOR SHALL NOTIFY UNDERGROUND SERVICE ALERT AT TELEPHONE NUMBER 811 AT LEAST TWO FULL WORKING DAYS PRIOR TO THE START OF WORK.
6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTACTING APPROPRIATE UTILITIES AND REQUESTING VERIFICATION OF SERVICE POINTS, FIELD VERIFICATION OF LOCATION, SIZE, AND DEPTH FOR ALL THEIR FACILITIES AND TO COORDINATE WORK SCHEDULE.
7. OMISSION OR INCLUSION OF UTILITY ITEMS ON THE DRAWINGS DOES NOT CONSTITUTE NONEXISTENCE OR DEFINITE LOCATION. LOCATION OF THE UTILITIES PROVIDED ON THE PLANS ARE FOR CONTRACTOR'S INFORMATION ONLY AND THE CONTRACTOR IS RESPONSIBLE FOR LOCATING ALL UTILITIES IN THE FIELD.
8. CONTRACTOR MUST MAKE ALL ATTEMPTS TO LOCATE UTILITIES INCLUDING POTHOLING, IF NECESSARY, PRIOR TO COMMENCING EXCAVATION.
9. WHEN UTILITY LINES NOT KNOWN OR INDICATED ON THE PLANS ARE ENCOUNTERED WITHIN THE AREA OF OPERATIONS, THE CONTRACTOR MUST NOTIFY THE OWNER'S REPRESENTATIVE AND UTILITY OWNER, IF KNOWN, IMMEDIATELY. MEASURES SHALL BE TAKEN TO PROTECT THE UTILITY AND PREVENT DAMAGE TO THE UTILITY FOR UTILITIES LOCATED OUTSIDE OF PROJECT EXCAVATIONS.
10. ALL BURIED UTILITIES LOCATED OUTSIDE OF EXCAVATION FOOTPRINTS WILL BE MANAGED BY THE GENERAL CONTRACTOR OUTSIDE THE SCOPE OF THE 2022 SGMP AND THE REMEDIAL SOIL EXCAVATION PLAN FOLLOWING THE COMPLETION OF ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIALS.

ENVIRONMENTAL PROTECTION

1. THE CONTRACTOR SHALL SUBMIT THEIR ENVIRONMENTAL PROTECTION PLAN TO THE ENVIRONMENTAL CONSULTANT, WHICH SHALL INCLUDE SPILL PREVENTION AND RESPONSE PROCEDURES.
2. THE CONTRACTOR SHALL BE PREPARED AT ALL TIMES TO INTERCEPT, CLEAN UP, AND DISPOSE ANY SPILLS THAT MAY OCCUR.
3. THE CONTRACTOR SHALL KEEP ALL MATERIALS REQUIRED TO CLEAN UP SPILLS (SPILL KITS) READILY AVAILABLE ON SITE.
4. THE CONTRACTOR SHALL SUBMIT TO THE ENVIRONMENTAL CONSULTANT FOR APPROVAL A DECONTAMINATION PLAN TO PROVIDE DETAILS ON DECONTAMINATION PROCEDURES, DECONTAMINATION AREAS, AND THE MANAGEMENT OF DECONTAMINATION WASTES.
5. DECONTAMINATE EQUIPMENT AND REUSABLE MATERIALS PRIOR TO DEPARTURE FROM THE SITE.
6. EACH PIECE OF EQUIPMENT OR MATERIAL MUST BE INSPECTED BY THE CONTRACTOR PRIOR TO DEPARTURE FROM THE SITE TO VERIFY THAT DECONTAMINATION HAS BEEN CONDUCTED. CONTRACTOR SHALL. PROVIDE DOCUMENTATION OF DECONTAMINATION TO THE ENVIRONMENTAL CONSULTANT.
7. CONTAIN DECONTAMINATION WATER, SOLIDS, AND OTHER MATERIALS GENERATED DURING EQUIPMENT DECONTAMINATION AT THE SITE, AND DO NOT ALLOW THESE MATERIALS TO BE RELEASED TO DRAINS OR STORM DRAINS OR WATERWAYS OR TO CONTACT NATIVE MATERIALS. CONTRACTOR SHALL DISPOSE OF WATER, SOLIDS, AND OTHER MATERIALS GENERATED DURING DECONTAMINATION OFF-SITE IN ACCORDANCE WITH FEDERAL, STATE, AND LOCAL LAWS AND REGULATIONS.
8. PERFORM MAJOR MAINTENANCE, REPAIR JOBS OFF SITE.
9. IF REFUELING OR VEHICLE MAINTENANCE MUST BE DONE ONSITE, WORK IN A BERMED AREA AWAY FROM STORM DRAINS AND OVER A DRIP PAN OR DROP CLOTHS LARGE ENOUGH TO COLLECT FLUIDS. RECYCLE OR DISPOSE OF FLUIDS APPROPRIATELY.
10. IF VEHICLE OR EQUIPMENT CLEANING IS DONE ONSITE, CLEAN WITH WATER ONLY IN A BERMED AREA THAT WILL NOT ALLOW RINSE WATER TO RUN INTO GUTTERS, STREETS, STORM DRAINS, OR SURFACE WATERS.
11. DO NOT CLEAN VEHICLE OR EQUIPMENT ONSITE USING SOAPS, SOLVENTS, DEGREASERS, OR STEAM CLEANING EQUIPMENT.
12. LABEL ALL HAZARDOUS MATERIALS AND HAZARDOUS WASTES (SUCH AS PESTICIDES, PAINTS, THINNERS, FUEL, OIL AND ANTIFREEZE) IN ACCORDANCE WITH CITY, COUNTY, STATE AND FEDERAL REGULATIONS.
13. STORE HAZARDOUS MATERIALS AND WASTES IN WATERTIGHT CONTAINERS. STORE IN APPROPRIATE SECONDARY CONTAINMENT AND COVER THEM AT THE END OF EVERY WORK DAY OR DURING WET WEATHER OR WHEN RAIN IS FORECAST.
14. FOLLOW MANUFACTURER'S APPLICATION INSTRUCTIONS FOR HAZARDOUS MATERIALS AND BE CAREFUL NOT TO USE MORE THAN NECESSARY. DO NOT APPLY CHEMICALS OUTDOORS WHEN RAIN IS FORECAST WITHIN 24 HOURS.
15. ARRANGE FOR APPROPRIATE DISPOSAL OF ALL WASTES.

SPILL PREVENTION AND CONTROL

1. IMPLEMENT SUFFICIENT BEST MANAGEMENT PRACTICES (BMPS) TO PREVENT THE SPREAD OF MATERIALS FROM THE SITE – SEE HTTPS://DOT.CA.GOV/-/MEDIA/DOT-MEDIA/PROGRAMS/CONSTRUCTION/DOCUMENTS/ENVIRONMENTAL-COMPLIANCE/CSBMP-MAY-2017-FINAL.PDF
2. DO NOT HOSE DOWN SURFACES WHERE FLUIDS HAVE SPILLED. USE DRY CLEANUP METHODS (ABSORBENT MATERIALS, CAT LITTER, AND/OR RAGS).
3. KEEP SPILL CLEANUP MATERIALS (E.G., RAGS, ABSORBENTS AND CAT LITTER) AVAILABLE AT THE CONSTRUCTION SITE AT ALL TIMES.
4. INSPECT VEHICLES AND EQUIPMENT FREQUENTLY AND REPAIR LEAKS PROMPTLY. USE DRIP PANS TO CATCH LEAKS UNTIL REPAIRS ARE MADE.
5. CLEAN UP SPILLS OR LEAKS IMMEDIATELY AND DISPOSE OF CLEANUP MATERIALS PROPERLY.
6. SWEEP UP SPILLED DRY MATERIALS IMMEDIATELY. DO NOT TRY TO WASH THEM AWAY WITH WATER, OR BURY THEM.
7. CLEAN UP SPILLS ON DIRT AREAS BY DIGGING UP AND PROPERLY DISPOSING OF CONTAMINATED SOIL.
8. REPORT SIGNIFICANT SPILLS IMMEDIATELY. YOU ARE REQUIRED BY LAW TO REPORT ALL SIGNIFICANT RELEASES OF HAZARDOUS MATERIALS, INCLUDING OIL. TO REPORT A SPILL: 1) DIAL 911 OR YOUR LOCAL EMERGENCY RESPONSE NUMBER; 2) CALL THE GOVERNOR'S OFFICE OF EMERGENCY SERVICES WARNING CENTER AT (800) 852-7550 (24 HOURS).

STORMWATER POLLUTION PREVENTION

1. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR IMPLEMENTING TEMPORARY EROSION AND SEDIMENT CONTROL (TESC) MEASURES AND BEST MANAGEMENT PRACTICES (BMPS). THE TESC MEASURES SHOWN ON THE PROJECT CIVIL DRAWINGS ARE TO BE CONSIDERED MINIMUM REQUIREMENTS. THE CONTRACTOR SHALL IMPLEMENT ADDITIONAL MEASURES AND BMPS AS NECESSARY FOR STORMWATER POLLUTION PREVENTION.
2. GENERAL MANAGEMENT PRACTICES, HEREIN, SHALL BE FOLLOWED TO MINIMIZE STORM WATER POLLUTION EMANATING FROM THIS WORK SITE AND ACHIEVE THE FOLLOWING:
    A. KEEP MATERIALS OUT OF DRAINAGEWAYS
    B. PREVENT OFF-SITE TRACKING OF SEDIMENT
    C. KEEP POLLUTANTS OFF EXPOSED SURFACES
    D. PREVENT POLLUTANT CONTACT WITH RAINFALL OR RUNOFF
    E. PROTECT EXISTING VEGETATION TO BE RETAINED
    F. MINIMIZE WASTE AND DISPOSE OF WASTE PROPERLY
    G. PREVENT SPILLS AND LEAKS; CLEAN SPILLS AND LEAKS IMMEDIATELY
    H. COVER AND SECURELY STORE ALL MATERIALS WITH SECURED TARPS OR PLASTIC SHEETING.
    I. KEEP CONCRETE AND CEMENT MORTAR OUT OF DRAINAGE WAYS AND STREAMS
    J. CONTROL. EROSION AND RUN-OFF OF SEDIMENT
3. THE SEQUENCE OF CONSTRUCTION ACTIVITIES AND THE MITIGATION ELEMENTS SHALL BE AS FOLLOWS:
    A. INSPECT CONSTRUCTION ENTRANCE AT ALL ACCESS POINTS
    B. INSTALL TEMPORARY STRAW BALE BARRIER WATTLES AND/OR SILT FENCE AT GRADING LIMITS AND OTHER AREAS AS INDICATED
    C. GRUB AND CLEAR THE SITE AS NEEDED
    D. CREATE TEMPORARY CONSTRUCTION AND WASTE MATERIALS STORAGE AND CONTAINMENT AREA
    E. PROTECT EXISTING DRAINAGE INLETS WITH TEMPORARY DRAINAGE INLET PROTECTION AS NEEDED
    F. PERFORM EXCAVATION AND BACKFILLING
4. ALL STOCKPILES WILL BE TARPED AT THE END OF EACH DAY.
5. ALL ACTIVE STOCKPILES WILL BE TARPED FOR THOSE PORTIONS OF THE STOCKPILE THAT ARE NOT ACTIVELY BEING USED.
6. ALL DUST CONTROL SHALL BE MANAGED BY THE APPLICATION OF WATER.
7. WATER TRUCK SHALL BE PRESENT AND IN USE AT THE REMEDIATION SITE. ALL PORTIONS OF THE SITE SUBEJCT TO BLOWING DUST SHALL BE WATERED AS OFTEN AS NEEDED IN ORDER TO ENSURE PROPER CONTROL OF BLOWING DUST FOR THE DURATION OF THE PROJECT.
8. WATERING ASSOCIATED WITH ONSITE ACTIVITY SHALL TAKE PLACE BETWEEN THE ESTABLISHED SITE WORK HOURS AND SHALL INCLUDE AT LEAST ONE LATE-AFTERNOON WATERING TO MINIMIZE THE EFFECTS OF BLOWING DUST.
9. ONSITE PAVED ACCESS ROADS, PARKING AERAS AND STAGING AREAS SHALL BE SWEPT DAILY WITH A WATER SWEEPER.
10. ALL GRADING OPERATIONS SHALL BE SUSPENDED DURING SECOND (OR WORSE) STAGE SMOG ALERTS.
11. ALL TRUCK LOADS SHALL BE COVERED TO REDUCE DUST.
12. THE STREET ADJACENT TO PARCEL 1 SHALL BE CLEANED BY VACUUM OR BY WET SWEEPING DAILY TO THE SATISFACTION OF THE CITY ENGINEER.
13. ALL GRADED SURFACES AND MATERIALS, WHETHER FILLED, EXCAVATED, TRANSPORTED OR STOCKPILED, SHALL BE WETTED, PROTECTED OR CONTAINED IN SUCH A MANNER AS TO PREVENT NUISANCE FROM DUST, OR SPILLAGE UPON ADJOINING PROPERTY OR STREETS.
14. IN THE EVENT OF EXTREME RAINS, FILTER MATS (OR OTHER APPROVED METHODS) SHALL BE PLACED OVER STORM DRAINS TO PREVENT SEDIMENTS FROM ENTERING THE STORM DRAINAGE SYSTEM DURING GRADING AND CONSTRUCTION ACTIVITIES.
15. CONFLICTS WITH THE SWPPP ARE SUPERSEDED BY THE MORE STRINGENT REQUIREMENT.

CONSTRUCTION ENTRANCE AND EXIT

1. GENERAL CONTRACTOR TO ESTABLISH AND MAINTAIN EFFECTIVE PERIMETER CONTROLS AND INSTALL CONSTRUCTION ENTRANCES AND EXITS IN ACCORDANCE WITH CALIFORNIA DEPARTMENT OF TRANSPORTATION BMP R-1 (MAY 2017) TO SUFFICIENTLY CONTROL EROSION AND SEDIMENT DISCHARGES FROM SITE AND TRACKING OFFSITE. METHODS FOR CONTROLLING TRACKING OFFSITE MAY INCLUDE RUMBLE STRIPS AND/OR CRUSHED ROCK GRAVEL AT SITE EXIT IF MAINTAINING TRUCKS ON CONCRETE SURFACES AT ALL TIMES IS NOT ADEQUATE TO PREVENT TRACKING SOIL ONTO CITY STREETS.
2. GENERAL CONTRACTOR IS RESPONSIBLE FOR MAINTAINING THE CONSTRUCTION ENTRANCES AND EXITS.
3. CAUTION WILL BE EXERCISED WHEN ENTERING AND EXITING THE SITE BASED ON THE POSSIBLE PRESENCE OF HOMELESS PEOPLE LIVING IN THE IMMEDIATE VICINITY OF THE SITE.
4. TRAFFIC TO AND FROM THE SITE FOR SITE REMEDIATION WILL BE IN ACCORDANCE WITH THE TRAFFIC SEQUENCING PLAN IN THE 2022 SGMP.
5. ALL TRAFFIC ENTERING THE SITE WILL APPROACH THE SITE FROM THE SOUTH HEADING NORTH ON PINE STREET AND WILL ENTER PARCEL 2 LOCATED IMMEDIATELY TO THE NORTH OF THE SITE FROM PINE STREET.
6. ALL TRAFFIC EXITING THE SITE WILL EXIT ONTO PINE STREET HEADING SOUTH.
7. SWEEP OR VACUUM DIRT TRACKED ONTO ANY STREET IMMEDIATELY AND SECURE THE SEDIMENT SOURCE TO PREVENT FURTHER TRACKING. NEVER HOSE DOWN STREETS TO CLEAN UP TRACKING.
8. NO TIRE WASHOUT IS REQUIRED. HOWEVER, IF EXCESS OFF-SITE TRACKING IS ENCOUNTERED, WHEEL WASHERS SHALL BE INSTALLED AND USED TO CLEAN ALL TRUCKS AND EQUIPMENT LEAVING THE SITE. IF WHEEL WASHERS CANNOT BE INSTALLED, TIRES OR TRACKS OF ALL TRUCKS AND EQUIPMENT SHALL BE WASHED OFF BEFORE LEAVING THE CONSTRUCTION SITE.

WASTE MANAGEMENT

1. CONTRACTOR WILL IMPLEMENT AND VERIFY PROPER WASTE MANAGEMENT, LABELING, CHARACTERIZATION, AND DISPOSAL OF CONTRACTOR-GENERATED WASTE (I.E. PPE, TRASH, CLEAN-UP WASTE). ALL WASTE WILL BE APPROPRIATELY CHARACTERIZED AND MANIFESTED FOR OFF-SITE DISPOSAL AT A DISPOSAL FACILITY APPROVED BY THE ENVIRONMENTAL CONSULTANT.
2. THE CONTRACTOR SHALL COMPLY WITH ALL STATE AND FEDERAL REGULATIONS, STANDARDS, AND GUIDELINES FOR HANDLING AND DISPOSAL OF WASTE.
3. EXCAVATED SOIL AND WASTE WATER SHALL BE DISPOSED OF AT AN APPROPRIATE DISPOSAL FACILITY APPROVED BY THE ENVIRONMENTAL CONSULTANT.
4. THE CONTRACTOR WILL BE RESPONSIBLE FOR COMPLETION, MANAGEMENT, AND TRACKING OF ALL TRANSPORTATION AND DISPOSAL DOCUMENTATION, INCLUDING BILLS OF LADING, WASTE MANIFESTS, WEIGHT TICKETS, AND CERTIFICATES OF DISPOSAL.
5. THE CONTRACTOR WILL BE RESPONSIBLE FOR CHARACTERIZING, PROFILING, AND PROCESSING ANY EXCAVATED SOIL FOR OFFSITE DISPOSAL SUCH THAT THE MATERIAL MEETS THE REQUIREMENTS OF THE DISPOSAL FACILITIES FOR ACCEPTANCE.
6. LOAD MATERIALS FOR TRANSFER TO THE CONSOLIDATION TRENCH OR FOR TRANSPORT FOR OFFSITE DISPOSAL IN A MANNER THAT PREVENTS SPILLAGE OR SPREADING OF WASTE. PROVIDE PROTECTIVE TEMPORARY COVERING, SUCH AS POLYETHYLENE SHEETING (6-MIL VISQUEEN OR EQUIVALENT) TO PROTECT CLEAN AREAS SITUATED BETWEEN TRANSPORT AND THE EXCAVATION FROM CROSS-CONTAMINATION DUE TO SPILLAGE OF WASTE MATERIAL, AS NEEDED.
7. FOR EACH WASTE DISPOSED AT FACILITIES, PROVIDE WEIGHT TICKETS DOCUMENTING THE AMOUNT OF WASTE DISPOSED.
8. COVER WASTE DISPOSAL CONTAINERS SECURELY WITH TARPS AT THE END OF EVERY WORK DAY AND DURING WET WEATHER.
9. CHECK WASTE DISPOSAL CONTAINERS FREQUENTLY FOR LEAKS AND TO MAKE SURE THEY ARE NOT OVERFILLED. NEVER HOSE DOWN A DISPOSAL CONTAINER ON THE CONSTRUCTION SITE.
10. GENERAL CONTRACTOR TO CLEAN OR REPLACE PORTABLE TOILETS, AND INSPECT THEM FREQUENTLY FOR LEAKS AND SPILLS.
11. DISPOSE OF ALL WASTES AND DEBRIS PROPERLY. RECYCLE MATERIALS AND WASTES THAT CAN BE RECYCLED (SUCH AS ASPHALT, CONCRETE, AGGREGATE BASE MATERIALS, WOOD, GYPSUM BOARD, PIPE, ETC.).
12. CONTRACTOR SHALL SUBMIT A TRANSPORT AND DISPOSAL PLAN FOR ALL WASTES FOR APPROVAL BY THE ENVIRONMENTAL CONSULTANT. THE PLAN MUST CLEARLY DESCRIBE HAUL ROUTES TO AND FROM THE APPROVED DISPOSAL FACILITIES.

BACKFILL AND COMPACTION REQUIREMENTS

1. MATERIALS FOR USE AS FILL SHALL CONFORM TO REQUIREMENTS FOR FILL AS SET FORTH IN THE 6/16/20 GEOTECHNICAL REPORT FOR THE PROJECT.
2. IMPORTED MATERIAL FOR USE AS FILL AT THE SITE SHALL CONFORM TO REQUIREMENTS FOR IMPORTED FILL AS SET FORTH IN THE 2022 SGMP.
3. PRIOR TO IMPORT MATERIAL ARRIVING ON SITE, CONTRACTOR SHALL PROVIDE ANALYTICAL AND GEOTECHNICAL TESTING RESULTS FOR IMPORT MATERIAL TO THE GEOTECHNICAL ENGINEER AND ENVIRONMENTAL CONSULTANT. ALL IMPORTED MATERIAL SHALL MEET THE PROJECT GEOTECHNICAL REQUIREMENTS SET FORTH IN THE PROJECT GEOTECHNICAL REPORT AND SHALL MEET THE CHEMISTRY REQUIREMENTS SET FORTH IN THE 2022 SGMP. GEOTECHNICAL AND ENVIRONMENTAL CONSULTANT WILL RESPOND REGARDING ACCEPTABILITY WITHIN 5 BUSINESS DAYS OF RECEIPT OF DOCUMENTATION REGARDING CHARACTERISTICS OF THE MATERIAL. NO CLEAN FILL IMPORT IS TO BE BROUGHT ONTO THE SITE WITHOUT THE WRITTEN APPROVAL OF BOTH THE GEOTECHNICAL ENGINEER AND THE ENVIRONMENTAL CONSULTANT.
4. ANY SITE MATERIAL THAT IS RECYCLED FOR USE AS FILL AT THE SITE SHALL CONFORM TO THE REQUIREMENTS FOR RECYCLED MATERIAL AS SET FORTH IN THE 2022 SGMP.
5. ANY CONFLICT IN BACKFILL SPECIFICATIONS IS SUPERSEDED BY THE SPECIFICATIONS SET FORTH IN THE 6/16/20 PROJECT GEOTECHNICAL REPORT.
6. FILL WILL BE BACKFILLED AND COMPACTED IN ACCORDANCE WITH SPECIFICATIONS SET FORTH IN THE 6/16/20 PROJECT GEOTECHNICAL REPORT AND IN ACCORDANCE WITH DIRECTION FROM THE GEOTECHNICAL ENGINEER. CONTRACTOR WILL WORK COOPERATIVELY WITH THE GEOTECHNICAL ENGINEER TO PERFORM COMPACTION TESTING TO VERIFY COMPLIANCE WITH GEOTECHNICAL REPORT BACKFILLING AND COMPACTION REQUIREMENTS.
7. ANY CONFLICT REGARDING COMPACTION SPECIFICATIONS IS SUPERSEDED BY THE 6/16/20 PROJECT GEOTECHNICAL REPORT.
8. COMPACTION OF THE BACKFILL MATERIAL SHALL BE TESTED BY THE GEOTECHNICAL ENGINEER IN ACCORDANCE WITH THE 6/16/20 PROJECT GEOTECHNICAL REPORT.
9. IN ADDITION TO REQUIREMENTS IDENTIFIED ABOVE FOR IMPORTED FILL MATERIAL, CONTRACTOR WILL PROVIDE DOCUMENTATION TO THE GEOTECHNICAL ENGINEER FOR USE OF ANY CONTROLLED LOW-STRENGTH MATERIAL (CLSM) FOR APPROVAL THAT THE CLSM MIXTURE DESIGN WILL ACHIEVE THE STRENGTH AND FLOWABILITY REQUIREMENTS IDENTIFIED BY THE GEOTECHNICAL ENGINEER. CERTIFIED PLANT MIX REPORTS FOR CLSM SHALL BE DELIVERED TO THE GEOTECHNICAL ENGINEER. CLSM SHALL BE SELF-LEVELING AND SELF-COMPACTING CEMENTITIOUS MATERIAL. CEMENT: TYPE II PORTLAND CEMENT. CLSM MATERIAL SHALL BE SELECTED AND PROPORTIONED BY THE CLSM SUPPLIER ON THE BASIS OF FIELD EXPERIENCE AND/OR LABORATORY TRIAL MIXTURE TO PRODUCE COHESIVE AND NON-SEGREGATING MIXTURE MEETING THE FOLLOWING PROPERTIES:
    a. STRENGTH: PRIOR TO MOBILIZATION AND EVERY 50 CUBIC YARDS OR ONCE PER DAY, WHICHEVER IS MORE FREQUENT.
    b. 50 TO 100 POUNDS PER SQUARE INCH UNCONFINED COMPRESSIVE STRENGTH.

GENERAL NOTES

1) ALL HISTORICAL SITE ENVIRONMENTAL INVESTIGATION INFORMATION IS PROVIDED ON GEOTRACKER AT THE FOLLOWING LINK: https://geotracker.waterboards.ca.gov/profile_report.asp?global_id=T10000011072
2) SANITATION INCLUDING SINK FOR WASHING TO BE PROVIDED BY AND MAINTAINED BY GENERAL CONTRACTOR.
3) GENERAL CONTRACTOR TO MAINTAIN SITE ENTRANCE AND EXIT FREE FROM OBSTRUCTIONS.
4) NO TEMPORARY POWER POLE OR ELECTRICITY WILL BE AVAILABLE AT THE SITE DURING SITE REMEDIATION EXCAVATION.
5) NO WATER WILL BE AVAILABLE AT THE SITE DURING SITE REMEDIATION.
6) GENERAL CONTRACTOR TO PROVIDE WATER METER FOR FIRE HYDRANT FOR WATER TO BE USED ON SITE. CONTRACTOR TO PROVIDE THEIR OWN WATER TRUCK AND ANY WATER STORAGE.
7) CONTRACTOR TO PERFORM SURVEY AND PROVIDE DOCUMENTATION OF CITY ROAD CONDITIONS FOR TRUCK ROUTES ASSOCIATED WITH SOIL REMOVAL FROM THE SITE PRIOR TO INITIATION OF CONCRETE OR SOIL OFFHAUL.
8) CONTRACTOR SHALL EXCAVATE AN EXPLORATORY POTHOLE WITHIN THE FOOTPRINT OF THE FIRE LANE TO DETERMINE THE DEPTH TO GROUNDWATER AND WILL EXCAVATE THE TRENCH FOR ONSITE LEAD-IMPACTED MATERIAL CONSOLIDATION TO A DEPTH OF ONE FOOT ABOVE THE STATIC WATER LEVEL IN THE EXPLORATORY POTHOLE.

BENCHMARK NOTES

1) LEA & BRAZE ENGINEERING, INC. CIVIL DRAWING SHEET C-1.0 TITLE SHEET FOR SUBMITTAL SET DATED 11-15-19 SITE BENCHMARK NOTES IDENTIFIES ELEVATIONS IN THE DRAWINGS AS BEING BASED ON CITY OF OAKLAND DATUM.

NEW UTILITY NOTES

1) LEA & BRAZE ENGINEERING, INC. CIVIL DRAWING SHEET C-3.2 UTILITY PLAN (AREA OF DETAIL) FOR SUBMITTAL SET DATED 11-15-19 INCLUDES INFORMATION FOR THE FOLLOWING NEW UNDERGROUND UTILITIES IN THE PROPOSED EXCAVATION FOR LEAD-IMPACTED MATERIAL ONSITE CONSOLIDATION:
    a) STORM DRAIN.
    b) CATCH BASIN STORM DRAIN LATERAL.
    c) JOINT TRENCH.
2) NO OTHER PROPOSED UNDERGROUND UTILITIES ARE KNOWN TO BE PRESENT IN THE PROPOSED EXCAVATION FOR LEAD-IMPACTED MATERIAL ONSITE CONSOLIDATION.
3) UTILITY TRENCH BEDDING ASSUMED TO BE 6 INCHES (0.5 FT) OF SAND BEDDING BENEATH UTILITIES.

REMEDIATION EXCAVATION AND BACKFILLING NOTES

1) ALL WORK TO BE PERFORMED IN ACCORDANCE WITH THE CURRENT SITE SGMP.
2) THE WORK DESCRIBED HEREIN INCLUDES THE FOLLOWING:
    a) REMOVE AND RECYCLE OFFSITE THE CONCRETE FROM THE PROPOSED FIRE LANE SHOWN ON THE FIGURES REFERENCED ABOVE (26 FEET WIDE), PLUS AN ADDITIONAL 12 FEET ON EITHER SIDE OF THE FIRE LANE (A TOTAL WIDTH OF APPROXIMATELY 50 FEET).
    b) EXCAVATE LEAD-IMPACTED MATERIAL THAT IS LOCATED DIRECTLY BENEATH THE CONCRETE COVER AND STOCKPILE IT TEMPORARILY ON PARCEL 1.
    c) EXCAVATE A TRENCH FROM SHOREY STREET TO PARCEL 2 IN THE FOOTPRINT OF THE FIRE LANE TO A DEPTH OF APPROXIMATELY 8 FEET FOR ONSITE LEAD-IMPACTED MATERIAL CONSOLIDATION. SOIL REMOVED FROM THE TRENCH HAS PREVIOUSLY BEEN SAMPLED WITH SOIL BORING SAMPLES AND IDENTIFIED AS CLEAN. THE CLEAN SOIL THAT IS REMOVED FROM THE TRENCH WILL BE TEMPORARILY STORED ON PARCEL 2. THE ENDS OF THE TRENCH WILL BE LOCATED APPROXIMATELY 10 FEET FROM THE PROPERTY LINE AT SHOREY STREET AND APPROXIMATELY 10 FEET FROM THE BOUNDARY WITH PARCEL 2.
    d) ALL STOCKPILES ARE TO BE COVERED AT THE END OF EACH DAY TO MINIMIZE DUST.
    e) PLACE THE LEAD-IMPACTED SOIL THAT WAS TEMPORARILY STORED ON PARCEL 1 INTO THE TRENCH WITH ORANGE DEMARCATION MATERIAL AND COMPACT.
    f) ONCE THE TEMPORARILY STORED LEAD-IMPACTED MATERIAL IS CONSOLIDATED IN THE TRENCH, REMOVE THE REMAINING CONCRETE COVER FOR PARCEL 1. RECYCLE THE CONCRETE OFFSITE, AND CONSOLIDATE THE UNDERLYING LEAD-IMPACTED MATERIAL IN THE ONSITE TRENCH AS THE LEAD-IMPACTED MATERIAL BECOMES EXPOSED. THE EXTENT OF CONCRETE REMOVAL IS DEFINED AS FOLLOWS:
        i) NORTH - THE BOUNDARY WITH PARCEL 2.
        ii) EAST – THE PARCEL 1 PROPERTY LINE ALONG PINE STREET.
        iii) SOUTH – THE PARCEL 1 PROPERTY LINE ALONG SHOREY STREET.
        iv) WEST - THE WESTERN PROPERTY LINE FOR PARCEL 1, WHICH IS LOCATED APPROXIMATELY 5.7 FEET FROM THE SOUND BARRIER WALL AT THE SOUTHWEST CORNER OF THE PROPERTY AND WHICH NARROWS TO APPROXIMATELY 2.2 FEET FROM THE SOUND BARRIER WALL AT A LOCATION APPROXIMATELY 55 FEET NORTH OF THE SOUTHWESTERN PROPERTY BOUNDARY.
    g) ANY LEAD-IMPACTED MATERIALS THAT ARE PLACED INTO THE TRENCH FOR ONSITE CONSOLIDATION WILL BE COVERED AT THE END OF EACH DAY PENDING FINAL COVER WITH CLEAN SOIL.
    h) DEMOLISH AND REMOVE CONCRETE IN A MANNER TO KEEP CONCRETE DEMOLITION AND REMOVAL EQUIPMENT AND TRUCKS ON CONCRETE SURFACES AT ALL TIMES.
    i) CONCRETE FOOTINGS AND STRUCTURES AND UTILITIES THAT ARE ENCOUNTERED BENEATH THE SITE CONCRETE SLAB THAT EXTEND BELOW THE DEPTH OF LEAD-IMPACTED SOIL REMOVAL WILL REMAIN IN PLACE FOR REMOVAL AND RECYCLING BY THE PROJECT GRADING CONTRACTOR FOLLOWING THE COMPLETION OF LEAD-IMPACTED SOIL REMEDIATION.
    j) WHEN ALL OF THE LEAD-IMPACTED MATERIAL IS CONSOLIDATED IN THE TRENCH, COVER IT WITH CLEAN MATERIAL THAT WAS STOCKPILED ON PARCEL 2. THE REMAINING CLEAN MATERIAL ON PARCEL 2 WILL BE TEMPORARILY LEFT ON PARCEL 2 PENDING POST-REMEDIATION SITE COMPACTION AND GRADING.
3) NO STOCKPILING OF LEAD-IMPACTED MATERIALS WITH THE EXCEPTION OF THE LEAD-IMPACTED MATERIALS THAT ARE TEMPORARILY STOCKPILED DURING TRENCH EXCAVATION BENEATH THE PROPOSED FIRE LANE.
4) ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIALS WILL BE NO DEEPER THAN 8 FEET BELOW EXISTING GRADE, AND WILL BE NO SHALLOWER THAN 1 FOOT BELOW PROJECT FINISH GRADE. AT LOCATIONS WHERE NEW UTILITIES OR NEW FOUNDATION FEATURES MIGHT ENCOUNTER LEAD-IMPACTED MATERIALS THAT ARE CONSOLIDATED ONSITE, A MINIMUM HORIZONTAL AND A MINIMUM VERTICAL DISTANCE OF 1 FOOT OF CLEAN BACKFILL MATERIAL WILL BE MAINTAINED BETWEEN THE NEW UTILITY OR NEW FOUNDATION FEATURE AND LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE.
5) ALL LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE WILL BE PLACED ON ORANGE DEMARCATION CONSTRUCTION FENCE, INCLUDING ON THE SIDES OF THE EXCAVATION WHERE THE LEAD-IMPACTED MATERIALS ARE PLACED. ALL LEAD-IMPACTED MATERIAL THAT IS CONSOLIDATED ONSITE WILL BE COVERED WITH ORANGE DEMARCATION CONSTRUCTION FENCE AT THE COMPLETION OF ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIAL.
6) AREAS IN THE CONSOLIDATION TRENCH WHERE FUTURE UTILITIES WILL CROSS THE CONSOLIDATION TRENCH WILL BE FILLED USING CLEAN FILL. THE CLEAN FILL IN THE CONSOLIDATION TRENCH WILL MEET THE FOLLOWING REQUIREMENTS:
    a) TRENCHES WILL BE LINED ON THE BOTTOM AND SIDES ONLY WITH ORANGE DEMARCATION CONSTRUCTION FENCE (NOT ON THE TOP).
    b) DETECTABLE METALIZED WARNING TAPE (CALPICO TYPE 2, SETON, OR EQUIVALENT) WILL BE PLACED APPROXIMATELY 6 TO 12 INCHES BELOW THE FINAL ROUGH GRADED SURFACE ON EACH SIDE OF TRENCHES FOR THE ENTIRE LENGTH OF THE CLEAN FILL PORTION OF THE TRENCH.
    c) MARK WITH PAINT ON CONCRETE SURFACES AT THE ENDS OF TRENCHES WHERE CONCRETE IS NOT DEMOLISHED FOR FUTURE TRENCH LOCATION.
    d) CLEAN FILL TRENCH LOCATIONS AND DEPTHS WILL BE SURVEYED BY THE GENERAL CONTRACTOR TO CONFIRM PROPER FUTURE PLACEMENT FOR UTILITIES.
7) THE LOCATIONS WHERE LEAD-IMPACTED MATERIAL IS CONSOLIDATED ONSITE WILL BE SURVEYED HORIZONTALLY AND VERTICALLY BY THE GENERAL CONTRACTOR AND THE SURVEYED LOCATIONS RECORDED ON A SITE MAP THAT WILL BE PROVIDED TO THE ENVIRONMENTAL CONSULTANT.
8) UNDERLYING LEAD-IMPACTED MATERIAL WILL BE REMOVED AND CONSOLIDATED ONSITE AS IT BECOMES EXPOSED TO THE ATMOSPHERE TO MINIMIZE THE POSSIBILITY OF DUST CONTAINING LEAD. ANY LEAD-IMPACTED MATERIAL THAT IS NOT CONSOLIDATED ONSITE WILL BE DISPOSED OF AT A PROJECT-APPROVED DISPOSAL FACILITY. LEAD-IMPACTED MATERIAL WILL NOT BE STOCKPILED ONSITE (WITH THE EXCEPTION OF LEAD-IMPACTED MATERIAL THAT IS TEMPORARILY STOCKPILED AND COVERED DURING EXCAVATION OF THE INITIAL CONSOLIDATION PIT FOR ONSITE CONSOLIDATION OF LEAD-IMPACTED MATERIALS), AND WILL BE COVERED AT THE END OF EACH DAY FOLLOWING PLACEMENT FOR ONSITE CONSOLIDATION SO AS TO MINIMIZE POSSIBLE DUST CONTAINING LEAD.
9) LEAD-IMPACTED MATERIAL WILL BE USED FOR BACKFILL IN A MANNER SO AS TO MAINTAIN A HORIZONTAL AND VERTICAL DISTANCE OF AT LEAST ONE FOOT FROM ALL FUTURE UTILITIES SHOWN ON SITE CONSTRUCTION DRAWINGS, AND TO MAINTAIN A HORIZONTAL AND VERTICAL DISTANCE OF AT LEAST ONE FOOT FROM EXCAVATIONS FOR BUILDING FOUNDATIONS AND FROM THE BOTTOM OF LANDSCAPING, SURFACE COVER MATERIALS, AND ANY SITE IMPROVEMENTS.
10) FOLLOWING PLACEMENT OF ORANGE DEMARCATION MATERIAL ON TOP OF THE LEAD-IMPACTED MATERIAL, THE REMAINING PORTION OF THE ONSITE CONSOLIDATION PIT WILL BE BACKFILLED AND COMPACTED USING CLEAN FILL OBTAINED FROM THE CLEAN MATERIAL THAT WAS EXCAVATED FROM THE CONSOLIDATION TRENCH AND TEMPORARILY STOCKPILED ON PARCEL 2.
11) ALL BACKFILLING AND COMPACTION WILL BE PERFORMED IN ACCORDANCE WITH PROCEDURES AND SPECIFICATIONS APPROVED BY THE GEOTECHNICAL ENGINEER AND IN ACCORDANCE WITH THE SITE GEOTECHNICAL REPORT.
12) CONTRACTOR TO COORDINATE BACKFILLING ACTIVITIES WITH GENERAL CONTRACTOR SO THAT GENERAL CONTRACTOR CAN CONFIRM THE LOCATION AND DIMENSIONS OF LEAD-IMPACTED MATERIALS BY SURVEYING.
13) FOLLOWING REMOVAL OF LEAD-IMPACTED MATERIAL, SURFACE CONFIRMATION SOIL SAMPLES WILL BE COLLECTED IN ACCORDANCE WITH TABLE 2 AND ANALYZED FOR TOTAL LEAD TO VERIFY THAT NO ADDITIONAL EXCAVATION OF LEAD-IMPACTED MATERIAL IS REQUIRED.
14) BASED ON CONFIRMATION SAMPLE RESULTS, ADDITIONAL SOIL EXCAVATION AND CONFIRMATION SAMPLE COLLECTION MAY BE REQUIRED.
15) WHEN BACKFILLING WITH LEAD-IMPACTED MATERIAL, CLEAN MATERIAL WILL BE USED FOR BACKFILLING IN THE VICINITY OF FUTURE UTILITIES TO MAINTAIN A ONE FOOT THICKNESS HORIZONTALLY AND VERTICALLY AS DESCRIBED ABOVE BETWEEN LEAD-IMPACTED MATERIAL AND THE LOCATIONS OF FUTURE BURIED UTILITIES AND BUILDING FOUNDATION ELEMENTS.
16) ANY EXCESS LEAD-IMPACTED MATERIAL THAT CANNOT BE CONSOLIDATED ONSITE IN ACCORDANCE WITH THE PROJECT DRAWINGS WILL BE REMOVED FROM THE SITE IN ACCORDANCE WITH THE CURRENT SGMP.
17) ANY REQUIRED TREATMENT OF LEAD-IMPACTED MATERIAL OR CLEAN SOIL THAT IS USED FOR BACKFILLING SO THAT THE LEAD-IMPACTED MATERIAL OR CLEAN SOIL WILL BE NON-EXPANSIVE WILL BE PERFORMED IN ACCORDANCE WITH GEOTECHNICAL ENGINEER REQUIREMENTS AND IN ACCORDANCE WITH GEOTECHNICAL REPORT REQUIREMENTS FOR NON-EXPANSIVE SOIL.
18) ENVIRONMENTAL CONSULTANT TO MARK EXCAVATION BOUNDARY LOCATIONS WITH WHITE PAINT. GENERAL CONTRACTOR TO VERIFY THE LOCATIONS WITH SURVEYING BEFORE THE BEGINNING OF CONCRETE SURFACE REMOVAL.

SITE CHARACTERIZATION NOTES

OTHER SITE CONTAMINANTS

1. TETRACHLOROETHENE (PCE) SOIL GAS CONCENTRATIONS AT THE SITE ARE SHOWN ON SHEET 8 IN DETAIL 1.
2. TRICHLOROETHENE (TCE) SOIL GAS CONCENTRATIONS AT THE SITE ARE SHOWN ON SHEET 8 IN DETAIL 2.
3. THE HIGHEST DETECTED PCE AND TCE SOIL GAS CONCENTRATIONS DETECTED TO DATE DO NOT EXCEED OSHA PERMISSIBLE EXPOSURE LIMITS.
4. AIR MONITORING FOR VOLATILE ORGANIC COMPOUNDS THAT INCLUDE PCE AND TCE WILL BE PERFORMED BY THE AIR MONITORING CONTRACTOR PROVIDED BY THE GENERAL CONTRACTOR DURING SITE EXCAVATION.

LEAD-IMPACTED MATERIALS

5) LEAD-IMPACTED MATERIAL THICKNESS AT THE SITE WILL BE EVALUATED AT PROPOSED LOCATIONS SHOWN ON SHEET 8 DETAIL 3.
6) SAMPLES WILL BE COLLECTED AT DEPTHS OF 0.5, 1.0, AND 1.5 FEET BELOW THE GROUND SURFACE BY CORING THROUGH THE CONCRETE SURFACE AND USING A SLIDE HAMMER OR GEOPROBE DIRECT PUSH MACROCORE BARREL SAMPLER TO COLLECT BASE ROCK AND SOIL SAMPLES TO THE TOTAL PROPOSED DEPTH OF EXPLORATION.
7) SAMPLES COLLECTED AT DEPTHS OF 0.5 AND 1.0 FEET BELOW THE GROUND SURFACE WILL BE ANALYZED FOR TOTAL LEAD AND PERCENT MOISTURE AT A STATE-ACCREDITED LABORATORY.
8) ALL OTHER SAMPLES WILL BE PLACED ON HOLD AT THE LABORATORY PENDING RECEIPT OF THE SAMPLE RESULTS.
9) ALL WORK WILL BE PERFORMED IN ACCORDANCE WITH PROCEDURES IN THE FOLLOWING ACDEH-APPROVED DOCUMENTS PREPARED BY P&D:
10) MARCH 23, 2018 LIMITED SUBSURFACE INVESTIGATION WORK PLAN.
11) JUNE 10, 2020 LIMITED SUBSURFACE INVESTIGATION WORK PLAN.
12) THE SAMPLE RESULTS WILL BE PROVIDED TO ACDEH FOR APPROVAL OF THE LEAD-IMPACTED MATERIAL EXCAVATION DEPTH AND LOCATIONS.

SOIL GAS WELLS

13) SOIL GAS WELLS ASSOCIATED WITH THE SITE ARE SHOWN ON SHEET 7.1 DETAIL 1.
14) SOIL GAS WELLS ASSOCIATED WITH PARCEL 1 WILL BE DESTROYED PRIOR TO DEMOLITION OF CONCRETE SURFACE COVER FOR PARCEL 1 IN ACCORDANCE WITH PROCEDURES IDENTIFIED IN A WORK PLAN APPROVED BY THE ACDEH.
15) SOIL GAS WELLS THAT ARE LOCATED ON PARCELS 2, 3 AND 4 THAT ARE NOT DESTROYED WILL BE PROTECTED FROM DAMAGE BY THE CONTRACTOR DURING SITE REMEDIATION AND BY THE GENERAL CONTRACTOR DURING SITE CONSTRUCTION.

Project Name: The Phoenix

February 06, 2020

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605

(916) 414-6600

Project Summary

Consultation Code:	08ESMF00-2020-SLI-0982
Event Code:	08ESMF00-2020-E-03133
Project Name:	The Phoenix
Project Type:	DEVELOPMENT
Project Description:	Development of two detached buildings on a vacant site. A four-story, 101-unit multifamily residential building will provide permanent, supportive housing and affordable housing for low-income households. A two-story community building will provide 7,503 square feet of gathering and office space to provide supportive housing services.

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/place/37.809857052520115N122.30322544794424W

Counties: Alameda, CA

Endangered Species Act Species

There is a total of 12 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

To: "patrick@baseline-env.com" <patrick@baseline-env.com>

Thank you for contacting Alameda County Department of Environmental Health (ACDEH) Certified Unified Program Agency (CUPA) for your Public Records Act Request.

We have no ACDEH CUPA records for the address(es) you requested.

Please note that ACDEH CUPA only has files for sites within its jurisdiction and some cities within Alameda County are not part of the ACDEH CUPA jurisdiction. In those cases we advise that you contact the Fire or Planning Department of that city for any records. **Please view our Jurisdiction List in this link:**
https://deh.acgov.org/hazmat-assets/docs/CUPA-jurisdictions.pdf

In addition, ACDEH has other divisions which may have records for the requested address(es). I have listed the divisions below and who to contact to acquire records if relevant.

- Solid/Medical Waste
  Contact: LaTresca Porter at latresca.porter@acgov.org

- Operations Division (retail food, recreation, and tattoo parlors)
  Contact: dehwebmain@acgov.org

- Vector Control Division
  Contact: Daniel Wilson at daniel.wilson@acgov.org

- Land and Water Division (Local Oversite Program (LOP) and Onsite Wastewater Treatment Systems)
  The links listed below may be helpful to gather information on LOP sites. The search on the geotracker link may be conducted by address or site name. If you cannot find documents you are searching for then please contact LOP directly.
  Contact: deh.loptoxic@acgov.org
  https://deh.acgov.org/landwater/index.page
  http://geotracker.waterboards.ca.gov/

Due to the COVID-19 pandemic, all requested files are provided electronically.
However, once the precautionary measures related to COVID-19 are lifted, our office may make files available by appointment for review on Thursdays and Fridays from 9:00 AM until 12:00 noon. We will keep our requestors aware of this situation as it progresses.

Please send all future requests to dehcupafilereview@acgov.org.

Please reach out to us if you have any further questions or clarifications.

Thank you,
Joel Dooha-Chambers

April 28, 2022

Julianne Polanco
Office of Historic Preservation
Department of Parks & Recreation
1725 23rd Street, Suite 100
Sacramento, CA 95816
calshpo.ohp@parks.ca.gov

Subject: Request For Section 106 Review: The Phoenix Mixed-Use Affordable Housing Project; 800 Pine Street or 800 Cedar (south half of city block bounded by 9th, Pine, and Shorey Street); Oakland, Alameda County, California; Assessor Parcel Number 006 004700101

Dear Ms. Polanco:

The City of Oakland (City) and the East Bay Asian Local Development Corporation (EBALDC) are proposing to use funding from the U.S. Department of Housing and Urban Development (HUD) for the purposes of providing affordable housing. HUD requires the City to satisfy federal environmental review under the National Environmental Policy Act (NEPA) and the National Historic Preservation Act (NHPA) and all related federal statutes, including 24 CFR Part 58, HUD's Environmental Review Regulations, prior to use of its program funds.

Enclosed are materials to identify and evaluate historic properties and cultural resources within the Area of Potential Effect of this undertaking, pursuant to Section 106 of the Historic Preservation Act and its implementing regulations at 36 CFR Part 800. On behalf of William Gilchrist, Agency Official for this project, I request your views regarding the effect of the project upon historic properties and cultural resources. Horizon Water and Environment, LLC and Baseline LLC have been engaged to prepare the federal environmental review under NEPA and 24 CFR Part 58, HUD Environmental Review Regulations.

Upon reviewing the attached Cultural Resources Assessment Report, I concur with the description of the undertaking and the Area of Potential Effects. The undertaking may result in disturbance and removal of subsurface deposits of potentially important cultural resources and/or Tribal cultural resources during construction, which the City proposes to mitigate with Conditions of Approval that include archaeological monitoring, data recovery and post-discovery review protocols.

Please contact me if you have any questions or need additional information. I can be reached at (510) 238-3659 or hklein@oaklandca.gov.

Thank you,

Heather Klein Planner IV, for
William Gilchrist, Agency Official

Limitations

This report contains confidential cultural resources location information; report distribution should be restricted to those with a need to know. Cultural resources are non-renewable, and their scientific, cultural, and aesthetic values can be significantly impaired by disturbance. To deter vandalism, artifact hunting, and other activities that can damage cultural resources, the locations of cultural resources should be kept confidential. The legal authority to restrict cultural resources information is in California Government Code 6254.1 and the National Historic Preservation Act of 1966, as amended, Section 304.

Executive Summary

The City of Oakland (City) and the East Bay Asian Local Development Corporation (EBALDC) are proposing to develop The Phoenix affordable housing project (project or proposed project), a mixed-use affordable and supportive housing project at the northwest corner of Pine Street and Shorey/8th Street in Oakland, California. The project is part of a larger master-plan development on the 4.65-acre site bound by 9th/Pine/Shorey streets, and the frontage road to Interstate 880 (I-880). The proposed project will consist of 101 affordable apartments and a community building and is Phase 1 of the master-plan development.

The project will be partially funded by the U.S. Department of Housing and Urban Development (HUD); therefore, the Project must comply with the implementing regulations of Title 54 United States Code (USC) Section 306108, commonly known as Section 106 of the National Historic Preservation Act (NHPA) (Section 106), and its implementing regulations under 36 Code of Federal Regulations (CFR) 800, as amended. The project must also comply with the California Environmental Quality Act (CEQA). A cultural resources study for the project was begun in early 2020 by Tom Origer & Associates (Origer). Origer conducted a records search for the project area at the Northwest Information Center (NWIC) of the California Historical Resources Information System (CHRIS) at Sonoma State University and a pedestrian survey of the project site before the project was suspended. Origer was not available to complete the work, once the project was reactivated in the fall of 2021, and Horizon Water and Environment (Horizon) was retained by Baseline Environmental Consultants to prepare this Cultural Resources Assessment Report. Record search materials and the results of the survey, as well as photographs of the project area, were graciously provided by Origer to complete this effort.

The project is immediately adjacent to the western border of the Oakland Point Historic District, which according to the Built Environment Resources Directory (BERD) maintained by the California Office of Historic Preservation, was formally determined eligible for the National Register of Historic Places (NRHP) in 1990. Eleven properties containing historic-era buildings are located both within the boundaries of the Oakland Point Historic District and within the architectural area of potential effects (APE) defined by the City for the Phoenix project. Nine of these historic-era buildings were contributors to the district and two were found ineligible as district contributors as of 1990 (according to the BERD). The current study recommends that one of the contributing residences has been significantly altered such that it no longer retains its historic integrity. Five properties in the Oakland Point Historic District and the APE have residences that are not of sufficient age (50 years) to be considered historic properties. Six parcels within the Oakland Point Historic District and the APE are vacant.

An additional seven parcels are located within the APE for visual effects (i.e., adjacent to the project area) but outside the historic district; four are vacant. There are a total of seven historic-era buildings located on the three properties within the APE and outside the historic district. These properties were evaluated for NRHP eligibility under the current study and one, a commercial building at 1791 8th Street, is recommended eligible for listing.

The Phoenix housing project will not directly impact any of the historical resources in the Oakland Point Historic District or the building at 1791 8th Street; however, it will be visible from each of the parcels and would change the viewscape. That being said, the proposed project is a residential building which is compatible with the mixed use (residential, industrial, and commercial) of the Oakland Point Historic District and its surroundings. Furthermore, the size of the proposed buildings is in scale with industrial buildings historically located on the project site, and the design will be compatible with the historic neighborhood. Therefore, there would be no adverse effect to built environment historic properties pursuant to 36 CFR 800.4(d)(1) as the result of project implementation.

No archaeological resources were identified at the project site, other than the concrete slab remaining after demolition of the Independent Iron Works/Phoenix building: the slab was not recorded on a Department of Parks and Recreation (DPR) form 523. Research indicates that a residence and ancillary building existed on the subject parcel by 1889. By 1931, these were replaced by the iron works foundry, which operated until 1989 when the Loma Prieta earthquake occurred. As a result, there is a potential for discovering late 19th century archaeological remains during demolition of the concrete slab and construction of the Phoenix facility. Research also indicates that the potential for discovery of tribal resources is low based on the site's location near the historic margins of San Francisco Bay and now overlain by artificial fill as well as the geology (sand dunes) which would likely not have supported substantial human activity. However, Native American outreach to local tribes indicated that the project site may be located near a potentially significant pre-Contact site; therefore, there is also the possibility of encountering ancestral Native American materials during project construction.

1 Introduction

1.1 Location and Setting

The project site is located at 801 Pine Street in southwest Oakland, Alameda County, California (**Figure 1**), as depicted on the Oakland West 7.5' U.S. Geological Survey (USGS) topographic map (**Figure 2**). The project is in the Prescott neighborhood, at the west edge of residential Oakland (City of Oakland 2014a, 2014b). I-880 is directly west, and west of the freeway is the Port of Oakland and the San Francisco Bay. The area is characterized by residences that date back to the 1800s, along with some historic-era commercial and industrial buildings and contemporary residential infill. The houses across from the project parcel along the east side of Pine Street and at its intersection with 9th Street are within the Oakland Point Historic District and the APE. (The historic district extends beyond the project APE to the east and north.) A property featuring several historic-era industrial buildings is across the street from the subject parcel to its north; there is a historic-era church across the street from the subject parcel to its south and a historic-era commercial building to the southeast. These three historic-era properties are outside the boundaries of the historic district.

The project site consists of 0.9 acres which is the south half of a larger 4.65-acre site (APN 006-0047-001-00 and APN 006-0047-002-00) that comprises the city block bounded by 9th, Pine, and Shorey (the west extension of 8th Street) streets on the north, east, and south, respectively; the frontage road (once the location of Cedar Street) to I-880 marks the west side of the block. The parcel is flat and sits at an elevation of 10 feet above sea level. The block was once occupied by a large factory/warehouse that was demolished to accommodate construction of I-880 in the 1990s (see Section 2.3, Historic Era Context, for a history of the project area). Today, the block is covered with decomposing concrete (**Figure 3**). Vegetation is sparse and limited to grasses and forbs that have pushed through cracks in the concrete, along with a few trees at the edge of the parcel.

1.2 Project Description and Area of Potential Effects

1.2.1 Project Description

The proposed project will construct a four-story, 101-unit residential building and a two-story community building (**Figure 4**). The project is part of a larger master-plan development that will consist of a total of 316 apartments and 12,000 square feet of ground floor retail and commercial maker space on the 4.65-acre site bound by 9th/Pine/Shorey streets, and the frontage road to I-880. The proposed project will consist of 101 affordable apartments and a community building and is Phase 1 of the master-plan development. There will be a shared access fire lane for the master plan along the west side of the subject property, but the proposed project will only be responsible for construction and maintenance of the portion of the lane that sits on the subject parcel, and all the required fire access needed by the subject property will sit on the subject parcel. For these reasons, the current proposed project is not dependent on future phases and their associated improvements.

Figure 3. Project Site View to North from Shorey Street (courtesy of Tom Origer & Associates 2020)

Figure 4. Perspective from Pine Street and Shorey Street Intersection (Lowney Architecture 2018)

The L-shaped residential building will be wood frame and factory built. Its west leg will be four stories and its north leg three stories. Exterior materials will include board-form concrete at the foundation as well as wood composite veneer, stucco, and fiber cement panels. Fenestration will consist of vertically oriented rectangular openings of varying widths. approximately half of the units will be permanent supportive housing. Supportive housing combines permanent, independent rental apartments with services that help people who formerly experienced homelessness live more stable, productive lives. The balance of the residential units will be reserved for low-income households, with incomes no greater than 60 percent of the area median income. Each apartment will have its own bathroom and kitchen area. The unit mix will be 82 studios, three one-bedroom units, and 16 two-bedroom units. Lobby space and trash facilities will be located on each floor.

The approximately 7,503-square-foot community building will be L-shaped and two stories. Exterior materials will include stucco, and fiber cement panels. Horizontal wood composite cladding will be utilized around the corner entrance facing the intersection of Pine and Shorey streets. Fenestration will consist of large vertically oriented rectangular openings. The community building will provide meeting space and office space for the case workers, property managers, and security guards who support the health of the residents. The community building will also include laundry facilities, mailboxes, and a bike room with 75 long-term bicycle parking spaces for residents. The residential and community building will surround a 3,582-square-foot courtyard that will serve as outdoor common space for the buildings' residents. An access road will be developed along the western boundary of the property; it will provide a fire lane along with 21 surface parking spaces on either side. The project will provide several on-street vehicle parking spaces along Shorey Street near the south elevations of the buildings. Concrete curbing and gutters will also be developed.

Design plans and visual simulations for the project are provided in **Appendix A**.

1.2.2 Area of Potential Effects

The area of potential effects (APE) (**Figure 5**) for the proposed project consists of the entire block that contains the project site on its south half, and the first row of adjacent buildings to the north, east, and south; there are no buildings to the west.

The archaeological APE is limited to the south half of parcel APN 006-0047-001-00, which is the block bounded by 9th/Pine/Shorey streets, and the frontage road to I-880 as well as Shorey Street. The vertical archeological APE is 10 feet below the ground surface to accommodate utility installations/connections, and 56 feet above the ground surface to reflect the highest point of the new facilities.

The individual parcels surrounding the project site constitute the architectural APE. There are 29 parcels within the indirect architectural APE (**Figure 6**); of these, 19 contain at least one building and one contains a structure, while the balance (nine parcels) are vacant lots. Potential adverse effects pursuant to Section 106 primarily pertain to potential visual effects on historic properties within the APE by construction of the new facility.

1.3 Federal Policies and Regulations

1.3.1 National Environmental Policy Act, 42 U.S.C. Sections 4321–4347, 40 C.F.R. Part 1508.27

NEPA, as amended, establishes the federal policy for assessing effects on important historic, cultural, and natural aspects of our national heritage during federal project planning. All federal or federally assisted projects requiring action pursuant to Section 102 of NEPA must take into account the effects on cultural resources. According to the NEPA regulations, in considering whether an action may "significantly affect the quality of the human environment," an agency must consider, among other things, unique characteristics of the geographic area such as proximity to historic or cultural resources (40 C.F.R. § 1508.27(b)(3)) and the degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places (NRHP).

The NEPA regulations also require that, to the fullest extent possible, agencies prepare draft environmental impact statements concurrently with and integrated with environmental impact analyses and related surveys and studies required by the National Historic Preservation Act (NHPA). When Section 106 of the NHPA and NEPA are integrated, project impacts that cause adverse effects under Section 106 are usually considered to be significant under NEPA.

1.3.2 Section 106 of the National Historic Preservation Act

Section 106 of the NHPA requires federal agencies to consider the effects of their actions on historic properties (54 U.S.C. 306108). The Section 106 review process typically consists of the following major steps by federal agencies, all of which occur in consultation with the State Historic Preservation Officer (SHPO), Native American Tribes, and other consulting parties.

1. Initiate Section 106 process by defining the federal undertaking and establishing a plan for consultation.

2. Identify the area of potential effect (APE).

3. Identify historic properties within the limits of the APE.

4. Assess the effects of the undertaking by applying the criteria for adverse effects.

5. Resolve adverse effects.

The Section 106 regulations define an adverse effect as an effect that alters, directly or indirectly, the qualities that make a resource eligible for listing on the NRHP (36 C.F.R. § 800.5[a][1]).

Consideration must be given to the property's location, design, setting, materials, workmanship, feeling, and association, to the extent that these qualities contribute to the integrity and significance of the resource. Adverse effects may be direct and reasonably foreseeable or may be more remote in time or distance (36 C.F.R. § 800.5[a][1]).

1.3.3 National Register of Historic Places

The NRHP is a federal registration program that was established in the NHPA and is administered by the National Parks Service. Historic properties are districts, sites, buildings, structures, and/or objects that are listed in or eligible for listing in the NRHP (36 C.F.R. §800.16[l][1]). A property may be listed in the NRHP if it meets the criteria for significance and integrity described in the NRHP regulations (36 C.F.R. § 60.4).

Historic properties possess integrity of location, design, setting, materials, workmanship, feeling, and association that conveys historical significance found under one or more of the following significance criteria:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess artistic value, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.

2 Project Context

2.1 Pre-Contact Context

The pre-contact (or prehistoric) era of the project area reflects information known about the indigenous population from the time the region was first populated with humans until the arrival of the first Europeans, who visited and recorded their journeys through the written record. The pre-contact record is derived from over a century of archaeological research, and while much has been gleaned from these studies, large gaps in the data record remain. The following pre-contact culture sequence, derived from Milliken et al. (2010:114-118), briefly outlines the prehistory of the San Francisco Bay region.

The Early Holocene (Lower Archaic; 8000 to 3500 B.C.) is considered a time when populations continued to be very mobile as they practiced a foraging subsistence pattern around the region. Artifacts that characterize this period include the milling slab and handstone to process seeds, as well as large wide-stemmed and leaf-shaped projectile points.

The Early Period (Middle Archaic; 3500 to 500 B.C.) is marked by the appearance of cut shell beads in the archaeological record, as well as the presence of the mortar and pestle for processing acorns. House floors with postholes indicate substantial living structures, which suggests a move toward establishing a more sedentary lifestyle and an increasing population.

The Middle Period, which includes the Lower Middle Period (Initial Upper Archaic; 500 B.C. to A.D. 430) and Upper Middle Period (Late Upper Archaic; A.D. 430 to 1050), appears to be a time when geographic mobility may have continued, although groups began to establish longer-term base camps in localities from which a more diverse range of resources could be exploited. The first rich black middens are recorded from this period. The addition of milling tools, obsidian and chert concave-base projectile points, and the occurrence of sites in a wider range of environments suggest that the economic base was more diverse. By the Upper Middle Period, mobility was being replaced by the development of numerous small villages. Around A.D. 430 a “dramatic cultural disruption” occurred, as evidenced by the sudden collapse of the Olivella saucer bead trade network.

The Initial Late Period (Lower Emergent; A.D. 1050 to 1550) reflects a social complexity that had developed toward lifeways of large, central villages with resident political leaders and specialized activity sites. Artifacts associated with the period include the bow and arrow, small corner-notched projectile points, and a diversity of beads and ornaments.

The Terminal Late Period (Upper Emergent; A.D. 1550 to circa 1750) generally represents the indigenous cultures that were encountered by the Spanish when they first arrived in San Francisco Bay.

2.2 Ethnohistoric Context

The population indigenous to the project area spoke a language referred to as Costonoan, a derivative from a Spanish term for “coast people.” Costonoan, which consisted of six known languages and various dialects within those languages, was spoken over a broad territory that included all of the San Francisco Peninsula and all lands along the east and south of San Francisco Bay, and that extended south to include Monterey Bay, Salinas Valley, and the area around Hollister. Those residing in the project area likely spoke the Chochenyo dialect of San Francisco Bay Costonoan (Milliken et al. 2009:33-35).

The Costonoan peoples, who are referred to as the Ohlone, Mutsun, or Rumsen, depending on geography, were not a united cultural or political entity (Milliken et al. 2009:2-4). Rather, there were strong differences, not only in language but also in culture, between the San Francisco and Monterey bay occupants, and political affinity was based on the tribelet, which comprised one or more villages within a specific geographic territory (Levy 1978:487).

Tribelet territory had a range of 10 to 12 miles in diameter and contained a population that consisted of 200 to 400 people living among four or five villages (Milliken et al. 2010:99). Those living in the project area resided in large villages along permanent streams in locations that allowed access to the diverse resources found in the tidal marshlands, the valley floor, and the hills. (Milliken et al. 2010:106; Moratto 2004:225).

The Ohlone group associated with the project area are the Huchiuns, who occupied all of the lands bordering San Francisco Bay from Oakland north to Richmond and the Carquinez Strait (Milliken et al. 2009:40). Records indicate that they were closely tied to the Yelamu tribe, who lived across the bay on the northern San Francisco Peninsula, with whom they shared the Chochenyo language dialect, intermarried, and traded. No Huchiun villages are known within proximity to the project site.

The Huchiuns were among the first in the region to feel the impact created by the arrival of the Spanish. Mission Dolores was founded in San Francisco in 1777, and Mission Santa Clara, in the town of Santa Clara, was established just seven months later. This was followed by the pueblo at San Jose (El Pueblo San Jose de Guadalupe) shortly thereafter (Kyle et al. 2002:423-424). Members of the Huchiuns were quickly conscripted into Mission Dolores, and by 1794 the tribe had the largest population of any local tribe there. The following year, they rebelled, along with their Saclan neighbors who lived around Mount Diablo, and many returned to the East Bay. Mission San Jose, in present-day Fremont, was established in 1797 in response to the rebellion. Most of the Huchiun population appears to have been returned to Mission Dolores or other nearby missions over the next two decades.

Today the Ohlone reside throughout the region and strive to maintain their cultural traditions.

2.3 Historic-Era Context

Northern Alameda County was part of Rancho San Antonio, a vast tract of land granted to the Peralta family (who lived in San José) in 1820. Like other Mexican land grant recipients, the Peraltas had difficulty holding onto their land after California entered the United States in 1850. When the Gold Rush brought large numbers of Americans to California in 1849, the East Bay became an important transit station for passengers and cargo. American hunters and fortune-seekers began camping in the area that would become Oakland. Horace Carpentier was one of these squatters, and after obtaining a lease from the Peralta family incorporated Oakland in 1852. Carpentier received an extremely valuable grant for the use of most of its waterfront at the first meeting of the city trustees (PGAdesign Inc. and Page & Turnbull 2006; Wood 1883).

Oakland Point is notable for its position as the closest East Bay land location to San Francisco. In the 1850s, the area was occupied by small farm plots and cut off from the rest of the city by a large marsh, with more marshes to the north and south. These marshes were initially used as dumps and sewage outlets before their development for industrial uses in the 20th century. In the 1860s, Rodmond

Gibbons and partners developed the Bay Street Wharf and the San Francisco and Oakland Railroad at the Point. The railroad included a commuter line that met the ferry at the wharf. Railroad service began in 1862-63 and was expanded to the east in 1864 and the west in 1868. In 1869 the Central Pacific Railroad connected Oakland Point to the transcontinental railroad. Former mayor Horace Carpentier formed a partnership with the Central Pacific Railroad in 1869. He subsequently deeded most of the waterfront to the Central Pacific Railroad, allowing Oakland to become the western terminus of the railroad, with transcontinental shipping passing through, but preventing other development in the area. The railroad tracks and pier system were expanded in 1870, 1871, and 1879–1881; at one point, the piers extended 2 miles into the Bay to reach deep water (City of Oakland 1990; Minor 2000).

Railroad development in the area led to rapid residential and commercial growth in the 1870s. Two large-scale developers, John Winfield Pearson and John Ziegenbein, built many houses in Oakland Point over the 1870s-1890s. The neighborhood was largely built out by the end of the century; 70 percent of buildings extant in the historic district in 1990 were built before 1889. Large numbers of Oakland Point residents were railroad employees through the 1930s; until the 1920s, railroad workers were required to live west of Adeline Street near their jobs. The Pullman Palace Car Company, which employed exclusively Black porters, arrived in 1869, giving rise to the beginnings of Oakland's large and early Black population. The Pullman Company employed around 30 percent of the local Black population as late as 1929. Many Oakland Point residents of this era were lodgers and moved frequently, especially those who worked for the railroad. The Point was also a convenient residential area for San Francisco commuters. Early Oakland Point included a notably large population of working women; an 1880–1881 city directory reported at least 15 businesses owned by women. Oakland Point during the 19th century was dominated by Americans who had moved to Oakland from northern states and immigrants from northwestern Europe, with small but visible Black and Chinese communities. By 1900, there were significant Irish, British, German, and Scandinavian populations as well as over 1,000 Black residents (nearly 20 times the 1870 Black population). The early 20th century saw large increases in the Italian and Slavic populations. The surrounding city grew significantly at this time; Oakland's population doubled between 1900 and 1910 as a result of the 1906 San Francisco earthquake. The Point's Black population also continued to grow and included homeowners and business owners. The Pacific Coast Real Estate and Employment Company was established in 1907 to serve this growing community. The Oakland and East Bay Negro Business League, the first organization of its kind in the region, was formed in 1919. Oakland Point was known in the 1920s and 1930s for its Black music venues and nightclubs; touring performers were barred from most hotels and generally lodged with local residents. Oakland Point was highly praised by residents in the first decades of the 20th century for its racial diversity (Allen 2005; City of Oakland 1990).

By 1910, the Western Pacific Railroad had broken the Southern Pacific Railroad (successor to the Central Pacific Railroad) monopoly in court. This action allowed the Western Pacific to construct its own pier to the south of the existing pier and begin its own service as the main freight and passenger route from the Bay Area to Northeastern California. Oakland Point's hold as the geographic center of the railroad industry was diluted by the Southern Pacific Railroad's conversion of local passenger service from steam to electric, which required more widely-scattered headquarters. There were several electrical power stations in the region, and lineman had to maintain long overhead power lines, so electrical service maintenance was dispersed rather than concentrated in the rail yards. The Southern Pacific Railroad built a car shop in Alameda, and the Oakland Point area began to open to other kinds of development; by the 1910s; most new construction in Oakland Point was for industrial properties located around the edges of the neighborhood's residential center. This included the establishment of shipyards and shipping terminals, which expanded significantly during World

War I. Oakland became one of the foremost shipbuilding centers in the nation; in 1920, their peak year, Oakland shipyards reportedly employed more men than every other industry combined. Oakland Point continued to develop local businesses in the 1910s and 1920s, especially along 7th Street (Railroad Avenue) including neighborhood-serving ventures like grocery stores and gas stations. Business owners tended to live in the neighborhood, and Oakland Point was noted locally for residents' ability to meet all their needs without leaving the Point. The influence of the railyards declined in the 1920s as trucking began to compete with rail freight and ferry service became an increasingly significant part of the Southern Pacific Railroad's business. Passenger service declined as well with the opening of the Bay Bridge between Oakland and San Francisco in 1936, and local service stopped in 1941 (City of Oakland 1990).

The City of Oakland was zoned in the 1930s, by which time it was one of the largest cities in California. Oakland Point was zoned industrial (a designation retained until 1974). By the 1930s, houses in the Point were considered deteriorated, and new residential redevelopment began in 1939 with the construction of two large Federally funded housing projects, Campbell Village and Peralta Villa. These housing projects were controversial among Oakland Point residents, many of whom regarded them as an insidious attempt at racial segregation. Objectors pointed out that the locations chosen for the projects had large numbers of Black residents, while whiter blocks in worse condition were allowed to remain. The 1939 studies that justified the projects explicitly mapped "non-white families" alongside factors like disease and substandard housing. At least half of the displaced residents were homeowners with limited options to buy elsewhere, and attempts to force the projects to integrate were only moderately successful. During World War II, Oakland shipyards sent recruiters to the south and more than 50,000 Black people moved to the East Bay. High demand for housing led to further rapid residential redevelopment as single-family houses were divided into multiple units and commercial buildings were converted to housing. Many houses in Oakland Point had basement units added in the 1940s. Moore Shipyards built its own housing project in 1942 to accommodate wartime employees, and there were several other temporary dormitories for wartime workers in industrial neighborhoods around the city (Allen 2005; City of Oakland 1990).

Historically an integrated area, Black residents became a larger percentage of the population in West Oakland as southerners moving to the Bay Area for defense work displaced Black communities in East Oakland, Richmond, and other cities across the region. Oakland Point's Black population reached a majority of around 80 percent in 1950 and remained about the same until at least the 1980s. The Oakland City Council designated West Oakland as "blighted" in 1949, leading to additional demolitions that decreased its population. Redevelopment projects of the ensuing decades continued to target West Oakland's Black population. In the 1950s, Cypress Freeway construction cut through the neighborhood and isolated it from the rest of the city. Five hundred homes were demolished for the US Postal Distribution Center in 1960, and much of the neighborhood's commercial core on 7th Street (which has been home to a lively cultural scene) was destroyed in 1970 to make way for the Bay Area Rapid Transit station. By the end of the 1960–1970 era of urban renewal, more than 800 businesses had closed, 2,500 houses had been demolished, and almost 5,000 households had been pushed out (Bindman 2020; City of Oakland 1990).

Redevelopment was a devastating blow to a community that had been hit hard by the shrinking railroad industry and loss of industrial jobs in the decades following the end of World War II. Redlining meant that West Oakland homeowners were excluded from federally insured mortgages. Of the 137 groceries serving in West Oakland in 1960, just 22 remained by 1980, and many of these businesses had been replaced by liquor stores. Social problems followed disinvestment and redevelopment. Oakland, and particularly West Oakland, was hit hard by the drug epidemics of the 1970s and 1980s, with drugs sold openly on many corners and violence following the drug trade. The large office buildings, hotels, and convention center facilities that brought economic revitalization to downtown Oakland during this era did not bring similar benefits to West Oakland (Lindsey 1984; Schwarzer 2021).

The Loma Prieta earthquake in 1989 destroyed a number of historic buildings in Oakland Point, and the Cypress Freeway collapsed, killing 42 people. Oakland Point and South Prescott residents organized and successfully pushed Caltrans to re-route I-880 around the neighborhood, turning the space previously used by the freeway into a greenway called the Mandela Parkway. Gentrification due to the Bay Area's tech economy began to affect Oakland in the 1990s and escalated after 2000. An eviction crisis led to unprecedented levels of homelessness in the city, and the Black population has consistently declined in numbers for decades. By 2010, Oakland's Black population was smaller than the white population for the first time since 1970, and by 2020 only about one out of four households in West Oakland was Black (City of Oakland 2014a; Connect Oakland 2015; Jackson 1998; Rowen 2021).

3 Native American Consultation and Archival Research

In accordance with the Secretary of the Interior's Standards and the Guidelines for Archaeology and Historic Preservation (Title 48 CFR Section 44716 [amended 1983]), the goals of this cultural resources assessment were to identify and completely document the location, qualities, and condition of any potential historic properties in the project's APE. Methods employed to achieve these goals follow.

3.1 Native American Consultation

An email request was made to the Native American Heritage Commission (NAHC) on November 19, 2021, to review its files for the presence of recorded sacred sites on the project site. The NAHC responded on February 14, 2022. Their letter noted that the sacred lands file search was positive, indicating that significant Native American resources are located near the project site. The NAHC also recommended contacting the Amah Mutsun Tribal Band of Mission San Juan Bautista and the North Valley Yokuts Tribe for additional information.

The City contacted the Amah Mutsun Tribal Band of Mission San Juan Bautista and the North Valley Yokuts Tribe, as well as 11 additional tribes on January 27, 2022, via U.S mail with a return receipt, as well as by email. Letters were also sent to additional contacts for the Indian Canyon Mutsun Band of Costanoan, Muwekma Ohlone Indian Tribe of the SF Bay Area, North Valley Yokuts Tribe on February 17, 2022, as the result of the NAHC response letter. **Table 1** lists those contacted and summarizes the results of the outreach.

Table 1. Native American Consultation (results as of February 3, 2022)

Organization/Tribe	Name of Contact	Letter Date	Response	Comments
Amah Mutsun Tribal Band of Mission San Juan Bautista	Irene Zwierlein, Chairperson	01/27/2022	No formal response to date	
Costanoan Rumsen Carmel Tribe	Tony Cerda, Chairperson	01/27/2022	No formal response to date	
Guidiville Indian Rancheria	Donald Duncan, Chairperson	01/27/2022	No formal response to date	
Indian Canyon Mutsun Band of Costanoan	Ann Marie Sayers, Chairperson	01/27/2022	No formal response to date	

Organization/Tribe	Name of Contact	Letter Date	Response	Comments
Muwekma Ohlone Indian Tribe of the San Francisco Bay Area	Charlene Nijmeh, Chairperson	01/27/2022	No formal response to date	
North Valley Yokuts Tribe	Katherine Erolinda Perez, Chairperson	01/27/2022	No formal response to date	
Rumsen Am:a Tur:ataj Ohlone	Dee Dee Manzanares Ybarra, Chairperson	01/27/2022	No formal response to date	
Tamien Nation	Quirina Luna Geary, Chairperson	01/27/2022	Email response on February 1, 2022	Deferred to Corrina Gould and Andrew Galvin
The Confederated Villages of Lisjan	Corrina Gould, Chairperson	01/27/2022	Email response on January 31, 2022	Requested results of NAHC sacred lands search and a copy of the cultural resources report. A response was sent on behalf of the City on the same day, noting that the NAHC had not responded, and that the cultural report would be made available when it was completed. Noted the project is near a potentially significant site in a subsequent email on 02/09/2022. Additional project locational information was provided via email on the same day.
Ohlone Indian Tribe	Andrew Galvin	01/27/2022	No formal response to date	
Tule River Indian Tribe	Neil Peyron, Chairperson	01/27/2022	No formal response to date	

Organization/Tribe	Name of Contact	Letter Date	Response	Comments
Wilton Rancheria	Jesus G. Tarango Jr., Chairperson	01/27/2022	No formal response to date	
Wuksache Indian Tribe/Eshom Valley Band	Kenneth Woodrow, Chairperson	01/27/2022	No formal response to date	
Indian Canyon Mutsun Band of Costanoan	Kanyon Sayers-Roods, MLD* Contact	02/17/2022	Email response on March 17, 2022	Noted the project is near a potentially significant site. interest in consulting, recommending construction monitoring, sensitivity training, and acknowledgement of the Ohlone ancestry in some manner (such as a plaque) at the new facility
Muwekma Ohlone Indian Tribe of the San Francisco Bay Area	Monica Arellano, Vice Chairwoman	02/17/2022	No formal response to date	
North Valley Yokuts Tribe	Timothy Perez, MLD Contact	02/17/2022	No formal response to date	

*MLD = Most Likely Descendent

Chairperson Corrina Gould, Chairperson of the Confederated Villages of Lisjan, and Kanyon Sayers-Roods, representing the Indian Canyon Mutsun Band of Costanoan, both indicated that project site may be very near an important Native American resource. This information was forwarded to the project proponent. All correspondence with the NAHC and Native American tribes, is provided in **Appendix B**..

3.2 Archival Research and Results

A record search was conducted by Origer at the NWIC on May 1, 2020 (NWIC File No. 19-1765) (see **Appendix C**). The purpose of the record search was to determine whether any portions of the project area had been previously surveyed for cultural resources and to identify the presence of any previously recorded cultural resources within the project study area, as well as within a 0.25-mile buffer. According to the record search results, four previous studies have been conducted within or partially within the current project study area. Another 14 studies have been conducted within the 0.25-mile search radius. Studies identified by the record search in the project area are listed in

Table 2. Other sources of information reviewed included, but were not limited to, the current listings of properties on the National Register of Historic Places, California Historical Landmarks, California Register of Historical Resources, California Points of Historical Interest as listed in the Office of Historic Preservation's (OHP's) Historic Property Directory, and the Built Environment Resource Directory for Alameda County available at the OHP website.

Table 2. Previous Studies within the Project Study Area

Report Number	Author(s)	Year	Title
Studies within the Project Study Area			
S-012289	Garaventa, D. M., M. R. Fong, S. A. Jarvis, and A. M. Banet	1990	Archaeological Survey Report I-880/Cypress Replacement Project, 04-ALA-880 P.M. 32.4/34.3, Cities of Oakland and Emeryville, Alameda County, California
S-025526	Busby, C. I., M. E. Tannam, and D. M. Garaventa; and M. R. Corbett and W. C. Minor	1997	Historic Property Survey Report/Finding of Effect 50-Foot Channel Navigation Improvements Project, Oakland Harbor, Alameda County

S-046249	Praetzellis, M., and A. Praetzellis	2004	Putting the "There" There: Historical Archaeologies of West Oakland; I-880 Cypress Freeway Replacement Project

Sources: NWIC File No. 19-1765

The record search did not identify any previously recorded Native American or historic era archaeological sites within the project study area or record search buffer.

The archival research also revealed that the western edge of the Oakland Point Historic District is within the project APE. The district was formally determined eligible to the NRHP by the California SHPO on October 5, 1990. It is a residential district that covers about 47 city blocks in West Oakland. As of 1990, as documented by the Oakland Cultural Heritage Survey, the district included 845 properties, of which about 750 were wood-frame residential buildings erected before 1919, most between the 1870s and the 1890s (within the 1866–1910 period of significance). It exhibits Italianate, Stick, Queen Anne, Shingle, Craftsman, and Gothic Revival architecture as well as 19th-century vernacular residences. Its character-defining features include:

- Wood-frame residential construction
- Suburban-style building placement with relatively uniform front setback, back yards, and minimal side yards on predominantly 25' x 100' lots

- One- to two-story massing, usually with first floor above a raised basement
- Steeply-pitched hipped and gabled roof forms and some false-fronts
- Modest size and rectangular or stepped-back plan
- Partial-width front porches
- Cladding and ornamental features executed in wood
- Predominantly residential, with some commercial and industrial uses

The BERD shows the Oakland Point Historic District with a resource status code of 2S2, individually determined eligible for the NRHP by consensus through Section 106 process. As such, it is automatically listed in the CRHR, as are its individual contributing buildings with status codes of 2D2. Additional historical information on the Oakland Point Historic District is provided in Section 2.3 and in Appendix C. Sixteen of the 19 parcels that contain buildings in the project APE are within the Oakland Point Historic District boundaries; nine of these residences are contributors to the district and two are non-contributors according to the BERD. The Oakland Point Historic District properties within the APE are discussed in Section 4.2.

Three parcels in the APE that are outside the boundaries of the Oakland Point Historic District have historic-era buildings. These parcels contain a total of seven extant buildings. Buildings on two of the parcels (**#s 1 and 19 in Figure 6**) were recorded as part of the City's historic resources inventory in 1990 (See **Appendix D**). The historic-era building on the third parcel has not been previously evaluated.

The building at 918 Cedar Street (#1 in Figure 6,), which has since been demolished, was one of numerous buildings on the parcel. It was a brick building constructed by Standard Oil in 1889. The City evaluated the building as eligible for listing in the NRHP under Criteria A (history) and C (architecture) as "a rich artifact that has associations with known events, a rare surviving example of an important regional building type, and one that might yield important information about construction technology under further investigation" (OCHS 1990a).

The building at 1791 8th Street (**Figure 6, # 19**) was originally a two-story wood-framed structure in 1907 for the Oakland Athletic Club, but was significantly remodeled into a streamlined moderne office building in the 1940s. The 1990 OCHS evaluation determined that the building as remodeled was not eligible for the NRHP because it was then not yet 50 years old and did not appear to be of "exceptional importance" (OCHS 1990b).

In addition to the NWIC record search both Origer and Horizon conducted a review of historical maps and atlases. This research found that the project parcel was once occupied by residential buildings in the late 1800s, followed by industrial buildings by the 1930s.

3.3 Geoarchaeological Research

Information regarding the potential for the project site to contain buried archaeological resources was also researched by Origer and Horizon. A model for predicting a location's sensitivity for buried Native American archaeological sites was formulated by Byrd et al. (2017) based on the age of the landform, slope, and proximity to water. A location is considered to have the highest sensitivity if the landform dates to the Holocene[1] , has a slope of five percent or less, is within 150 meters (500 feet) of fresh water, and 150 meters (500 feet) of a confluence. A basic premise of the model is that Native American archaeological deposits will not be buried within landforms that predate human colonization of the area. Calculating these factors using the buried site model (Byrd et al. 2017: Tables 11 and 12), a location's sensitivity was scored on a scale of 1–10 and classed as follows: lowest (<1); low (1-3); moderate (3-5.5); high (5.5-7.5); highest (>7.5).

Based on landform age and the other factors described above, Byrd et al. (2017) determined that the sensitivity for buried sites at the location of the project area is considered low. Moreover, a review of Witter et al. (2006), a quaternary geology review of the Bay Area—from which the Byrd et al. (2017) analysis is partially derived—indicates that the project area is underlain by the Latest Pleistocene (20,000 years ago to 11, 700 years ago) to Holocene dune sand. This suggests that the location is underlain by a landform that would not have supported substantial human activity—that is, it is underlain by dune sand as opposed to alluvial plains that would have been more suitable for settlement and allowed for exploitation of resources. Further, the project area is directly east of the historic margins of San Francisco Bay (see **Figure 7**) and, as such, these areas representing former San Francisco Bay are overlain by artificial fill, which constitutes the lowest potential for buried Native American archaeological sites. However, given the presence of early historic era residences within the subject parcel, as discussed above, there is a high likelihood of buried materials related to late 19th century and early 20th century occupation of the parcel.

---

[1] The Holocene Epoch is the current period of geologic time, which began about 11,700 years ago, and coincides with the emergence of human occupation of the area.

4 Inventory Methods and Results

4.1 Cultural Resources Survey

An examination of the project area was completed by Origer on May 5, 2020. The ground surface of the project site was not visible as it is covered by paved surfaces and the surrounding surface areas are also paved or built upon. As a result, no archaeological resources were identified during the survey for the project. Built Environment Inventory

As noted in Section 1.2.2 Area of Potential Effects, there are 29 parcels within the indirect architectural APE (**Figure 6; Table 3**); of these, 19 contain at least one building and one contains a structure (a non-historic era skate park), while the balance (nine parcels) are vacant lots. Of the 19 parcels containing buildings, sixteen are within the Oakland Point Historic District. Three parcels containing buildings are within the APE but outside the Oakland Point Historic District.

19	1791 8th Street	006-0037-001-00	Contains a historic era building

A field review of the APE was conducted by a qualified Horizon architectural historian on November 25, 2021. All 19 of the parcels containing buildings in the APE were photographed from the public right of way; an attempt was made to collect several different angles of each building. Sixteen of the parcels with buildings are within the boundaries of the Oakland Point Historic District. Three parcels with buildings are within the APE, but outside of the Oakland Point Historic District.

A DPR form, including photographs, was prepared for each building in the APE. Condition assessments were made for those buildings that are within the Oakland Point Historic District to determine if they still retained sufficient integrity to be considered contributors to the district. The three buildings outside of the Oakland Point Historic District, were recorded and evaluated for NRHP/CRHR eligibility. The DPR forms for all the buildings are included as **Appendix D** of this report.

4.1.1 Oakland Point Historic District Buildings in the APE

As previously discussed, the Oakland Point Historic District has been determined eligible to the NRHP as a historic district under both Criterion A (history) and Criterion C (architecture). It is one of the largest Victorian-era neighborhoods in Oakland, and features a remarkable degree of integrity, with 616 contributors out 845 properties.

Sixteen buildings in the project APE are within the boundaries of the Oakland Point Historic District. As noted, each resource was recorded for the present report on a DPR form and a condition assessment for integrity was made. Relevant data on the properties containing buildings with the

Historic District including address, APN number, BERD status, and the results of the condition assessment are listed in **Table 4**. Each of the properties are identified by number in Figure 6.

Table 4. Buildings within the APE and Oakland Point Historic District

Figure 6 #	Address	APN	Year Built	Oakland Point Historic District (NRHP Status per BERD)	BERD (CA OHP)	Current Study Recommendations
2	903 Pine St	006-0049-023-00	1884	district contributor	2D2	Retains integrity
3	884/886 Pine St	006-0035-001-00	1884	district contributor	2D2	Retains integrity
4	882 Pine St	006-0035-002-00	1881	district contributor	2D2	Retains integrity
5	874 Pine St	006-0035-004-00	1991	Not evaluated		Not Historic Period
6	870 Pine St	006-0035-005-00	1991	Not evaluated		Not Historic Period
7	866 Pine St	006-0035-006-00	1882	district contributor	2D2	Retains integrity
8	862 Pine St	006-0035-007-00	2007	Not evaluated		Not Historic Period
9	854/858 Pine St	006-0035-009-01	1992	Not evaluated		Not Historic Period
10	850 (852) Pine St	006-0035-010-00	1881	district contributor	2D2	Retains integrity
11	842-844 (848) Pine St.	006-0035-066-00	1880s/1924	non-contributor (1990 city finding)	6Y	substantially altered after determined ineligible in 1990
12	840 Pine St.	006-0035-065-00	1945	non-contributor 1990 city finding)	6Y	utilitarian design lacks architectural significance
13	834 Pine St.	006-0035-064-00	2021	Not evaluated	none	Not Historic Period /constructed 2021
14	830 Pine St	006-0035-063-00	1877	district contributor	2D2	Extant but lacks integrity, see DPR update (completely rebuilt 2019)
15	816 Pine St.	006-0035-060-00	1888	district contributor	2D2	Retains integrity
16	1796 (1798) 8th St.	006-0035-057-00	1886	district contributor	2D2	Retains integrity
18	1798 9th St	006-0033-026-00	1868	district contributor	2D2	Retains integrity

All the buildings that are both within the Oakland Point Historic District boundary and the APE are residential properties. Nine of the properties (Figure 6 #s 2, 3, 4, 7, 10, 14, 15, 16, and 18) were determined eligible as contributors to the Oakland Point Historic District in 1990. The current evaluation determined that eight of those properties retain integrity as contributors to the Oakland

Point Historic District. One residence (Figure 6 #14 at 830 Pine Street) has been sufficiently altered such that it no longer retains its historic integrity (see DPR 523 update from, Appendix D). Research and field observation determined that four residences (Figure 6 #s 5, 6, 8, 9, and 13) within the Oakland Point Historic District limits had been constructed within the last 30 years; therefore, they do not meet the age criteria to be a historic property/historical resource. In fact, one residence (Figure 6 #13) was under construction at the time of the field review. Two houses (Figure 6 #s 11 and 12) are older than 50 years, but were determined ineligible in 1990.

4.1.2 Other Buildings in the APE

Three buildings (see **Table 5**) within the APE are not part of the Oakland Point Historic District. Each building was recorded on the appropriate DPR forms and evaluated for NRHP/CRHR eligibility. A summary description of each building is provided below; NRHP/CRHR evaluations are provided in Section 4.3. More detailed information can be found in the individual DPRs in Appendix D.

Table 5. Buildings within the APE but outside Oakland Point Historic District

Figure 6 #	Address	APN	Construction Year	Resource Type	NRHP/CRHR Evaluation
1	1819 10th Street	006-0049-025-01	Various times before 1940	Industrial	Not Eligible
17	767 Pine Street	006-0045-009-01	1945	Commercial	Not Eligible
19	1791 8th Street		1907; remodeled 1942	Commercial	Eligible

Figure 6 #1 – 1819 10th Street

This parcel comprises most of the block bounded by the I-880 frontage road (which roughly corresponds with what was once Cedar Street) and 9th, 10th, and Pine streets. The large industrial parcel with five buildings takes up most of the block, with a row of historic-era residences at its eastern border. Immediately across 9th Street, to the south, is the parcel on which the Phoenix project is proposed to be constructed.

The 1.64-acre parcel holds five industrial buildings:

- 1819 10th Street is oriented east-west and occupies most of the north half of the parcel. It is a double-height, gable-roofed industrial building with corrugated metal cladding and roofing. Large vehicle openings are fitted with metal rollup doors. There are banks of industrial-sash windows along the east, west, and south elevations.
- 1824 9th Street, which is oriented north-south and located at the southeast corner of the parcel. It is double-height gable-roofed industrial building with corrugated metal cladding and roofing. A vehicle opening along 9th Street is fitted with a top-mounted sliding door. An adjacent human-scale door is fitted with a metal security screen door. The building lacks fenestration.
- 1826 9th Street, which is oriented north-south and located immediately adjacent to the west elevation of 1824. 1826 9th Street is a single-height gable-roofed industrial building with

corrugated metal cladding and roofing. A vehicle opening along 9th Street is fitted with a metal rollup door.

- 1832 9th Street, which is oriented north-south and located at the center of the block. Itis a single-height industrial building with a low pitch gable roof with wide eaves. Cladding and roofing are corrugated metal. A vehicle opening along 9th Street is fitted with a metal rollup door. The small building at the southwest corner of the parcel also features a gable roof and metal cladding. There is a temporary metal carport structure near the center of the parcel.

- A small building at the southwest corner of the parcel

The buildings were constructed at various times between 1902 and 1985, as described below.

The block, which is bounded by Cedar, 9th, 10th, and Pine streets, was developed for housing in the 19th century. The shift to industry began when Standard Oil Company was the first to develop a warehouse on the southwest corner of the block in 1889 (918 Cedar). It was a valuable location for industrial development due to its proximity to the railroad tracks and waterfront. With the construction of more warehouses, industrial spurs were developed to connect the warehouses to the railroad tracks. The Spears-Wells Machinery Company developed multiple warehouses on the southwest half of block 703, at addresses 1830 9th Street, 1832 9th Street, and 1824 9th Street. Independent Iron Works had a warehouse to the east of the Spears-Wells assembling warehouse. On the northeast half of block 703, the Irving Subway Grating Company developed a large warehouse at 1819 10th Street and 1849 10th Street in 1949. Houses remain on the east edge of the block, facing Pine Street. In the 1990s, the original Standard Oil Company warehouse on the southwest corner was demolished (Sanborn Map Company, 1912-1951).

4.1.3 Spears-Wells Machinery Company

The Spears-Wells Machinery Company was owned by Charles Alvah Spears and Ira Moore Wells. Spears was the vice-president while Wells was secretary of the company. Prior to Spear-Wells Machinery Company, Charles Spears owned Graves-Spears Road Machinery Company in the 1910s. Wells, who was often present when company machinery was being used in road construction, appears to have been the technical expert in the partnership. In 1919, Spears-Wells Machinery Company began manufacturing farm machinery in Oakland, establishing an office on 12th Street and the factory in the brick former Standard Oil facility at the corner of Cedar and 9th streets (which had fallen into disuse after Standard Oil opened a new plant in Richmond). By September of that year, the company was installing its own machinery in the facility. Additional buildings were constructed, with a total expenditure of $50,000 to develop the plant. The company made graders, oilers, and other large equipment for road-building that was shipped all over the Western US. In 1920, it claimed to be the only company west of Chicago manufacturing road-building equipment (Oakland Tribune 1919, 1920, 1925, 1928).

Business was good in the 1920s, and the company added 5,640 square feet of floor space as well as new machinery in 1927 in order to increase production by 30 percent. Aerial photographs show that by 1931, there was a small addition (use for machinery storage) to the south of the original building as well as several large new buildings to the east including a brick machine shop and corrugated metal buildings used as assembly and shop areas. The company appears to have remained active through the late 1950s (Oakland Tribune 1927).

4.1.4 Independent Iron Works, Ltd.

The building at 1822-24 9th Street was constructed by the Independent Iron Works company as a warehouse after they purchased the property in 1942. It was across the street from the company's primary warehouses and manufacturing plant (no longer extant), which were on the parcel slated for development by the Phoenix project. Independent Iron Works was a steel manufacturing company founded in the 1920s by Henry Gede and William George Meagher. Gede was co-owner of the Independent Iron Works until he retired in 1954. Meagher continued with the company and his son, William G. Meagher, Jr., became vice-president for the Independent Iron Works, working alongside his father (Oakland Tribune 1973, 1979).

The company started out in fairly small facilities on the block bounded by Pine, 8th, 9th, and Cedar streets (across 9th Street to the south of the subject building). The plant appears to have expanded gradually over the 1930s, and eventually occupied the entire block as well as an office on 8th Street. By 1939, the plant had 250 employees. The company fabricated all sorts of steel products: structural steel beams for buildings, bridge girders, and small pre-fabricated buildings like gas stations and restrooms. With U.S. entry into World War II, Independent Iron Works expanded into the war work market, competing with the likes of Bethlehem Steel and Kaiser Steel. It supplied prefabricated parts to at least ten local plants that produced war materiel, and also manufactured its own metal barges. Many of the items it manufactured were for U.S. Navy or Merchant Marine ships including ladders, ships' doors, shelving, and sea chests. The warehouse north of 9th Street was developed as part of this expansion (Oakland Tribune 1939).

After the war, Independent Iron Works went back to manufacturing ordinary consumer goods, adding new products like barbells. Forty years after the company was started, the Meaghers sold it to Vinnell Steel in 1961. Vinnell Steel, which was based in Irwindale, California, was itself acquired by a larger company a few years later. By 1969, the Independent Iron Works main plant on Pine Street had been shuttered (Oakland Tribune 1961a). Phoenix Iron Works took over the space shortly thereafter and occupied the building until the Loma Prieta earthquake in 1989 (Litzing 2004; Northgate Environmental Management 2011). The main plant, located on the proposed project parcel, was demolished in the late 1990s.

4.1.5 Irving Subway Grating Company

Walter E. Irving established Irving Iron Works in Long Island, New York, in 1902. Irving was an innovator and inventor, introducing wire mesh grating systems for the New York City subway system in 1912. The firm changed its name to Irving Subway Grating Company, and began producing open-mesh decking for bridges. At the start of World War II, the company introduced innovative portable landing mats that were utilized by the U.S. Army Air Corps to quickly create airfields (IKG 2021).

Irving Subway Grating Company opened its West Coast factory in Emeryville in 1943, where it manufactured the landing mats as well as steel grating for industrial floors and bridges. During World War II, the company was the principal supplier of portable airstrips in the Pacific. In 1949, the company outgrew its Emeryville factory and built its 23,000-square-foot, corrugated metal plant on 10th Street. In the 1950s, J. C. Lynn was the president of the Irving Subway Grating Company's western division until he died in 1954. James E. Irving, Walter Irving's son, succeeded J. C. Lynn as president of the western division of Irving Subway Grating Company in 1955. He was also the executive vice president and general manager of the parent company in Long Island, New York (Oakland Tribune 1952, 1955).

In 1952, the Irving Subway Company warehouse at 1819 10th Street was used by the American Committee for Protection of the Foreign Born for a meeting to help with those who faced deportation. The chairman for that meeting was Henry Saunders, an attorney from Oakland who specialized in the legal matters for left-wing labor unions and Communist Party members. That same month, the Bay Area annual festival for the International Workers Order was held at this address. Around 100 people attended this gathering, most of them supporters of the Communist Party of California (Legislature of the State of California 1953).

Harsco Corporation acquired Irving Subway Grating and another company, Gary Gratings, in 1965, and Kerrigan Iron Works Company a year later. In 1966, the company expanded its Oakland facility by purchasing the adjacent property at 1832 9th Street from Spears-Wells Machinery Company. The brick warehouse that had been constructed by Spears-Wells Machinery Company between 1919 and 1927 was demolished in 1967. In 1969, the company changed its name to IKG to reflect the names of the firms it had merged (Oakland Tribune 1963, 1966).

IKG continued to operate the plant into the 1980s, and constructed a new corrugated metal warehouse at 1832 9th Street in 1985. By the end of the decade, the facility had been shuttered and Joe Clar and Sons, a scrap metal business, moved into 1819 10th Street in 1991. Between 1993 and 2000, 1820 and 1822-18249th Street were used by a company that gave lessons in trapeze and other circus performing arts. The brick warehouse constructed by Standard Oil Company west of 1824 9th at 918 Cedar in 1889 was demolished sometime between 1993 and 2000.

Figure 6 #17 – 767 Pine Street (APN 006-0045-009-01)

This small church building is located on the southwest corner of Pine Street and Shorey/8th Street, directly across the street and south of the proposed project location. It has a rectangular plan and features a medium-pitched gable roof with a vent on the gable end and minimal eaves. It is clad in stucco siding. The centered main entrance on the main (east) façade is fitted with a metal security screen door and is accessed via a wide set of concrete steps with a simple wood balustrade. Fenestration consists of fixed and sliding aluminum sash windows in rectangular openings with bars. The main façade features a square tower with a hipped roof to the left of the main entrance.

The first building on the property was a small residential building constructed in the early 1880s. The building was square in plan and set well back from the street, perhaps to take advantage of a lot that was somewhat wider than others on the block. In 1883, the house was advertised as a rooming house and records show that it was later a rental property (Oakland Tribune 1883, 1945a, 1961b).

At the end of 1945, the Mt. Moriah (Mariah) Baptist Church applied to remodel the house at 767 Pine Street for use as a neighborhood church. Reverend R. H. Sims, Jr. was the pastor of the Mt. Moriah Baptist Church. A Black man, he apparently moved from Pittsburg in 1945 in order to establish a Baptist congregation in the neighborhood to serve its Black residents. Irwin M. Johnson, a prolific Oakland architect best known for residential construction, was hired for the remodel. The modest project appears to have roughly doubled the size of the small house, extending it toward the street. The small church building apparently did not attract the interest of local newspapers, and research has not revealed any historic-era descriptions or photographs. A small building behind the main church was constructed for use as a church school and, at some point, a small belfry addition was constructed adjacent to Pine Street. A few years after its establishment, a second church with the same name was started in central Oakland; Reverend Sims may have moved to the new church (Oakland Tribune 1945b; Pittsburgh Courier 1964).

By 1975, the name of the congregation had changed to St. Luke Missionary Baptist Church. The institution appears to have continued to serve the local Black community, although little is known about its history. In 1975, Aristade Green, a local contractor who was also a deacon in the church, stuccoed the front of the building and replaced two of its original windows with aluminum sliding-sash windows; the other sides were later stuccoed as well. Later, Oakland-based evangelist Altha Washington was involved with the congregation. Although Washington did not call herself a professional minister, she gained some renown as an evangelist and preacher in the 1960s and 1970s. In the mid-1980s, J. W. Morrison was the pastor, apparently a part-time position since he also led a Baptist church in Vallejo. Claude Mason was the pastor in 2019. In 2021, the property appears to be abandoned (Alameda County 2019).

Figure 6 #19 – 1791 8th Street

The two-story commercial building at 1791 8th Street sits at the southeast corner of the intersection of Pine Street and 8th Street, diagonally across the street from the proposed project location. The main entrance of the structure opens directly to the street corner, facing northwest to the empty lot scheduled for construction of the Phoenix facility. The entrance is fitted with double metal commercial doors and is accessed via a wide set of terrazzo steps. The building contains elements of Streamline Moderne architecture. The main façade features two columns on either side of the entrance, which are wrapped with gold and white square panels; they support a curved Streamline Moderne awning and are flanked with curved windows fitted with glass block. Fenestration consists of steel casement windows in bands wrapping around both street fronts. Windows are fitted with steel security screens on the first floor. The off-street (south) elevation, which faces a fenced parking lot, is stuccoed and has a secondary entrance. The off-street, stuccoed east elevation has large window openings fitted with glass block.

The commercial/office building was originally constructed in 1907 for the West Oakland Athletic Club. It was a two-story wood-frame building with projecting square window bays on the second floor (see the DPR in Appendix D for a photograph), and only its footprint was retained when it was remodeled to its current form in 1942 by Mac D. Perkins. Mac Dudley Perkins (1897–1989) was an architect and engineer. Born in Colorado, he moved with his new wife to Berkeley in the 1924. Perkins had a practice as consulting engineer in San Francisco. He was part of a team of architects and engineers who designed the Art Deco Monterey County Courthouse, completed in 1943. He won an award as the structural engineer on the Hope Lutheran Church of San Francisco, designed with noted modernist Mario Corbett in 1954 (Oakland Tribune 1938, 1989; Progressive Architecture 1954:120).

The building was remodeled in 1942 to be used by the Independent Iron Works company as an office space for the company warehouses and manufacturing plant that were located diagonally across the street on the parcel proposed for the Phoenix project. Independent Iron Works was a steel manufacturing company founded in the 1920s by Henry Gede and William George Meagher. The company started out in fairly small facilities on the block bounded by Pine, 8th, 9th, and Cedar streets (across the street to the northwest of the subject building). The plant appears to have expanded gradually over the 1930s, and eventually occupied the entire block as well as a warehouse north of 9th Street. By 1939, the plant had 250 employees. The company fabricated all sorts of steel products: structural steel beams for buildings, bridge girders, and small pre-fabricated buildings like gas stations and restrooms. With U.S. entry into World War II, Independent Iron Works expanded into the war work market, competing with the likes of Bethlehem Steel and Kaiser Steel. It supplied prefabricated parts to at least 10 local plants that produced war materiel, and also manufactured its own metal barges. Many of the items it manufactured were for U.S. Navy or Merchant Marine ships including ladders, ships' doors, shelving, and sea chests (Oakland Tribune 1939, 1973, 1979).

By late 1942, the expanding steel plant across the street had taken over the old boxing arena at 1791 8th Street. Its interior had been converted to use as a paint shop, but it was lacking structurally; beams were strengthened, and framing added that would allow installation of ribbon bands of steel-sash windows. Floors and partitions were installed to convert the interior to use as Independent Iron Works office headquarters. The project appears to have been completed in 1943 (Oakland Tribune 1942).

After the war, Independent Iron Works went back to manufacturing ordinary consumer products, adding new products like barbells. Forty years after the company was started, the Meaghers sold it to Vinnell Steel in 1961. Vinnell Steel, which was based in Irwindale, California, was itself acquired by a larger company a few years later. By 1969, the Independent Iron Works plant on Pine Street had closed, though it was soon-after used by Phoenix Iron Works until 1989. The main plant was demolished in the late 1990s (Oakland Tribune 1961a).

In the 1980s, the office building at 1791 8th Street was used by the Rich and Famous Theatre Company, started by Diana D. Duffer. More recently, the building has been used as an art studio (Oakland Tribune 1985a, 1985b).

4.2 NRHP Evaluations

The Oakland Point Historic District has formally been determined eligible for listing in the NRHP (1990) and, therefore, is listed in the CRHR. Nine residences that were evaluated as contributors to the Historic District in 1990 are located within the project's APE. (Two additional district contributors within the APE were demolished between 1991 and 2000; their lots are currently vacant.) A condition assessment was made for each of the buildings as part of the current study, to compare the buildings with their recorded features in 19871990 during the original recordation of the district. The present study found that eight of the residences retain sufficient integrity to remain contributors to the Oakland Point Historic District. One residence (Figure 6 #14; 830 Pine Street), depicted in **Figures 8 and 9**, no longer retains integrity as it has been heavily altered and stripped of all Italianate decorative features including porch, cornice, and surface ornamentation. Only its two-story massing and double-height bay window reference its original form. It does not convey its identity as a Victorian-era building and does not retain sufficient integrity to be considered a district contributor.

Buildings on three parcels in the APE (Figure 6 #s 1, 17, and 19) were evaluated for NRHP eligibility. The NRHP require that a significance criterion from A-D be met for a resource to be eligible. (See Section 1.3.3 for criteria requirements).

Figure 8. 826 – 830 Pine Street (Map # 14) in November 2011 (Google street view image).

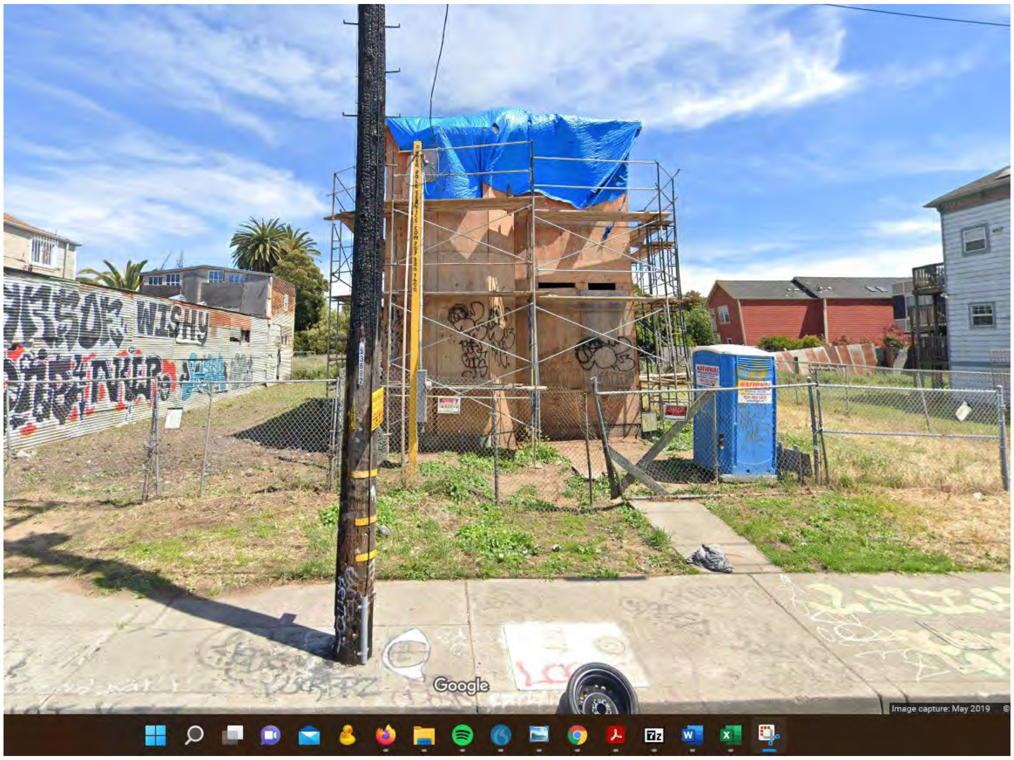

Figure 9. 826 – 830 Pine Street (Map # 14) in May 2019 (Google street view image).

Figure 6 #1 – 1819 10th Street

The large parcel, which is now referred to as 1819 10th Street, once contained a building on its southwest corner that was built by Standard Oil in 1889. In 1990, the City and Caltrans evaluated the building as eligible for listing in the NRHP during its historic resources inventory (OCHS 1990a); the building was razed shortly thereafter. However, the remaining buildings that exist on the parcel were not evaluated at that time and were evaluated for current project.

Criterion A/1: The extant buildings on the parcel at 1819 10th Street are not associated with events that have made a significant contribution to the broad patterns of our history. The property is generally associated with the industrial development of West Oakland during the 20th century. However, research has revealed no indication that any of the companies located on the block made important contributions to history. Irving Subway Grating Company did produce portable landing mats that were important to the U.S. war effort; however, they did not move to the site until after World War II. Likewise, Independent Iron Works contributed to Bay Area shipbuilding during the war, but its warehouse at the corner of Pine and 9th streets on the subject property was not its primary facility. Research has not revealed that the property is significant within the context of World War II defense production or any other historic context. Therefore, the property is recommended not eligible to the NRHP or CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. Research has not revealed any strong connection between the owners and managers of the various companies and the subject property; nor are these managers important historical figures. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP under Criterion B/2.

Criterion C/3: 1819 10th Street is not significant for its architecture. The extant warehouses on the property that were constructed within the historic period exhibit the typical characteristics of utilitarian buildings of the era. They are simple rectangular buildings with gabled roofs and corrugated metal cladding. They lack decorative features or associations with particular architectural styles. Nor do they possess unique engineering or other design features. For these reasons, the property is recommended not eligible to the NRHP under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. The buildings at 1819 10th Street are examples of a well-understood type of construction and do not appear to be a principal source of important information in this regard. For these reasons, the property is recommended not eligible to the NRHP or CRHR under Criterion D/4.

The property is recommended not eligible for listing on the NRHP.

Figure 6 #17 – 767 Pine Street (APN 006-0045-009-01)

Criterion A/1: The church at 767 Pine Street is not associated with events that have made a significant contribution to the broad patterns of our history. The property is generally associated with the residential development of the Oakland Point neighborhood in West Oakland and with its Black community. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the NRHP under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. The families who lived on the property were not significant contributors to Oakland's development, and research has revealed no important professional accomplishments or lasting impact on local history. Nor do the pastors associated with the church appear to have been historically significant individuals. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP under Criterion B/2.

Criterion C/3: 767 Pine Street is not significant for its architecture. Originally a modest dwelling, the building has been altered many times over the decades and is not a good example of any historic architectural style. For these reasons, the property is recommended not eligible to the NRHP under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 767 Pine Street is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard. For these reasons, the property is recommended not eligible to the NRHP or CRHR under Criterion D/4.

The property is recommended not eligible for listing on the NRHP.

Figure 6 #19 – 1791 8th Street

The building at 1791 8th Street was initially recorded and evaluated for NRHP-eligibility in 1990 as part of the City's historic resources inventory (OCHS 1990b). At that time, although built in 1907, the building was significantly remodeled in the 1940s and did not meet the age criteria for eligibility; therefore, it was determined not eligible for listing. Because the building, with its 1940s configuration, is now more than 50 years old, it was re-evaluated for NRHP eligibility.

Criterion A/1: 1791 8th Street is associated with events that have made a significant contribution to the broad patterns of our history. It was the office for Independent Iron Works, a small local steel fabrication company that expanded into war work during World War II. The company played a small but significant role in the production of ships and barges that were used in the U.S. war effort, and is associated with the important role of the East Bay as a locus of the industrial power that underpinned the war effort. 1791 8th Street was used as a paint shop early in the war as the plant was expanding, and then remodeled into its current form to serve as administrative offices for the company in 1943. Its plant, originally located across the street, has been demolished, leaving the office building the only remnant of the company in the built environment. Therefore, the property is recommended eligible to the NRHP and CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. William Meagher and Henry Gede were successful businessmen, but do not appear to have been technical innovators in the steel manufacturing field. Research has revealed no evidence that indicates that either man had a lasting impact on the steel business. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: 1791 8th Street is significant for its architecture. It is an excellent, if rather simple, example of Streamline Moderne architecture, a relatively rare style that was popular for only a brief time. Its curved corner at the main entryway with character-defining curved awning and glass block are strong elements of the style. Because of its association with war work, it was constructed in 1943, a time when almost no office or commercial buildings were constructed in the U.S. because of material shortages caused by the war. Furthermore, because its steel-sash windows were in all likelihood fabricated across the street at the Independent Iron Works plant, the architecture of the building is associated with the purpose of the company. For these reasons, the property is recommended eligible to the NRHP and CRHR under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 1791 8th Street is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard. For these reasons, the property is recommended not eligible to the NRHP or CRHR under Criterion D/4.

The building at 1791 8th Street has not been moved and therefore retains integrity of location. The composition of elements that constitute the form, plan, space, structure, and style of the building have not been altered substantially. The building's integrity of materials and workmanship is evident in the survival of original exterior details. The property retains sufficient significant physical characteristics from its period of significance to convey its historic qualities and, therefore, retains integrity of feeling. Continued use as commercial/art studio space allows it to convey integrity of association. Therefore, the building conveys its historic significance through all seven aspects of integrity.

The property is recommended eligible for listing on the NRHP and CRHR under Criteria A/1 and C/3.

This page intentionally left blank.

5 Finding of Effect

Historic properties are identified in the APE include contributing elements of one historic district, the Oakland Point Historic District, and the building at 1791 8th Street. Pursuant to 36 CFR 800.5(a)(1). The project (i.e., undertaking) has the potential to cause an adverse effect by directly or indirectly altering the characteristics of a historic property, such that it would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Applicable potential effects to the Oakland Point Historic District and 1791 8th Street could include a change of the character of physical features within the properties' setting that contribute to their historic significance, and introduction of visual, atmospheric, or audible elements that diminish the integrity of the properties' significant historic features (see 36 CFR 800.5(a)(2)). The proposed project would not physically alter any of the structures within the Oakland Point Historic District or to the building at 1791 8th Street.

The Secretary of the Interior's Standards for the Treatment of Historic Properties (Grimmer 2017) provide guidelines for the preservation and rehabilitation of historic properties. Adherence to these standards is widely accepted as a method of avoiding significant adverse effects to historic buildings while allowing their continued use. Most of the standards are directly related to the physical modification of individual buildings in some manner, such as the use of compatible materials during restoration activities, modifications to defining architectural features, or replacement of architectural elements with incompatible elements, and are not pertinent to the current project. However, applicable Secretary of Interior's Standards for Rehabilitation are listed below as a way for assessing the effects of the project on historic properties:

> *Standard 3: Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.*

The prohibition on conjectural features refers to application of "fantasy" architectural details to a historic-era building when such details have not been documented as original features. It therefore does not apply to the proposed project. Project design will allow the new buildings to be recognized as a physical record of their time, place, and use. The project will avoid creating a false sense of historical development, and repurposed elements of historic properties will not be utilized in the proposed project. Therefore, the proposed project conforms to this standard.

> *Standard 8: Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.*

Although no archaeological resources were identified during a pedestrian survey of the archaeological APE, construction of the proposed project has the potential to uncover buried archaeological remains that may be determined historic properties. Should unanticipated discovery of archaeological resources occur, appropriate measures would be implemented if the archaeological resources cannot be avoided, as discussed in section 6. Therefore, the proposed project conforms to this standard.

> *Standard 9: New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials,*

> *features, size, scale and proportion, and massing to protect the integrity of the property and its environment.*

The proposed project will not destroy historic materials, features, or spatial relationships that characterize adjacent historic properties or the historic district. The new buildings will be differentiated from adjacent buildings by using a contemporary rather than a historicist architectural style. The project design will avoid inappropriate application of historicist ornament onto the essentially contemporary design of the building. Features such as vertical window openings will be utilized to respond to the design vocabulary of the existing historic neighborhood without mimicking its architecture. Variation in color, texture, and materials will respond to the rhythm of historic single-family residences across the street. Utilization of board-form concrete and horizontal board cladding will create compatibility of materials with the historic neighborhood. Size, scale, massing, and proportion will also be compatible with the nearby historic residential buildings, the closest of which are across the street. During the historic era, the subject property was the site of an industrial/warehouse facility similar in scale and massing to the proposed project. Furthermore, the proposed project has been designed to be stepped down in the areas closest to the historic district, with two-and three-story volumes nearest the historic residences and four-story volumes behind. For these reasons, the proposed project protects the integrity of individual historic buildings as well as the historic district and its environment. Therefore, the proposed project conforms to this standard.

> *Standard 10: New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.*

Future reversal of the proposed project would not impair the essential form and integrity of adjacent historic properties or historic districts. Therefore, the proposed project conforms to Standard 10.

In summary, a finding of no adverse effect to historic properties is recommended for this undertaking, pursuant to 36 CFR Section 800.5(b).

6 Summary and Recommendations

The City of Oakland and East Bay Asian Local Development Corporation propose to develop The Phoenix, a mixed-use affordable and supportive housing project on one lot that totals 0.90 acres (Parcel 1 of APN 006-0047-001-00) at 801 Pine Street, situated at the northwest corner of Pine Street and 8th Street in Oakland, California. The proposed project will construct a four-story, 101-unit residential building and a two-story community building. The residential and community buildings will surround a 3,582-square-foot courtyard which serves as outdoor common space for the buildings' residents. The project will demolish concrete slabs currently covering the site.

A cultural resources study for the proposed project was conducted in 2020 and 2021. The study identified the presence of the Oakland Point Historic District, a historic property determined eligible for inclusion to the NRHP, and a commercial building at 1791 8th Street that is recommended eligible for the NRHP, within the project's APE. No archaeological resources have been identified within the APE.

The proposed project will not materially alter any of the historic properties in the APE, nor will the new facilities create a false sense of historical development, or destroy historic materials, features, or spatial relationships that characterize adjacent historic properties or the historic district. The new facility will be similar in scale and massing to the industrial/warehouse facility that was historically present. As a result, the proposed project will have no adverse effect to historic properties according to 36 CFR Section 800.5(b).

Although no archaeological sites were identified by the archaeological inventory, significant cultural resources may be buried with no surface manifestation and be discovered during construction of the project. A geoarchaeological analysis indicates that there is a low potential for encountering buried pre-contact Native American resources at the project location; however, two Native American tribes noted that the project may be near an ancestral Native American site and this ancestral knowledge cannot be discounted. Archival research, furthermore, suggests that subsurface remains that date to the late 19th century residential occupation of the area may be present.

Due to the potential sensitivity of the project site to contain both Native American and historic era subsurface materials, it is recommended that, for post-review discovery of archaeological materials or human remains, protocols consistent with the Conditions of Approval adopted for the project by the City of Oakland (City of Oakland 2020), pursuant to prior local land use approvals, be implemented. Implementation of the protocols would result in no adverse effect to Pre-contact Native American and historic era archaeological resources discovered during project construction. These protocols provide for the following:

Archaeological and Paleontological Resources – Discovery during Construction: Pursuant to CEQA Guidelines section 15064.5(f), in the event that any historic or prehistoric subsurface cultural resources are discovered during ground disturbing activities, all work within 50 feet of the resources shall be halted and the project applicant shall notify the City and consult with a qualified archaeologist or paleontologist, as applicable, to assess the significance of the find. In the case of discovery of paleontological resources, the assessment shall be done in accordance with the Society of Vertebrate Paleontology standards. If any find is determined to be significant, appropriate avoidance measures recommended by the consultant and approved by the City must be followed unless avoidance is determined unnecessary or infeasible by the City. Feasibility of avoidance shall be determined with consideration of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is unnecessary or infeasible, other appropriate measures (e.g., data recovery, excavation) shall be instituted. Work may proceed on other parts of the project site while measures for the cultural resources are implemented.

In the event of data recovery of archaeological resources, the project applicant shall submit an Archaeological Research Design and Treatment Plan (ARDTP) prepared by a qualified archaeologist for review and approval by the City. The ARDTP is required to identify how the proposed data recovery program would preserve the significant information the archaeological resource is expected to contain. The ARDTP shall identify the scientific/historic research questions applicable to the expected resource, the data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. The ARDTP shall include the analysis and specify the curation and storage methods. Data recovery, in general, shall be limited to the portions of the archaeological resource that could be impacted by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practicable. Because the intent of the ARDTP is to save as much of the archaeological resource as possible, including moving the resource, if feasible, preparation and implementation of the ARDTP would reduce the potential adverse impact to less than significant. The project applicant shall implement the ARDTP at his/her expense.

In the event of excavation of paleontological resources, the project applicant shall submit an excavation plan prepared by a qualified paleontologist to the City for review and approval. All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and/or a report prepared by a qualified paleontologist, as appropriate, according to current professional standards and at the expense of the project applicant.

When Required: During construction

Initial Approval: N/A

Monitoring/Inspection: Bureau of Building

Human Remains – Discovery During Construction: Requirement: Pursuant to CEQA Guidelines section 15064.5(e)(1), in the event that human skeletal remains are uncovered at the project site during construction activities, all work shall immediately halt and the project applicant shall notify the City and the Alameda County Coroner. If the County Coroner determines that an investigation of the cause of death is required or that the remains are Native American, all work shall cease within 50 feet of the remains until appropriate arrangements are made. In the event that the remains are Native American, the City shall contact the California Native American Heritage Commission (NAHC), pursuant to subdivision (c) of section 7050.5 of the California Health and Safety Code. If the agencies determine that avoidance is not feasible, then an alternative plan shall be prepared with specific steps and timeframe required to resume construction activities. Monitoring, data recovery, determination of significance, and avoidance measures (if applicable) shall be completed expeditiously and at the expense of the project applicant.

When Required: During construction

Initial Approval: N/A

Monitoring/Inspection: Bureau of Building

Archaeologically Sensitive Areas – Pre-Construction Measures:

Provision A: Intensive Pre-Construction Study: Requirement: The project applicant shall implement either Provision A (Intensive Pre-Construction Study) or Provision B (Construction ALERT Sheet) concerning archaeological resources.

Provision A: Intensive Pre-Construction Study.

The project applicant shall retain a qualified archaeologist to conduct a site-specific, intensive archaeological resources study for review and approval by the City prior to soil-disturbing activities occurring on the project site. The purpose of the site-specific, intensive archaeological resources study is to identify early the potential presence of history-period archaeological resources on the project site. At a minimum, the study shall include:

a. Subsurface presence/absence studies of the project site. Field studies may include, but are not limited to, auguring and other common methods used to identify the presence of archaeological resources.

b. A report disseminating the results of this research.

c. Recommendations for any additional measures that could be necessary to mitigate any adverse impacts to recorded and/or inadvertently discovered cultural resources.

If the results of the study indicate a high potential presence of historic-period archaeological resources on the project site, or a potential resource is discovered, the project applicant shall hire a qualified archaeologist to monitor any ground disturbing activities on the project site during construction and prepare an ALERT sheet pursuant to Provision B below that details what could potentially be found at the project site. Archaeological monitoring would include briefing If the results of the study indicate a high potential presence of historic-period archaeological resources on the project site, or a potential resource is discovered, the project applicant shall hire a qualified archaeologist to monitor any ground disturbing activities on the project site during construction and prepare an ALERT sheet pursuant to Provision B below that details what could potentially be found at the project site. Archaeological monitoring would include briefing construction personnel about the type of artifacts that may be present (as referenced in the ALERT sheet, required per Provision B below) and the procedures to follow if any artifacts are encountered, field recording and sampling in accordance with the Secretary of Interior's Standards and Guidelines for Archaeological Documentation, notifying the appropriate officials if human remains or cultural resources are discovered, and preparing a report to document negative findings after construction is completed if no archaeological resources are discovered during construction.

Or -

Provision B: Construction ALERT Sheet: The project applicant shall prepare a construction "ALERT" sheet developed by a qualified archaeologist for review and approval by the City prior to soil-disturbing activities occurring on the project site. The ALERT sheet shall contain, at a minimum, visuals that depict each type of artifact that could be encountered on the project site. Training by the qualified archaeologist shall be provided to the project's prime contractor, any project subcontractor firms (including demolition, excavation, grading, foundation, and pile driving), and utility firms involved in soil- disturbing activities within the project site. The ALERT sheet shall state, in addition to the basic archaeological resource protection measures contained in other standard conditions of approval, all work must stop and the City's Environmental Review Officer contacted in the event of discovery of the following cultural materials: concentrations of shellfish remains; evidence of fire (ashes, charcoal, burnt earth, fire- cracked rocks); concentrations of bones; recognizable Native American artifacts (arrowheads, shell beads, stone mortars [bowls], humanly shaped rock); building foundation remains; trash pits, privies (outhouse holes); floor remains; wells; concentrations of bottles, broken dishes, shoes, buttons, cut animal bones, hardware, household items, barrels, etc.; thick layers of burned building debris (charcoal, nails, fused glass, burned plaster, burned dishes); wood structural remains (building, ship, wharf); clay roof/floor tiles; stone walls or footings; or gravestones. Prior to any soil-disturbing activities, each contractor shall be responsible for ensuring that the ALERT sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, and supervisory personnel. The ALERT sheet shall also be posted in a visible location at the project site.

When Required: Prior to approval of construction-related permit; during construction

Initial Approval: Bureau of Building; Bureau of Planning

Monitoring/Inspection: Bureau of Building

In summary, this report has been prepared to assist the City of Oakland, who has been delegated by HUD to act on behalf of the federal lead agency, comply with the requirements of Section 106 for the Phoenix affordable housing project. Acceptance of this report indicates the City's concurrence of the APE delineated for the project, as well as the recommended determination that no built environment historic properties will be adversely affected by this undertaking. Furthermore, implementation of the City of Oakland Standard Conditions of Approval, as required by the project, will ensure that there will be no adverse effect to archaeological resources (pre-contact Native American and historic era) and human remains discovered during project construction.

7 Personnel

Fieldwork, analysis, and reporting were carried out by the below-listed professionals who meet the U.S. Secretary of the Interior's Professional Standards for Archaeology (per Title 48 of the CFR, Section 44716, as amended in 1983). Procedures complied with NHPA Section 106 as set forth in Title 36 of the CFR, Section 800.

- **Janis Offermann, Registered Professional Archaeologist** (RPA) (Horizon), prepared this report. She has a bachelor's degree in Anthropology from Sonoma State University in Rohnert Park, California, and a master's degree in Anthropology from the University of California at Davis. She has more than 40 years of experience in California archaeology and cultural resource management. Ms. Offermann is the cultural resources practice leader with Horizon.

- **Kara Brunzell, Architectural Historian** (Horizon), conducted the field review of the parcels within APE, contributed heavily to the historic-era context of this report, prepared the DPRs found in Appendix D, and provided the impacts analysis for the historic properties in the APE. Ms. Brunzell holds a bachelor's degree in History from the University of California, Los Angeles, and a master's degree in Public History from California State University, Sacramento. She has been a practicing architectural historian in California for 15 years.

Required Information

Project Title: Phoenix Mixed-Use Affordable Housing Project

Local Government/Lead Agency: City of Oakland, Planning and Building Department

Contact Person: Heather Klein, Zoning Area Supervisor

Street Address: 250 Frank H. Ogawa Plaza

City: Oakland, CA **Zip:** 94612

Phone: 510-238-3659 **Fax:**

Email: hklein@oaklandca.gov

Specific Area Subject to Proposed Action

County: Alameda **City/Community:** Oakland

Project Description:

The City of Oakland is proposing to develop The Phoenix, a mixed-use affordable and supportive housing project at the northwest corner of Pine Street and 8th Street in Oakland, California. The Project will consist of a four-story, 101-unit residential building and a two-story community building.

Tony Cerda, Chairperson
Costanoan Rumsen Carmel Tribe
244 E. 1st Street
Pomona, CA 91766

RE: Phoenix Affordable Housing Project

Dear Honorable Chairperson Cerda:

The Oakland Housing Authority is considering funding the project listed above with federal funds from the U.S. Department of Housing and Urban Development (HUD). Under regulation 24 CFR 58.4, the City has assumed HUD's environmental review responsibilities for the project, including tribal consultation related to historic properties, on behalf of HUD. Historic properties include archeological sites, burial grounds, sacred landscapes or features, ceremonial areas, traditional cultural places and landscapes, plant and animal communities, and buildings and structures with significant tribal association.

The City will conduct a review of the project described below to comply with Section 106 of the National Historic Preservation Act and its implementing regulations 36 CFR Part 800. While, we were unable to receive a tribal consultation list from the Native American Heritage Commission, we have identified you as a local Tribe and would like to invite you to be a consulting party in this review to help identify historic properties in the project area that may have religious and cultural significance to your tribe, and if such properties exist, to help assess how the project might affect them. If the project might have an adverse effect, we would like to discuss possible ways to avoid, minimize or mitigate potential adverse effects.

Enclosed are maps showing the project area (Figure 1). The East Bay Asian Local Development Corporation (EBALDC), and Allied Housing (Allied) are proposing to develop The Phoenix (proposed project), an affordable and supportive housing project at the northwest corner of Pine Street and Story/8th Street in Oakland, California. The project will consist of a four-story, 101-unit residential building and a two-story community building.

The project is in an area affected by the Loma Prieta earthquake and the subsequent reconstruction of I-880 near the Port of Oakland. The project will be located on half of a city

block that once housed a large warehouse. The warehouse was removed during freeway construction and the surface of the area is currently covered with concrete. The Oakland Point Historic District, which is largely comprised of homes built in the late 1800s, abuts the project block on the north and east.

A record search at the Northwest Information Center of the California Historical Resources Information System at Sonoma State University did not identify any known Native American cultural resources in or near the project location. A geoarchaeological analysis of the project site found the area to have a low sensitivity for buried cultural remains, as the area is underlain by dune sand and there are no fresh water sources within ¼ mile of the parcel.

More information on the Section 106 review process is available at http://www.comcon.org/sites/default/files/historic_preservation/ . HUD's process for tribal consultation under Section 106 is described in a Notice available at http://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/environment/atec.

To meet project timeframes, if you would like to be a consulting party on this project, can you please let us know of your interest within 30 days? If you have any initial concerns with impacts of the project on religious or cultural properties, can you please note them in your response along with the name and contact information for the tribe's principal representative in the consultation? If you do not wish to consult on this project, can you please inform us?

Your comments and concerns are important to us, and we look forward to hearing from you. If you have any questions or comments regarding the project, I can be contacted via email at hklein@oaklandca.gov or by phone at (510)238-3659.

Sincerely,

Heather Klein

The project will consist of a four-story, 101-unit residential building and a two-story community building.

The project is in an area affected by the Loma Prieta earthquake and the subsequent reconstruction of I-880 near the Port of Oakland. The project will be located on half of a city

block that once housed a large warehouse. The warehouse was removed during freeway construction and the surface of the area is currently covered with concrete. The Oakland Point Historic District, which is largely comprised of homes built in the late 1800s, abuts the project block on the north and east.

A record search at the Northwest Information Center of the California Historical Resources Information System at Sonoma State University did not identify any known Native American cultural resources in or near the project location. A geoarchaeological analysis of the project site found the area to have a low sensitivity for buried cultural remains, as the area is underlain by dune sand and there are no fresh water sources within ¼ mile of the parcel.

More information on the Section 106 review process is available at http://www.comcon.org/sites/default/files/historic_preservation/ . HUD's process for tribal consultation under Section 106 is described in a Notice available at http://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/environment/atec.

To meet project timeframes, if you would like to be a consulting party on this project, can you please let us know of your interest within 30 days? If you have any initial concerns with impacts of the project on religious or cultural properties, can you please note them in your response along with the name and contact information for the tribe's principal representative in the consultation? If you do not wish to consult on this project, can you please inform us?

Your comments and concerns are important to us, and we look forward to hearing from you. If you have any questions or comments regarding the project, I can be contacted via email at hklein@oaklandca.gov or by phone at (510)238-3659.

Sincerely,

Heather Klein

Quirina Luna Geary, Chairperson
Tamien Nation
P.O. Box 8053
San Jose, CA 95155

RE: Phoenix Affordable Housing Project

Dear Honorable Chairperson Geary:

The Oakland Housing Authority is considering funding the project listed above with federal funds from the U.S. Department of Housing and Urban Development (HUD). Under regulation 24 CFR 58.4, the City has assumed HUD's environmental review responsibilities for the project, including tribal consultation related to historic properties, on behalf of HUD. Historic properties include archeological sites, burial grounds, sacred landscapes or features, ceremonial areas, traditional cultural places and landscapes, plant and animal communities, and buildings and structures with significant tribal association.

The City will conduct a review of the project described below to comply with Section 106 of the National Historic Preservation Act and its implementing regulations 36 CFR Part 800. While, we were unable to receive a tribal consultation list from the Native American Heritage Commission, we have identified you as a local Tribe and would like to invite you to be a consulting party in this review to help identify historic properties in the project area that may have religious and cultural significance to your tribe, and if such properties exist, to help assess how the project might affect them. If the project might have an adverse effect, we would like to discuss possible ways to avoid, minimize or mitigate potential adverse effects.

Enclosed are maps showing the project area (Figure 1). The East Bay Asian Local Development Corporation (EBALDC), and Allied Housing (Allied) are proposing to develop The Phoenix (proposed project), an affordable and supportive housing project at the northwest corner of Pine Street and Story/8th Street in Oakland, California. The project will consist of a four-story, 101-unit residential building and a two-story community building.

The project is in an area affected by the Loma Prieta earthquake and the subsequent reconstruction of I-880 near the Port of Oakland. The project will be located on half of a city

block that once housed a large warehouse. The warehouse was removed during freeway construction and the surface of the area is currently covered with concrete. The Oakland Point Historic District, which is largely comprised of homes built in the late 1800s, abuts the project block on the north and east.

A record search at the Northwest Information Center of the California Historical Resources Information System at Sonoma State University did not identify any known Native American cultural resources in or near the project location. A geoarchaeological analysis of the project site found the area to have a low sensitivity for buried cultural remains, as the area is underlain by dune sand and there are no fresh water sources within ¼ mile of the parcel.

RE: Phoenix Affordable Housing Project

Dear Honorable Chairperson Tarango:

The Oakland Housing Authority is considering funding the project listed above with federal funds from the U.S. Department of Housing and Urban Development (HUD). Under regulation 24 CFR 58.4, the City has assumed HUD's environmental review responsibilities for the project, including tribal consultation related to historic properties, on behalf of HUD. Historic properties include archeological sites, burial grounds, sacred landscapes or features, ceremonial areas, traditional cultural places and landscapes, plant and animal communities, and buildings and structures with significant tribal association.

The City will conduct a review of the project described below to comply with Section 106 of the National Historic Preservation Act and its implementing regulations 36 CFR Part 800. While, we were unable to receive a tribal consultation list from the Native American Heritage Commission, we have identified you as a local Tribe and would like to invite you to be a consulting party in this review to help identify historic properties in the project area that may have religious and cultural significance to your tribe, and if such properties exist, to help assess how the project might affect them. If the project might have an adverse effect, we would like to discuss possible ways to avoid, minimize or mitigate potential adverse effects.

Enclosed are maps showing the project area (Figure 1). The East Bay Asian Local Development Corporation (EBALDC), and Allied Housing (Allied) are proposing to develop The Phoenix (proposed project), an affordable and supportive housing project at the northwest corner of Pine Street and Story/8th Street in Oakland, California. The project will consist of a four-story, 101-unit residential building and a two-story community building.

The project is in an area affected by the Loma Prieta earthquake and the subsequent reconstruction of I-880 near the Port of Oakland. The project will be located on half of a city

block that once housed a large warehouse. The warehouse was removed during freeway construction and the surface of the area is currently covered with concrete. The Oakland Point Historic District, which is largely comprised of homes built in the late 1800s, abuts the project block on the north and east.

A record search at the Northwest Information Center of the California Historical Resources Information System at Sonoma State University did not identify any known Native American cultural resources in or near the project location. A geoarchaeological analysis of the project site found the area to have a low sensitivity for buried cultural remains, as the area is underlain by dune sand and there are no fresh water sources within ¼ mile of the parcel.

More information on the Section 106 review process is available at http://www.comcon.org/sites/default/files/historic_preservation/ . HUD's process for tribal consultation under Section 106 is described in a Notice available at http://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/environment/atec.

To meet project timeframes, if you would like to be a consulting party on this project, can you please let us know of your interest within 30 days? If you have any initial concerns with impacts of the project on religious or cultural properties, can you please note them in your response along with the name and contact information for the tribe's principal representative in the consultation? If you do not wish to consult on this project, can you please inform us?

Your comments and concerns are important to us, and we look forward to hearing from you. If you have any questions or comments regarding the project, I can be contacted via email at hklein@oaklandca.gov or by phone at (510)238-3659.

Sincerely,

Heather Klein

Phoenix Mixed-Use Affordable Housing Project

From: Janis Offermann
To: "Corrina Gould"
Cc: "Klein, Heather"
Subject: RE: Phoenix Affordable Housing Project, Oakland, CA_project notification and request for information letter
Date: Monday, January 31, 2022 12:39:00 PM

Hello Chairperson Gould,
Thank you for your quick response to our email.

In answer to your questions, we submitted a request to the Native American Heritage Commission in mid-November 2021 and we have yet to receive a response from them, despite sending several follow-up emails to them and also giving them a call. So I am afraid I don't have information about the negative or positive findings of the Sacred Lands file search. However, a records search at the Northwest Information Center did not identify any Native American sites within ¼ mile of the project location.

A draft cultural resources assessment report is currently under preparation. With permission of the City of Oakland, we will be happy to provide you with a copy of the report when it is completed. Please let me know if you have any other questions.

Thank you
Janis

Hello,

Thank you for your email. Can you please send additional information regarding the site? Has there been a Sacred Lands File search at the Native American Heritage Commission with Negative or Positive findings? Once this information is available, we can move forward with possible consultation.

'Uni (Respectfully),

Corrina Gould, Tribal Chair

Hi, Chairwoman Gould
I am writing to inform you that the City finally received a response from the Native American Heritage Commission. The letter noted that the sacred lands file search was **positive**, but did not offer any addition information, as is common. The letter also recommended contacting the North Valley Yokuts Tribe and the Amah Mutsun Tribal Band of Mission San Juan Bautista, both of whom received the same letter sent to you. We have not yet heard back from either tribe, but will be following up shortly.

Please let me know if there is anything else I can do for you.
Thank you

Hello again, Chairwoman Gould

Heather kindly reminded me that this is not an AB 52 action but a Section 106 undertaking. If the screen shot I sent does not provide enough information and you would like to visit the project site, please let me know and I will notify the federal lead agency (HUD).
Thank you and I apologize for the error.

Hi, Chairwoman Gould
Thank you for sharing your concerns about the project. I have attached a snapshot from Google Earth that shows the location of the project (the yellow pin). You can see that Wood Street is the next street to the right of the project area.

I have copied Heather Klein, who is the AB 52 contact for the City of Oakland. If you would like to meet with the City at the project site, please coordinate with her.

Please let me know if there is any other information I can provide at this moment.
Best regards
Janis

Dear Janis,

Thank you for your email. The Tribes concern with this project is that it is planned to be in West Oakland in a historically old part of the City. On Wood Street the Tribe knows of buried cultural resources in the back yards of multiple homes. We will need to take a trip to identify how close it is to the current proposed project site.

Hello, Ms. Sayers-Rood

Thank you for your email. I apologize for the delayed response, but I was on vacation last week and I am still sorting through emails.

I appreciate your concerns and will forward your request to consult to the project proponent. Please note that this project is a Section 106 undertaking through HUD, and is not subject to the requirements of AB52/CEQA.

Thanks again. I am sure we will be in touch.

miSmin Tuuhis [Good Day]

Kan rakat Kanyon Sayers-Roods. I am writing this on behalf of the Indian Canyon Band of Costanoan Ohlone People as requested, responding to your letter

As this project's Area of Potential Effect (APE) overlaps or is near the management boundary of a potentially eligible cultural site, I am interested in consulting and voicing our concerns. With some instances like this, usually we recommend that a Native American Monitor and an Archaeologist be present on-site at all times during any/all ground disturbing activities. The presence of a Native monitor and archaeologist will help the project minimize potential effects on the cultural site and mitigate inadvertent issues.

Kanyon Konsulting, LLC has numerous Native Monitors available for projects such as this, if applicable, we recommend a Cultural Sensitivity Training at the beginning of each project. This service is offered to aid those involved in the project to become more familiar with the indigenous history of the peoples of this land that is being worked on.

Kanyon Konsulting is a strong proponent of honoring truth in history, when it comes to impacting Cultural Resources and potential ancestral remains, we need to recognise the history of the territory we are impacting. We have seen that projects like these tend to come into an area to consult/mitigate and move on shortly after - barely acknowledging the Cultural Representatives of the territory they steward and are responsible for. Because of these possibilities, we highly recommend that you receive a specialized consultation provided by our company as the project commences, bringing in considerations about the Indigenous peoples and environment of this territory that you work, have settled upon and benefit from.

As previously stated, our goal is to Honor Truth in History. And as such we want to ensure that there is an effort from the project organizer to take strategic steps in ways that #HonorTruthinHistory. This will make all involved aware of the history of the Indigenous communities whom we acknowledge as the first stewards and land managers of these territories.
Potential Approaches to Indigenous Cultural Awareness/History:
⤜Signs or messages to the audience or community of the territory being developed. (ex. A commerable plaque, page on the website, mural, display, or an Educational/Cultural Center with information about the history/ecology/resources of the land)
⤜Commitment to consultation with the Native Peoples of the territory in regards to presenting and messaging about the Indigenous history/community of the land (Land Acknowledgement on website, written material about the space/org/building/business/etc, Cultural display of cultural resources/botanical knowledge or Culture sharing of Traditional Ecological Knowledge - Indigenous Science and Technology)
⤜Advocation of supporting indigenous lead movements and efforts. (informing one's audience and/or community about local present Indigenous community)

We look forward to working with you.
Tumsan-ak kannis [Thank You]

***Recorded by** Monte Kim, SAIC, 525 Anacapa St., Santa Barbara, CA ***Date** 02/28/03 X☐ Continuation X☐ Update

The extant historic buildings in the district are mostly small to medium in size, 1 or 2 stories, although many now function as 2-story flats with a basement unit. The majority of the structures date from the 1870s and 1880s. Accordingly, the predominant styles in the district are Italianate and Queen Anne, intermingled with some Colonials, Craftsman, and vernacular architectural styles.

Typical remodelings in the district are maintenance-related such as incorporation of: aluminum windows; asbestos removal; aluminum vinyl; stucco or asphalt siding; security doors and grilles; and replaced porches and railings. Many of the houses, especially the cottages, have had the basements expanded into garages, second units, or other usable space. Complete restyling of houses are not common, but have occurred. Commercial buildings in the district have undergone heavier remodeling than the houses, as well as being newer as a group.

The integrity of the district is somewhat eroded by deterioration and neglect of buildings—a few have stood in states of partial demolition or suspended work since at least 1986, and several reasonably unaltered buildings have long been vacant and boarded up. On the other hand, there have been some excellent restorations.

***NRHP Status Code: 3S**
***Resource Identifier** (Assigned by recorder): Oakland Point District

D1. Historic Name: Oakland Point
D2. Common Name: Oakland Point District
*D3. Detailed Description: **(Discuss overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district):**

This district includes 845 properties, of which about 750 are wood-frame residential buildings erected before 1919.

*D4. Boundary Description: (Describe limits of district and attach map showing boundary and district elements):

The Oakland Point residential district is an area of about 47 city blocks in West Oakland bounded on the south by the 7th Street commercial strip along the elevated BART tracks, on the east by the site of the Cypress Street portion of the Nimitz Freeway, and on the west and north by the industrial areas around the 16th Street railroad station and tracks.

***D5. Boundary Justification:**

Boundaries for the district are drawn to exclude a freeway exit at 14th and Cypress streets, a four block area containing a post-1940 church, school, and housing project south of 10th Street from Peralta to Willow, and several small new buildings, giving the district an inverted Y shape on the map. This is by far the largest and most intact section of the historic Oakland Point neighborhood, and one of the largest and most intact Victorian-era neighborhoods in Oakland.

*D6. Significance: Theme Residential, Commercial, & Ethnic Development of Oakland Neighborhoods Area West Oakland
Period of Significance 1866-1910 Applicable Criteria A & C
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity of the district as a whole.)

Oakland Point is a residential district comprised of 845 properties, of which 616 contribute to the district. It is one of Oakland's largest and most intact Victorian neighborhoods and for its distinctive architecture and its period of significance is 1866 to 1910. The district covers about 47 city blocks of flat land laid out in nineteenth-century grid arrangement, traversed by several diagonal streets. Houses are primarily single family, wood-frame one or two stores, onstructed in the Italianate, Stick, Queen Anne and Colonial Revival styles. Although a few elaborate houses exist, the importance of the district is as a vast, oherent neighborhood of working peoples' houses. Also included in the district are one church and a number of small neighborhood stores. Notable features of the district are the groups of matching and near-matching houses, erected by well-known early developers who were also neighborhood residents.

Important themes associated with the neighborhood include its settlement, its association with the railroads, which prompted the area's growth, and its ethnic heritage. Located about two miles west of the earliest settlements in Oakland, "the Point" was the nearest land to San Francisco for Passenger ferries and freight, and had its beginnings as a commuter suburb in the early 1860s. The Central (later the Southern) Pacific Railroad arrived in Oakland in 1869, establishing the western terminus of the transcontinental railroad at the Point. Oakland Point was then transformed into a populous town, almost a "company town," in that a high percentage of its residents were employed by the railroad or related industries. The Point is remembered as melting pot of many nationalities and ethnic groups, which changed over the years, beginning with primarily Yankee and Northern Europeans, then Italian and Slavic, Asian, and African-Americans. Afro-Americans have a long history in the neighborhood, attracted by employment as porters on the railroad, and became a large majority in the area since World War II.

The SHPO determined the Oakland Point Historic District eligible for listing in the National Register of Historic Places under Criteria A and C on October 5, 1990 during evaluation of the proposed Route I-880 Replacement Project from the I-980 Interchange to the I-80/I-580/I-880 Distribution Structure in the cities of Oakland and Emeryville, Alameda County (FHWA 1991). Its architectural significance stems from a large and remarkably intact 19th-century residential neighborhood containing distinguished individual buildings and groups by important local developers, as well as a solid background of typical working people's houses of the 1880s through the early 1900s. Its historical significance is rooted in the district's importance as one of the earliest residential, commercial, and ethnic neighborhoods in Oakland., making it historically significant at the local level.

SIGNIFICANCE

19. Briefly state historical and/or architectural importance (include dates, events, and persons associated with the site):

The Oakland Point district appears eligible for the National Register under Criterion C, Architecture, and Criterion A, Patterns of History. As architecture, its most visible area of significance, it is a large and remarkably intact 19th century residential neighborhood, containing distinguished individual buildings and groups by important local developers as well as a solid background of typical working people's houses of the 1860s through 1900s. It is historically significant in the areas of Exploration/ Settlement as one of Oakland's oldest neighborhoods and one which sheds light on early development and housebuilding practices; Transportation, for its close association with the railroads which prompted the neighborhood's growth and employed many of its residents; and Ethnic Heritage: European and Black, as a neighborhood whose predominant character changed over the years from Irish, to Italian and Slavic, to Black, which was both a renowned melting pot and a cradle of ethnic self-help movements and institutions. Its significance is local, and its period of significance as an architectural district is from 1866--the earliest extant building in the district--to about 1910, when the

7b. Physical Description (continued)

Secondary Importance, not National Register eligible): the South Prescott Neighborhood (between 7th and 3rd Streets, near the S.P. yards), the Oakland Point ASI (beyond the western tip of this district), the 7th Street commercial district (Henry to Wood Streets), and the 16th Street S.P. Station commercial district. There are also small residential clusters near the district on the 1700 block of 14th Street (Wood to Willow) and 1600 blocks of 16th Street (Willow to Campbell).

The extant historic buildings in the district are mostly small to medium in size, 1 or 2 stories: 400-plus can be described as cottages, although many now function as 2-story flats with a basement unit. The majority date from the 1870s (287, pre-earthquake 290) and 1880s (274), with 18 pre-1870, 85 1890s, and 78 1900s. Accordingly the predominant styles in the district are Italianate (330, 333 pre-earthquake), Stick (162), and Queen Anne (222), intermingled with about 85 Colonials (houses, flats, and cottages - some as late as the 1940s), 8 shingle, 11 Craftsman, and about 70 19th century vernacular (minimally Greek Revival/Italianate) and 4 slightly Gothic. Many of the visibly oldest 1-1/2 story steep-gabled vernacular houses are located in the southwest part of the district nearest the historic waterfront and tracks (Wood, Pine, 10th, 9th, Shorey Streets).

Only 22 of the district's pre-1910 buildings originated as other than houses: one church (835 Chester), the carbarn (1450 14th), a small 1906 warehouse (829 Wood), and the rest small neighborhood stores, mostly groceries or meat markets with flats above, all natural adjuncts of a residential neighborhood. About 20 of the 19th century residential buildings and 20 from 1900-1910 appear to have originated as multiple dwellings - mostly flats, and half a dozen unusual side-by-side duplexes from the 1870s and 1880s. Commercial buildings are found mainly along 8th, 14th, and Peralta Streets, which were local transit routes and are today the main traffic streets.

Lots in the district are generally small to medium - 25 to 50' wide, 100 to 125' deep. Some of the larger lots cluster along Peralta and Center in the southeast part of the district, and predominantly smaller ones along Wood, Willow, and Pine to the west, but without a marked distinction between richer and poorer sub-neighborhoods. Perhaps a dozen houses in the district are conspicuously large, and on large lots; as homes of early large landowners, they are scattered through the district, where their first residents often owned whole blocks. They include the Chase house at 801 Wood, Borgeson house at 905 Willow, Bagge house at 1321 Peralta, and Samm-Dalton house at 1454 8th. Incidentally, the preferred location for these big houses seems to have been the southeast corner of the block.

The land at the Point is flat and close to sea level, and streets are laid out in grids. However, two different grids meet along Peralta and 8th Streets, producing a number of triangular, trapezoidal, and very long blocks. Some of

7b. Physical Description (continued)

the most distinctive views in the district are along these diagonal streets - the east side of Peralta north of 12th, where the facades are staggered and well displayed; 12th and Peralta where a group of 11 matching Stick cottages wraps around the acute-angled corner; the long block of Peralta from 9th to 12th, containing St. Patrick's convent, the Ziegenbein house, and a group of other mostly large houses on large lots; the high-1700 block of 8th (Shorey) Street, with a number of very old houses, protected from traffic by the zig-zag course of the street.

Notable features of the district are its groups of matching and near-matching houses. The 11 Stick cottages at 12th and Peralta are an outstanding example. Two-story Italianates with hip roof, 2-story bay, portico, and often a porthole occur in groups, particularly around 8th, 9th, 12th, and Peralta, near the home of their developer John Ziegenbein (1004 Peralta), and form a recurring theme through the district even where they occur singly. A particularly striking Ziegenbein group occupies the long block from 938 to 1102 Chester, hip-roofed Italianate cottages alternating 2 designs, side bay and full-width porch. The large west-district block intersected by McElroy Street (between Pine, Wood, 9th, and 8th) is a whole tract of early-1880s Stick-style workers' cottages, a nearly intact group of 9 similar along Pine developed by G. Holland in 1881-82, and most of the rest - surviving more fragmentarily - by Ziegenbein between 1881 and 1885.

Probably a third of the houses in the district are parts of groups or at least have neighboring twins or semi-twins: false-front Italianate cottages at 839 and 835 Wood, 1872-73; vernacular cottages at 710 and 714 Henry, 1877-78; Stick houses at 1531 and 1537 9th, 1879-80, and many more. This pattern also applies to some of the later houses in the district: two clusters of similar Craftsman houses developed by Myron Wurts in 1912 (830 and 834 Peralta, 1230, 1234, and 1240 Willow), and a group of high-gabled shingle-style houses around 9th and Peralta designed in 1899 by A.W. Smith (912 and 1031 Peralta, 1532 9th 1522 9th). These recurring designs give the district additional coherence beyond its remarkable unity of period, styles, and building types.

Of the 845 properties in the district, 616 (73%) are considered to contribute by virtue of age (pre-1912), style, and integrity. Of these, only about 14 are large, elaborate, and prominently located enough to be considered anchor buildings; the importance of this district is as a vast, continuous neighborhood of everyday 19th century homes. The Western Market/Liberty Hall at 1485 8th Street and St. Patrick's Convent at 920 Peralta Street are the only properties in the district currently considered individually eligible for the National Register. About 2 dozen properties might become eligible if restored, individually or as parts of building groups. The Consolidated Piedmont Cable/Oakland Traction Company carbarn, the Chester Street Methodist Episcopal Church, and the Walsh and O'Brien Grocery are recognizable neighborhood commercial and institutional landmarks, now heavily altered.

HISTORIC RESOURCES INVENTORY CONTINUATION PAGE

Address: Oakland Point District Serial Number: NONE

7b. Physical Description (continued)

Other potentially eligible properties are the homes of significant individuals or works of noted architects or developers: except for the Ziegenbein and Shorey houses (1004 Peralta and 1782 8th Street), these would become fairly minor National Register candidates if restored. In addition, a few clusters of houses might be eligible as visually and historically related groups or sub-districts - the corner of 12th and Peralta, some of the Ziegenbein houses.

Of the 229 noncontributing buildings, about 40 per cent are too new to contribute, and about 60 per cent are older buildings which have been heavily altered. The new buildings include a few Prairie and Mediterranean cottages (15 total, some apparently remodelings of older houses), about 20 mid and late 20th century houses (including about 8 which appear to be factory-built), 5 small postwar apartment buildings, and a steady succession of commercial buildings and storefront additions, gas stations, and churches (one formerly a 1910s movie theater: 1488 14th Street) from every decade up to the present. Of the remodeled buildings, most are still recognizable for what they were, and are classified as compatible noncontributors in their present state, and as contingency contributors (National Register 4Db) which would contribute to the district if restored. An important aspect of this district is that most of the noncontributing buildings are small in scale, and do not overpower the historic setting. Some of the most recent, the small multi-gabled townhouses at 1710 8th and 1736 Chase, like the 1930s and 40s Colonial cottages at 1422 and 1408 16th Street, are classified as "compatible noncontributors" for their size, shapes, and materials consistent with those of the historic buildings.

Within the district boundaries, there are very few vacant lots and not many serious intrusions. The south and east boundaries are recent impositions - the strip cleared along Cypress Street for the Nimitz Freeway in the 1950s, the virtual clearance of 7th Street for BART and the main post office around 1970, redevelopment of residential blocks as Campbell Village in 1939-41, and replacement of St. Patrick's Church and Prescott School, the institutional hearts of the neighborhood, with new buildings in the postwar era. The west and north boundaries, however, are still the historic edges where housing shaded off into industrial and railroad uses on the waterfront and filled marshes. Along Pine and Wood Streets large early 20th century factory and warehouse buildings face blocks of 19th century cottages, and other blocks have small metal or concrete industrial buildings or yards interspersed with the houses. Some of the small industrial buildings are early - the Kohler-Chase warehouse, a 2-story generic woodframe building at 829 Wood, and the Oakland Cream Depot, adjoining the district at 14th and Willow, both built in 1906-07. The Baird Brush factory, 1769 Chase St., dates from 1931, and several 1920s and 1930s garages and service stations are scattered through the district, mostly at prominent intersections (1451 13th St., 1926; 1600 Peralta, 1928; 1700 Center, 1930; 800 Center, 1931; 1532 Peralta, 1940). A layer of more recent automotive, industrial, and commercial buildings (c.1954-65) is found along Cypress Street where freeway construction reshaped

7b. Physical Description (continued)

some blocks. Two large open areas opposite each other at 13th and Wood Streets at the district's north end are the products of recent clearing - a 3/4-block parking lot behind the 1947-55 Mount Zion Missionary Baptist Church, and a half-block city park on the site of the home of 1880s capitalist Ferdinand Koenig.

Typical remodelings in the district are maintenance-related: aluminum windows, asbestos, aluminum, vinyl, stucco, or asphalt siding, security doors and grilles, replaced porches and railings. Many of the houses, especially the cottages, have the basements expanded into garages, second units, or other usable space. Complete restylings of houses are not common, but have occurred: examples of houses considered so altered that their original age is not apparent and they are in effect, visually, late 20th century buildings are 1661 11th Street, 1425 Peralta, 822 Henry, and 1128 Chester. 1405 Campbell, 1411 Peralta, 1620 13th, and 1650 12th Street are houses which were remodeled into apartments during World War II and restyled into something resembling '40s ranch houses in the process. At least 7 of the district's 1920s-30s Mediterranean houses appear to be remodelings of earlier buildings rather then all new construction: 1012 Chester, 1438 15th, 1620 15th, 1630 13th, 1410 14th, 1716 9th, 1414 Campbell Street. From the beginning, houses in the district were enlarged and updated, often by adding a new front - tiny vernacular cottages incorporated into Italianates and Sticks a decade after original construction (e.g. 1416 12th, 1752 9th, 1427 15th), Italianates and Sticks updated as Queen Annes (920, 1014, and 1020 Wood, 1469 13th, 1434 9th, and 1454 8th), 19th century houses turned into Colonial Revival flats (1768 8th, 1726 10th, 1616 15th). About 35 houses are described in the survey with dual dates such as "1889 inc. (incorporates) 1876," the first the visually apparent date (style of the facade, largest part of the house, etc.), the second an identifiable incorporated but more or less hidden component. The most spectacular example of these is 1454 8th, the large Samm-Dalton house, an elaborate Queen Anne whose Italianate past is still recognizable. This house also has a 1940s storefront addition, another common pattern in the district. (Among others, 1669 12th, 1422 and 1673 15th, 1223 Peralta; earlier storefront additions 712 and 904 Peralta.)

Commercial buildings in the district have undergone heavier remodeling than the houses, as well as being newer as a group. The 1914-15 Peralta Theater at 1488 14th Street is completely resurfaced in stuccostone as a church and social hall. There are other storefronts converted to churches with less alteration - 810 Chester, 1451 16th. Other stores are more or less modernized while continuing in commercial use, with new sash, doors, security measures, etc., and some of the early ground-floor stores in mixed-use 19th century buildings are now occupied as residences.

The district contains at least 45 moved buildings, with moving dates from 1884 to the present. Original dates, locations, and owners of about 20 are known,

7b. Physical Description (continued)

and these came mostly from within the district. An exception is the oldest known house in the district - the 1858 William Watts house, now at 1436 Peralta, moved in 1898 from the Watts Tract in northwest Oakland and remodeled as a Queen Anne. Since the district's significance is as a group of fairly generic 19th century houses, moving alone is not considered to keep a compatible building from contributing, though many of the houses moved in this century have also been remodeled in the process.

The integrity of the district is also somewhat eroded by deterioration and neglect of buildings - a few have stood in states of partial demolition or suspended work since at least 1986 (Citywide Preliminary Survey), and several reasonably unaltered buildings have long been vacant and boarded up. On the other hand, there have been some excellent recent restorations, notably Liberty Hall (1485 8th) and 718 Henry Street.

HISTORIC RESOURCES INVENTORY CONTINUATION PAGE

Address: Oakland Point District

Serial Number: NONE

Photo number: 476-3
Photo date: 08/19/87

1126 to 1114 Chester St., 1887-92

Photo number: 491-17
Photo date: 09/04/87

1551 to 1561 8th St., John Ziegenbein, 1878

post-Earthquake building boom completed the area's physical development.

The district's setting contributes to its significance at its south ends, where it adjoins the fragments of the 7th Street commercial district, the mixed commercial-residential blocks of 8th Street opposite Campbell Village and Prescott School (containing an 1890s firehouse and several 1870s houses), and the Oakland Point ASI district (a fragmentary group containing several very early houses including 714 Pine Street). There is another cluster of early houses just outside the district to the northwest, on 14th between Wood and Willow. Elsewhere the surroundings are not contributing, since as described in 7b, the boundaries are drawn where the 19th century residential character of the district ends.

RAILROAD (National Register Criterion A: Industry, Transportation)

Oakland Point is located two miles west of the site around 1st and Broadway where the City of Oakland was first established. The 3190-acre "original town" of 1852 included the undeveloped West Oakland area as well as the roughly 500 acres along Broadway that were laid out in streets in the Kellersberger map of 1853. The Point was of obvious geographic interest to early Oakland as the closest land to San Francisco, for passenger ferries and shipping: meanwhile, the transbay route was up the shallow, marshy San Antonio Creek or estuary to the foot of Broadway. A Bay Street Wharf was begun at the Point in the early 1850s by Rodmond Gibbons but not completed.

In 1861 Gibbons and several partners (including George Goss and Samuel Wood, namesakes of streets in the Point) revived the project in conjunction with train service to Broadway, as the San Francisco and Oakland Railroad. This commuter line ran out 7th Street and met the ferry "Contra Costa" in deep water at the end of a 3/4-mile wharf over mud flats. (The route in the enabling ordinance was described as "Seventh Street from its easterly limits, to... Market Street... thence in a straight line to the western boundary of the city" - the Point was not yet provided with streets.) SF&O service began in 1862 (using an engine and cars built by Novelty Iron Works at the Point) and was extended over the next few years, east to the Brooklyn area beyond Lake Merritt in 1864, and farther west on an enlarged 1-1/4-mile pier by 1868. By 1867, the <u>Oakland Daily News</u> (February 14, p. 13) reported on "The Oakland Point":

> Recently having occasion to ride through this flourishing part of the city, we could but think of the very great and almost wonderful change which the mere presence of the railroad has wrought. Previous to its construction, nearly all that part of the Encinal west of Adeline Street was a wilderness, there being scarcely a house or fence on the whole tract. The ground was generally covered with a thick growth of underbrush and tangled vines. Pleasure parties occasionally went there to gather

19. Historical and/or Architectural Importance (continued)

> blackberries... As soon, however, as the railroad was completed, and our citizens felt that they could rely upon the facilities which it afforded, there was a very great and marked increase of our population... Today there are there a large number of elegant and comfortable houses. We presume that the average value of land there is about $2,000 per acre. We have not ascertained the exact population of that section of the city, but the number of children in attendance at the public school which they have established, is sixty...
>
> Unfortunately the means of communication between the Point and the central part of the city, is very poor. There is only one road leading there, and that is narrow, crooked and sandy... When a large number of houses have been erected, the cost of laying out and grading streets will be infinitely greater. Before other buildings are erected there, the present residents should agree among themselves upon some plan for opening streets upon their land. It will increase in value as it becomes accessible, and it is almost as necessary that there should be a ready means of communication between the Point and Broadway as between the Point and San Francisco.

Apparently the Point, and to some extent Oakland as a whole, was considered mostly a San Francisco commuter suburb at this time. In 1871 a promotional brochure published by the Oakland Daily Transcript ("Information Concerning the Terminus...," pp. 27, 34) stated:

> Various considerations may lead people to prefer a residence outside of the great city to one within, and not the least among these is the larger quantity of ground obtainable for the same amount of money...
>
> The street car trips, from the business portion of San Francisco to, or from any point in that city, where residence property cost even double that of residence property in Oakland, consume more time than the trips between San Francisco and Oakland...
>
> During the year 1870, the cars and boat made twelve trips per day, each way. The average number of passengers to each trip was one hundred and eighty, making four thousand three hundred and twenty passengers per day, or over one million and a half for the year...
>
> Indeed, it is quite evident that the time is not distant when crossings will be made every ten minutes; and persons seeking homesteads can safely depend upon realizing this prediction.

The Central (later Southern) Pacific arrived in 1869 and soon transformed Oakland Point into an active, populous company town. The transcontinental

19. Historical and/or Architectural Importance (continued)

railroad wound down to Alameda County over the Altamont Pass, through Livermore, Pleasanton, Niles, San Lorenzo, San Leandro, and up the Oakland Estuary. The city and ex-mayor Horace Carpentier convinced the Central Pacific to make Oakland the western terminus by giving the railroad virtually the entire waterfront and tidelands (which the city had granted to Carpentier in 1853). This monopoly, which lasted until 1910, retarded industrial development along the Oakland waterfront for decades - except at the Point where the railroad itself was a major industry.

The main passenger depot for Oakland was at 7th Street (also called Railroad Avenue) and Broadway. Passengers for San Francisco - the ultimate transcontinental terminus - continued out 7th and beyond to the ferry. By 1870 traffic was so heavy that the tracks were divided east of Lake Merritt, the freight and overland trains going along 1st Street and the locals - the former San Francisco and Oakland Railroad - along 7th Street. Successive expansions of the pier system were the Long Wharf, 1871, and the Oakland Mole, a major freight and passenger terminal, built in 1879-81. At their longest, the wharves extended about 2 miles, or halfway to Yerba Buena Island. They handled deep-water shipping on a massive scale - the very first freight ferry, the Thoroughfare, 1870, held 18 loaded freight cars ("without breaking bulk" - a sort of early piggyback service) and 16 carloads of loose stock, and warehouse and berthing facilities were in proportion. Seventh Street today continues out over the route of the Mole to container terminals, and a 1910 railroad signal tower still stands. Inland, across 7th from the Point residential neighborhood, extensive freight yards still exist, as well as a few late 19th century brick buildings from the Southern Pacific shop complex, southwest of 7th and Wood, and some 1910s electrical and administration buildings at 415-525 Bay Street.

On this outer stretch, south of 7th Street, the Central Pacific established enormous switching and maintenance yards, a roundhouse, car repair shops, car building shops, a creosoting plant, and shipyards as well, since the CPRR took over the pier and the ferry service. In mid-1874 the expansion of the yards and shops was major local news: "The Point... is now really the most prosperous part of Oakland... The main cause of prosperity down there is the location of the railroad workshops, to which is now being added the Railroad Company's ship yard. The workmen mostly employed there are white men and spend the greater part of their wages on the spot. We suppose that within a twelvemonth no less than twenty business places have been opened at the Point and all appear to be doing well." (News, July 27, 1874) "In view of the proposed harbor improvements on this side of the bay, there is little risk in saying that within three to five years the entire railroad manufacturing and repairing force will be established in West Oakland, adding thousands to the general population and immensely to the business of the city throughout." (Tribune, July 17, 1874) The Illustrated Album of Alameda County (1896) gives some sense of the size and importance of the SP's West Oakland yards:

> THE RAILROAD YARDS. The headquarters of the constructive

19. Historical and/or Architectural Importance (continued)

operations of the Southern Pacific Company's system are at the West Oakland yards....The bridge and building department does all the building for the railroad and for the Pacific Improvement Company, a branch of the Southern Pacific, with the single exception of the laying of the rails. It primarily is designed to build all the bridges which the track and engineer departments require. The latter department supplies the superintendent with a profile of the space to be bridged and the data necessarily connected therewith. From this the designs are drawn and the parts of the bridge made and fitted in these yards. The bridge is built in place by a gang from this department, and when finished and turned over to the track department is ready to receive the rails.

The territory extends all over the Pacific Coast to the most distant points reached by the Southern Pacific Company's lines, whether owned or leased. To the south it reaches El Paso, to the east Ogden, and toward the north it runs into Oregon. Over this territory it supplies, with the exception of ties, every bit of lumber that is used by the several departments of the road, even providing the car department at Sacramento with all its material.... The department is even farther reaching in its scope, for it does the work of construction for the Pacific Improvement Company. The new Del Monte Hotel, at Monterey, Hotel El Carmelo, at Pacific Grove, Castle Crag, near Mount Shasta, are all the work of this department, and a singular proof of the capacity of the West Oakland yards is the fact that the task of supplying the material for this enormous structure did not in the least interfere with the usual work of the shop.

All stations, roundhouses, and other buildings are constructed from data supplied to this department....so that at the place of erection nothing is left the workmen but to fit the pieces together according to the orders given. The department has charge of the shipyard, also, at West Oakland, and has built or repaired all the steamers of the railroad company's large fleet. During the past year this one department has handled over fifteen million feet of lumber and has given employment to some twenty-five hundred men, of which number at least four hundred and fifty are carried upon the pay roll of the Oakland shops. ...

The buildings of the department of motive power and machinery stand close together at the shore of the bay, and in addition to a few tool houses are the machine shop, the blacksmithy, and the roundhouse. The division for which these are the repair shops extends from Oakland to San Jose by Niles, to Sacramento by Livermore on the Western Pacific, to Sacramento by Benicia on the Northern and California Pacific, and to Lathrop. ...

19. Historical and/or Architectural Importance (continued)

> The blacksmithy has four forges and a steam hammer of ten tons. The machine shop is amply fitted with necessary tools, a lathe for turning tires, an hydraulic press for putting wheels on, a large planer, a large slatting machine, three drill punches, and six lathes. Here also is the air compressor which supplies the block signal system, extending from the pier to Sixteenth Street on the overland lines, and to Alice Street on the Fifteenth Street lines. The roundhouse has room for twenty-one locomotives. The daily supply of coal used by the locomotives is, on the average, one hundred tons.
>
> The department employs one hundred and ten men, and the pay roll is growing larger every month. These are classed as follows: Mechanics, thirty-four, comprising smiths, carpenters, boiler makers, machinists, and painters; helpers, twenty-six; laborers, twenty-two; wipers, fifteen, being boys who are in the line of eventually becoming engineers; watchmen and dispatchers, eleven; a foreman of the roundhouse and a foreman of the machine shop. The engineers number ninety-five, and the firemen ninety-eight. The monthly pay roll amounts to $21,000, of which the engineers receive $10,000, the repairing branch $6,000, and the firemen $5,000. ...
>
> The shipyard, which belongs to the bridge building department, is close alongside the repair shops, upon the shore of the creek. It was first established in its present place in 1874, and the steamers Oakland and Transit were the first boats built here....in 1878 the Solano was built. This, the mammoth steamer of the company's fleet, is the largest ferryboat in the world. ...
>
> In the car department all cars or coaches arriving from the East are thoroughly inspected, repaired, and cleaned. The yard set apart for this purpose is probably the most extensive and best fitted for the purpose in the United States. ... There are ten parallel tracks, one thousand feet long, with all necessary switches and cut-offs, running into a long brick shop. ... From two hundred to four hundred passenger coaches are cleaned monthly at these yards.

Railroad craftsmen, operators, and administrators all worked and settled at the Point in great numbers. So did local business people whose hotels, markets, iron works, livery stables, photo studios, saloons, and "female boarding houses" in one way or other served the railroad and its employees or passengers. From 1869 to the 1930s, vast numbers of Point residents are listed in directories as working for the C.P.R.R. or (after 1885) the S.P.Co. as engineers, conductors, firemen, brakemen, signalmen (or towermen - a common post after one was disabled by injury on the job), oilers, wipers, car cleaners, car builders, car repairers, carpenters, upholsterers, painters,

19. Historical and/or Architectural Importance (continued)

ship carpenters, boilermakers, blacksmiths, machinists, bridge builders, sailors, deckhands, stevedores, pile drivers, laborers, clerks, foremen, watchmen, tallymen, collectors, cooks, and porters. The S.P. treasurer, Charles Redington, lived at the Point (1678 10th), as did the S.P. physician, Western Division superintendent, paymaster, and "politicians" (Oscar Breiling, "Memories of Old West Oakland," 1935, p. 29). "The railroad's expanding gradually and employing thousands, had much to do in governing civic and political affairs and many a man in political life owed his start to his railroad connections" (Walter Johnston, "West of Market Boys," ms. c.1940s)

In the early years some carpenters were listed as employees of the "W.D.Co." and "P.I.Co." - Western Development and Pacific Improvement, land-development subsidiaries of the railroads. As Pacific Improvement Co., the West Oakland yards did much of the millwork for the construction of Stanford University. (Enquirer, July 16, 1891) Another related employer was the P.P.C.Co. - the Pullman Palace Car Company - many of whose all-black corps of porters settled in Oakland, and formed the nucleus of a notably early, large, and active East Bay Afro-American community. Almost every house in the Oakland Point district has identifiable railroad-related owners or residents somewhere in its history. From censuses, directories, and memoirs like Oscar Breiling's and those in the West of Market Boys' Journal, it seems possible that in the 19th century close to half the Point's employed residents worked for the railroad. Up to about the 1920s, railroad employees were required to live west of Adeline, to be on call for unscheduled duty. Breiling describes the "tin lunch buckets for the average 100 boarders" at the Railroad Exchange Hotel on 7th Street around 1885. Later, the Tribune reported (12/23/05) that one of the largest accounts of Breiling's own newly organized West Oakland Bank and Trust Company was the S.P. payroll: "about 5,000 men call at this bank each month for their wages." (This superseded "the old pay car," which made monthly rounds of all the job sites, paying the men in gold and silver coin, which was fondly remembered by a West of Market Boy, c.August 1940.) Because of the residence requirement, "Seventh Street was a real shopping center... it was a sorry day for the merchants when the change came." (J.M. Samuels, Seventh Street store keeper, in West of Market Boys' Journal, May 1937)

The role of the railroad in West Oakland began changing around 1910. The Western Pacific began service to Oakland that year with its own pier south of the Southern Pacific pier, having broken the S.P. monopoly in court. Also around 1910 the Southern Pacific converted its local passenger service from steam to electric power, and expanded its routes. This meant some changes in the work in the yards, and some dispersal - power stations were spaced through the region at Fruitvale, West Oakland, and North Berkeley, a new car shop was built in Alameda, and the overhead power lines required scattered headquarters for linesmen. The end of the monopoly also opened up the inner and outer harbors to development, including private shipyards and shipping terminals. World War I enormously expanded shipbuilding in Oakland, and made Oakland one of the nation's major shipbuilding centers. "During the peak year of 1920,

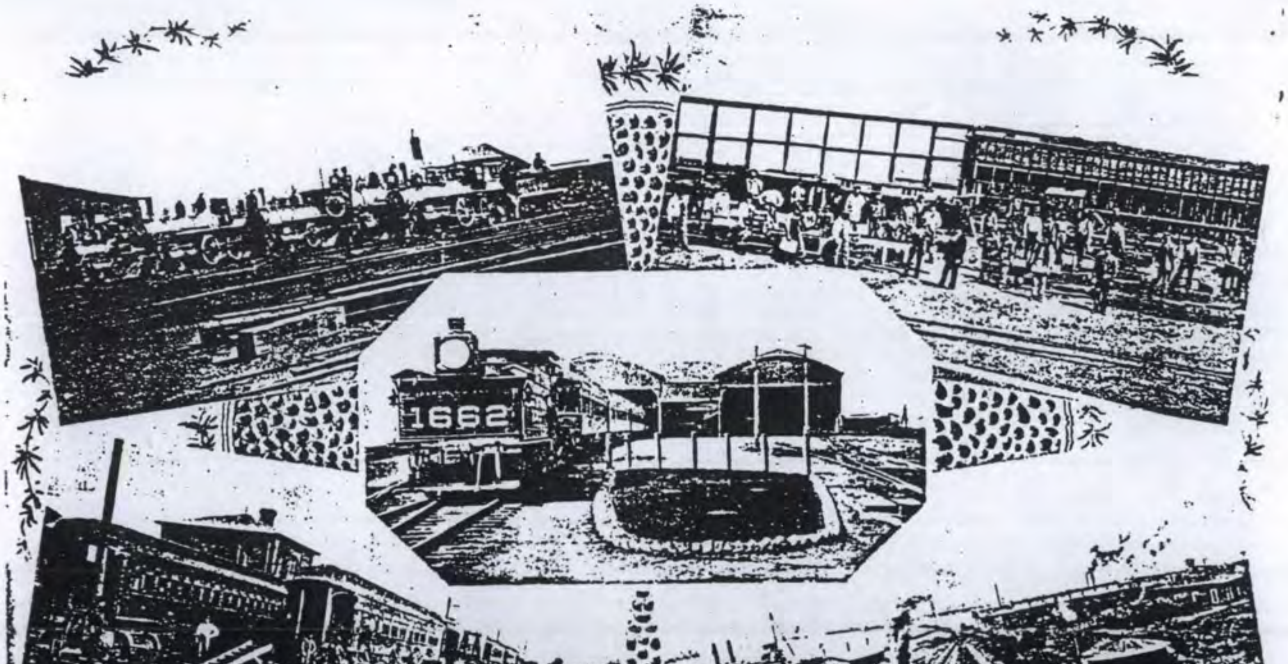
19. Historical and/or Architectural Importance (continued)

Oakland shipyards employed no less than 40,000 men or more than all other industries combined." (Hinkel & McCann, p.887) By the time new shipping terminals were operating on fill in the outer harbor in the 1920s, motor freight was competing with rail service, and auto ferry service became an important part of S.P.'s offerings. After the Bay Bridge opened, the S.P. local service vanished entirely - the 7th Street trains stopped running in 1941. Large rail yards still exist south of 7th Street, but the intimate connection with the neighborhood seems to have died out around the 1930s.

Oakland Tribune, Alameda County Illustrated, 1898, p. 145



RAILROAD YARDS, WEST OAKLAND.
The Terminus of the Central and Southern Pacific Railroads.

19. Historical and/or Architectural Importance (continued)

NEIGHBORHOOD DEVELOPMENT (National Register Criteria A: Exploration/Settlement, C: Architecture)

Maps and contemporary reports confirm the impression that the railroad made Oakland Point. The 1857 Coast Survey map (Hegemann, p. 4) shows winding roads or trails among trees on most of the present neighborhood, the short (reportedly uncompleted) Bay Street pier, and what appear to be a couple of small fenced farms. The Oakland Transcript's 1871 promotional brochure, "Information Concerning the Terminus," describes Oakland of 20 years before as part of the Peralta cattle ranch, and Breiling says that in the early 1860s cattlemen rode their horses up to the bar in the Ridley House at 7th and Cedar. The 1860 Whitcher map shows West Oakland surveyed in multi-acre plots, with Adeline and 8th the only streets, 8th Street skirting a large marsh to the south from about present-day Market to Center Streets, which isolated the Point from the rest of town.

This marsh shows on maps from the 1850s and 60s as a vast diamond-shaped area a mile or more across, with substantial creeks or inlets winding through it to the narrow, shallow channel of San Antonio Creek (now called the Oakland Estuary). Part of this south marsh was subsequently occupied by the Southern Pacific Railroad yards, maintenance shops, and shipyards, and its outer edges in later years filled for the Oakland Naval Supply Depot and Port of Oakland Middle Harbor Terminals. Another marsh area lay to the north of the developing Point neighborhood, beyond about the present 16th Street. This northern marsh is the area now occupied by industry, the 16th Street S.P. (Amtrak) station, and Raimondi (Bay View) Park northwest of the residential area. For the most part it was not developed until the 20th century, and was never residential. On the edges of this north marsh, parts of some blocks were large vegetable gardens (Willow from 14th to 16th, in the 1902 Sanborn map), and farther north it was a city dump and sewage outlet. Part of the south marsh (south of 3rd, Poplar to Cypress) was also a garbage dump until it became S.P. freight yards around the 1920s.

The marshes were enjoyed by children and duck hunters (West of Market Boys' Journal, various references) but were a recognized public health hazard. Under the heading "THE DEATH MARSH: How the West Oakland Morass Slays the Little Children," the Oakland Tribune (February 23, 1892) quoted a Dr. Maher on three cases of typho-malaria in the 1600 block of 17th Street: "The West Oakland marsh comes right up to the doors. There is no place for it to drain into and the place around the house is slimy and sloppy. The malarial complications which I have found in these cases characterize the majority of the cases down there, and there is no other explanation." (One proposed solution, not acted upon, was to cut a wide ship channel east through the marsh to Adeline Street, and use the dredging to "fill the surrounding marsh to a hygienic height" - Tribune, January 3, 1891.) The marshes remained enduring natural boundaries until the era of residential development at the Point was past.

19. Historical and/or Architectural Importance (continued)

The 1870-71 birdseye view published by Snow & Roos has the Point in the foreground, and illustrates the rapid growth prompted by the railways. The present street system is well established, and the blocks on either side of 7th west of Wood are fairly densely developed. The CPRR yards are beginning to fill in, and the mansions of Rodmond Gibbons and C.F. McDermott each occupy a full block along 7th Street at Center. This map also prominently shows the marshes.

An 1881 birdseye, looking across central Oakland to the west, shows the Point as part of an unbroken urban area from Broadway west; a fully developed neighborhood, with houses on most blocks, church steeples, and commercial buildings along the whole length of 7th Street. (In these same decades, the population of Oakland as a whole grew from 1543 in 1860, to 10,500 in 1870, to 34,555 in 1880.) The 1878-79 city directory spotlights the Point in its summary of Oakland's progress and advantages (pp. 10-11):

> LOCATION OF IMPROVEMENTS. It is always a matter of interest to know in what directions the tide of improvements is setting, and what are the causes for the preference of one locality over another in a city advancing to a great position in population and influence. Oakland has two leading thoroughfares - Broadway, running north and south, and Seventh Steet or Railroad Avenue running east and west. The latter owes its importance to the local railroad. At the various stations along the street business centers have been created, which may be said to owe their existence to the railroad. The most westerly station, at the Point, has assumed greater proportions and a more active business than the others, from its proximity to the Central Pacific Railroad shops, which give employment to a large number of men, who mostly reside in the neighborhood and trade at the local shops. The vote of this ward is considerably larger than that of any other in the city. The growth of this section is enhanced or retarded somewhat by the progress of railroad work, and by its prospective future course. The climate at the Point is fresher, cooler and more bracing than that farther away from the bay. To most people this is deemed desirable, while it is avoided by others in different circumstances of health. Building in this section has been fairly active during the year. There are fewer vacant lots in proportion to those already occupied than in other parts.
>
> Passing up to Center [Street] Station, we find that all the vacant ground in the vicinity is rapidly being improved. Fully one hundred houses of the better class were built during 1878, within a radius of one-fourth of a mile from the station. The value of improvements in the territory naturally tributary to this station was not less than half a million dollars during the past year.

19. Historical and/or Architectural Importance (continued)

> Good two story houses are to be obtained upon the installment plan on Eighth, Ninth, Chester and other contiguous streets, on most favorable terms.

The 1878 Thompson & West map shows the same changes in another form - all the big plots at the Point are now laid out in a grid of blocks with named streets and tracts and city-size 25' to 40' lots. Some of the early tracts shown on this map are Toland, 1868 (Wood-Campbell, 10th-11th), Casserly, 1867-69 (Wood-Campbell, 8th-9th), Bay View Homestead, 1868-69 (the South Prescott neighborhood) and Bovee Tract, south of 8th and west of Wood. Dates of the 845 existing buildings in the district show the same pattern: 16 probably built in the 1860s, 290 in the 1870s, 274 in the 1880s. In the boom decade of the '70s, of buildings which can be precisely dated, about 10 per year date from 1870 to 1873; about 30 each date from tax years 1874-75 and 1875-76, 50 from 1876-77, 65 from 1877-78, 32 from 1878-79, and 17 from 1879-80. The heaviest later building years were 1884-85 and 1888-89, with 50-plus each. (The oldest house in the district, the 1858 Watts house at 1436 Peralta, was moved there in 1898 from the Watts Tract in north Oakland. The probable oldest house originally in the district, Rodmond Gibbons' "Folly" of roughly similar date, was located on 7th between Chester and Center, but removed in its last vestiges sometime in the 1980s.)

The extant pre-1869 houses are all located on or west of Wood, from Goss to 10th Street (and one more is at 714 Pine in the now-separate Oakland Point ASI). One is an early San Francisco merchant's two-story Italianate villa - 801 Wood, home of Quincy Chase of Kohler & Chase pianos. The rest are 19th century vernacular, minimally Italianate or Greek Revival cottages and 1-1/2 story houses. The original owners of some of these 1866-69 houses are identified as carpenters, and they may well have built their own homes (e.g. 941 Pine, 930 Wood). A statement in the 1878-79 city directory may shed some light on early building practices, and the many houses at the Point that seem to incorporate a small, early vernacular cottage or saltbox in a slightly later, more fully-developed house:

> Dwellings of more humble pretensions, mostly built for homes by the workingmen of the city, are by far the most numerous of all... It may be stated, however, that many of these consist of only a beginning of a house or rear part, as hundreds who have purchased lots for homestead purposes are not at once able to build a house complete, but are anxious to secure the use of their lot and to save rents. All this indicates thrift and a permanent accession of the bone and sinew of the country in the most desirable shape - that of property-owners.

By the early 1870s, the area had two large-scale developers. John Winfield Pearson, a speculator, farmer, rancher, and lumber mill owner with property all over the Pacific Coast, by 1871 had settled in a "large and magnificent residence at Oakland Point" and was developing houses there. Of the existing

19. Historical and/or Architectural Importance (continued)

houses in the district, 1767 and 1771 11th Street (1871-72), 1782 8th (1873), 1671 11th (1874-75), and 1709 12th (1875-76) are identifiably his (from tax rolls). "Pearson's Row" on the west side of Pine had about 20 cottages, and there are almost certainly others unidentified: the News (July 27, 1874) referred to his "determination of tenanting his end of the city." Sketches of Leading and Representative Men in 1875 said he owned "one hundred and ten tenement houses in the city of Oakland ... intends to build a great number ... and has twenty or thirty houses under way at the present time."

About the same time as Pearson, John Ziegenbein settled at 1004 Peralta (1870-71). Ziegenbein was a German-born San Francisco produce commission merchant who went into land development in West Oakland "and did more than anyone to furnish homes to the people of the First Ward," building almost 300 "houses of plain design but substantial workmanship" and selling them on the installment plan (obituary, Tribune, January 17, 1889). The Enquirer obituary (same date) praised him as a benefactor who enabled people to own homes and kept "a large force of men almost constantly employed" over a period of 18 years. City directories regularly mentioned him in their reports on the year's building improvements - 35 houses in 1879-80, "about 30" in 1880-81. The Enquirer obituary identified Peter Swanson as his foreman at that time, and a group of houses in 1874 (938 to 1102 Chester) appear to have been built in collaboration with Bacon & Dinsmore, but who did the actual building or design for Ziegenbein is not known. About 100 of his houses have been identified among the existing buildings in the district, from tax records and occasional newspaper building lists. The largest number are close to his own house, along Peralta, Chester, Center, Henry, 8th, and 9th Streets, and are one- and two-story 1870s Italianates of two or three fairly standard designs. In the '80s he was building Stick houses and cottages, apparently one or two at a time rather than in larger tracts (850 and 866 Pine, 1454 and 1456 9th, 927 and 931 Chester, 1537 and 1531 9th). Ziegenbein's houses may have been "of plain design" but they were not backward in style - by the late '80s he was building Queen Anne cottages (872 and 876 McElroy, 1218-1234 Campbell, 1101-1125 Peralta). His groups of matching houses still give Oakland Point architectural coherence and a distinctive identity.

Other people besides Ziegenbein and Pearson developed smaller tracts of houses at the Point in the 19th century. French mining engineer Amedee Blanc and collector Aime Fossard developed a particularly striking group of eleven Stick cottages at 12th and Peralta (1884-86), which they kept as rentals for many years. Ann Harris owned a group of 7 Queen Anne rental houses (1011-1111 Center, 1887-88) which were apparently developed by H.S. DeFremery. The DeFremery family, whose 1867 estate outside the Oakland Point District at 16th and Adeline is now a city park, were capitalists with enterprises citywide; so were Galindo & Glascock, who developed and sold 9 houses at 1105-1135 Wood Street in 1884, and show up as developers in marsh areas elsewhere in Oakland. Many neighborhood residents developed a few houses for rental or sale. Some were early large landowners subdividing their property: Christian Bagge, a Danish farmer (1321 Peralta, 1660 14th), Quincy Chase, San Francisco music dealer (801-835 Wood, 1872-73 and 1884-85), Ferdinand Koenig, a brewer who owned and developed the block at 13th and Willow now occupied by a park (1651-1653 14th, 1885-90). Others were local merchants and tradespeople: the Hufschmidt family, plumbers (1725 and 1729 10th etc.), candy manufacturer August Albrecht (1552-1560 8th at Peralta, 1876- 77), stove and tinware dealer James de la Montanya (717-729 Willow etc., 1889-90). Some were carpenters, who very likely built the groups of houses they owned: Patrick Dempsey (710 and 714 Henry, 1877-78), Peter Sorensen (921-933 Willow, 1881-82), Alvin B. Tarr (1414 10th, 1882; 919 Cypress, 1885-86; 1438 10th, 1889-90), Joseph Pettitt (929 and 933 Wood, 1889-90).

A look at the list of names and dates in the district, and at the houses themselves, reveals many more neighborhood residents who owned two or three houses, usually matching, and lived in one and rented the other(s). These small landlords represented all the occupations found in the district - grocers, artisans, building trades, railroad employees at all levels, factory and laundry workers, widows, waiters, saloon and boardinghouse keepers, not much different as a group from their tenants. Large and small houses mix in all parts of the neighborhood, giving at least partial support to early accounts and reminiscences of the Point as a place where class lines where unimportant. Censuses and voting registers show that many households also had unrelated lodgers - often traveling railroad men. Tenants moved frequently, especially railroad workers, and for some houses no residents can be identified. On the other hand, some residents - both owners and tenants - stayed in the same house for 50 years and two or three generations, up to and beyond World War II.

By the time John Ziegenbein died, Oakland Point was in many ways fully developed. 582 of the district's present buildings were in existence - 70% of all buildings now there, 80% of those built before 1910. Only 85 were built in the whole decade of the 1890s, 78 in the 1900s, and 24 in the 1910s. 1888-89 was the last big boom year for construction - 50-plus buildings in the district, as well as many commercial buildings adjoining the district on 7th Street. West Oakland in the late 1880s and early 1890s is the classic West Oakland remembered by the generation who became old timers in the 1930s and 40s, and described in detail in their West of Market Boys' Journal and elsewhere.

An important part of all these early descriptions of the district is the transportation system - trains, streetcars, and horsecars. The Point was well served by transit: the 7th Street local trains from 1863, by the late '70s a horsecar line out 14th from downtown to the SP station at 16th and Wood with branches to Wood and 7th Street (the 14th Street Railway/Consolidated Piedmont Cable Co. carbarn, 1450 14th Street, is a relic of this system), and after about 1891 a network of electric street railways passing within 2 blocks of anywhere in the Point (map in Oakland Enquirer, July 8, 1893). Stations and transfer points supported lively business centers at 7th and Wood, 14th and Peralta, and 17th and Peralta. Like housing, transit at the Point was

19. Historical and/or Architectural Importance (continued)

virtually fully developed by 1893: the coming of the Key System, which consolidated Oakland's street railways in 1903, meant mostly a change of administration of the Point's existing services, while elsewhere in Oakland it created whole new streetcar suburbs. These new neighborhoods perhaps drew away some of the Point's upwardly mobile residents, and thus the Key System accelerated social changes in the district.

Building at the Point after Ziegenbein's time was mostly infill. In the early '90s the Baseball Grounds tract was subdivided on 14th east of Center. The ball field (also used for exhibition fights and a Wild West show - Breiling, p. 44) was part of the property of the Contra Costa Laundry, a major local employer. On this block Elias Fred Sandelin, a 7th Street druggist, developed several houses (1410 to 1420 14th) between 1894 and 1900. Other late houses went onto lots created out of large single homesites: the group of high-gabled shingle style houses at 9th and Peralta (1522 and 1532 9th, 912 Peralta; 1899-1900, A.W. Smith, architect) are on lots sold off from the grounds of the Gensoul mansion where peacocks once roamed (now the site of St. Patrick's Convent, 920 Peralta). Once the district was built up, the way to improve one's living standards was to enlarge and modernize an existing house. Sometimes tax records describe and assess the work ("new front," "raised," etc.), and sometimes there is only the visual evidence of the building itself. A good example is 1454 8th Street, the Samm-Dalton house, an early industrialist's large 1877-78 Italianate transformed in 1895 by another manufacturer-politician into an elaborate Queen Anne. Others, out of many, are 1717 and 1730 8th, 1740 11th, 1414 and 1685 12th, 1477 14th, 1115 Chester, 840 and 1436 Peralta, and 824 Wood.

Somewhat ironically, architects' and builders' names are recorded only after the Point's heyday of development. From California Architect and Building News, Edwards Transcripts, and, after 1905, city building permits, architects' names can be attached to 31 buildings before 1920, the earliest an 1884 Stick cottage by Thomas Newsom (722 Henry) and the next an 1889 Queen Anne cottage by A.W. Smith (1526 9th). A prolific and original architect active in the East Bay from the 1880s to c.1930, Smith has 7 other identified or attributed houses in the district, dating from 1898 to 1902 (919 Center; 912, 1031, 1035, and 1039 Peralta; 1522 and 1532 9th Street), making him by far the most-recorded architect at the Point in its later years. Other major Oakland architects and builders of the 1890s and 1900s have a house or two known at the Point: Charles Mau (who lived in a Ziegenbein house at 1004 Chester in his youth) designed 1477 8th (1892) and 1620 14th (1905), 905 Willow (1890-91) is by A.W. Pattiani, 1748 9th (1901) by Cunningham and Politeo, and C.M. MacGregor was the builder for Smith's 912 Peralta and 1532 9th. John Conant and Albert W. Cornelius (1410 8th, 1894), F.W. Delanoy (1406 8th, 1894), J.C.S. Whalin (718 Henry, 1892; 823 Wood, 1896), and Fred Voorhees (1216 Willow, 1902) are other turn of the century architects who found at least one job at the Point.

By about 1890 and especially after 1900 it was common to build flats, or

19. Historical and/or Architectural Importance (continued)

convert older houses (though occasional flats and side-by-side duplexes were built from the earliest years). A few are part of the residential building boom that followed the 1906 earthquake, but most are earlier: Oakland Point outside the marshes was fully built up, and did not strongly participate in either the Key System boom or the earthquake boom that are so important elsewhere in Oakland. Only about 25 buildings in the district date between the earthquake and 1910. The post-earthquake building boom took place mostly in close-in undeveloped areas like Adams Point and Glascock's marshland north of Lake Merritt (Waverly Street), and in areas newly opened by expanded Key System and Southern Pacific transit service. The effect on West Oakland, in a sense, was secondary: its homes began to look older by comparison, and less desirable. In 1912 Myron Wurts developed 8 similar Craftsman speculative and rental houses in two clusters (1230 to 1240 Willow, 1689 13th, 815 and 817 Henry, 830 and 834 Peralta). After that only a building or two a year was added to the district, and increasingly these were commercial. Here and there, residents built or rebuilt homes in Prairie, bungalow, and Mediterranean styles, as well as some late Colonials which are barely distinguishable from pre-earthquake ones. There are only about 14 of these later-styled houses in the district (e.g. 1414 Campbell, 1716 9th, 1427 Campbell, 1788 9th, 911 Wood).

The Hegemann report (1915) published a map showing "distribution of individual dwellings built in Oakland in 1914", with the comment that "West Oakland has become to a considerable degree industrial and few homes of any kind are being erected." This did not mean that industry was replacing homes, however. New industries came into West Oakland in the 1910s, but mostly to the marsh area bordering the District around the 16th Street Station (e.g. Oakland Mazda Lamp Works, 1600 Campbell Street, 1910-17) and to new terminals in the Outer Harbor. (An exception is the Shredded Wheat factory, 1914, on 14th Street in the Oak Center neighborhood to the east, considered to have started the decline of that area.) At the Point, the California Door Company and Wentworth Boot and Shoe Factory near the station were old established uses (and employers), as were the rail and shipyards, and the Dalton Foundry and Pacific Coast Canning Company along the shoreline west of Pine Street from about 10th to 14th Street. A map of "Industrial Development as of December 31, 1929" in the 1930 Tribune Yearbook still shows only these sites, surrounding a solidly residential district not much different from the present boundaries.

Through the 1910s, 20s, and into the present, stores, gas stations, churches, restaurants, and even a theater (1488 14th at Peralta) continued being built in the district in small but steady numbers, the adjuncts of a living residential neighborhood. In the 1921 Tribune Yearbook West Seventh Street (from Market to Bay) was described as "By far the largest of [Oakland's] business subcenters ...with 227 retail stores of which 52 are grocers and meat markets, and 5 drug stores." (The next largest had 122.) For years it was said that one could live one's whole life without ever needing to leave West Oakland.

19. Historical and/or Architectural Importance (continued)

When Oakland was first zoned in the early 1930s the entire Point west of Poplar was zoned industrial, and the zoning remained so until 1974. Industrial development still took place only along the fringes - Phoenix Ironworks and other large complexes along Pine, additional Outer Harbor development. Major change came to the neighborhood in the form of residential redevelopment. Beginning in 1939, following studies by the WPA and the city (which documented the need for the project by means of maps locating substandard housing, juvenile delinquency, disease, and "non-white families"), the 154-unit Campbell Village housing project was constructed by the new Oakland Housing Authority with federal relief funds on the 2-1/2 blocks bounded by 8th, 10th, Willow, and Campbell Streets. Soon afterward a larger similar project, Peralta Villa, was built 3 blocks west between Cypress and Union Streets (see resource inventory form for 935 Union Street). Accounts of neighborhood reaction to the plan ("Riot Over Housing Disrupts Council," Post-Enquirer 7/14/39; "Confiscation and Discrimination Charges Are Made," Tribune 4/14/39) and later recollections suggest that this was a real social and economic breaking-point for the neighborhood, though the Depression-era deterioration and population shifts which prompted the study and the project were real. One of the West of Market Boys in 1939 wrote of "the wrecked and weatherbeaten shacks on either side of the street that were well kept and happy homes when I was a boy"; black activist C.L. Dellums and the Labor Non-Partisan League campaigned for needed low-rent public housing, and part of the public opposition was that houses elsewhere in the neighborhood were in worse condition than those selected for redevelopment.

Further physical changes came during World War II - houses and commercial buildings were extensively remodeled to create emergency housing (1125 Campbell, 1650 14th, 1405 Campbell, 1727 12th, 1620 13th, 1411 Peralta), and the division and expansion of single-family houses into rental units accelerated, to the extent that today almost every cottage has a basement unit, often dating from the '40s. A third housing project was built in 1942 by Moore Shipyards for its war workers on the old McDermott estate between 7th, 8th, Center, and Cypress; this is the ancestor of the present Westwood Gardens project on that site. (There were also at least three temporary wartime dormitory complexes in the industrial areas adjoining the district.) In the postwar years, in the mid-1950s, the district was reshaped by freeway construction along Cypress Street, cutting the "West of Market" neighborhood in half and brutally isolating the west half - the Point - from the rest of Oakland. Construction of the rapid transit station and main post office around 1970 destroyed what remained of the local commercial and social center along 7th Street and much of the residential area south of it. The Point residential district, though, is still largely intact if isolated: in the words of historian Tom Wolf (Peralta College Oakland history course), "from the West Oakland BART station you can see a 19th century suburban village."

SOCIAL, CULTURAL, AND ECONOMIC LIFE AND INSTITUTIONS

West Oakland before World War II has a Golden Age reputation which appears in too many sources and in too many forms to be pure promotion or pure nostalgia. The keynote is always that the community was a melting pot of classes, nationalities, races, and, for that matter, land uses.

West of Market Boys' Journal, Oct. 1950:

> Everyone at the Point, be he laborer, mechanic, business or professional man were all neighbors. No class lines were drawn. No poverty, no bread lines, and few wealthy people. Wages were not large, hours of work rather long, but everyone was satisfied and happy.

William McFarland, "That's That," Western American (a black Oakland newspaper), April 29, 1927:

> Here Briton, Teuton, and Slav, yellow men, Latin and Black live and toil in an atmosphere of peace and harmony... A comradie (sic) of good fellowship has grown among them that cannot be found in any other spot along the Pacific Coast. Here men are workers and beneath the grime of honest toil beat hearts of purest gold.
>
> Here churches are plentiful and well attended and spacious schools... there no mansions; here are no slums... Here tenant owns the home and takes pride in the love of possession... Here girls are prettier, boys are stronger and babies capture the blue ribbons of excellence. Here the sun shines brighter and the birds warble sweeter and all nature lends lavishly of her charms.
>
> There are many other reasons why we like West Oakland, but these will do for the present.

(Neighborhood boosterism is of course perennial: in the Oakland News of May 20, 1875, "The Point people...brag in the manner and form following, to-wit: They have the two largest vegetable gardens; the largest laundry; the biggest windmill, the only shipyard, the most waterfront, the greatest numbers of prospective railroads, the shortest distance to the city of San Francisco," and so on.)

The largest collection of West Oakland vignettes is found in the West of Market Boys' Journal, published monthly from 1936 to 1959 by an organization of old-time West Oaklanders, by that time mostly living elsewhere and unabashedly dealing in nostalgia. The most extensive of these detailed first-hand accounts is the series "A Sightseeing Tour of West Oakland in the Late Eighties and Early Nineties" written by Ed Anthony, M.D., in 1939-41, a

19. Historical and/or Architectural Importance (continued)

house-by-house and person-by-person tour which vividly evokes the lively, prosperous neighborhood, fleshing out the names and occupations and addresses normally available to historians in censuses and directories and block books, and recording the vanished 7th Street businesses and the constant travel that animated the area. A sampling:

> That red building to my right in the distance is the Round House and the framework in the foreground is the S.P. Shipyard. At times the carp are so thick in the mud flats out there the all that is required to go fishing is a club...boys come here and dig for clams which they sell to housewives in the neighborhood (or)...to Charley O'Gara at the Fire House on Eighth Street and Charley makes clam chowder for Bill Ennis, the driver of the Fire Engine, ...Mike McGuinn the driver of the Hose Cart, and others ... There have been so many accidents at this crossing where the Berkeley Local and Oakland Trains speed around this curve to enter the Oakland Mole that it has been named 'Death Curve.' This is Bay Street ... Railroad men take a pride in their watches ..., so Mr. Fry, the jeweler next door, is kept busy repairing their watches. This section ... is a regular rendezvous for politicians. Guess that there is soon to be election as I see a group of prominent S.P. politicians with their heads together up the street. The big man ... is Wm. McKenzie, master mechanic. The others are Dan Robertson, master bridge builder, Al McKeen and W.B. Ludlow, master car repairers. Ludlow's hobby is gardening. He has a hot-house containing rare plants from all over the world [on 8th, now Campbell Village]... Right here on the corner is Lozier's Grocery. Mr. Lozier is a fine, generous men who has a large book account and he is liked by all of the people in this neighborhood. The railroad strike at a later date broke him...
>
> Just look up Eighth street ..., those tall poplar trees, as far as the eye can see. This is one of the prettiest drives in Oakland ... Many of the business men and bankers doing business in San Francisco and living in Oakland drive down Eighth street in the morning in their classy victorias and board the train at the 'point station,' and they are met at Wood street on their return in the evenings by their wives. I recall Mrs. Pedar Sather and her fine span of horses and coachmen who were often seen along this highway...
>
> We will now drive north on Pine street passing the home of Patricks, an S.P. fireman, and next the McCuens, Billy, Ada, Kittie, George and Jack. Fred Clifford, a car inspector for the S.P., lives in there on Maple street. Over here on this corner is the home of Billy Norton, Chief Train Dispatcher of the S.P. Capt. Tietgen lives next door with Alfred Champreux and his family. Frank Carman, a carpenter, and Jensen, the tailor, live in the

19. Historical and/or Architectural Importance (continued)

next two houses. Across the street is what is known as "Pierson Row." Wm. Wilkinson lives in the first house. He is a carpenter for the S.P. Billy is a fireman. George is employed by the same company. He was later killed in a railroad accident...

John and Pat Fannon, S. P. employees, live over there. John Ziegenbein, a real estate dealer in San Francisco and the subdivider of this section, lives in that large white house with the attractive gardens. He has a son Johnnie and a daughter, Annie. ... G.L. Curtis, a capitalist and horse fancier lives in that large house across the street facing Campbell St. He has a son, Burt, who is in the police department ... Andy Ryder, an old time S.P. main line conductor, lives in that large home this way. It is reported that he is about to retire on a pension and that he has sold his home to Father McNally who is going to use it for a parish house ... Some women, returning home from a Methodist Church meeting, were passing the Ryder home after it had been purchased by Father McNally. Father Mac was remodelling the house to accommodate more people. One woman said to the other "I wonder why they are enlarging that house?" Another spoke up, "Father Mac's family are coming home."... That is St. Patrick's Church across the street. The old white horse and phaeton parked in front is the transportation system of Father Mac ... adored with reverence by all who know him. He is a political power in West Oakland and any candidate for election who has his endorsement can just consider himself elected...

There to our left is the Second Congregational Church, whose congregation included such families as the Hanfords, Ludlows, Youses, Surrhynes, Woodalls, etc. The pastor is the Rev. Frear who lives on Peralta Street. ...

Josiah Gibbs is a carpenter and does some collection work on the side. Hiram Hatch, a carpenter lives over there. His wife is a dressmaker. Looking down Willow Street toward Seventh, Thad Phillips, a Pullman porter, lives upstairs over that store... Mose Morris, a wealthy Pullman porter, lives in the next house ... he has two daughters, Elaine and Lettie, who at a later date was a bookkeeper for the Contra Costa Laundry ... in that large house around the corner on Campbell Street Wm. Wagner ... is a capitalist and one of the officers of the West Oakland Building and Loan Association ... It is here [W.O.B. & L.] that Andrea Sbarboro is making so much money that he is going into the banking business in San Francisco and is also promoting the Italian Swiss Colony ... As we were driving along 12th street and Willow, I forgot to mention a family of some consequence on 13th St. Wm. W. Henry is a commission merchant in S.F. He has two daughters ... Aurelia now Dr. Aurelia Reinhardt, President of Mills College...

19. Historical and/or Architectural Importance (continued)

In this memoir and in other records, the great number of railroad jobs stands out, along with a few other large local employers like Contra Costa Laundry and California Door Company; the endless variety of all other trades and professions making up a self-sufficient community; and the mixture of large and small houses and large and small businesspeople side by side. The number of working women in notable - wives and daughters of working men as well as single women and widows - as dressmakers, bookkeepers, teachers, laundry workers, proofreaders and compositors, keepers of notions or fancy goods stores and boarding houses, as well as less common occupations like physician and real estate agent. In the 1880-81 Pacific Coast Business Directory listings for West Oakland (at that time "a distinct post office") there are at least 15 businesses headed by women, fancy goods and bakeries the most numerous.

San Franciso commuters not only passed through on 8th Street, they lived at the Point, and they too had jobs at all levels. Several residents worked at the mint or the custom house (e.g. Andrew Hollywood, 1668 12th), and there were printers, carpenters, and machinists who held jobs across the bay as well as merchants and manufacturers who owned San Francisco businesses, like Quincy Chase (801 Wood; pianos), showcase manufacturers John Dixon and Charles Borgeson (neighbors at 925 and 927 Willow), commission merchants William Henry (whose house no longer exists) and John Ziegenbein (1004 Peralta) and Austin Hills (1558 8th, later of Hills Bros. Coffee), and dry goods merchant John F. Hink (938 Chester, later of Hink's department store in Berkeley).

Oakland industrialists who lived at the Point in the 19th century included Henry Dalton (1454 8th), whose ironworks was located along Pine; Jacob Samm (1454 8th before Dalton) and John C. Westphal (1475 8th, gone; rental property at 1477 8th) who ran Samm & Westphal's Bay City Flouring Mill downtown, Thomas Corder (932 Center) who had a tannery and stockyard in Emeryville, saw manufacturer Nathan Spaulding (1040 Peralta), Ira Martin Wentworth (1626 14th - destroyed by the Loma Prieta earthquake) whose boot and shoe factory adjoined the 16th Street Station, Thomas Henneberry (1685 12th) who owned the Phoenix Foundry at 1st and Castro, brewer Ferdinand Koenig (rental houses survive at 1657-1661 14th), and Daniel Hayes who built firetrucks (1501 8th).

Most of the proprietors of neighborhood businesses lived in the area, sometimes above the store: the Zeisses and Breilings of the Western Market (later Liberty Hall, 1485 8th: see SHRI) and surrounding rental property; the Bullock plumbing family (1626 and 1630 12th, 823 Center, 1558 8th), restaurant keeper John Cumbelich (718 and 720 Henry), candy maker Christian Schrieber (1107 Willow), William Walsh of the Center Junction Cash Grocery and saloon on the flatiron block at the north tip of the district (1615 Center), 7th Street druggists Charles Morey (824 Wood) and Elias Fred Sandelin (1410-1420 14th, 1001 Chester), baker Conrad Thaler (1502 and 1516 8th), grocers John and Matthew Nunan (822 and 824 Henry) and Rose and James Curran (1042 Willow), and many other grocers, butchers, saloon keepers, plumbers, hardware dealers, and

HISTORIC RESOURCES INVENTORY CONTINUATION PAGE

Address: Oakland Point District Serial Number: NONE

19. Historical and/or Architectural Importance (continued)

other proprietors, as well as their employees.

Many Point residents worked as building tradesmen or artisans, alone or as employees: carpenters, plumbers, machinists, painters, plasterers, metalworkers, etc. Some of the carpenters who appear as original owners of houses may have been the builders: Beriah Fisher (941 Pine, 1867-68), Thomas Johnson (930 Wood and 1733 10th, 1868-69), Maxwell Long (1798 9th, c. 1868), Zeno P. Nickerson (819 Willow, 1875- 76), Charles Lougee (1523 8th, 1875-76), Alex Bruce McDonald (1010 Wood, 1876-77), Willim Tuggey (1514 Peralta, 1877-78), Thomas Cogan (1744 8th, 1881), Alvin B. Tarr (1414 and 1438 10th, 1882 and 1889-90), Silas Carle (1309 and 1311 Center, 1882-83), Peter Svenson (905 Pine, 1883-84), Joseph Pettitt (929 and 933 Wood, 1889-90), Hyacinth Gil (1442 and 1448 10th, 1880-81 and 1891-92).

Several residents classified themselves as farmers or ranchers, or in mining, and Barbados-born whaling master William Shorey (1782 8th Street - see resource inventory form) made his living on the high seas. John Treadwell, 926 Center, was part of a well-known Alaska gold mining family that later developed coal mines and brickyards in the Livermore area. Rodmond Gibbons, of Gibbons' Folly and the S.F. & O. Railroad, was apparently another retired miner ("accentric," according to Breiling). Christian Bagge, who arrived in the 1860s and owned a whole block at 14th and Peralta, probably operated as a "farmer" right there; Laban Langley, called a farmer in the 1890s when he lived at 1422 9th Street, and some other Langleys on Willow called ranchers, may have had their acres outside the Point by that time. The 1892-93 directory lists H. Yoshiike's nursery at 16th and Willow with "ornamental evergreens, flowering shrubs, greenhouse plants, new and rare chrysanthemums and roses." The Grondona family, long a name in the Oakland Produce Market, had vegetable gardens at the north end of the district and lived nearby along Wood and Willow north of 13th, now site of warehouses and a 1980s townhouse project. One other open-air occupation was that of George Van Haltren, professional baseball player (941 Center, 737 Henry).

Point residents were active in various ways in city and neighborhood civic affairs. Saw manufacturer Nathan Spaulding (1040 Peralta) was mayor of Oakland in 1872-73. Henry Dalton (1454 8th) and Eugene Garrison (1144 Peralta, 1472 13th, 1527 8th) both served as county assessor, one starting as a foundry operator and the other as a timekeeper for the S.P. William Hynes (1421 17th) ultimately became District Attorney. Breiling concluded in 1935 that Oakland's "...judges, and county officials, are practically to a man, products of West Oakland" and named Dalton and Walsh among the neighborhood's "old time politicians" (p.18, 32). Charles Redington (1678 10th), S.P. paymaster and treasurer, served on the Board of Education in the early 1900s. Captain Shorey and his wife were active in black philanthropic affairs, and a street at the Point has borne their name since 1907. Father McNally, who presided over St. Patrick's (Catholic) Church for 35 years (1878-1913), was a political as well as spiritual power in the First Ward.

19. Historical and/or Architectural Importance (continued)

Residents in other types of public service included police officers (Bert Curtiss, 1101 and 1107 Campbell; Patrick Hynes, 1421 17th; Dennis Holland, 903 Pine), firemen (see SHRI for Engine Co. No. 3, 1681 8th Street), and teachers. St. Patrick's residence, now at 1625 11th, housed the anonymous teachers of the parochial school. Teachers at the Prescott public elementary school - established 1869 - lived in the district (Ed Anthony gives names: they were mostly women, largely Irish, and rarely householders). Thomas O. Crawford (1531 9th) was principal of Prescott School in the '90s, after serving as superintendent of the Home for the Blind on Telegraph Avenue; he also ran a private boarding school on or near Peralta Street. Charles Burckhalter (914 Chester) was a prominent astronomer and director of the Oakland school department's Chabot Observatory. Lillie Stetson (831 Center) taught at the West Oakland Free Kindergarten at Peralta and Pacific, and other district residents worked at the West Oakland Home for orphans (incorporated 1888). Luke Parker (720 Peralta) was curator of the West Oakland Free Reading Room.

Like the commercial district along 7th Street, early West Oakland institutions - churches, schools, halls - scarcely exist as buildings today. St. Patrick's Church is represented by its rectory (moved to 921 Chester), the teachers' residence (1625 11th), and the convent (920 Peralta), but the school and the church itself were replaced after World War II. Prescott School is also a new building: the church and school, which adjoin Campbell Village, are now part of the gap in the Point historic district, at least for National Register purposes, instead of its centerpieces. The storefront at 712 Peralta which replaced the 7th Street Free Reading Room as the branch library in 1907 still exists, but the library branch was moved to 18th and Adeline, east of the freeway, in 1977. The West Oakland Home was on the Campbell Village site, the Free Kindergarten where the new post office is. The first site of the Fannie Wall Children's Home, a black institution founded in 1918 and at this location until 1928, still stands at 1215 Peralta, now a private house. Sole survivors of the numerous lodge and social halls at the Point are Liberty Hall, 1485 8th (listed on the National Register), originally a store and flat, converted to civic use in the 1920s, first by Marcus Garvey's Universal Negro Improvement Association and then by Father Divine's Peace Mission; and the former Alcatraz Lodge Masonic Hall just south of the district at 715 Peralta, built in 1899 and totally remodeled in 1943 for wartime housing. One union hall survives at 1716 7th Street, in the 7th Street commercial district fragment, where C.L. Dellums headed the Brotherhood of Sleeping Car Porters from 1934 to 1978.

Around 1890 there were at least 11 fraternal, social, and labor halls in the Point, among them Hansen's Hall at Wood and Goss, a political meeting place, Germania and Cavalry Halls favored by the "social element" (Breiling, p. 8), and Kohler's Hall at Center Street Station where the Brotherhood of Locomotive Engineers, the Yard-Masters' Association, the Odd Fellows, and a number of other organizations met (Enquirer, July 22, 1886). The Masons, Foresters, Knights of Pythias, Druids, Woodmen of the World, American Legion of Honor, Ancient Order of United Workmen, Knights of Honor, Chosen Friends, and Young Men's Institute all had at least one branch at the Point. The 1872-73

19. Historical and/or Architectural Importance (continued)

directory lists a skating rink at Pearson Hall, NE Wood and Railroad Avenue, O.P. (Oakland Point). There was a West Oakland Ladies' Aid Society (Times, April 18, 1878) and a West Oakland Improvement Association (Enquirer, Aug. 17, 1889). At least five newspapers are known from scattered references and directory listings to have operated at least briefly: the Semi-Tropical Press, 1874, the West Oakland Home Journal, c.1886, West Oakland Herald, 1888, West Oakland Star, c.1890, and West Oakland Sun, c.1892-93.

If the tales of Father McNally are to be believed, the Point in the 19th century was close to being a one-church town. St. Patrick's was established in 1878 as an offshoot of St. Mary's downtown for a community of predominantly Irish railroad workers, and today "after changes upon changes" (the title of its centennial booklet) it is still a spiritual and community service center in the neighborhood, notably through the housing and job development activities of Jubilee West. The one extant historic church building in the district is the Chester Street Methodist Episcopal Church, 835 Chester, built in 1888-89. (About 1920 it became the Parks Chapel A.M.E. Church, and when Parks Chapel moved uptown, the True Light Church of God in Christ.) In the 1890s there were two other Methodist Episcopal churches at the Point, Norwegian-Danish (Campbell near 9th) and Swedish (10th and Center). Others were Second Congregational, on Chase between Wood and Willow, St. Andrew's Episcopal at 9th and Cypress, and a second Catholic church, St. Joseph's at 7th and Chestnut, a Portuguese national parish. St. Joseph's was established in 1891 to serve the large Portuguese community in South Prescott and to some extent the growing Italian and Spanish-speaking communities (Italian and Slavic immigrants were also absorbed by St. Patrick's). Still farther east of the Point proper, serving another group of its residents, was the Shiloh A.M.E. Chapel, located at 7th and Market from 1863 to 1884. Organized in 1858 "in a small house on 5th Street near the Point" when the black residents of Oakland and Brooklyn numbered about 40, this was one of West Oakland's earliest churches, and a social and educational center that probably helped establish Oakland's Afro- American community near the Point even before the railroad came. The San Francisco A.M.E. church organized camp meetings in the fields near Shiloh in the 1860s (Hausler, 1984). The present-day descendant of Shiloh Chapel is First A.M.E., located at 15th and West Streets from 1884 and now relocated to 37th and Telegraph not far from Parks Chapel. Churches in the district today are probably as numerous as ever, and belong almost entirely to black denominations. Except for 835 Chester, they are a mixture of converted houses and storefronts and postwar church buildings. Besides True Light C.O.G.I.C., they include Morning Star C.O.G.I.C. (745 Willow, 1945-46); Mount Zion, True Light, and New Bethel Missionary Baptist Churches; New Jerusalem, Mt. Carmel, and Center Street Baptist Churches, and Mt. Zion Spiritual Temple (West Coast Kingdom, 1488 14th).

19. Historical and/or Architectural Importance (continued)

ETHNIC GROUPS (National Register Criterion A: Ethnic Heritage: European, Black)

Oakland Point's churches probably embody the district's ethnic history better than any other institution or activity: a large, early, and dominant Irish community; an early, small, close-knit black community, which grew to a majority by the mid-20th century; a fairly large but little discussed Scandinavian presence; successive waves of Portugese, Italian, and Slavic immigrants from the 1880s to the 1920s. There was also a large German immigrant community from the earliest years (several German Lutheran and M.E. Churches, and synagogues, were located outside the Point), a small but visible Chinese and Japanese population, and a gypsy band at the Point, along with the (probably scant) majority of British and Anglo-American residents. A look at the historic names - owners and residents - in the district property list provides a cross-section of the many nationalities at the Point between the 1860s and World War II. The history of the Point in the 20th century can be described as a changing ethnic population in a basically unchanged 19th century built environment.

The 19th century Point evoked by Ed Anthony and Oscar Breiling was predominantly a Yankee and northern European immigrant community, with small numbers of other races and nationalities whom these majority memoirists regarded as both neighbors and exotics. Estimated numbers of European-born and black residents in Oakland as a whole (Hinkel & McCann, 1939, v.I, p.366), extrapolated from census data for selected nationalities, probably correspond generally to proportions at the Point:

	1870	1900	1910	1930
England, Scotland, Wales	420	3382	5304	7674
Ireland	1150	3664	4160	3175
Germany	559	4223	5476	4778
Sweden, Norway, Denmark	19	2598	4794	1551
Italy	38	816	3800	6350
France	122	707	1205	1334
black (wherever born)	55	1026	3055	7503

Figures for Portugese and Slavic immigrants are not included in these estimates, though they were a recognized presence at the Point; in the 1930 census there were about 3000 Poles, Czechs, Austrians, Hungarians, Yugoslavs, and Russians, and about 3500 Oaklanders from Portugal and the Azores.

19. Historical and/or Architectural Importance (continued)

Censuses and directories as well as memoirs show that there was always some job specialization among nationalities, prompted sometimes by experience and tradition abroad and sometimes by local prejudice. The Centennial Yearbook of Alameda County (1876, p. 553) said that in 1851 "communication with San Francisco was by launches and whaleboats manned by Portuguese, who would pull across the bay when there were passengers enough to make a load." Sailing and fishing were frequent occupations for Portuguese Oaklanders, many of whom came from the Azores and Hawaii. Many also worked for the railroads, more often as laborers than as engineers or carpenters. In the present Point district, their homes seem to have been scattered; the local Portuguese enclave was across 7th Street in South Prescott (see Bay View Homestead Tract district form).

German names are prominent from the Point's earliest years as merchants and landowners: Ziegenbein, Hufschmidt, Fuchs, Hink, Schrieber, Hoppe, Scholl, Gohrman, Zeiss and Breiling, Gernreich and Thornburgh, Samm and Westphal, Thaler, Albrecht, Kohler, and many more. Germans farther down the economic scale seem generally to have worked more as artisans and independent tradespeople, and less for the railroad, than other national groups. The absence of a German church at the Point proper also suggests that, like John Ziegenbein, many were freethinkers who "did not belong to any church or secret society" (Enquirer, Jan. 17, 1889). They lived and worked throughout the district: there does not seem to be a recognizable German neighborhood. Scandinavians were sometimes popularly classed with Germans: Breiling (p.12) called "Captain Baggy" "an old-fashioned German" (Theodor Bagge, Danish capitalist; see Christian Bagge house, 1321 Peralta. The point of Breiling's story is that Bagge "nevertheless had the French idea for frogs," raising them on the grounds of his home). The Larsens and Hansens and Nissens and Petersons and Andersons who lived throughout the district often worked for the railroad as carpenters and sailors, or independently in the same occupations.

French immigrants lived at the Point in fairly small numbers, and do not figure prominently in the folklore. Amedee Blanc and Aime Z. Fossard developed a notable group of rental houses at 12th and Peralta in 1884-86. Blacksmith and firefighter Aime Sicotte who lived on 8th Street next to the firehouse (outside the district) was often mentioned for his civic role; Ed Anthony remarked on Sicotte's neighbor Mrs. Melquiond, and her recent immigrant French boarders whose children wore berets and harnesses. There seem to have been a number of French and French-Canadian carpenters and stair builders: Hyacinth Gil (1442 and 1448 10th), Camille Gamp (1417 15th), and the Peter Dubois household which included (English-Canadian) architect Leo Nichols.

The Point's Italian community began small but became a powerful presence by the 1910s and 20s. From the earliest years there was an Italian capitalist element at the Point: the 11 incorporators of the West Oakland Masonic Hall Association in 1876 (News, March 13, 1876) included F. and Natale Gamboni and Andrea Sbarboro of the West Oakland Building and Loan Association, and G. Beretta (1733 10th). Paolo Bacigalupi was another of the earliest residents

19. Historical and/or Architectural Importance (continued)

of the district (1729 11th, 1670-71). Later, when the Italian community was larger, distinctive occupations appear to have involved food and produce - grocery stores, bakeries, gardens, and canneries. Breiling and Anthony both remember "Garibaldi," a neighborhood character of the '90s: "Every child in West Oakland knows Garibaldi and they all fear him. He is a gardener who wears a red flannel shirt, grizzled whiskers, ear rings, and a little cap. A dirk knife in his belt...Garibaldi is not his real name, I will not attempt to spell it. He makes his own 'Dago Red.'" The Grondona vegetable gardens at 13th and Wood apparently lasted into the 1930s.

Much of the new construction in the district after about 1910, both residential and commercial, was done by Italians: houses and flats of Antonio Bertola (1124 Center, 1907), Peter Ratto (1616 15th, c. 1912), Francisco Taramasso (1614 14th, 1915-16), Peter Brocchini (1794 9th, c. 1915), Pasquale Andreuccetti (1220 Peralta, 1921-22), Theo Ninatti (1423 Peralta, 1926), Paul Zarubbi (1730 9th, 1930) and others; stores and gas stations of Gaetano Cuneo (1522 Peralta, 1925), Giacomo Ratto (1600 Peralta, 1928), Luca Catera (1448 14th, 1938), Italo Cencini's winery (1522 Peralta), and others. Even the builders were Italian: Pio Benassini (1220 Peralta), Pietro Delucchi (several buildings including 1522 Peralta and 1629 14th), Charles Ungaretti (1427 Campbell). John Zunino, a West of Market Boy, wrote in 1946, about the St. Patrick's Day celebrations at old St. Patrick's (then being demolished): "One year I took part, playing my little old squeeze box, and on looking over the program I discovered that mine was the only foreign name on the program, the rest being all Irish. In later years, things began to change, as they often do. The old families began moving out of the old neighborhood little by little, until few were left. I'll never forget an entertainment at St. Patrick's where the entertainers were either Slavs or Italians, and only two Irish names appeared in the program." The five-fold growth of Oakland's Italian population between 1900 and 1910 has been attributed to North Beach residents moving from San Francisco after the earthquake (Eleanor Edwards, "Memories of West Oakland," The Montclarion, July 7, 1982, summarizing oral histories).

Slavic and East European immigrants lived and worked at the Point from the beginning in small numbers, and like the Italians became a large community after 1900. Besides the many who worked for the railroad, their early specialization both downtown and at the Point seems to have been restaurants: Novakovich and Kesovia's restaurant at 1790 7th Street is listed in the 1886 directory, and others later. Slavic names are numerous among the owners of new houses after about 1906: John Cumbelich (720 Henry, 1908-09), Martin Savlovich (834 Peralta, 1912), P. Meloslavich (815 Henry, 1912), John Trebotich (911 Wood, 1919), John Tumpich (1663 11th, 1923), Michael Krka (1225 Peralta, 1925-27), Vincent Radovan (734 Henry, c. 1940s). Unlike the Italians, in this sample at any rate, they do not appear as owners of commercial buildings. Common occupations in the 1920s and 30s are driver, factory worker, metal worker.

19. Historical and/or Architectural Importance (continued)

Another small but visible and established ethnic group at the Point was the Chinese. There was always a major Oakland Chinatown near the central business district, but Chinese workers were dispersed through the city, including the Point. Despite their histroic association with the railroads, Chinese workers are not prominent in accounts of the West Oakland yards, which the News (July 27, 1874) said employed "mostly white men." The Tribune on September 7, 1874 reported under news of the Point that W.C. Gray, in charge of dredging at the shipyard, "found himself minus a crew as his Chinamen bucked on him and quit. He is now hiring white men to do the work." Ed Anthony reminisced about throwing stones from the train at a Chinese laundry on 7th Street, and about how "our China cook, Ah Shoo, and Gee Nye, Fred Sandelin's cook, always chipped in to give a real Fourth of July to the neighbors." The Oakland Enquirer's West Oakland correspondent (Aug. 17, 1889) mentioned "Chinese lotteries" as a local nuisance. What later made the Chinese a special presence at the Point was the Pacific Coast Canning Company, established by Lew Hing on two blocks at 12th and Pine in 1903-04. "Lew Hing was the largest single employer of Chinese in the area and by 1911, one of Oakland's largest businesses. There were 1,000 employees hired at peak season." (Jean Moon Liu, Lew Hing; A Family Portrait, p. 8) Lew Hing himself lived downtown, but the cannery complex included large "Chinese quarters" (Sanborn map, 1935), and even before the cannery opened, another Chinese property owner, Yee Sue Kwai, was building nearby (flats and store at 1216 Willow and 1698 12th, 1902 and 1905-06). By the 1920s other homes near the cannery (1137 and 1118 Wood) were owned by Lew Tye, Ed Lew Wing, and Lew Shang Hubert, all associated with Pacific Coast Canning and possibly related to Lew Hing.

West Oakland today is a predominantly black neighborhood - 81%, according to the 1980 census, and about the same in 1950. This large majority, as is well known, dates from World War II, but African-Americans have a long and prominent history at the Point. Like the Irish, they owe their presence at the Point as a group to the railroads. The census for Oakland City puts the number of black residents in 1860 at 18 and 55 in 1870 - the tiny community which, with a few neighbors from Brooklyn, established Shiloh A.M.E. Church and a series of schools for their children. In the 1869 Oakland city directory - the earliest published, and one of two which identify individuals as "colored" - there are 11 black breadwinners listed. Two lived at the Point - J.P. Stewart, a hairdresser (the leading occupation, with 3 listings), and Rev. Abraham Gross, pastor of the "African Church." By 1874, the other color-coded directory, there are about 80 listings. Brooklyn had been annexed bringing in 13 waiters at the Tubbs Hotel, but more importantly, the transcontinental railroad arrived in 1869 with the institution of the Pullman Palace Car and its porters. In 1874, 18 porters with the Central Pacific Railroad were listed with the address "Oakland Ferry Wharf." Besides porters, barber Oscar Jackson (see resource inventory form for 714 Pine Street) and two widows were the only black residents listed at the Point. "Oakland Ferry Wharf" probably referred to company housing; 4 porters that year gave private addresses (3 downtown, one at the Point). Before long, many of these traveling workers established residence - as lodgers, renters, or homeowners -

19. Historical and/or Architectural Importance (continued)

at the Oakland terminus of the railroad where the Pullman car shops and porters' quarters were located.

By 1880 the number of black Oaklanders was 593, 644 in 1890, 1026 in 1900, 3055 in 1910, 5489 in 1920, 7503 in 1930, 8462 in 1940, and 47,562 in 1950. The community of 500 to 1000 in the late 19th century was "enough to support an increasingly complex social structure"; and businesses "multiplied in the growing market along the western part of Seventh Street ... many offering services their owners had learned to perform as employees ... barbershops and beauty salons, carpentry and painting establishments, dress shops, restaurants, retail shops, and bars and clubs" (Crouchett, p. 10-11). J.M. Acty (1620 14th) had a coal yard on 7th Street by 1902. Whaling master Capt. William Shorey settled on 8th Street in the 1880s, was active in black civic and self-help organizations and in 1903 entertained Booker T. Washington at his home (see resource inventory form for 1782 8th Street). A series of black newspapers were published in Oakland (west and otherwise) from 1892: the Illustrated Guide, the Oakland Sunshine, the Western Outlook, the California Voice, the Western American. "In a long letter to the Oakland Enquirer in 1892, Rev. R.A. McGwinn, pastor of Beth Eden Baptist Church, summed up the advantages of Oakland, where housing was better and cheaper and employment more plentiful than in San Francisco. He noted that 'those who have been here long enough to net any earnings have readily seized the opportunity to own their own homes' (Crouchett, p. 15). Despite the low wages paid to porters, many did become homeowners at the Point, and new arrivals did choose Oakland over San Francisco - for the economic reasons given, and because there was already an established black community. (In the 1920 census San Francisco had 2414 black residents out of 506,676, while Oakland had 5489 out of 216,261.)

Porters spread the word as they traveled the country, and more and more settled in Oakland. In the 1910 census the Point begins to show a large number of homes occupied as lodgings by groups of porters and railroad cooks and waiters, with or without wives who might work as domestics, dressmakers, private nurses, or keepers of the lodging houses. Porters William Vance and Simon Dedrick, from Texas, became nationally known when they saved their wages, bought homes, left the railroad, and opened a restaurant at 7th and Wood Streets which was written up in the New York Colored American Magazine in 1905.

In 1907 the Pacific Coast Real Estate and Employment Company was organized at 1696 7th Street to serve this growing population, reportedly the first black business of its kind in the East Bay. In 1915 Charles Tilghman published a Bay Area black directory, in which Oakland businesses predominate, and photos proudly illustrate "homes owned by our race." In 1919 an Oakland and East Bay Negro Business League was established (Crouchett, 17-18).

This period also saw the beginnings of the important cluster of black popular music clubs along west 7th Street, beginning with the Creole Cafe (which closed in 1922 due to "lack of patronage by the Race"), through the great days

19. Historical and/or Architectural Importance (continued)

of Slim Jenkins' "most celebrated black nightclub on the West Coast," 1933 to 1962 (Lee Hildebrand, "Where the Train Stopped," The Express, June 1, 1988). "It was maybe not baby Harlem, but if one existed it probably was" ("oral account" quoted by Mary Cardwell). Another aspect of this entertainment district involved what Douglas Daniels (Pioneer Urbanites, p. 59ff) calls "travelcraft" - a sort of latter-day underground railroad - since visiting black performers were excluded from most hotels (except the California in North Oakland - see SHRI for 3501 San Pablo Avenue), and usually stayed with neighborhood residents.

Most of Seventh Street and its businesses are gone. A few 1920s-30s stores and homes of black business owners survive and are identified in the residential district: these include Phoebe Evans's store and flats at 1229 Peralta (1927-38), a rental owned by furniture dealer James Bridges (1434 15th), and the home and shop of hairdresser Gertrude Foney (1480 8th).

Despite the real growth in black businesses and widening of job opportunities (notably in civil service and the industries which expanded after the opening of the waterfront and during the first World War), as late as 1929 it was estimated that 60% of black Oaklanders' income came from the railroads, 30% specifically from the Pullman company (1930 East Bay Colored Business Directory, cited by Stuart Henry, p. 9). In the mid-20s Dad Moore and C.L. Dellums, Oakland porters who had "learned of the Brotherhood through Eastern Porters coming into the Quarters" (International Brotherhood of Sleeping Car Porters, silver jubilee program, 1950) organized a West Coast branch of A. Philip Randolph's union, originally called San Francisco Local No. 1 but renamed Oakland Division "because most of the porters reside in Oakland, the Headquarters then was in Oakland, the sign-out office is in Oakland, and all of the trains with the exception of a few S.P. trains to Los Angeles operate out of Oakland" (ibid). Union headquarters was at the Point, first at 517 Wood (post office site), and from 1934 to 1978 at 1716 7th Street. There was also a Dining Car Cooks and Waiters Union local at 705 Peralta in the 1930s. The Brotherhood became doubly important in the '30s, when employment opportunities shrank due to the Depression and African-Americans again found themselves restricted to railroad work and "going down to the sea in ships" (Dellums). It was also an important training ground and example for black leadership and activism: Dellums' nephew Ronald, who now represents the East Bay in Congress, and Ruth Acty (1629 14th), the first black teacher in the Berkeley public schools, are two of many leaders from families of porters.

The period roughly from the 1906 earthquake to the end of the Depression is the era remembered as the golden age of the West Oakland melting pot. Royal Towns, born in the early 1900s and a longtime West of Market Boy as well as a civil rights activist and historian, provides the apotheosis of the legend (quoted by Douglas Daniels, Pioneer Urbanites, p. 75):

> The day I was born, I heard all these different women,... Mrs. Moriah, Mrs. Tracy, Mrs. O'Brian, Mrs. Silva, Mrs. Riposa, and

19. Historical and/or Architectural Importance (continued)

> Mrs. Filotta, all those different names, I said, 'Doctor, hey, doc, what kind of a place is this where all these people of different nationalities come to help this old Black woman with her baby?'
>
> And he said, 'This is West Oakland.'
>
> And I said, 'Well, jeez, West Oakland must be a heaven on earth. It must be a really fine place.'

Black homeownership expanded in the 20th century. "By 1910, approximately 200 of Oakland's 3,055 black residents owned their own homes. By 1930 the number would be 700, but blacks could no longer buy anywhere they wished. In the 1920s South Berkeley became the prestige address for successful middle class blacks" (Crouchett, p. 22), and directory information on Point (and Clawson) residents confirms that South Berkeley was a common destination. The racial restrictions that came into use in housing tracts opened during and after the 1906 earthquake boom would become a greater issue later, when more Point residents wished to leave, though in 1918 the irony of the City Council approving one such ordinance "on the day an all-black army unit... left Oakland for World War I" (Crouchett, p. 21) was not lost on the community.

Though Towns and others recalled that, on a personal level at least, "the place was a checkerboard" and "there was none of this racial business" (Tribune, May 6, 1973, "Oldtimers Salute West Oakland"), it was in the '20s that Marcus Garvey's separatist UNIA established a branch at Liberty Hall (1485 8th Street), and other black self-help institutions existed, such as the Fannie Wall Children's Home in the Point district (founded 1918; 1215 Peralta). Father Divine's Peace Mission (1485 8th) and the black YMCA and YWCA branches (outside the district) became important relief agencies during the Depression. One old-time German-Amercian West Oaklander (Donald Mockel, oral history at Oakland History Room) blamed the Depression for the end of the era when "West Oakland was everybody," saying that "Okies and Arkies brought Jim Crow in." When federal relief came to West Oakland in the form of low rent housing projects, a concerned Italian-surnamed resident protested:

> Where will the three or four hundred families who are tenants find other houses to move into? Here in West Oakland there are no houses for rent. They are all occupied. As about 60 per cent of these families are colored they will not be welcome in many sections of the town even if they do find vacancies and can meet the higher rentals. Are they to be turned adrift? (Michael Santi, Tribune, 5/11/39)

One of the charges at the city council hearing (Tribune, July 14, 1939) was "that the Authority intends to discriminate against the Negro race with a 'Jim Crow' project," "where Negroes, whites, and other races have mingled harmoniously for years." Indeed, the "non-white families" map in the project

Address: Oakland Point District

Serial Number: NONE

19. Historical and/or Architectural Importance (continued)

study shows that the blocks proposed for the housing project were among those with the most black residents. The map also shows that many blocks at the Point, south of 12th and east as far as Adeline, were by this time home to 25 or more black families. The blocks along Pine, which protesters said were in worse condition and should have been demolished instead, seem to have housed fewer minorities. A citizens' committee appointed by the mayor reported (Tribune, 12/29/39) that the targeted houses were "in good condition, or could be made so," that "property owners constitute at least half of the residents," and that "there is in both the areas a community spirit that is worth preserving. This community solidarity, the result of a slow growth, cannot be transferred." C.L. Dellums concentrated on making the Housing Authority integrate the projects, got Campbell Village "checkerboarded every floor, every unit," but achieved only "integrated segregation" (building by building) at Peralta Villa, and "lily-whitism" at the third project, Lockwood in East Oakland (Dellums, pp.72-73).

By the time the projects opened, the U.S. was in World War II. "Between 1942 and 1945, slightly more than 50,000 black people moved to the East Bay" to work in shipyards and other war industries. Oakland's Kaiser and Moore shipyards sent labor recruiters through the south; "newcomers outnumbered the old community by five-to-one. ...Old houses in West Oakland... were suddenly occupied by as many as 50 men, often sleeping in shifts... Families living in small apartments or bungalows took in boarders" (Crouchett, pp.45-49). To crowding was added unemployment when the war industries closed, and widespread discrimination when black residents tried to move to other districts. Still, the district experienced a moderate postwar building boom of its own; the new St. Patrick's Church, Mount Zion M.B.C. (1203 Willow), Morning Star C.O.G.I.C. (745 Willow), and a score of small commercial buildings, restaurants, and storefront additions, as well as residential additions and modernizations, date from the late '40s and '50s.

"In 1949 the Oakland City Council declared West Oakland, by then 85 percent black, to be a 'blighted' area, a designation which made it a prime target for massive demolition... Population figures for the Prescott district of West Oakland record the destruction: 22,000 in 1950 11,000 in 1970, and fewer than 6,000 in 1980" (Crouchett, p.56). Major losses in Prescott - Oakland Point - were the whole 7th Street commercial core and much of the neighborhood south of it, and the sense of connection to the rest of Oakland when the freeway and the Acorn project east of it were constructed. This isolation has to some extent kept the remaining "19th century suburban village" at the Point from receiving much attention, either destructive or beneficial, from local government: it remains to be seen what will be done with this resource, important to Oakland for both its 19th century development and its 20th century social history.

DESCRIPTION

7a. Architectural style: predominantly Italianate, Stick, Queen Anne
7b. Briefly describe the present *physical description* of the site or structure and describe any major alterations from its original condition:

The Oakland Point residential district is an area of about 47 city blocks in West Oakland bounded on the south by the 7th Street commercial strip along the elevated BART tracks, on the east by the Cypress Street portion of the Nimitz Freeway, and on the west and north by the industrial areas around the 16th Street railroad station and tracks. This district includes 848 properties of which about 750 are wood-frame residential buildings erected before 1910. Boundaries for the National Register eligible district are drawn to exclude a freeway exit at 14th and Cypress Streets, a 4-block area containing a post-1940 church, school, and housing project south of 10th Street from Peralta to Willow, and several small new buildings, giving the district a sort of inverted Y shape on the map. This is by far the largest and most intact section of the historic Oakland Point neighborhood, and one of the largest and most intact Victorian neighborhoods in Oakland. Other portions of the "Point", now isolated from the main district by intrusions or demolitions, are recorded on separate State Historic Resources Inventory (SHRI) forms: the South Prescott Neighborhood (between 7th and 3rd Streets, near the S.P. yards), the Oakland Point ASI (beyond the western tip of this district), the 7th Street commercial district, and the 16th Street Station commercial district. There are also small residential clusters near the district on the 1700 block of 14th Street and 1600 blocks of 16th Street.

SIGNIFICANCE

19. Briefly state historical and/or architectural importance (include dates, events, and persons associated with the site.)

The Oakland Point district appears eligible for the National Register under Criterion C, Architecture, and Criterion A, Patterns of History. As architecture, it is a large and remarkably intact 19th century residential neighborhood, containing distinguished individual buildings and groups by important local developers as well as a solid background of typical working people's houses of the 1860s through 1900s. It is historically significant in the areas of Exploration/Settlement as one of Oakland's oldest neighborhoods and one which sheds light on early development and housebuilding practices; Transportation, for its close association with the railroads which prompted the neighborhood's growth and employed many of its residents; and Ethnic Heritage: European and Black, as a neighborhood whose predominant character changed over the years from Irish, to Italian and Slavic, to Black, which was both a renowned melting pot and a cradle of ethnic self-help movements and institutions.

7b. Physical Description (continued from page 1)

The extant historic buildings in the district are mostly small to medium in size, 1 or 2 stories: 400-plus can be described as cottages, although many now function as 2-story flats with a basement unit. The majority date from the 1870s (290) and 1880s (274), with 18 pre-1870, 85 1890s, and 78 1900s. Accordingly the predominant styles in the district are Italianate (333), Stick (162), and Queen Anne (222), intermingled with about 85 Colonials (houses, flats, and cottages - some as late as the 1940s), 8 shingle, 11 Craftsman, and about 70 19th century vernacular (minimally Greek Revival/Italianate) and 4 slightly Gothic. Many of the visibly oldest 1-1/2 story steep-gabled vernacular houses are located in the southwest part of the district nearest the historic waterfront and tracks (Wood, Pine, 10th, 9th, Shorey Streets).

Only 22 of the district's pre-1910 buildings originated as other than houses: one church (835 Chester), the carbarn (1450 14th), a small 1906 warehouse (829 Wood), and the rest small neighborhood stores, mostly groceries or meat markets with flats above, all natural adjuncts of a residential neighborhood. About 20 of the 19th century residential buildings and 20 from 1900-1910 appear to have originated as multiple dwellings - mostly flats, and half a dozen unusual side-by-side duplexes from the 1870s and 1880s. Commercial buildings are found mainly along 8th, 14th, and Peralta Streets, which were local transit routes and are today the main traffic streets.

Lots in the district are generally small to medium - 25 to 50' side, 100 to 125' deep. Some of the larger lots cluster along Peralta and Center in the southeast part of the district, and predominantly smaller ones along Wood, Willow, and Pine to the west, but without a marked distinction between richer and poorer sub-neighborhoods. Perhaps a dozen houses in the district are conspicuously large, and on large lots; as homes of early large landowners, they are scattered through the district, where their first residents often owned whole blocks. They include the Chase house at 801 Wood, Borgeson house at 905 Willow, Bagge house at 1321 Peralta, and Samm-Dalton house at 1454 8th. Incidentally, the preferred location for these big houses seems to have been the southeast corner of the block.

The land at the Point is flat and close to sea level, and streets are laid out in grids. However, two different grids meet along Peralta and 8th Streets, producing a number of triangular, trapezoidal, and very long blocks. Some of the most distinctive views in the district are along these diagonal streets - the east side of Peralta north of 12th, where the facades are staggered and well displayed; 12th and Peralta where a group of 11 matching Stick cottages wraps around the acute-angled corner; the long block of Peralta from 9th to 12th, containing St. Patrick's convent, the Ziegenbein house, and a group of other mostly large houses on large lots; the high-1700 block of 8th (Shorey) Street, with a number of very old houses, protected from traffic by the zig-zag course of the street.

Notable features of the district are its groups of matching and near-matching houses. The 11 Stick cottages at 12th and Peralta are an outstanding example. Two-story Italianates with hip roof, 2-story bay, portico, and often a porthole occur in groups, particularly around 8th, 9th, 12th, and Peralta, near the home of their developer John Ziegenbein (1004 Peralta), and form a recurring theme through the district even where they occur singly. A particularly striking Ziegenbein group occupies the long block from 938 to 1102 Chester, hip-roofed Italianate cottages alternating 2 designs, side bay and full-width porch. The large west-district block intersected by McElroy Street (between Pine, Wood, 9th, and 8th) is a whole tract of early-1880s Stick-style workers' cottages, a nearly intact group of 9 similar along Pine developed by G. Holland in 1881-82, and most of the rest - surviving more fragmentarily - by Ziegenbein between 1881 and 1885.

Probably a third of the houses in the district are parts of groups or at least have neighboring twins or

(see continuation page 4)

Street or rural address: Oakland Point District - API State Form Part 1

7b. Physical Description (continued from page 3)

semi-twins: false-front Italianate cottages at 839 and 835 Wood, 1872-73; vernacular cottages at 710 and 714 Henry, 1877-78; Stick houses at 1531 and 1537 9th, 1879-80, and many more. This pattern also applies to some of the later houses in the district: two clusters of similar Craftsman houses developed by Myron Wurts in 1912 (830 and 834 Peralta, 1230, 1234, and 1240 Willow), and a group of high-gabled shingle-style houses around 9th and Peralta designed in 1899 by A.W. Smith (912 and 1031 Peralta, 1532 9th 1522 9th). These recurring designs give the district additional coherence beyond its remarkable unity of period, styles, and building types.

Of the 848 properties in the district, 618 (73%) are considered to contribute by virtue of age (pre-1912), style, and integrity. Of these, only about 14 are large, elaborate, and prominently located enough to be considered anchor buildings; the importance of this district is as a vast, continuous neighborhood of everyday 19th century homes. The Western Market/Liberty Hall at 1485 8th Street, St. Patrick's Convent at 920 Peralta, and the Shorey house at 1782 8th Street are the only properties in the district currently considered individually eligible for the National Register. About 2 dozen properties might become eligible if restored, individually or as parts of building groups. The Consolidated Piedmont Cable/Oakland Traction Company carbarn, the Chester Street Methodist Episcopal Church, and the Walsh and O'Brien Grocery are recognizable neighborhood commercial and institutional landmarks, now heavily altered. Other potentially eligible properties are the homes of significant individuals or works of noted architects or developers: except for the Ziegenbein house, these would become fairly minor National Register candidates if restored. In addition, a few clusters of houses might be eligible as visually and historically related groups or sub-districts - the corner of 12th and Peralta, some of the Ziegenbein houses.

Of the 230 noncontributing buildings, about 40 per cent are too new to contribute, and about 60 per cent are older buildings which have been heavily altered. The new buildings include a few Prairie and Mediterranean cottages (15 total, some apparently remodelings of older houses), about 20 mid and late 20th century houses (including about 8 which appear to be factory-built), 5 small postwar apartment buildings, and a steady succession of commercial buildings and storefront additions, gas stations, and churches (one formerly a 1910s movie theater: 1488 14th Street) from every decade up to the present. Of the remodeled buildings, most are still recognizable for what they were, and are classified as compatible noncontributors in their present state, and as contingency contributors (National Register 4Db) which would contribute to the district if restored. An important aspect of this district is that most of the noncontributing buildings are small in scale, and do not overpower the historic setting. Some of the most recent, the small multi-gabled townhouses at 1710 8th and 1736 Chase, like the 1930s and 40s Colonial cottages at 1422 and 1408 16th Street, are classified as "compatible noncontributors" for their size, shapes, and materials consistent with those of the historic buildings.

Within the district boundaries, there are very few vacant lots and not many serious intrusions. The south and east boundaries are recent impositions - the strip cleared along Cypress Street for the Nimitz Freeway in the 1950s, the virtual clearance of 7th Street for BART and the main post office around 1970, redevelopment of residential blocks as Campbell Village in 1939-42, and replacement of St. Patrick's Church and Prescott School, the institutional hearts of the neighborhood, with new buildings in the postwar era. The west and north boundaries, however, are still the historic edges where housing shaded off into industrial and railroad uses on the waterfront and filled marshes. Along Pine and Wood Streets large early 20th century factory and warehouse buildings face blocks of 19th century cottages, and other blocks have small metal or concrete industrial buildings or yards interspersed with the houses. Some of the small industrial buildings are early - the Kohler-Chase warehouse, a 2-story generic woodframe building at 829 Wood, and the Oakland Cream Depot, adjoining the district at 14th and Willow, both built

(see continuation page 5)

Street or rural address: Oakland Point District - API State Form Part 1

7b. Physical Description (continued from page 4)

in 1906-07. The Baird Brush factory, 1769 Chase St., dates from 1931, and several 1920s and 1930s garages and service stations are scattered through the district, mostly at prominent intersections (1451 13th St., 1926; 1600 Peralta, 1928; 1700 Center, 1930; 800 Center, 1931; 1532 Peralta, 1940). A layer of more recent automotive, industrial, and commercial buildings (c.1954-65) is found along Cypress Street where freeway construction reshaped some blocks. Two large open areas opposite each other at 13th and Wood Streets at the district's north end are the products of recent clearing - a 3/4-block parking lot behind the 1947-55 Mount Zion Missionary Baptist Church, and a half-block city park on the site of the home of 1880s capitalist Ferdinand Koenig.

Typical remodelings in the district are maintenance-related: aluminum windows, asbestos, aluminum, vinyl, stucco, or asphalt siding, security doors and grilles, replaced porches and railings. Many of the houses, especially the cottages, have the basements expanded into garages, second units, or other usable space. Complete restylings of houses are not common, but have occurred: examples of houses considered so altered that their original age is not apparent and they are in effect, visually, late 20th century buildings are 1661 11th Street, 1425 Peralta, 822 Henry, and 1128 Chester. 1405 Campbell, 1411 Peralta, 1620 13th, and 1650 12th Street are houses which were remodeled into apartments during World War II and restyled into something resembling '40s ranch houses in the process. At least 7 of the district's 1920s-30s Mediterranean houses appear to be remodeling of earlier buildings rather then all new construction: 1012 Chester, 1438 15th, 1620 15th, 1630 13th, 1410 14th, 1716 9th, 1414 Campbell Street. From the beginning, houses in the district were enlarged and updated, often by adding a new front - tiny vernacular cottages incorporated into Italianates and Sticks a decade after original construction (e.g. 1416 12th, 1752 9th, 1427 15th), Italianates and Sticks updated as Queen Annes (920, 1014, and 1020 Wood, 1469 13th, 1434 9th, and 1454 8th), 19th century houses turned into Colonial Revival flats (1768 8th, 1726 10th, 1616 15th). About 35 houses are described in the survey with dual dates such as "1889 inc. (incorporates) 1876," the first the visually apparent date (style of the facade, largest part of the house, etc.), the second an identifiable incorporated but more or less hidden component. The most spectacular example of these is 1454 8th, the large Samm-Dalton house, an elaborate Queen Anne whose Italianate past is still recognizable. This house also has a 1940s storefront addition, another common pattern in the district. (Among others, 1669 12th, 1422 and 1673 15th, 1223 Peralta; earlier storefront additions 712 and 904 Peralta.)

Commercial buildings in the district have undergone heavier remodeling than the houses, as well as being newer as a group. The 1914-15 Peralta Theater at 1488 14th Street is completely resurfaced in stuccostone as a church and social hall. There are other storefronts converted to churches with less alteration - 810 Chester, 1451 16th. Other stores are more or less modernized while continuing in commercial use, with new sash, doors, security measures, etc., and some of the early ground-floor stores in mixed-use 19th century buildings are now occupied as residences.

The district contains at least 45 moved buildings, with moving dates from 1884 to the present. Original dates, locations, and owners of about 20 are known, and these came mostly from within the district. An exception is the oldest known house in the district - the 1858 William Watts house, now at 1436 Peralta, moved in 1898 from the Watts Tract in northwest Oakland and remodeled as a Queen Anne. Since the district's significance is as a group of fairly generic 19th century houses, moving alone is not considered to keep a compatible building from contributing, though many of the houses moved in this century have also been remodeled in the process.

The integrity of the district is also somewhat eroded by deterioration and neglect of buildings - a few have stood in states of partial demolition or suspended work since at least 1986 (Citywide Preliminary Survey), and several reasonably unaltered buildings have long been vacant and boarded up. On the other hand, there have been some excellent recent restorations, notably Liberty Hall (1485 8th) and 718 Henry Street.

19. Historical and/or Architectural Importance (continued from page 2)

RAILROAD (Context Codes RR, WT, IN, SF, BU; National Register Criteria, A: Transportation)

Oakland Point is located two miles west of the site around 1st and Broadway where the City of Oakland was first established. The 3190-acre "original town" of 1852 included the undeveloped West Oakland area as well as the roughly 500 acres along Broadway that were laid out in streets in the Kellersberger map of 1853. The Point was of obvious geographic interest to early Oakland as the closest land to San Francisco, for passenger ferries and shipping: meanwhile, the transbay route was up the shallow, marshy San Antonio Creek or estuary to the foot of Broadway. A Bay Street Wharf was begun at the Point in the early 1850s by Rodmond Gibbons but not completed.

In 1861 Gibbons and several partners (including George Goss and Samuel Wood, namesakes of streets in the Point) revived the project in conjunction with train service to Broadway, as the San Francisco and Oakland Railroad. This commuter line ran out 7th Street and met the ferry "Contra Costa" in deep water at the end of a 3/4-mile wharf over mud flats. (The route in the enabling ordinance was described as "Seventh Street from its easterly limits, to… Market Street… thence in a straight line to the western boundary of the city" - the Point was not yet provided with streets.) SF&O service began in 1862 (using an engine and cars built by Novelty Iron Works at the Point) and was extended over the next few years, east to the Brooklyn area beyond Lake Merritt in 1864, and farther west on an enlarged 1-1/4-mile pier by 1868. By 1867, the Oakland Daily News (February 14, p. 13) reported on "The Oakland Point":

> Recently having occasion to ride through this flourishing part of the city, we could but think of the very great and almost wonderful change which the mere presence of the railroad has wrought. Previous to its construction, nearly all that part of the Encinal west of Adeline Street was a wilderness, there being scarcely a house or fence on the whole tract. The ground was generally covered with a thick growth of underbrush and tangled vines. Pleasure parties occasionally went there to gather blackberries… As soon, however, as the railroad was completed, and our citizens felt that they could rely upon the facilities which it afforded, there was a very great and marked increase of our population… Today there are there a large number of elegant and comfortable houses. We presume that the average value of land there is about $2,000 per acre. We have not ascertained the exact population of that section of the city, but the number of children in attendance at the public school which they have established, is sixty…
>
> Unfortunately the means of communication between the Point and the central part of the city, is very poor. There is only one road leading there, and that is narrow, crooked and sandy… When a large number of houses have been erected, the cost of laying out and grading streets will be infinitely greater. Before other buildings are erected there, the present residents should agree among themselves upon some plan for opening streets upon their land. It will increase in value as it becomes accessible, and it is almost as necessary that there should be a ready means of communication between the Point and Broadway as between the Point and San Francisco.

Apparently the Point, and to some extent Oakland as a whole, was considered mostly a San Francisco commuter suburb at this time. In 1871 a promotional brochure published by the Oakland Daily Transcript ("Information Concerning the Terminus…," pp. 27, 34) stated:

> Various considerations may lead people to prefer a residence outside of the great city to one within, and not the least among these is the larger quantity of ground obtainable for the same amount of money…

(see continuation page 12)

19. Historical and/or Architectural Importance (continued from page 11)

> The street car trips, from the business portion of San Francisco to, or from any point in that city, where residence property cost even double that of residence property in Oakland, consume more time than the trips between San Francisco and Oakland...
>
> During the year 1870, the cars and boat made twelve trips per day, each way. The average number of passengers to each trip was one hundred and eighty, making four thousand three hundred and twenty passengers per day, or over one million and a half for the year...
>
> Indeed, it is quite evident that the time is not distant when crossings will be made every ten minutes; and persons seeking homesteads can safely depend upon realizing this prediction.

The Central (later Southern) Pacific arrived in 1869 and soon transformed Oakland Point into an active, populous company town. The transcontinental railroad wound down to Alameda County over the Altamont Pass, through Livermore, Pleasanton, Niles, San Lorenzo, San Leandro, and up the Oakland Estuary. The city and ex-mayor Horace Carpentier convinced the Central Pacific to make Oakland the western terminus by giving the railroad virtually the entire waterfront and tidelands (which the city had granted to Carpentier in 1853). This monopoly, which lasted until 1910, retarded industrial development along the Oakland waterfront for decades - except at the Point where the railroad itself was a major industry.

The main passenger depot for Oakland was at 7th Street (also called Railroad Avenue) and Broadway. Passengers for San Francisco - the ultimate transcontinental terminus - continued out 7th and beyond to the ferry. By 1870 traffic was so heavy that the tracks were divided east of Lake Merritt, the freight and overland trains going along 1st Street and the locals - the former San Francisco and Oakland Railroad - along 7th Street. Successive expansions of the pier system were the Long Wharf, 1871, and the Oakland Mole, a major freight and passenger terminal, built in 1879-81. At their longest, the wharves extended about 2 miles, or halfway to Yerba Buena Island. They handled deep-water shipping on a massive scale - the very first freight ferry, the Thoroughfare, 1870, held 18 loaded freight cars ("without breaking bulk" - a sort of early piggyback service) and 16 carloads of loose stock, and warehouse and berthing facilities were in proportion. Seventh Street today continues out over the route of the Mole to container terminals, and a 1910 railroad signal tower still stands. Inland, across 7th from the Point residential neighborhood, extensive freight yards still exist, as well as a few late 19th century brick buildings from the Southern Pacific shop complex, southwest of 7th and Wood, and some 1910s electrical and administration buildings at 415-525 Bay Street.

On this outer stretch, south of 7th Street, the Central Pacific established enormous switching and maintenance yards, a roundhouse, car repair shops, car building shops, a creosoting plant, and shipyards as well, since the CPRR took over the pier and the ferry service. In mid-1874 the expansion of the yards and shops was major local news: "The Point... is now really the most prosperous part of Oakland... The main cause of prosperity down there is the location of the railroad workshops, to which is now being added the Railroad Company's ship yard. The workmen mostly employed there are white men and spend the greater part of their wages on the spot. We suppose that within a twelvemonth no less than twenty business places have been opened at the Point and all appear to be doing well." (News, July 27, 1874) "In view of the proposed harbor improvements on this side of the bay, there is little risk in saying that within three to five years the entire railroad manufacturing and repairing force will be established in West Oakland, adding thousands to the general population and immensely to the business of the city throughout." (Tribune, July 17, 1874) The Illustrated Album of Alameda County (1896) gives some sense of the size and importance of the SP's West Oakland yards:

19. Historical and/or Architectural Importance (continued from page 12)

THE RAILROAD YARDS. The headquarters of the constructive operations of the Southern Pacific Company's system are at the West Oakland yards....The bridge and building department does all the building for the railroad and for the Pacific Improvement Company, a branch of the Southern Pacific, with the single exception of the laying of the rails. It primarily is designed to build all the bridges which the track and engineer departments require. The latter department supplies the superintendent with a profile of the space to be bridged and the data necessarily connected therewith. From this the designs are drawn and the parts of the bridge made and fitted in these yards. The bridge is built in place by a gang from this department, and when finished and turned over to the track department is ready to receive the rails.

The territory extends all over the Pacific Coast to the most distant points reached by the Southern Pacific Company's lines, whether owned or leased. To the south it reaches El Paso, to the east Ogden, and toward the north it runs into Oregon. Over this territory it supplies, with the exception of ties, every bit of lumber that is used by the several departments of the road, even providing the car department at Sacramento with all its material.... The department is even farther reaching in its scope, for it does the work of construction for the Pacific Improvement Company. The new Del Monte Hotel, at Monterey, Hotel El Carmelo, at Pacific Grove, Castle Crag, near Mount Shasta, are all the work of this department, and a singular proof of the capacity of the West Oakland yards is the fact that the task of supplying the material for this enormous structure did not in the least interfere with the usual work of the shop.

All stations, roundhouses, and other buildings are constructed from data supplied to this department....so that at the place of erection nothing is left the workmen but to fit the pieces together according to the orders given. The department has charge of the shipyard, also, at West Oakland, and has built or repaired all the steamers of the railroad company's large fleet. During the past year this one department has handled over fifteen million feet of lumber and has given employment to some twenty-five hundred men, of which number at least four hundred and fifty are carried upon the pay roll of the Oakland shops. ...

The buildings of the department of motive power and machinery stand close together at the shore of the bay, and in addition to a few tool houses are the machine shop, the blacksmithy, and the roundhouse. The division for which these are the repair shops extends from Oakland to San Jose by Niles, to Sacramento by Livermore on the Western Pacific, to Sacramento by Benicia on the Northern and California Pacific, and to Lathrop. ...

The blacksmithy has four forges and a steam hammer of ten tons. The machine shop is amply fitted with necessary tools, a lathe for turning tires, an hydraulic press for putting wheels on, a large planer, a large slatting machine, three drill punches, and six lathes. Here also is the air compressor which supplies the block signal system, extending from the pier to Sixteenth Street on the overland lines, and to Alice Street on the Fifteenth Street lines. The roundhouse has room for twenty-one locomotives. The daily supply of coal used by the locomotives is, on the average, one hundred tons.

The department employs one hundred and ten men, and the pay roll is growing larger every month. These are classed as follows: Mechanics, thirty-four, comprising smiths, carpenters, boiler makers, machinists, and painters; helpers, twenty-six; laborers, twenty-two; wipers, fifteen, being boys who are in the line of eventually becoming engineers; watchmen and dispatchers, eleven; a foreman of the roundhouse and a foreman of the machine shop. The engineers number ninety-five, and the firemen

(see continuation page 14)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 13)

> ninety-eight. The monthly pay roll amounts to $21,000, of which the engineers receive $10,000, the repairing branch $6,000, and the firemen $5,000. …
>
> The shipyard, which belongs to the bridge building department, is close alongside the repair shops, upon the shore of the creek. It was first established in its present place in 1874, and the steamers Oakland and Transit were the first boats built here….in 1878 the Solano was built. This, the mammoth steamer of the company's fleet, is the largest ferryboat in the world. …
>
> In the car department all cars or coaches arriving from the East are thoroughly inspected, repaired, and cleaned. The yard set apart for this purpose is probably the most extensive and best fitted for the purpose in the United States. … There are ten parallel tracks, one thousand feet long, with all necessary switches and cut-offs, running into a long brick shop. … From two hundred to four hundred passenger coaches are cleaned monthly at these yards.

Railroad craftsmen, operators, and administrators all worked and settled at the Point in great numbers. So did local business people whose hotels, markets, iron works, livery stables, photo studios, saloons, and "female boarding houses" in one way or other served the railroad and its employees or passengers. From 1869 to the 1930s, vast numbers of Point residents are listed in directories as working for the C.P.R.R. or (after 1885) the S.P.Co. as engineers, conductors, firemen, brakemen, signalmen (or towermen - a common post after one was disabled by injury on the job), oilers, wipers, car cleaners, car builders, car repairers, carpenters, upholsterers, painters, ship carpenters, boilermakers, blacksmiths, machinists, bridge builders, sailors, deckhands, stevedores, pile drivers, laborers, clerks, foremen, watchmen, tallymen, collectors, cooks, and porters. The S.P. treasurer, Charles Redington, lived at the Point (1678 10th), as did the S.P. physician, Western Division superintendent, paymaster, and "politicians" (Oscar Breiling, "Memories of Old West Oakland," 1935, p. 29). "The railroad's expanding gradually and employing thousands, had much to do in governing civic and political affairs and many a man in political life owed his start to his railroad connections" (Walter Johnston, "West of Market Boys," ms. c.1940s)

In the early years some carpenters were listed as employees of the "W.D.Co." and "P.I.Co." - Western Development and Pacific Improvement, land-development subsidiaries of the railroads. As Pacific Improvement Co., the West Oakland yards did much of the millwork for the construction of Stanford University. (Enquirer, July 16, 1891) Another related employer was the P.P.C.Co. - the Pullman Palace Car Company - many of whose all-black corps of porters settled in Oakland, and formed the nucleus of a notably early, large, and active East Bay Afro-American community. Almost every house in the Oakland Point district has identifiable railroad-related owners or residents somewhere in its history. From censuses, directories, and memoirs like Oscar Breiling's and those in the West of Market Boys' Journal, it seems possible that in the 19th century close to half the Point's employed residents worked for the railroad. Up to about the 1920s, railroad employees were required to live west of Adeline, to be on call for unscheduled duty. Breiling describes the "tin lunch buckets for the average 100 boarders" at the Railroad Exchange Hotel on 7th Street around 1885. Later, the Tribune reported (12/23/05) that one of the largest accounts of Breiling's own newly organized West Oakland Bank and Trust Company was the S.P. payroll: "about 5,000 men call at this bank each month for their wages." (This superseded "the old pay car," which made monthly rounds of all the job sites, paying the men in gold and silver coin, which was fondly remembered by a West of Market Boy, c.August 1940.) Because of the residence requirement, "Seventh Street was a real shopping center… it was a sorry day for the merchants when the change came." (J.M. Samuels, Seventh Street store keeper, in West of Market Boys' Journal, May 1937)

(see continuation page 15)

19. Historical and/or Architectural Importance (continued from page 14)

The role of the railroad in West Oakland began changing around 1910. The Western Pacific began service to Oakland that year with its own pier south of the Southern Pacific pier, having broken the S.P. monopoly in court. Also around 1910 the Southern Pacific converted its local passenger service from steam to electric power, and expanded its routes. This meant some changes in the work in the yards, and some dispersal - power stations were spaced through the region at Fruitvale, West Oakland, and North Berkeley, a new car shop was built in Alameda, and the overhead power lines required scattered headquarters for linesmen. The end of the monopoly also opened up the inner and outer harbors to development, including private shipyards and shipping terminals. World War I enormously expanded shipbuilding in Oakland, and made Oakland one of the nation's major shipbuilding centers. "During the peak year of 1920, Oakland shipyards employed no less than 40,000 men or more than all other industries combined." (Hinkel & McCann, p.887) By the time new shipping terminals were operating on fill in the outer harbor in the 1920s, motor freight was competing with rail service, and auto ferry service became an important part of S.P.'s offerings. After the Bay Bridge opened, the S.P. local service vanished entirely - the 7th Street trains stopped running in 1941. Large rail yards still exist south of 7th Street, but the intimate connection with the neighborhood seems to have died out around the 1930s.

19. Historical and/or Architectural Importance (continued from page 15)

NEIGHBORHOOD DEVELOPMENT (Context Codes 19, EQ, 20, W2, TR, RM, BU, IN; National Register Criteria A: Exploration/Settlement, C: Architecture)

Maps and contemporary reports confirm the impression that the railroad made Oakland Point. The 1857 Coast Survey map (Hegemann, p. 4) shows winding roads or trails among trees on most of the present neighborhood, the short (reportedly uncompleted) Bay Street pier, and what appear to be a couple of small fenced farms. The Oakland Transcript's 1871 promotional brochure, "Information Concerning the Terminus," describes Oakland of 20 years before as part of the Peralta cattle ranch, and Breiling says that in the early 1860s cattlemen rode their horses up to the bar in the Ridley House at 7th and Cedar. The 1860 Whitcher map shows West Oakland surveyed in multi-acre plots, with Adeline and 8th the only streets, 8th Street skirting a large marsh to the south from about present-day Market to Center Streets, which isolated the Point from the rest of town.

This marsh shows on maps from the 1850s and 60s as a vast diamond-shaped area a mile or more across, with substantial creeks or inlets winding through it to the narrow, shallow channel of San Antonio Creek (now called the Oakland Estuary). Part of this south marsh was subsequently occupied by the Southern Pacific Railroad yards, maintenance shops, and shipyards, and its outer edges in later years filled for the Oakland Naval Supply Depot and Port of Oakland Middle Harbor Terminals. Another marsh area lay to the north of the developing Point neighborhood, beyond about the present 16th Street. This northern marsh is the area now occupied by industry, the 16th Street S.P. (Amtrak) station, and Raimondi (Bay View) Park northwest of the residential area. For the most part it was not developed until the 20th century, and was never residential. On the edges of this north marsh, parts of some blocks were large vegetable gardens (Willow from 14th to 16th, in the 1902 Sanborn map), and farther north it was a city dump and sewage outlet. Part of the south marsh (south of 3rd, Poplar to Cypress) was also a garbage dump until it became S.P. freight yards around the 1920s.

The marshes were enjoyed by children and duck hunters (West of Market Boys' Journal, various references) but were a recognized public health hazard. Under the heading "THE DEATH MARSH: How the West Oakland Morass Slays the Little Children," the Oakland Tribune (February 23, 1892) quoted a Dr. Maher on three cases of typho-malaria in the 1600 block of 17th Street: "The West Oakland marsh comes right up to the doors. There is no place for it to drain into and the place around the house is slimy and sloppy. The malarial complications which I have found in these cases characterize the majority of the cases down there, and there is no other explanation." (One proposed solution, not acted upon, was to cut a wide ship channel east through the marsh to Adeline Street, and use the dredging to "fill the surrounding marsh to a hygienic height" - Tribune, January 3, 1891.) The marshes remained enduring natural boundaries until the era of residential development at the Point was past.

The 1870-71 birdseye view published by Snow & Roos has the Point in the foreground, and illustrates the rapid growth prompted by the railways. The present street system is well established, and the blocks on either side of 7th west of Wood are fairly densely developed. The CPRR yards are beginning to fill in, and the mansions of Rodmond Gibbons and C.F. McDermott each occupy a full block along 7th Street at Center. This map also prominently shows the marshes.

An 1881 birdseye, looking across central Oakland to the west, shows the Point as part of an unbroken urban area from Broadway west; a fully developed neighborhood, with houses on most blocks, church steeples, and commercial buildings along the whole length of 7th Street. (In these same decades, the population of Oakland as a whole grew from 1543 in 1860, to 10,500 in 1870, to 34,555 in 1880.) The 1878-79 city directory spotlights the Point in its summary of Oakland's progress and advantages (pp. 10-11):

(see continuation page 17)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 16)

> LOCATION OF IMPROVEMENTS. It is always a matter of interest to know in what directions the tide of improvements is setting, and what are the causes for the preference of one locality over another in a city advancing to a great position in population and influence. Oakland has two leading thoroughfares - Broadway, running north and south, and Seventh Steet or Railroad Avenue running east and west. The latter owes its importance to the local railroad. At the various stations along the street business centers have been created, which may be said to owe their existence to the railroad. The most westerly station, at the Point, has assumed greater proportions and a more active business than the others, from its proximity to the Central Pacific Railroad shops, which give employment to a large number of men, who mostly reside in the neighborhood and trade at the local shops. The vote of this ward is considerably larger than that of any other in the city. The growth of this section is enhanced or retarded somewhat by the progress of railroad work, and by its prospective future course. The climate at the Point is fresher, cooler and more bracing than that farther away from the bay. To most people this is deemed desirable, while it is avoided by others in different circumstances of health. Building in this section has been fairly active during the year. There are fewer vacant lots in proportion to those already occupied than in other parts.
>
> Passing up to Center [Street] Station, we find that all the vacant ground in the vicinity is rapidly being improved. Fully one hundred houses of the better class were built during 1878, within a radius of one-fourth of a mile from the station. The value of improvements in the territory naturally tributary to this station was not less than half a million dollars during the past year.
>
> Good two story houses are to be obtained upon the installment plan on Eighth, Ninth, Chester and other contiguous streets, on most favorable terms.

The 1878 Thompson & West map shows the same changes in another form - all the big plots at the Point are now laid out in a grid of blocks with named streets and tracts and city-size 25' to 40' lots. Some of the early tracts shown on this map are Toland, 1868 (Wood-Campbell, 10th-11th), Casserly, 1867-69 (Wood-Campbell, 8th-9th), Bay View Homestead, 1868-69 (the South Prescott neighborhood) and Bovee Tract, south of 8th and west of Wood. Dates of the 848 existing buildings in the district show the same pattern: 16 probably built in the 1860s, 290 in the 1870s, 274 in the 1880s. In the boom decade of the '70s, for buildings which can be precisely dated, about 10 per year date from 1870 to 1873; about 30 each date from tax years 1874-75 and 1875-76, 50 from 1876-77, 65 from 1877-78, 32 from 1878-79, and 17 from 1879-80. The heaviest later building years were 1884-85 and 1888-89, with 50-plus each. (The oldest house in the district, the 1858 Watts house at 1436 Peralta, was moved there in 1898 from the Watts Tract in north Oakland. The probable oldest house originally in the district, Rodmond Gibbons' "Folly" of roughly similar date, was located on 7th between Chester and Center, but removed in its last vestiges sometime in the 1980s.)

The extant pre-1869 houses are all located on or west of Wood, from Goss to 10th Street (and one more is at 714 Pine in the now-separate Oakland Point ASI). One is an early San Francisco merchant's two-story Italianate villa - 801 Wood, home of Quincy Chase of Kohler & Chase pianos. The rest are 19th century vernacular, minimally Italianate or Greek Revival cottages and 1-1/2 story houses. The original owners of some of these 1866-69 houses are identified as carpenters, and they may well have built their own homes (e.g. 941 Pine, 930 Wood). A statement in the 1878-79 city directory may shed some light on early building practices, and the many houses at the Point that seem to incorporate a small, early vernacular cottage or saltbox in a slightly later, more fully-developed house: "Dwellings of more humble pretensions, mostly built for homes by the workingmen of the city, are by far the most numerous of all... It may be stated, however, that many of these consist of only a beginning of a house or rear part, as hun-

(see continuation page 18)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 17)

dreds who have purchased lots for homestead purposes are not at once able to build a house complete, but are anxious to secure the use of their lot and to save rents. All this indicates thrift and a permanent accession of the bone and sinew of the country in the most desirable shape - that of property-owners."

By the early 1870s, the area had two large-scale developers. John Winfield Pearson, a speculator, farmer, rancher, and lumber mill owner with property all over the Pacific Coast, by 1871 had settled in a "large and magnificent residence at Oakland Point" and was developing houses there. Of the existing houses in the district, 1767 and 1771 11th Street (1871-72), 1782 8th (1873), 1671 11th (1874-75), and 1709 12th (1875-76) are identifiably his (from tax rolls). "Pearson's Row" on the west side of Pine had about 20 cottages, and there are almost certainly others unidentified: the News (July 27, 1874) referred to his "determination of tenanting his end of the city." Sketches of Leading and Representative Men in 1875 said he owned "one hundred and ten tenement houses in the city of Oakland … intends to build a great number … and has twenty or thirty houses under way at the present time."

About the same time as Pearson, John Ziegenbein settled at 1004 Peralta (1870-71). Ziegenbein was a German-born San Francisco produce commission merchant who went into land development in West Oakland "and did more than anyone to furnish homes to the people of the First Ward," building almost 300 "houses of plain design but substantial workmanship" and selling them on the installment plan (obituary, Tribune, January 17, 1889). The Enquirer obituary (same date) praised him as a benefactor who enabled people to own homes and kept "a large force of men almost constantly employed" over a period of 18 years. City directories regularly mentioned him in their reports on the year's building improvements - 35 houses in 1879-80, "about 30" in 1880-81. The Enquirer obituary identified Peter Swanson as his foreman at that time, and a group of houses in 1874 (938 to 1102 Chester) appear to have been built in collaboration with Bacon & Dinsmore, but who did the actual building or design for Ziegenbein is not known. About 100 of his houses have been identified among the existing buildings in the district, from tax records and occasional newspaper building lists. The largest number are close to his own house, along Peralta, Chester, Center, Henry, 8th, and 9th Streets, and are one- and two-story 1870s Italianates of two or three fairly standard designs. In the '80s he was building Stick houses and cottages, apparently one or two at a time rather than in larger tracts (850 and 866 Pine, 1454 and 1456 9th, 927 and 931 Chester, 1537 and 1531 9th). Ziegenbein's houses may have been "of plain design" but they were not backward in style - by the late '80s he was building Queen Anne cottages (872 and 876 McElroy, 1218-1234 Campbell, 1101-1125 Peralta). His groups of matching houses still give Oakland Point architectural coherence and a distinctive identity.

Other people besides Ziegenbein and Pearson developed smaller tracts of houses at the Point in the 19th century. French mining engineer Amedee Blanc and collector Aime Fossard developed a particularly striking group of eleven Stick cottages at 12th and Peralta (1884-86), which they kept as rentals for many years. Ann Harris owned a group of 7 Queen Anne rental houses (1011-1111 Center, 1887-88) which were apparently developed by H.S. DeFremery. The DeFremery family, whose 1867 estate outside the Oakland Point District at 16th and Adeline is now a city park, were capitalists with enterprises citywide; so were Galindo & Glascock, who developed and sold 9 houses at 1105-1135 Wood Street in 1884, and show up as developers in marsh areas elsewhere in Oakland. Many neighborhood residents developed a few houses for rental or sale. Some were early large landowners subdividing their property: Christian Bagge, a Danish farmer (1321 Peralta, 1660 14th), Quincy Chase, San Francisco music dealer (801-835 Wood, 1872-73 and 1884-85), Ferdinand Koenig, a brewer who owned and developed the block at 13th and Willow now occupied by a park (1651-1653 14th, 1885-90). Others were local merchants and tradespeople: the Hufschmidt family, plumbers (1725 and 1729 10th etc.), candy manufacturer August Albrecht (1552-1560 8th at Peralta, 1876-77), stove and tinware dealer James de la Montanya (717-729 Willow etc., 1889-90). Some were carpenters,

(see continuation page 19)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 18)

who very likely built the groups of houses they owned: Patrick Dempsey (710 and 714 Henry, 1877-78), Peter Sorensen (921-933 Willow, 1881-82), Alvin B. Tarr (1414 10th, 1882; 919 Cypress, 1885-86; 1438 10th, 1889-90), Joseph Pettitt (929 and 933 Wood, 1889-90).

A look at the list of names and dates in the district, and at the houses themselves, reveals many more neighborhood residents who owned two or three houses, usually matching, and lived in one and rented the other(s). These small landlords represented all the occupations found in the district - grocers, artisans, building trades, railroad employees at all levels, factory and laundry workers, widows, waiters, saloon and boardinghouse keepers, not much different as a group from their tenants. Large and small houses mix in all parts of the neighborhood, giving at least partial support to early accounts and reminiscences of the Point as a place where class lines where unimportant. Censuses and voting registers show that many households also had unrelated lodgers - often traveling railroad men. Tenants moved frequently, especially railroad workers, and for some houses no residents can be identified. On the other hand, some residents - both owners and tenants - stayed in the same house for 50 years and two or three generations, up to and beyond World War II.

By the time John Ziegenbein died, Oakland Point was in many ways fully developed. 582 of the district's present buildings were in existence - 70% of all buildings now there, 80% of those built before 1910. Only 85 were built in the whole decade of the 1890s, 78 in the 1900s, and 24 in the 1910s. 1888-89 was the last big boom year for construction - 50-plus buildings in the district, as well as many commercial buildings adjoining the district on 7th Street. West Oakland in the late 1880s and early 1890s is the classic West Oakland remembered by the generation who became old timers in the 1930s and 40s, and described in detail in their West of Market Boys' Journal and elsewhere.

An important part of all these early descriptions of the district is the transportation system -- trains, streetcars, and horsecars. The Point was well served by transit: the 7th Street local trains from 1863, by the late '70s a horsecar line out 14th from downtown to the SP station at 16th and Wood with branches to Wood and 7th Street (the 14th Street Railway/Consolidated Piedmont Cable Co. carbarn, 1450 14th Street, is a relic of this system), and after about 1891 a network of electric street railways passing within 2 blocks of anywhere in the Point (map in Oakland Enquirer, July 8, 1893). Stations and transfer points supported lively business centers at 7th and Wood, 14th and Peralta, and 17th and Peralta. Like housing, transit at the Point was virtually fully developed by 1893: the coming of the Key System, which consolidated Oakland's street railways in 1903, meant mostly a change of administration of the Point's existing services, while elsewhere in Oakland it created whole new streetcar suburbs. These new neighborhoods perhaps drew away some of the Point's upwardly mobile residents, and thus the Key System accelerated social changes in the district.

Building at the Point after Ziegenbein's time was mostly infill. In the early '90s the Baseball Grounds tract was subdivided on 14th east of Center. The ball field (also used for exhibition fights and a Wild West show - Breiling, p. 44) was part of the property of the Contra Costa Laundry, a major local employer. On this block Elias Fred Sandelin, a 7th Street druggist, developed several houses (1410 to 1420 14th) between 1894 and 1900. Other late houses went onto lots created out of large single homesites: the group of high-gabled shingle style houses at 9th and Peralta (1522 and 1532 9th, 912 Peralta; 1899-1900, A.W. Smith, architect) are on lots sold off from the grounds of the Gensoul mansion where peacocks once roamed (see SHRI form for St. Patrick's Convent, 920 Peralta). Once the district was built up, the way to improve one's living standards was to enlarge and modernize an existing house. Sometimes tax records describe and assess the work ("new front," "raised," etc.), and sometimes there is only the visual evidence of the building itself. A good example is 1454 8th Street, the Samm-Dalton

(see continuation page 20)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 19)

house, an early industrialist's large 1877-78 Italianate transformed in 1895 by another manufacturer-politician into an elaborate Queen Anne. Others, out of many, are 1717 and 1730 8th, 1740 11th, 1414 and 1685 12th, 1477 14th, 1115 Chester, 840 and 1436 Peralta, and 824 Wood.

Somewhat ironically, architects' and builders' names are recorded only after the Point's heyday of development. From California Architect and Building News, Edwards Trancripts, and, after 1905, city building permits, architects' names can be attached to 31 buildings before 1920, the earliest an 1884 Stick cottage by Thomas Newsom (722 Henry) and the next an 1889 Queen Anne cottage by A.W. Smith (1526 9th). Smith has 7 other identified or attributed houses in the district, dating from 1898 to 1902 (919 Center; 912, 1031, 1035, and 1039 Peralta; 1522 and 1532 9th Street), making him by far the most-recorded architect at the Point in its later years. (For discussion of Smith and his turn-of-the century houses, see SHRI form for the Summers house, 1105 32nd Street, in the Clawson Neighborhood.) Other major Oakland architects and builders of the 1890s and 1900s have a house or two known at the Point: Charles Mau (who lived in a Ziegenbein house at 1004 Chester in his youth) designed 1477 8th (1892) and 1620 14th (1905), 905 Willow (1890-91) is by A.W. Pattiani, 1748 9th (1901) by Cunningham and Politeo, and C.M. MacGregor was the builder for Smith's 912 Peralta and 1532 9th. John Conant and Albert W. Cornelius (1410 8th, 1894), F.W. Delanoy (1406 8th, 1894), J.C.S. Whalin (718 Henry, 1892; 823 Wood, 1896), and Fred Voorhees (1216 Willow, 1902) are other turn of the century architects who found at least one job at the Point.

By about 1890 and especially after 1900 it was common to build flats, or convert older houses (though occasional flats and side-by-side duplexes were built from the earliest years). A few are part of the residential building boom that followed the 1906 earthquake, but most are earlier: Oakland Point outside the marshes was fully built up, and did not strongly participate in either the Key System boom or the earthquake boom that are so important elsewhere in Oakland. Only about 25 buildings in the district date between the earthquake and 1910. The post-earthquake building boom took place mostly in close-in undeveloped areas like Adams Point and Glascock's marshland north of Lake Merritt (Waverly Street), and in areas newly opened by expanded Key System and Southern Pacific transit service. The effect on West Oakland, in a sense, was secondary: its homes began to look older by comparison, and less desirable. In 1912 Myron Wurts developed 8 similar Craftsman speculative and rental houses in two clusters (1230 to 1240 Willow, 1689 13th, 815 and 817 Henry, 830 and 834 Peralta). After that only a building or two a year was added to the district, and increasingly these were commercial. Here and there, residents built or rebuilt homes in Prairie, bungalow, and Mediterranean styles, as well as some late Colonials which are barely distinguishable from pre-earthquake ones. There are only about 14 of these later-styled houses in the district (e.g. 1414 Campbell, 1716 9th, 1427 Campbell, 1788 9th, 911 Wood).

The Hegemann report (1915) published a map showing "distribution of individual dwellings built in Oakland in 1914", with the comment that "West Oakland has become to a considerable degree industrial and few homes of any kind are being erected." This did not mean that industry was replacing homes, however. New industries came into West Oakland in the 1910s, but mostly to the marsh area bordering the District around the 16th Street Station (e.g. Oakland Mazda Lamp Works, 1910-17: see SHRI) and to new terminals in the Outer Harbor. (An exception is the Shredded Wheat factory, 1914, on 14th Street in the Oak Center neighborhood to the east, considered to have started the decline of that area.) At the Point, the California Door Company and Wentworth Boot and Shoe Factory near the station were old established uses (and employers), as were the rail and shipyards, and the Dalton Foundry and Pacific Coast Canning Company along the shoreline west of Pine Street from about 10th to 14th Street. A map of "Industrial Development as of December 31, 1929" in the 1930 Tribune Yearbook still shows only these sites, surrounding a solidly residential district not much different from the present boundaries.

(see continuation page 21)

19. Historical and/or Architectural Importance (continued from page 20)

Through the 1910s, 20s, and into the present, stores, gas stations, churches, restaurants, and even a theater (1488 14th at Peralta) continued being built in the district in small but steady numbers, the adjuncts of a living residential neighborhood. In the 1921 Tribune Yearbook West Seventh Street (from Market to Bay) was described as "By far the largest of [Oakland's] business subcenters ...with 227 retail stores of which 52 are grocers and meat markets, and 5 drug stores." (The next largest had 122.) For years it was said that one could live one's whole life without ever needing to leave West Oakland.

When Oakland was first zoned in 1935 the entire Point west of Poplar was zoned industrial, and the zoning remained so until 1974. Industrial development still took place only along the fringes - Phoenix Ironworks and other large complexes along Pine, additional Outer Harbor development. Major change came to the neighborhood in the form of residential redevelopment. Beginning in 1939, following studies by the WPA and the city (which documented the need for the project by means of maps locating substandard housing, juvenile delinquency, disease, and "non-white families"), the 154-unit Campbell Village housing project was constructed by the new Oakland Housing Authority with federal relief funds on the 2-1/2 blocks bounded by 8th, 10th, Willow, and Campbell Streets. Soon afterward a similar project, Peralta Villa, was built 3 blocks west between Cypress and Union Streets. Accounts of neighborhood reaction to the Campbell Village plan ("Riot Over Housing Disrupts Council," Post-Enquirer 7/14/39; "Confiscation and Discrimination Charges Are Made," Tribune 4/14/39) and later recollections suggest that this was a real social and economic breaking-point for the neighborhood, though the Depression-era deterioration and population shifts which prompted the study and the project were real. One of the West of Market Boys in 1939 wrote of "the wrecked and weatherbeaten shacks on either side of the street that were well kept and happy homes when I was a boy"; black activist C.L. Dellums and the Labor Non-Partisan League campaigned for needed low-rent public housing, and part of the public opposition was that houses elsewhere in the neighborhood were in worse condition than those selected for redevelopment.

Further physical changes came during World War II - houses and commercial buildings were extensively remodeled to create emergency housing (1125 Campbell, 1650 14th, 1405 Campbell, 1727 12th, 1620 13th, 1411 Peralta), and the division and expansion of single-family houses into rental units accelerated, to the extent that today almost every cottage has a basement unit, often dating from the '40s. A third housing project, now called Westwood Gardens and much modernized, was built in 1942 by Moore Shipyards for its war workers on the old McDermott estate between 7th, 8th, Center, and Cypress. (There were also at least three temporary wartime dormitory complexes in the industrial areas adjoining the district.) In the postwar years, in the mid-1950s, the district was reshaped by freeway construction along Cypress Street, cutting the "West of Market" neighborhood in half and brutally isolating the west half - the Point - from the rest of Oakland. Construction of the rapid transit station and main post office around 1970 destroyed what remained of the local commercial and social center along 7th Street and much of the residential area south of it. The Point residential district, though, is still largely intact if isolated: in the words of historian Tom Wolf (Peralta College Oakland history course), "from the West Oakland BART station you can see a 19th century suburban village."

SOCIAL, CULTURAL, AND ECONOMIC LIFE AND INSTITUTIONS (Context Codes CO, RR, AG, IN, WW, LT, RM, PS)

West Oakland before World War II has a Golden Age reputation which appears in too many sources and in too many forms to be pure promotion or pure nostalgia. The keynote is always that the community was a melting pot of classes, nationalities, races, and, for that matter, land uses.

West of Market Boys' Journal, Oct. 1950:

> Everyone at the Point, be he laborer, mechanic, business or professional man were all neighbors. No class lines were drawn. No poverty, no bread lines, and few wealthy people. Wages were not large, hours of work rather long, but everyone was satisfied and happy.

William McFarland, "That's That," Western American (a black Oakland newspaper), April 29, 1927:

> Here Briton, Teuton, and Slav, yellow men, Latin and Black live and toil in an atmosphere of peace and harmony… A comradie (sic) of good fellowship has grown among them that cannot be found in any other spot along the Pacific Coast. Here men are workers and beneath the grime of honest toil beat hearts of purest gold.
>
> Here churches are plentiful and well attended and spacious schools… there no mansions; here are no slums… Here tenant owns the home and takes pride in the love of possession… Here girls are prettier, boys are stronger and babies capture the blue ribbons of excellence. Here the sun shines brighter and the birds warble sweeter and all nature lends lavishly of her charms.
>
> There are many other reasons why we like West Oakland, but these will do for the present.

(Neighborhood boosterism is of course perennial: in the Oakland News of May 20, 1875, "The Point people…brag in the manner and form following, to-wit: They have the two largest vegetable gardens; the largest laundry; the biggest windmill, the only shipyard, the most waterfront, the greatest numbers of prospective railroads, the shortest distance to the city of San Francisco," and so on.)

The largest collection of West Oakland vignettes is found in the West of Market Boys' Journal, published monthly from 1936 to 1959 by an organization of old-time West Oaklanders, by that time mostly living elsewhere and unabashedly dealing in nostalgia. The most extensive of these detailed first-hand accounts is the series "A Sightseeing Tour of West Oakland in the Late Eighties and Early Nineties" written by Ed Anthony, M.D., in 1939-41, a house-by-house and person-by-person tour which vividly evokes the lively, prosperous neighborhood, fleshing out the names and occupations and addresses normally available to historians in censuses and directories and block books, and recording the vanished 7th Street businesses and the constant travel that animated the area. A sampling:

> That red building to my right in the distance is the Round House and the framework in the foreground is the S.P. Shipyard. At times the carp are so thick in the mud flats out there the all that is required to go fishing is a club…boys come here and dig for clams which they sell to housewives in the neighborhood (or)…to Charley O'Gara at the Fire House on Eighth Street and Charley makes clam chowder for Bill Ennis, the driver of the Fire Engine, …Mike McGuinn the driver of the Hose Cart, and others … There have been so many accidents at this crossing where the Berkeley Local and Oakland Trains speed around this curve to enter the Oakland Mole that it has been named 'Death Curve.' This is Bay Street … Railroad men take a pride in their watches …, so Mr. Fry, the

(see continuation page 26)

-et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 25)

jeweler next door, is kept busy repairing their watches. This section … is a regular rendezvous for politicians. Guess that there is soon to be election as I see a group of prominent S.P. politicians with their heads together up the street. The big man … is Wm. McKenzie, master mechanic. The others are Dan Robertson, master bridge builder, Al McKeen and W.B. Ludlow, master car repairers. Ludlow's hobby is gardening. He has a hot-house containing rare plants from all over the world [on 8th, now Campbell Village]… Right here on the corner is Lozier's Grocery. Mr. Lozier is a fine, generous men who has a large book account and he is liked by all of the people in this neighborhood. The railroad strike at a later date broke him…

Just look up Eighth street …, those tall poplar trees, as far as the eye can see. This is one of the prettiest drives in Oakland … Many of the business men and bankers doing business in San Francisco and living in Oakland drive down Eighth street in the morning in their classy victorias and board the train at the 'point station,' and they are met at Wood street on their return in the evenings by their wives. I recall Mrs. Pedar Sather and her fine span of horses and coachmen who were often seen along this highway…

We will now drive north on Pine street passing the home of Patricks, an S.P. fireman, and next the McCuens, Billy, Ada, Kittie, George and Jack. Fred Clifford, a car inspector for the S.P., lives in there on Maple street. Over here on this corner is the home of Billy Norton, Chief Train Dispatcher of the S.P. Capt. Tietgen lives next door with Alfred Champreux and his family. Frank Carman, a carpenter, and Jensen, the tailor, live in the next two houses. Across the street is what is known as "Pierson Row." Wm. Wilkinson lives in the first house. He is a carpenter for the S.P. Billy is a fireman. George is employed by the same company. He was later killed in a railroad accident…

John and Pat Fannon, S. P. employees, live over there. John Ziegenbein, a real estate dealer in San Francisco and the subdivider of this section, lives in that large white house with the attractive gardens. He has a son Johnnie and a daughter, Annie. … G.L. Curtis, a capitalist and horse fancier lives in that large house across the street facing Campbell St. He has a son, Burt, who is in the police department … Andy Ryder, an old time S.P. main line conductor, lives in that large home this way. It is reported that he is about to retire on a pension and that he has sold his home to Father McNally who is going to use it for a parish house … Some women, returning home from a Methodist Church meeting, were passing the Ryder home after it had been purchased by Father McNally. Father Mac was remodelling the house to accommodate more people. One woman said to the other "I wonder why they are enlarging that house?" Another spoke up, "Father Mac's family are coming home."… That is St. Patrick's Church across the street. The old white horse and phaeton parked in front is the transportation system of Father Mac … adored with reverence by all who know him. He is a political power in West Oakland and any candidate for election who has his endorsement can just consider himself elected…

There to our left is the Second Congregational Church, whose congregation included such families as the Hanfords, Ludlows, Youses, Surrhynes, Woodalls, etc. The pastor is the Rev. Frear who lives on Peralta Street. ….

Josiah Gibbs is a carpenter and does some collection work on the side. Hiram Hatch, a carpenter lives over there. His wife is a dressmaker. Looking down Willow Street toward Seventh, Thad Phillips, a Pullman porter, lives upstairs over that store… Mose Morris, a wealthy Pullman porter, lives in the next house … he has two daughters, Elaine and Lettie, who at a later date was a bookkeeper for the Contra Costa Laundry … in that large house around the corner on Campbell Street

(see continuation page 27)

et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 26)

> Wm. Wagner … is a capitalist and one of the officers of the West Oakland Building and Loan Association … It is here [W.O.B. & L.] that Andrea Sbarboro is making so much money that he is going into the banking business in San Francisco and is also promoting the Italian Swiss Colony … As we were driving along 12th street and Willow, I forgot to mention a family of some consequence on 13th St. Wm. W. Henry is a commission merchant in S.F. He has two daughters … Aurelia now Dr. Aurelia Reinhardt, President of Mills College…

In this memoir and in other records, the great number of railroad jobs stands out, along with a few other large local employers like Contra Costa Laundry and California Door Company; the endless variety of all other trades and professions making up a self-sufficient community; and the mixture of large and small houses and large and small businesspeople side by side. The number of working women in notable - wives and daughters of working men as well as single women and widows - as dressmakers, bookkeepers, teachers, laundry workers, proofreaders and compositors, keepers of notions or fancy goods stores and boarding houses, as well as less common occupations like physician and real estate agent. In the 1880-81 Pacific Coast Business Directory listings for West Oakland (at that time "a distinct post office") there are at least 15 businesses headed by women, fancy goods and bakeries the most numerous.

San Franciso commuters not only passed through on 8th Street, they lived at the Point, and they too had jobs at all levels. Several residents worked at the mint or the custom house (e.g. Andrew Hollywood, 1668 12th), and there were printers, carpenters, and machinists who held jobs across the bay as well as merchants and manufacturers who owned San Francisco businesses, like Quincy Chase (801 Wood; pianos), showcase manufacturers John Dixon and Charles Borgeson (neighbors at 925 and 927 Willow), commission merchants William Henry (whose house no longer exists) and John Ziegenbein (1004 Peralta) and Austin Hills (1558 8th, later of Hills Bros. Coffee), and dry goods merchant John F. Hink (938 Chester, later of Hink's department store in Berkeley).

Oakland industrialists who lived at the Point in the 19th century included Henry Dalton (1454 8th), whose ironworks was located along Pine; Jacob Samm (1454 8th before Dalton) and John C. Westphal (1475 8th, gone; rental property at 1477 8th) who ran Samm & Westphal's Bay City Flouring Mill downtown, Thomas Corder (932 Center) who had a tannery and stockyard in Emeryville, saw manufacturer Nathan Spaulding (1040 Peralta), Ira Martin Wentworth (1626 14th) whose boot and shoe factory adjoined the 16th Street Station, Thomas Henneberry (1685 12th) who owned the Phoenix Foundry at 1st and Castro, brewer Ferdinand Koenig (rental houses survive at 1657-1661 14th), and Daniel Hayes who built firetrucks (1501 8th).

Most of the proprietors of neighborhood businesses lived in the area, sometimes above the store: the Zeisses and Breilings of the Western Market (later Liberty Hall, 1485 8th: see SHRI) and surrounding rental property; the Bullock plumbing family (1626 and 1630 12th, 823 Center, 1558 8th), restaurant keeper John Cumbelich (718 and 720 Henry), candy maker Christian Schrieber (1107 Willow), William Walsh of the Center Junction Cash Grocery and saloon on the flatiron block at the north tip of the district (1615 Center), 7th Street druggists Charles Morey (824 Wood) and Elias Fred Sandelin (1410-1420 14th, 1001 Chester), baker Conrad Thaler (1502 and 1516 8th), grocers John and Matthew Nunan (822 and 824 Henry) and Rose and James Curran (1042 Willow), and many other grocers, butchers, saloon keepers, plumbers, hardware dealers, and other proprietors, as well as their employees.

Many Point residents worked as building tradesmen or artisans, alone or as employees: carpenters, plumbers, machinists, painters, plasterers, metalworkers, etc. Some of the carpenters who appear as original owners of houses may have been the builders: Beriah Fisher (941 Pine, 1867-68), Thomas Johnson (930 Wood and 1733 10th, 1868-69), Maxwell Long (1798 9th, c. 1868), Zeno P. Nickerson (819 Willow, 1875-

(see continuation page 28)

et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 27)

76), Charles Lougee (1523 8th, 1875-76), Alex Bruce McDonald (1010 Wood, 1876-77), Willim Tuggey (1514 Peralta, 1877-78), Thomas Cogan (1744 8th, 1881), Alvin B. Tarr (1414 and 1438 10th, 1882 and 1889-90), Silas Carle (1309 and 1311 Center, 1882-83), Peter Svenson (905 Pine, 1883-84), Joseph Pettitt (929 and 933 Wood, 1889-90), Hyacinth Gil (1442 and 1448 10th, 1880-81 and 1891-92).

Several residents classified themselves as farmers or ranchers, or in mining, and Barbados-born whaling master William Shorey (1782 8th Street - see SHRI) made his living on the high seas. John Treadwell, 926 Center, was part of a well-known Alaska gold mining family that later developed coal mines and brickyards in the Livermore area. Rodmond Gibbons, of Gibbons' Folly and the S.F. & O. Railroad, was apparently another retired miner ("accentric," according to Breiling). Christian Bagge, who arrived in the 1860s and owned a whole block at 14th and Peralta, probably operated as a "farmer" right there; Laban Langley, called a farmer in the 1890s when he lived at 1422 9th Street, and some other Langleys on Willow called ranchers, may have had their acres outside the Point by that time. The 1892-93 directory lists H. Yoshiike's nursery at 16th and Willow with "ornamental evergreens, flowering shrubs, greenhouse plants, new and rare chrysanthemums and roses." The Grondona family, long a name in the Oakland Produce Market, had vegetable gardens at the north end of the district and lived nearby along Wood and Willow north of 13th, now site of warehouses and a 1980s townhouse project. One other open-air occupation was that of George Van Haltren, professional baseball player (941 Center, 737 Henry).

Point residents were active in various ways in city and neighborhood civic affairs. Saw manufacturer Nathan Spaulding (1040 Peralta) was mayor of Oakland in 1872-73. Henry Dalton (1454 8th) and Eugene Garrison (1144 Peralta, 1472 13th, 1527 8th) both served as county assessor, one starting as a foundry operator and the other as a timekeeper for the S.P. William Hynes (1421 17th) ultimately became District Attorney. Breiling concluded in 1935 that Oakland's "...judges, and county officials, are practically to a man, products of West Oakland" and named Dalton and Walsh among the neighborhood's "old time politicians" (p.18, 32). Charles Redington (1678 10th), S.P. paymaster and treasurer, served on the Board of Education in the early 1900s. Captain Shorey and his wife were active in black philanthropic affairs, and a street at the Point has borne their name since 1907. Father McNally, who presided over St. Patrick's (Catholic) Church for 35 years (1878-1913), was a political as well as spiritual power in the First Ward.

Residents in other types of public service included police officers (Bert Curtiss, 1101 and 1107 Campbell; Patrick Hynes, 1421 17th; Dennis Holland, 903 Pine), firemen (see SHRI for Engine Co. No. 3, 1681 8th Street), and teachers. St Patrick's residence, now at 1625 11th, housed the anonymous teachers of the parochial school. Teachers at the Prescott public elementary school - established 1869 - lived in the district (Ed Anthony gives names: they were mostly women, largely Irish, and rarely householders). Thomas O. Crawford (1531 9th) was principal of Prescott School in the '90s, after serving as superintendent of the Home for the Blind on Telegraph Avenue; he also ran a private boarding school on or near Peralta Street. Charles Burckhalter (914 Chester) was a prominent astronomer and director of the Oakland school department's Chabot Observatory. Lillie Stetson (831 Center) taught at the West Oakland Free Kindergarten at Peralta and Pacific, and other district residents worked at the West Oakland Home for orphans (incorporated 1888). Luke Parker (720 Peralta) was curator of the West Oakland Free Reading Room (see SHRI for 7th Street Commercial District).

Like the commercial district along 7th Street, early West Oakland institutions - churches, schools, halls - scarcely exist as buildings today. St. Patrick's Church is represented by its rectory (moved to 921 Chester), the teachers' residence (1625 11th), and the convent (920 Peralta), but the school and the

(see continuation page 29)

19. Historical and/or Architectural Importance (continued from page 28)

church itself were replaced after World War II. Prescott School is also a new building: the church and school, which adjoin Campbell Village, are now part of the gap in the Point historic district, at least for National Register purposes, instead of its centerpieces. The storefront at 712 Peralta which replaced the 7th Street Free Reading Room as the branch library in 1907 still exists, but the library branch was moved to 18th and Adeline, east of the freeway, in 1977. The West Oakland Home was on the Campbell Village site, the Free Kindergarten where the new post office is. The first site of the Fannie Wall Children's Home, a black institution founded in 1918 and at this location until 1928, still stands at 1215 Peralta, now a private house. Sole survivors of the numerous lodge and social halls at the Point are Liberty Hall, 1485 8th (see SHRI), originally a store and flat, converted to civic use in the 1920s, first by Marcus Garvey's Universal Negro Improvement Association and then by Father Divine's Peace Mission; and the former Alcatraz Lodge Masonic Hall, in the 7th Street Commercial District at 715 Peralta, built in 1899 and totally remodeled in 1943 for wartime housing. One union hall survives at 1716 7th Street, in the 7th Street District, where C.L. Dellums headed the Brotherhood of Sleeping Car Porters from 1934 to 1978.

Around 1890 there were at least 11 fraternal, social, and labor halls in the Point, among them Hansen's Hall at Wood and Goss, a political meeting place, Germania and Cavalry Halls favored by the "social element" (Breiling, p. 8), and Kohler's Hall at Center Street Station where the Brotherhood of Locomotive Engineers, the Yard-Masters' Association, the Odd Fellows, and a number of other organizations met (Enquirer, July 22, 1886). The Masons, Foresters, Knights of Pythias, Druids, Woodmen of the World, American Legion of Honor, Ancient Order of United Workmen, Knights of Honor, Chosen Friends, and Young Men's Institute all had at least one branch at the Point. The 1872-73 directory lists a skating rink at Pearson Hall, NE Wood and Railroad Avenue, O.P. (Oakland Point). There was a West Oakland Ladies' Aid Society (Times, April 18, 1878) and a West Oakland Improvement Association (Enquirer, Aug. 17, 1889). At least five newspapers are known from scattered references and directory listings to have operated at least briefly: the Semi-Tropical Press, 1874, the West Oakland Home Journal, c. 1886, West Oakland Herald, 1888, West Oakland Star, c. 1890, and West Oakland Sun, c. 1892-93.

If the tales of Father McNally are to be believed, the Point in the 19th century was close to being a one-church town. St. Patrick's was established in 1878 as an offshoot of St. Mary's downtown for a community of predominantly Irish railroad workers, and today "after changes upon changes" (the title of its centennial booklet) it is still a spiritual and community service center in the neighborhood, notably through the housing and job development activities of Jubilee West. The one extant historic church building in the district is the Chester Street Methodist Episcopal Church, 835 Chester, built in 1888-89. (About 1920 it became the Parks Chapel A.M.E. Church, and when Parks Chapel moved uptown, the True Light Church of God in Christ.) In the 1890s there were two other Methodist Episcopal churches at the Point, Norwegian-Danish (Campbell near 9th) and Swedish (10th and Center). Others were Second Congregational, on Chase between Wood and Willow, St. Andrew's Episcopal at 9th and Cypress, and a second Catholic church, St. Joseph's at 7th and Chestnut, a Portuguese national parish. St. Joseph's was established in 1891 to serve the large Portuguese community in South Prescott and to some extent the growing Italian and Spanish-speaking communities (Italian and Slavic immigrants were also absorbed by St. Patrick's). Still farther east of the Point proper, serving another group of its residents, was the Shiloh A.M.E. Chapel, located at 7th and Market from 1863 to 1884. Organized in 1858 "in a small house on 5th Street near the Point" when the black residents of Oakland and Brooklyn numbered about 40, this was one of West Oakland's earliest churches, and a social and educational center that probably helped establish Oakland's Afro-American community near the Point even before the railroad came. The San Francisco A.M.E. church organized camp meetings in the fields near Shiloh in the 1860s (Hausler, 1984). The present-day descendant of Shiloh Chapel is First A.M.E., located at 15th and West Streets from 1884 and now relocated to

(see continuation page 30)

t or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 29)

37th and Telegraph not far from Parks Chapel. Churches in the district today are probably as numerous as ever, and belong almost entirely to black denominations. Except for 835 Chester, they are a mixture of converted houses and storefronts and postwar church buildings. Besides True Light C.O.G.I.C., they include Morning Star C.O.G.I.C. (745 Willow, 1945-46); Mount Zion, True Light, and New Bethel Missionary Baptist Churches; New Jerusalem, Mt. Carmel, and Center Street Baptist Churches, and Mt. Zion Spiritual Temple (West Coast Kingdom, 1488 14th).

19. Historical and/or Architectural Importance (continued from page 30)

ETHNIC GROUPS (Context Codes IM, BL; National Register Criteria, A: Ethnic Heritage: European, Black)

Oakland Point's churches probably embody the district's ethnic history better than any other institution or activity: a large, early, and dominant Irish community; an early, small, close-knit black community, which grew to a majority by the mid-20th century; a fairly large but little discussed Scandinavian presence; successive waves of Portugese, Italian, and Slavic immigrants from the 1880s to the 1920s. There was also a large German immigrant community from the earliest years (several German Lutheran and M.E. Churches, and synagogues, were located outside the Point), a small but visible Chinese and Japanese population, and a gypsy band at the Point, along with the (probably scant) majority of British and Anglo-American residents. A look at the historic names - owners and residents - in the district property list provides a cross-section of the many nationalities at the Point between the 1860s and World War II. The history of the Point in the 20th century can be described as a changing ethnic population in a basically unchanged 19th century built environment.

The 19th century Point evoked by Ed Anthony and Oscar Breiling was predominantly a Yankee and northern European immigrant community, with small numbers of other races and nationalities whom these majority memoirists regarded as both neighbors and exotics. Estimated numbers of European-born residents in Oakland as a whole (Hinkel & McCann, 1939, v.I, p.366), extrapolated from census data for selected nationalities, probably correspond generally to proportions at the Point:

	1870	1900	1910	1930
England, Scotland, Wales	420	3382	5304	7674
Ireland	1150	3664	4160	3175
Germany	559	4223	5476	4778
Sweden, Norway, Denmark	19	2598	4794	1551
Italy	38	816	3800	6350
France	122	707	1205	1334
black (wherever born)	55	1026	3055	7503

Figures for Portugese and Slavic immigrants are not included in these estimates, though they were a recognized presence at the Point; in the 1930 census there were about 3000 Poles, Czechs, Austrians, Hungarians, Yugoslavs, and Russians, and about 3500 Oaklanders from Portugal and the Azores.

Censuses and directories as well as memoirs show that there was always some job specialization among nationalities, prompted sometimes by experience and tradition abroad and sometimes by local prejudice. The Centennial Yearbook of Alameda County (1876, p. 553) said that in 1851 "communication with San Francisco was by launches and whaleboats manned by Portuguese, who would pull across the bay when there were passengers enough to make a load." Sailing and fishing were frequent occupations for Portuguese Oaklanders, many of whom came from the Azores and Hawaii. Many also worked for the railroads, more often as laborers than as engineers or carpenters. In the present Point district, their homes seem to have been scattered; the local Portuguese enclave was across 7th Street in South Prescott (see SHRI form).

(see continuation page 34)

eet or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 33)

German names are prominent from the Point's earliest years as merchants and landowners: Ziegenbein, Hufschmidt, Fuchs, Hink, Schrieber, Hoppe, Scholl, Gohrman, Zeiss and Breiling, Gernreich and Thornburgh, Samm and Westphal, Thaler, Albrecht, Kohler, and many more. Germans farther down the economic scale seem generally to have worked more as artisans and independent tradespeople, and less for the railroad, than other national groups. The absence of a German church at the Point proper also suggests that, like John Ziegenbein, many were freethinkers who "did not belong to any church or secret society" (Enquirer, Jan. 17, 1889). They lived and worked throughout the district: there does not seem to be a recognizable German neighborhood. Scandinavians were sometimes popularly classed with Germans: Breiling himself (p.12) called "Captain Baggy" "an old-fashioned German" (Theodor Bagge, Danish capitalist; see Christian Bagge house (1321 Peralta. The point of Breiling's story is that Bagge "nevertheless had the French idea for frogs," raising them on the grounds of his home). The Larsens and Hansens and Nissens and Petersons and Andersons who lived throughout the district often worked for the railroad as carpenters and sailors, or independently in the same occupations.

French immigrants lived at the Point in fairly small numbers, and do not figure prominently in the folklore. Amedee Blanc and Aime Z. Fossard developed a notable group of rental houses at 12th and Peralta in 1884-86. Blacksmith and firefighter Aime Sicotte who lived on 8th Street next to the firehouse (outside the district) was often mentioned for his civic role; Ed Anthony remarked on Sicotte's neighbor Mrs. Melquiond, and her recent immigrant French boarders whose children wore berets and harnesses. There seem to have been a number of French and French-Canadian carpenters and stair builders: Hyacinth Gil (1442 and 1448 10th), Camille Gamp (1417 15th), and the Peter Dubois household which included (English-Canadian) architect Leo Nichols.

The Point's Italian community began small but became a powerful presence by the 1910s and 20s. From the earliest years there was an Italian capitalist element at the Point: the 11 incorporators of the West Oakland Masonic Hall Association in 1876 (News, March 13, 1876) included F. and Natale Gamboni and Andrea Sbarboro of the West Oakland Building and Loan Association, and G. Beretta (1733 10th). Paolo Bacigalupi was another of the earliest residents of the district (1729 11th, 1670-71). Later, when the Italian community was larger, distinctive occupations appear to have involved food and produce - grocery stores, bakeries, gardens, and canneries. Breiling and Anthony both remember "Garibaldi," a neighborhood character of the '90s: "Every child in West Oakland knows Garibaldi and they all fear him. He is a gardener who wears a red flannel shirt, grizzled whiskers, ear rings, and a little cap. A dirk knife in his belt...Garibaldi is not his real name, I will not attempt to spell it. He makes his own 'Dago Red.'" The Grondona vegetable gardens at 13th and Wood apparently lasted into the 1930s.

Much of the new construction in the district after about 1910, both residential and commercial, was done by Italians: houses and flats of Antonio Bertola (1124 Center, 1907), Peter Ratto (1616 15th, c. 1912), Francisco Taramasso (1614 14th, 1915-16), Peter Brocchini (1794 9th, c. 1915), Pasquale Andreuccetti (1220 Peralta, 1921-22), Theo Ninatti (1423 Peralta, 1926), Paul Zarubbi (1730 9th, 1930) and others; stores and gas stations of Gaetano Cuneo (1522 Peralta, 1925), Giacomo Ratto (1600 Peralta, 1928), Luca Catera (1448 14th, 1938), Italo Cencini's winery (1522 Peralta), and others. Even the builders were Italian: Pio Benassini (1220 Peralta), Pietro Delucchi (several buildings including 1522 Peralta and 1629 14th), Charles Ungaretti (1427 Campbell). John Zunino, a West of Market Boy, wrote in 1946, about the St. Patrick's Day celebrations at old St. Patrick's (then being demolished): "One year I took part, playing my little old squeeze box, and on looking over the program I discovered that mine was the only foreign name on the program, the rest being all Irish. In later years, things began to change, as they often do. The old families began moving out of the old neighborhood little by little, until few were left. I'll never forget an entertainment at St. Patrick's where the entertainers were either Slavs or

(see continuation page 35)

et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 34)

Italians, and only two Irish names appeared in the program." The five-fold growth of Oakland's Italian population between 1900 and 1910 has been attributed to North Beach residents moving from San Francisco after the earthquake (Eleanor Edwards, "Memories of West Oakland," The Montclarion, July 7, 1982, summarizing oral histories).

Slavic and East European immigrants lived and worked at the Point from the beginning in small numbers, and like the Italians became a large community after 1900. Besides the many who worked for the railroad, their early specialization both downtown and at the Point seems to have been restaurants: Novakovich and Kesovia's restaurant at 1790 7th Street is listed in the 1886 directory, and others later. Slavic nmes are numerous among the owners of new houses after about 1906: John Cumbelich (720 Henry, 1908-09), Martin Savlovich (834 Peralta, 1912), P. Meloslavich (815 Henry, 1912), John Trebotich (911 Wood, 1919), John Tumpich (1663 11th, 1923), Michael Krka (1225 Peralta, 1925-27), Vincent Radovan (734 Henry, c. 1940s). Unlike the Italians, in this sample at any rate, they do not appear as owners of commercial buildings. Common occupations in the 1920s and 30s are driver, factory worker, metal worker.

Another small but visible and established ethnic group at the Point was the Chinese. There was always a major Oakland Chinatown near the central business district (see SHRI for Chinatown Commercial District), but Chinese workers were dispersed through the city, including the Point. Despite their histroic association with the railroads, Chinese workers are not prominent in accounts of the West Oakland yards, which the News (July 27, 1874) said employed "mostly white men." The Tribune on September 7, 1874 reported under news of the Point that W.C. Gray, in charge of dredging at the shipyard, "found himself minus a crew as his Chinamen bucked on him and quit. He is now hiring white men to do the work." Ed Anthony reminisced about throwing stones from the train at a Chinese laundry on 7th Street, and about how "our China cook, Ah Shoo, and Gee Nye, Fred Sandelin's cook, always chipped in to give a real Fourth of July to the neighbors." The Oakland Enquirer's West Oakland correspondent (Aug. 17, 1889) mentioned "Chinese lotteries" as a local nuisance. What later made the Chinese a special presence at the Point was the Pacific Coast Canning Company, established by Lew Hing on two blocks at 12th and Pine in 1903-04. "Lew Hing was the largest single employer of Chinese in the area and by 1911, one of Oakland's largest businesses. There were 1,000 employees hired at peak season." (Jean Moon Liu, Lew Hing; A Family Portrait, p. 8) Lew Hing himself lived downtown, but the cannery complex included large "Chinese quarters" (Sanborn map, 1935), and even before the cannery opened, another Chinese property owner, Yee Sue Kwai, was building nearby (flats and store at 1216 Willow and 1698 12th, 1902 and 1905-06). By the 1920s other homes near the cannery (1137 and 1118 Wood) were owned by Lew Tye, Ed Lew Wing, and Lew Shang Hubert, all associated with Pacific Coast Canning and possibly related to Lew Hing.

West Oakland today is a predominantly black neighborhood - 81%, according to the 1980 census, and about the same in 1950. This large majority, as is well known, dates from World War II, but Afro-Americans have a long and prominent history at the Point. Like the Irish, they owe their presence at the Point as a group to the railroads. The census for Oakland City puts the number of black residents in 1860 at 18 and 55 in 1870 - the tiny community which, with a few neighbors from Brooklyn, established Shiloh A.M.E. Church and a series of schools for their children. In the 1869 Oakland city directory - the earliest published, and one of two which identify individuals as "colored" there are 11 black breadwinners listed. Two lived at the Point - J.P. Stewart, a hairdresser (the leading occupation, with 3 listings), and Rev. Abraham Gross, pastor of the "African Church." By 1874, the other color-coded directory, there are about 80 listings. Brooklyn had been annexed bringing in 13 waiters at the Tubbs Hotel, but more importantly, the transcontinental railroad arrived in 1869 with the institution of the Pullman Palace Car and its porters. In 1874, 18 porters with the Central Pacific Railroad were listed with the address "Oakland Ferry Wharf." Besides porters, barber Oscar Jackson (see 714 Pine, in Oakland Point ASI) and

(see continuation page 36)

et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 35)

two widows were the only black residents listed at the Point. "Oakland Ferry Wharf" probably referred to company housing; 4 porters that year gave private addresses (3 downtown, one at the Point). Before long, many of these traveling workers established residence - as lodgers, renters, or homeowners - at the Oakland terminus of the railroad where the Pullman car shops and porters' quarters were located.

By 1880 the number of black Oaklanders was 593, 644 in 1890, 1026 in 1900, 3055 in 1910, 5489 in 1920, 7503 in 1930, 8462 in 1940, and 47,562 in 1950. The community of 500 to 1000 in the late 19th century was "enough to support an increasingly complex social structure"; and businesses "multiplied in the growing market along the western part of Seventh Street ... many offering services their owners had learned to perform as employees ... barbershops and beauty salons, carpentry and painting establishments, dress shops, restaurants, retail shops, and bars and clubs" (Crouchett, p. 10-11). J.M. Acty (1620 14th) had a coal yard on 7th Street by 1902. Whaling master Capt. William Shorey settled on 8th Street in the 1880s, was active in black civic and self-help organizations and in 1903 entertained Booker T. Washington at his home (see SHRI for 1782 8th Street). A series of black newspapers were published in Oakland (west and otherwise) from 1892: the Illustrated Guide, the Oakland Sunshine, the Western Outlook, the California Voice, the Western American. "In a long letter to the Oakland Enquirer in 1892, Rev. R.A. McGwinn, pastor of Beth Eden Baptist Church, summed up the advantages of Oakland, where housing was better and cheaper and employment more plentiful than in San Francisco. He noted that 'those who have been here long enough to net any earnings have readily seized the opportunity to own their own homes.' (Crouchett, p. 15) Despite the low wages paid to porters, many did become homeowners at the Point, and new arrivals did choose Oakland over San Francisco - for the economic reasons given, and because there was already an established black community. (In the 1920 census San Francisco had 2414 black residents out of 506,676, while Oakland had 5489 out of 216,261.)

Porters spread the word as they traveled the country, and more and more settled in Oakland. In the 1910 census the Point begins to show a large number of homes occupied as lodgings by groups of porters and railroad cooks and waiters, with or without wives who might work as domestics, dressmakers, private nurses, or keepers of the lodging houses. Porters William Vance and Simon Dedrick, from Texas, became nationally known when they saved their wages, bought homes, left the railroad, and opened a restaurant at 7th and Wood Streets which was written up in the New York Colored American Magazine in 1905.

In 1907 the Pacific Coast Real Estate and Employment Company was organized at 1696 7th Street to serve this growing population, the first black business of its kind in the East Bay. In 1915 Charles Tilghman published a Bay Area black directory, in which Oakland businesses predominate, and photos proudly illustrate "homes owned by our race." In 1919 an Oakland and East Bay Negro Business League was established (Crouchett, 17-18).

This period also saw the beginnings of the important cluster of black popular music clubs along west 7th Street, beginning with the Creole Cafe (which closed in 1922 due to "lack of patronage by the Race"), through the great days of Slim Jenkins' "most celebrated black nightclub on the West Coast," 1933 to 1962 (Lee Hildebrand, "Where the Train Stopped," The Express, June 1, 1988). "It was maybe not baby Harlem, but if one existed it probably was" ("oral account" quoted by Mary Cardwell). Another aspect of this entertainment district involved what Douglas Daniels (Pioneer Urbanites, p. 59ff) calls "travelcraft" - a sort of latter-day underground railroad - since visiting black performers were excluded from most hotels (except the California in North Oakland - see SHRI for 3400 San Pablo Avenue), and usually stayed with neighborhood residents.

Most of Seventh Street and its businesses are gone. A few 1920s-30s stores and homes of black business

(see continuation page 37)

et or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 36)

owners survive and are identified in the residential district: these include Phoebe Evans's store and flats at 1229 Peralta (1927-38), a rental owned by furniture dealer James Bridges (1434 15th), and the home and shop of hairdresser Gertrude Foney (1480 8th).

Despite the real growth in black businesses and widening of job opportunities (notably in civil service and the industries which expanded after the opening of the waterfront and during the first World War), as late as 1929 it was estimated that 60% of black Oaklanders' income came from the railroads, 30% specifically from the Pullman company (1930 East Bay Colored Business Directory, cited by Stuart Henry, p. 9). In the mid-20s Dad Moore and C.L. Dellums, Oakland porters who had "learned of the Brotherhood through Eastern Porters coming into the Quarters" (International Brotherhood of Sleeping Car Porters, silver jubilee program, 1950) organized a West Coast branch of A. Philip Randolph's union, originally called San Francisco Local No. 1 but renamed Oakland Division "because most of the porters reside in Oakland, the Headquarters then was in Oakland, the sign-out office is in Oakland, and all of the trains with the exception of a few S.P. trains to Los Angeles operate out of Oakland" (ibid). Union headquarters was at the Point, first at 517 Wood (post office site), and from 1934 to 1978 at 1716 7th Street (see SHRI for 7th Street Commercial District. There was also a Dining Car Cooks and Waiters Union local at 705 Peralta in the 1930s). The Brotherhood became doubly important in the '30s, when employment opportunities shrank due to the Depression and Afro-Americans again found themselves restricted to railroad work and "going down to the sea in ships" (Dellums). It was also an important training ground and example for black leadership and activism: Dellums' nephew Ronald, who now represents the East Bay in Congress, and Ruth Acty (1629 14th), the first black teacher in the Berkeley public schools, are two of many leaders from families of porters.

The period roughly from the 1906 earthquake to the end of the Depression is the era remembered as the golden age of the West Oakland melting pot. Royal Towns, born in the early 1900s and a longtime West of Market Boy as well as a civil rights activist and historian, provides the apotheosis of the legend (quoted by Douglas Daniels, Pioneer Urbanites, p. 75):

> "The day I was born... I heard all these different women,... Mrs. Moriah, Mrs. Tracy, Mrs. O'Brian, Mrs. Silva, Mrs. Riposa, and Mrs. Filotta, all those different names, I said, 'Doctor, hey, doc, what kind of a place is this where all these people of different nationalities come to help this old Black woman with her baby?'
>
> "And he said, 'This is West Oakland.'"
>
> "And I said, 'Well, jeez, West Oakland must be a heaven on earth. It must be a really fine place.'"

Black homeownership expanded in the 20th century. "By 1910, approximately 200 of Oakland's 3,055 black residents owned their own homes. By 1930 the number would be 700, but blacks could no longer buy anywhere they wished. In the 1920s South Berkeley became the prestige address for successful middle class blacks" (Crouchett, p. 22), and directory information on Point (and Clawson) residents confirms that South Berkeley was a common destination. The racial restrictions that came into use in housing tracts opened during and after the 1906 earthquake boom would become a greater issue later, when more Point residents wished to leave, though the irony of the City Council approving one such ordinance "on the day an all-black army unit... left Oakland for World War I" (Crouchett, p. 21) was not lost on the community.

Though Towns and others recalled that, on a personal level at least, "the place was a checkerboard" and

(see continuation page 38)

t or rural address: Oakland Point District - API State Form Part 1

19. Historical and/or Architectural Importance (continued from page 37)

there was none of this racial business" (Tribune, May 6, 1973, "Oldtimers Salute West Oakland"), it was in the '20s that Marcus Garvey's separatist UNIA established a branch at Liberty Hall (1485 8th Street; see SHRI), and other black self-help institutions existed, such as the Fannie Wall Children's Home in the Point district (founded 1918; 1215 Peralta). Father Divine's Peace Mission (1485 8th) and the black YMCA and YWCA branches (outside the district) became important relief agencies during the Depression. One old-time German-Amercian West Oaklander (Donald Mockel, oral history at Oakland History Room) blamed the Depression for the end of the era when "West Oakland was everybody," saying that "Okies and Arkies brought Jim Crow in." When federal relief came to West Oakland in the form of low rent housing projects, a concerned Italian-surnamed resident protested:

> "Where will the three or four hundred families who are tenants find other houses to move into? Here in West Oakland there are no houses for rent. They are all occupied. As about 60 per cent of these families are colored they will not be welcome in many sections of the town even if they do find vacancies and can meet the higher rentals. Are they to be turned adrift?"
>
> (Michael Santi, Tribune, 5/11/39)

One of the charges at the city council hearing (Tribune, July 14, 1939) was "that the Authority intends to discriminate against the Negro race with a 'Jim Crow' project," "where Negroes, whites, and other races have mingled harmoniously for years." Indeed, the "non-white families" map in the project study shows that the blocks proposed for the housing project were among those with the most black residents. The map also shows that many blocks at the Point, south of 12th and east as far as Adeline, were by this time home to 25 or more black families. The blocks along Pine, which protesters said were in worse condition and should have been demolished instead, seem to have housed fewer minorities. A citizens' committee appointed by the mayor reported (Tribune, 12/29/39) that the targeted houses were "in good condition, or could be made so," that "Property owners constitute at least half of the residents," and that "there is in both the areas a community spirit that is worth preserving. This community solidarity, the result of a slow growth, cannot be transferred." C.L. Dellums concentrated on making the Housing Authority integrate the projects, got Campbell Village "checkerboarded every floor, every unit," but achieved only "integrated segregation" (building by building) at Peralta Villa, and "lily-whitism" at the third project, Lockwood in East Oakland (Dellums, pp.72-73)

By the time the projects opened, the U.S. was in World War II. "Between 1942 and 1945, slightly more than 50,000 black people moved to the East Bay" to work in shipyards and other war industries. Oakland's Kaiser and Moore shipyards sent labor recruiters through the south; "newcomers outnumbered the old community by five-to-one. ...Old houses in West Oakland... were suddenly occupied by as many as 50 men, often sleeping in shifts... Families living in small apartments or bungalows took in boarders" (Crouchett, pp.45-49). To crowding was added unemployment when the war industries closed, and widespread discrimination when black residents tried to move to other districts. Still, the district experienced a moderate postwar building boom of its own; the new St. Patrick's Church, Mount Zion M.B.C. (1203 Willow), Morning Star C.O.G.I.C. (745 Willow), and a score of small commercial buildings, restaurants, and storefront additions, as well as residential additions and modernizations, date from the late '40s and '50s.

"In 1949 the Oakland City Council declared West Oakland, by then 85 percent black, to be a 'blighted' area, a designation which made it a prime target for massive demolition... Population figures for the Prescott district of West Oakland record the destruction: 22,000 in 1950 11,000 in 1970, and fewer than 6,000 in 1980" (Crouchett, p.56). Major losses in Prescott - Oakland Point - were the whole 7th Street commercial core and much of the neighborhood south of it, and the sense of connection to the rest of Oakland when the freeway and the Acorn project east of it were constructed. This isolation has to some

19. Historical and/or Architectural Importance (continued from page 38)

extent kept the remaining "19th century suburban village" at the Point from receiving much attention either destructive or beneficial, from local government: it remains to be seen what will be done with this resource, important to Oakland for both its 19th century development and its 20th century social history.

CONTEXT CODES

The Survey evaluated each building in the Oakland Point District in relation to "broad patterns of cultural, social, political, economic, or industrial history, or of the development of the city, or of distinct geographic regions or ethnic groups, or of a particular well-defined era" (Oakland Cultural Heritage Survey, "Evaluation Criteria and Ratings"). These associations make up the historic contexts, or components of historic contexts, for the district, and are defined on the basis of the information in the Survey's research files for each property. The most frequently occurring patterns in Oakland Point were coded and included in the database for each property (up to 3 per property; listed as "Context(s):" on the continuation pages in vol. 2). Following are the context codes used in the Oakland Point survey, and their meanings.

Time periods:

19	19th century (pre-1906) development of West Oakland neighborhood
EQ	earthquake era, April 1906 to c.1910; city-wide building boom
20	20th century development, including infill and redevelopment
W2	World War II, c.1941-47; wartime housing, postwar building boom

Building development, property ownership:

BU	building trades, development by carpenter-builders
TR	tract development: subdividers, speculative building of house groups
RN	development or ownership of rental property by neighborhood residents
LT	long term residents: same family in same place 30 years or more

Economic - transportation, industries, employment:

RR	railroad employees as residents
WT	water transportation: sailors, shipwrights, etc.
IN	West Oakland industries (employees, proprietors, or premises)
CO	neighborhood commercial, premises or proprietors; 7th St. merchants
AG	agriculture: farmers, gardeners (land at the Point or elsewhere)
AR	artisans: metalworkers, shoemakers, etc., other than building trades
BU	building trades: carpenters, plumbers, painters, etc., as residents
SF	San Francisco commuters resident in West Oakland
WW	working women, as residents or owners

Social and ethnic:

PS	public service: teachers and schools, churches and clergy, politics, etc.
IM	immigrants: Irish, Italian, Slavic, other European, etc.
BL	early black residents (pre-World War II)

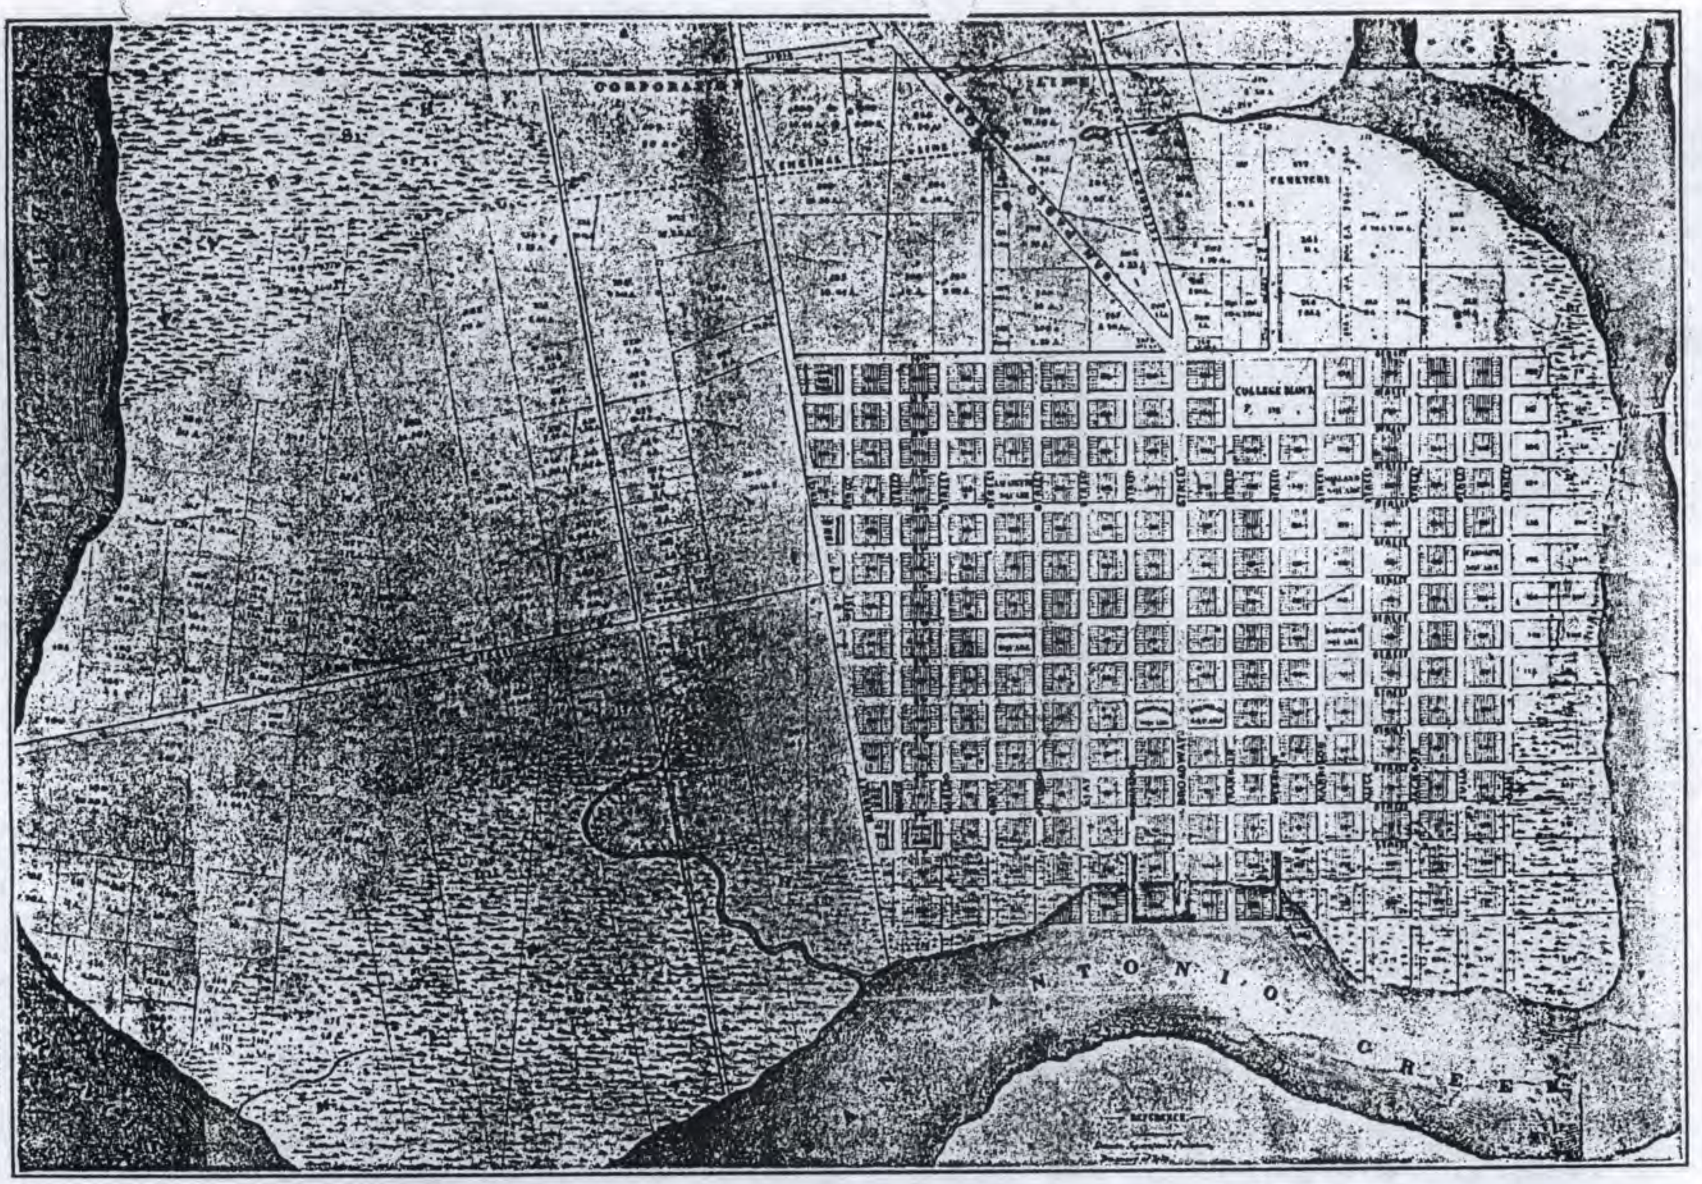
OAKLAND IN 1857

Part of the map: "San Antonio Creek, California. From a Trigometrical Survey under the direction of A. D. Bache, Superintendent of the SURVEY OF THE COAST OF THE UNITED STATES. Triangulation by A. D. Cutts, Assist. Topography by A. F. Rodgers, Sub-Assist. Hydrography by the Party under the command of Comdr. James Alden, U. S. N. Assist. 1857." This map appears to show how far the streets, which Kellersberger's Survey (filed September, 1853) put on the map, were actually built by 1857. In addition to Kellersberger's rigid gridiron (checkerboard) streets, the map shows a number of roads naturally grown and winding among the oak trees. The Twelfth Street bridge is the outlet to the East. San Pablo and Telegraph Avenues, as roads, were already in existence.

Oakland in 1857: Oakland Point and marsh at far left. (Hegemann Report, p.4)

eet or rural address: Oakland Point District - API State Form Part 1



OAKLAND IN 1860

From the "Official Map of the City of Oakland compiled from records & Surveys by J. E. Whitcher 1860. Publsd. By Drouaillet Lithogr. Cor. Washington & Kearney Streets, San Francisco." This map shows the original layout (1853) by Kellersberger, plus some new streets. The map also gives the explanation for the extremely long blocks, which still exist, in the area between Telegraph and San Pablo Avenues; namely, because this area lying outside the subdivided territory remained for many years in an agricultural state, and its streets were later developed with reference to the purely accidental lines of the two country roads (San Pablo and Telegraph) leading to town.

Oakland in 1860: Oakland Point occupies approximately the west 1/5 of the map, between north and south marshes. (Hegemann Report, p.5)

OAKLAND CULTURAL HERITAGE SURVEY

CERTIFIED LOCAL GOVERNMENT PROJECT AGREEMENT #06-93-80101

FINAL PROJECT REPORT

I. OVERVIEW

This report and the accompanying 1,900 Primary Records represent the product of three activities under Oakland's 1993-94 Certified Local Government subgrant. The activities are: (1) a reconnaissance survey in the San Antonio neighborhood, likely to serve as the beginning of a long term comprehensive survey of East Oakland, comparable to the Central District and West Oakland surveys; (2) a reconnaissance-level report on the ongoing citywide survey of the approximately 1500 buildings subject to the City of Oakland's Unreinforced Masonry Building ordinance; and (3) a test of the draft Primary Record form (DPR 523A-Test), pursuant to Oakland's participation as the local government representative on OHP's Inventory Testing Program committee.

The overall objectives of Oakland's 1993-94 Certified Local Government grant project were to work with the community and city staff to identify properties that may warrant preservation efforts, to provide information needed for implementation of the Historic Preservation Element and the Unreinforced Masonry Building Ordinance, to enable the city to propose priorities and procedures for completing reconnaissance and intensive surveys, and to integrate this information into the planning and development processes.

Under Project Agreement #06-93-80101 as amended, the Oakland Cultural Heritage Survey (OCHS) undertook two separate reconnaissance-level surveys, focusing on selected representative areas in the San Antonio neighborhood, and on unreinforced masonry buildings citywide. Both surveys were reported on Form DPR 523A-Test, the new Primary Record developed by the State Office of Historic Preservation. The San Antonio survey was conducted in June through September of 1994, and the reporting portion of the URM survey in April through September 1994, representing a continuation of ongoing research and evaluation of URMs funded by OHP and the city's Seismic Safety Division earlier in 1993-94. Both projects fill important needs in preservation programs in Oakland.

Oakland has had a preservation ordinance and a Landmarks Preservation Advisory Board since 1974, an ongoing Cultural Heritage Survey since 1979, and has been a Certified Local Government since 1986. Oakland Heritage Alliance, a large and respected nonprofit preservation education and advocacy organization, was founded in 1980 by participants in the first year of the Survey. Intensive area surveys of the Central District, Adams Point, West Oakland, and the Fruitvale Neighborhood Commercial Revitalization Area have been carried out. A citywide preliminary (windshield) survey was conducted in 1985-86, was put into a database in 1992-93, and will be completed in 1994-95. A citywide intensive survey of unreinforced masonry buildings will also be completed in

1994-95. A Historic Preservation Element of the Oakland General Plan was adopted in early 1994. Survey ratings will be given official recognition and preservation implications as the Element is implemented. Survey information is already being consulted almost routinely in environmental review, design review, and zoning cases, as well as for projects involving HUD and FEMA funding. Survey ratings are needed by the city's Seismic Safety Division in implementing the unreinforced masonry building ordinance, where City Landmark or National Register listing or a Survey rating of A or B classifies a building as "historic" and triggers special design review treatment and permits use of the State Historical Building Code.

FINAL REPORT

for the

Planning Phase of the

CULTURAL HERITAGE SURVEY

Oakland, CA

I. Overview:

The City of Oakland has a venerable history as one of the earliest incorporated cities in the State (1852), as one of the most populous California cities during a critical period in western cultural development (1880-1930), and as a recognized repository of worthwhile cultural features including Victorian and Art Deco/Moderne buildings in great quantity. Some of its oldest neighborhoods retain large blocks of unaltered 19th-century dwellings, while its active downtown area holds an impressive group of ceramic-faced and period revivalist commercial buildings in a good state of repair.

Of particular interest, too, is Oakland's pattern of growth and development through annexation, acquiring in successive "bites," numbers of smaller towns and settlements that contained their own significant histories. These collective backgrounds brought to Oakland a rich heritage of international influence, occupational diversity and stylistic variation.

The uniqueness of its bayside location with a network of creeks, estuaries, and tidal sloughs set against the hills of the coast range provided a dramatic natural setting which has only partially diminished over the past one hundred years with the improvement of the harbor, the undergrounding of water sources, and the building of freeways. An unusual city-center lake (Lake Merritt), improved in the mid-19th Century to accommodate recreation, is a treasure of unparalleled beauty and natural significance. Vistas from the hills ranging widely over the San Francisco Bay and beyond are more spectacular than many California cities can boast. The roster of distinguished citizens (male and female), lesser-known inhabitants, and anonymous settlers together reflect a valuable human diversity and creative spirit that continues unabated today.

In recent years there has been increasing interest on the part of local citizens and their government alike to address preservation concerns.

In 1963 a volume entitled, Design Resources in the Oakland Central District, was produced by the City Planning Department calling attention to the potential of existing cultural resources. In 1967 a proposal was published by them concerning the city's 19th-century "downtown," now called "Victorian Row." Rehabilitation was recommended and is now underway. In 1968 Oakland's Form and Appearance was published by the same office, outlining how the city looked at that time and suggesting approaches for capitalizing on its visual assets. In 1978 a book entitled Rehab Right, surveying Oakland's residential architectural history and providing instructions for stylistically correct and structurally sound rehabilitation of houses, was published by the Oakland City Planning Department. The book won an award of excellence from the National Trust for Historic Preservation.

Other publications have appeared recently through the efforts of the Oakland Museum, the Camron-Stanford House Preservation Association, the Landmarks Preservation Advisory Board, and private individuals. These feature still other aspects of Oakland's historical and visual heritage. All of these have found an interested and appreciative audience.

In 1974, after several years of planning, the City established a Landmarks Preservation Advisory Board to recommend landmark status for selected buildings and features. Their work, based on the suggestions of citizens, continues.

Preservation Park, a special zone containing a number of National Register and City Landmark buildings, is being developed in the shadow of Highway 980, tangential to the City's new City Center complex.

The 1977 opening of the Camron-Stanford House with educational programs and the special events programs of the City-owned historic Dunsmuir House both bring public attention to Oakland's heritage and spread information about it.

But more detailed, comprehensive, and systematic data is needed.

Against this background of developing interest in its unique past and precious present, Oakland undertook a planning project for a cultural resources survey in the spring of 1979. The enthusiasm with which the planning project was received and the diligence with which it has been carried out are chronicled below.

II. Statement of Purpose:

The planning phase of the Survey was undertaken to give the Coordinator and the sponsor an opportunity to study the most effective methods of carrying out a comprehensive historical and architectural inventory. The chance to engage in a serious planning phase was greatly appreciated by all involved--particularly as they addressed themselves to the difficult decision-making tasks set before them. It became apparent that to attempt such planning decisions during the same year that volunteer recruitment, research and field surveying, and the completion of State Forms would be required would be a virtually impossible job--especially considering the size and complexity of Oakland. The committee and the staff have been grateful for the planning opportunity.

The planning phase addressed itself to the following points as outlined in the contractual agreement:

(1) the identification of goals for the Survey.
(2) plans for Survey methodology and management.
(3) Survey scheduling, including phasing.
(4) selection of initial areas to be surveyed.
(5) determination of the types of cultural resources to be surveyed.
(6) establishment of criteria to determine what resources will be recorded and reported to the State Inventory.
(7) identification of documentary resources available to support Survey findings.
(8) development of a training program for community volunteers.
(9) proposal of a graphic mapping system suitable for presentation of resources identified.

A brief description of how these contract requirements have been met will be presented in the following sections of this report.

III. Methods Used:

The planning process for the Oakland Cultural Heritage Survey got underway in October 1979 with recruitment for a Steering Committee as mandated by the contract with the State. An effort was made to attract individuals to the committee who would bring knowledge of local history, knowledge of architectural history, a sensitivity to the visual environment, a familiarity with neighborhood diversity and speciality, and a sense of citizen representation.

We were gratified by the response of the community to our appeal for involvement. Some 250 individual letters were mailed to names on a list compiled from a variety of sources reflecting the above interest. All neighborhood organizations on the roster of such groups maintained by the City Planning Department were notified and urged to send applicants. Letters of application were received from about forty individuals to fill what we had expected would be about a 12-seat committee. The excellence

Historical Background

The area of West Oakland that is now called Prescott (after a Civil War era general) was originally referred to as Oakland Point, the Point, and very often Gibbon's Point. Gibbon was a physician who came to Oakland in 1851, became Mayor in 1864 and state senator in 1867. He owned a large amount of property in the Point which he subdivided and sold between 1870 and 1877. Although not included in the original map of Oakland filed in 1853, the Point did appear in one drawn four years later. By 1860, the real estate firm of Osborne & Sessions printed a brochure which included a "Map of the Land on Oakland Point." It offerred for sale seven blocks, plotted in small lots.

From its earliest time, the Point was a hub of transportation. In 1862, a wharf and ferry building was constructed and in the following year daily train service to San Francisco was initiated. The rail connection of Oakland with San Francisco greatly increased land values in the Point. More importantly, when the transcontinental railroad was completed in 1869, the Point was selected as its western terminus. An advertising circular from that period noted:

> . . . this very desirable property is located near the railroad station at the Point. The ground is finely wooded and has a pleasant outlook both towards the hills and the Bay. This portion of the City is rapidly growing in population and substantial imrpovements. Oakland Point participates very largely in the assured growth and brilliant prospects of the City.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story Queen Anne duplex has a rectangular plan and a medium-pitched gable-on-hip roof with elaborate corbels and decorative stickwork at the cornice. The gable end is clad in fishscale shingles, the balance of the house is clad in wood drop siding. The porch on the main (northwest) façade has a hip roof that shelters the side-by-side main entrances, which are right of center and fitted with metal security screen doors and accessed via a wide set of wood steps. A square wood post supports the porch at the corner; the simple balustrade is wood. The main façade features double-height cutaway bay windows to the left of the entrances. Fenestration consists of replacement hung sash windows and picture windows in rectangular openings with decorative casings. The property is in fair to good condition, with paint flaking away and a patched area on the south elevation but few serious deferred maintenance issues on other parts of the building. Alterations since it was documented in 1987 include installation of porch/stair railing and removal of elaborate scrolled brackets at the cutaway bays and corners of the porch. Window replacement, conversion to a duplex, and installation of metal security doors were performed at an unknown date. Despite these changes, many original decorative features remain and the house is a recognizable as a Queen Anne style residence that retains sufficient integrity to remain eligible as a district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story duplex, has a rectangular plan and a flat roof with minimal eaves. It is clad in wood lap siding. The main entrances on the main (northwest) façade are right of center and fitted with wood paneled doors and accessed via a wide set of wood steps; simple balustrade is wood. Entrances are sheltered by a shed roof porch, which is supported at the corners by square wood posts with a simple wood balustrade. The main façade features double-height cutaway bay windows to the left of the entrances. Fenestration consists of aluminum-sash windows in vertical and horizontal openings. The building is in good condition. It has been heavily altered and stripped of all Italianate decorative features including porch, cornice, and surface ornamentation. Wood-sash windows have been replaced, along with decorative window casings and spandrel panels. Doors and cladding have also been replaced. Originally an Italianate-style house that was a contributor to the historic district in 1990, only its two-story massing and double-height bay window reference its original form. It does not convey its identity as a Victorian-era building and does not retain sufficient integrity to remain a district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The two-story residence has a rectangular plan and a medium-pitched gable roof with boxed eaves. Gable ends are clad in narrow wood siding and the balance of the house is clad in wood drop siding. The main entrance on the main (northwest) façade is sheltered by the second story and sits left of center. It is fitted with a partially glazed paneled wood door and is accessed via a set of wood steps with a simple wood balustrade. The overhang above the door is supported at one corner by a square wood post. Fenestration consists of vinyl windows in vertical openings. There is a single-car garage to the right of the main entrance. The house was not constructed within the historic period of the Oakland Point API and is not a contributor to the historic district. Its basic form, materials, and massing are compatible with contributors to the historic district.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The one-story storefront/garage building has a rectangular plan and a flat roof with a parapet on the main (northwest) elevation. It is clad in corrugated metal siding. The human-scale entrance is left of center and fitted with a flat wood door and is accessed via a small ramp. The building lacks fenestration. The historic-period utilitarian building lacks decorative elements or features that connect it to the surrounding historic district. Previous documentation found the building did not contribute to the character of the Oakland Point historic district, and it is not a contributor to the Oakland Point District. It is in fair to good condition and has not been substantially altered since it was documented in 1988.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story residence has a rectangular plan and a medium-pitched gable roof with minimal eaves. It is clad in board-and-batten. The porch on the main (northwest) façade has a hip roof that shelters the centered main entrance that is fitted with a partially glazed paneled wood door and is accessed via a set of wood steps with a simple wood balustrade. Fenestration consists of vinyl replacement windows mounted flush in rectangular openings with non-operational shutters on second floor windows. The house is in excellent condition. Its overall form and massing along with research performed for the Oakland Point Cultural Heritage Survey suggest that the original house was constructed in the 1880s and substantially altered in 1924. The 1988 study found that it was compatible with the Oakland Point District but did not qualify as a district contributor. Siding, windows, and window casings have been replaced since 1990, and the porch was also added to the main façade. The property does not retain sufficient integrity to convey its identity as a historic-era house, and does not qualify as a contributor to the historic district.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The two-story Stick Cottage has a modified rectangular plan and a steeply-pitched gabled roof with decorative knee braces and a vent on the gable end. It is clad in wood drop siding. The main entrance on the second story of the main (northwest) façade is left of center and fitted with a metal security screen door. It is accessed via a tall tube-flight set of concrete steps with a solid stucco balustrade. The ground floor, probably originally a basement, has been converted to additional living space. Fenestration consists of vinyl replacement windows. There is an entrance to the ground floor on the southwest elevation below a projecting square window bay, facing Chase Street. The house is clad in horizontal drop siding. A rear addition has several volumes with different roof forms and is clad in vertical groove plywood. The house is in fair condition, with paint falling away and areas of decay at several window casings. The house has not been visibly altered since it was documented in 1987. It is recognizable as a Stick Cottage that retains sufficient integrity to remain eligible as a contributor to the Oakland Point District.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story residence has a rectangular plan and a steeply-pitched gable-on-hip roof with narrow eaves. It is clad in wood lap siding. The primary entrance on the main (west) façade is in a recessed volume left of the projecting front gable. It has a shed roof entry porch that shelters the main entrance, which is fitted with a metal security screen door. It is accessed via a set tall of wood steps with a solid balustrade. Fenestration is varied with a picture window on the main façade. It is at the center of a decorative bay window above the garage door on the first floor. The bay window is sheltered by a decorative gable end that is clad in fishscale shingles. The house is in good condition. It was not constructed within the historic period and is not a contributor to the Oakland Point historic district.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story Stick Cottage residence has a modified rectangular plan and steeply-pitched gable-on-hip roof with returns and narrow eaves. Decorative elements include elaborate scrolled brackets at the porch and cornice, which has a paneled frieze. It is clad in wood drop siding. The integral porch on the main (northwest) façade shelters the main entrance which is left of center. It is fitted with a metal security screen door and a transom; it is accessed via a tall set of wood steps with a simple wood balustrade. Fenestration consists of replacement windows in tall vertical openings. The main façade features a decorative square bay window with its own gabled roof, ornamental brackets, and spandrel panels. It shelters a secondary entrance on the first floor, which is fitted with a metal security screen door. The house is in excellent condition. It has not been visibly altered since it was documented in 1987. The house is recognizable as a Stick Cottage that retains sufficient integrity to remain eligible as an Oakland Point district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The one-story Italianate-Stick residence sits atop a raised basement and has a modified rectangular plan and steeply-pitched gable-on-hip roof with narrow eaves. Decorative features include stickwork and dentil molding at the cornice, bay window, and porch. The house is clad in wood drop siding. The partial-width porch on the main (west) façade shelters the main entrance, which is left of center and fitted with a partially glazed paneled wood door. It is accessed via a tall set of wood steps. Square columns with capitals, bases, and elaborate brackets support the porch roof at the corners. Fenestration consists of original double-hung wood-sash windows (which are rare in the neighborhood) in rectangular openings with decorative crowns. The main façade features a decorative slanted bay window to the right of the entrance with decorative cornice, pilasters, and scalloped crowns. The house is in fair condition with areas of decay around windows, and badly needs a coat of paint. It has not been visibly altered since it was documented in 1987. The house is recognizable as an Italianate-Stick residence that retains sufficient integrity to remain eligible as an Oakland Point district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The one-story Stick Cottage sits atop a raised basement and has a modified rectangular plan and steeply-pitched gable-on-hip roof with narrow eaves. It is clad in wood drop siding with plywood panels at the basement level. The partial-width porch on the main (northwest) façade is shelters the main entrance, which is right of center and fitted with a paneled wood door and transom. It is accessed via a tall two-flight set of wood steps with a wood lattice balustrade. Square wood columns with capitals and bases support the porch roof at the corners. Fenestration consists of double-hung wood-sash windows in rectangular openings and replacement sliding windows. The main and northeast façades feature decorative slanted bay windows with dramatic mansard roofs clad in fishscale shingles and scalloped detail at the eaves. The stair railing has been altered since the house was documented in 1987, but its important decorative features as well as its essential form and massing have been preserved. It is recognizable as a Stick Cottage that retains sufficient integrity to remain eligible as an Oakland Point district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story Stick-Gothic residence has an irregular plan and a steeply-pitched gable roof with knee braces, corbels, and decorative cornice. Gable ends are clad in fishscale shingles and have ornamental stickwork. The balance of the house is clad in wood drop siding. The main entrance on the second story of the main (southwest) façade is left of center and fitted with a metal security screen door. It is sheltered by an extraordinarily ornate porch with steeply-pitched gabled roof and accessed via a tall two-flight set of wood steps with a simple wood balustrade. The northwest and southwest elevations feature decorative square bay windows with unusual narrow center windows. Fenestration consists of replacement windows in decorative rectangular openings with decorative molding at the crowns. The house was raised about six feet to allow for a ground-floor garage at some point after 1990. Despite this change, the unusually profuse original decorative features remain and the house is a recognizable as a Stick-Gothic residence that retains sufficient integrity to remain eligible as an Oakland Point district contributor.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
The two-story residence has a rectangular plan and a steeply-pitched gable roof with boxed eaves. The house is clad in wood drop siding. The centered main entrance on the main (southwest) façade is recessed and fitted with a metal security screen door. The opening to the recessed entry porch is framed by decorative pilasters and crown. It is accessed via a set of wood steps. Fenestration consists of multiple-paned wood sash windows and replacement sliding windows in rectangular openings. A shed roof porch at the rear of the house has been enclosed. The porch addition on the main façade was demolished and was being rebuilt at the time of a 2021 field visit. The house is in fair condition with some areas of decay at the enclosed rear porch. The house retains integrity as a contributor to the Oakland Point historic district.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The 1.64-acre parcel holds four industrial buildings and one smaller building:

- 1819 10th St., which is oriented east-west and occupies most of the north half of the parcel
- 1824 9th St., which is oriented north-south and located at the southeast corner of the parcel
- 1826 9th St., which is oriented north-south and located immediately adjacent to the west elevation of 1824
- 1832 9th St., which is oriented north-south and located at the center of the block
- A small building at the southwest corner of the parcel

1819 10th St. is a large, double-height, double-gabled industrial building. Its cladding and roofing are corrugated metal. Large vehicle openings are fitted with metal rollup doors. There are banks of industrial-sash windows along the east, west, and south elevations. 1824 9th St. is double-height gable-roofed industrial building with corrugated metal cladding and roofing. A vehicle opening along 9th Street is fitted with a top-mounted sliding door. An adjacent human-scale door is fitted with a metal security screen door. The building lacks fenestration. 1826 9th St. is a single-height gable-roofed industrial building with corrugated metal cladding and roofing. A vehicle opening along 9th Street is fitted with a metal rollup door. 1832 9th St is a single-height industrial building with a low pitch gable roof with wide eaves. Cladding and roofing are corrugated metal. A vehicle opening along 9th Street is fitted with a metal rollup door. The small building at the southwest corner of the parcel also features a gable roof and metal cladding. There is a temporary metal carport structure near the center of the parcel.

B10. Significance (continued):

Oakland

The Oakland area was originally inhabited by Ohlone people. Northern Alameda County was part of Rancho San Antonio, a vast tract of land granted to the Peralta family (who lived in San José) in 1820. Like other Mexican land grant recipients, the Peraltas had difficulty holding onto their land after California entered the United States in 1850. When the Gold Rush brought large numbers of Americans to California in 1849, the East Bay became an important transit station for passengers and cargo. American hunters and fortune-seekers began squatting in the area that would become Oakland. Horace Carpentier was one of these squatters, and after obtaining a lease from the Peralta family incorporated Oakland in 1852. Carpentier received an extremely valuable grant for the use of most of its waterfront at the first meeting of the city trustees.[1]

Oakland Point is located about two miles west of the original City of Oakland. The Point is notable for its position as the closest land location to San Francisco. In the 1850s, the area was occupied by small farm plots and cut off from the rest of the city by a large marsh, with more marshes to the north and south. These marshes were initially used as dumps and sewage outlets before their development for industrial uses in the twentieth century. In the 1860s, Rodmond Gibbons and partners developed the Bay Street Wharf and the San Francisco and Oakland Railroad at the Point. The railroad included a commuter line that met the ferry at the wharf. Railroad service began in 1862 and was expanded to the east in 1864 and the west in 1868. In 1869 the Central Pacific Railroad connected Oakland Point to the transcontinental railroad. Former mayor Horace Carpentier (who had incorporated Oakland and received a grant to most of its waterfront in 1852) formed a partnership with the Central Pacific Railroad in 1869. He subsequently deeded most of the waterfront to the Central Pacific Railroad, allowing Oakland to become the western terminus of the railroad, with transcontinental shipping passing through, but preventing other development in the area. The railroad tracks and pier system were expanded in 1870, 1871, and 1879-1881; at one point, the piers extended two miles into the water.[2]

Railroad development in the area led to rapid residential growth; Oakland Point's development boomed in the 1870s, and the area was home to a significant portion of Oakland's population. There were two large-scale developers, John Winfield Pearson and John Ziegenbein, who built large tracts in Oakland Point over the decades. The neighborhood was largely built out by the 1890s; 70 percent of buildings extant in 1990 were built before 1889. Large numbers of Oakland Point residents were railroad employees through the 1930s (until the 1920s, railroad workers were required to live west of Adeline Street). The Pullman Palace Car Company, which employed exclusively Black porters, arrived in 1869, giving rise to the beginnings of Oakland's large and early Black population. The Pullman Company employed around 30% of the local Black population as late as 1929. Many Oakland Point residents of this era were lodgers and moved frequently, especially those who worked for the railroad. The Point was also a convenient residential area for San Francisco commuters. Early Oakland Point included a notably large population of working women; an 1880-1881 city directory reported at least fifteen businesses owned by women. Oakland Point during the nineteenth century was dominated by Americans who had moved to Oakland from northern states and immigrants from northwestern Europe, with small but visible Black and Chinese communities. By 1900, there were significant Irish, British, German, and Scandinavian populations as well as over 1000 Black residents (nearly 20 times the 1870 Black population). The early twentieth century saw large increases in the Italian and Slavic populations. The surrounding city grew significantly at this time; Oakland's population doubled between 1900 and 1910 as a result of the 1906 San Francisco earthquake. The Point's Black population also continued to grow and included homeowners and business owners. The Pacific Coast Real Estate and Employment Company was established in 1907 to serve this growing community. The Oakland and East Bay Negro Business League, the first organization of its kind in the region, was formed in 1919. Oakland Point was known in the 1920s and 1930s for its Black music venues and nightclubs; touring performers were barred from most hotels and generally stayed with residents. Oakland Point was highly praised by residents in the first decades of the twentieth century for its racial diversity.[3]

By 1910, the Western Pacific Railroad had broken the Southern Pacific Railroad (successor to the Central Pacific Railroad) monopoly in court. This action allowed the Western Pacific to construct its own pier to the south of the existing pier and begin its own service to Oakland, operating as the main freight and passenger route from the Bay Area to Northeastern California. Oakland Point's hold on the

[3] Oakland Point District DPR, Oakland Cultural Heritage Survey, August 23, 1990, 25-27, 29-30, 32-36, 43, 47, 50-53; Annalee Allen, *Oakland: A Postcard History* (San Francisco: Arcadia Press, 2005), 9.

railroad industry was also diluted by the Southern Pacific Railroad's conversion of local passenger service from steam to electric, which required more widely-scattered headquarters. There were several electrical power stations in the region, and lineman had to maintain long overhead power lines, so electrical service maintenance was dispersed rather than concentrated in the rail yards. The Southern Pacific Railroad built a car shop in Alameda, and the Oakland Point area began to open to other kinds of development; by the 1910s, most new construction in Oakland Point was for industrial properties, located around the edges of the neighborhood's residential center. This included the establishment of shipyards and shipping terminals, which expanded significantly during World War I. During this time, Oakland became one of the foremost shipbuilding centers in the nation; in 1920, their peak year, Oakland shipyards employed more men than every other industry combined. Oakland Point also developed a number of local businesses in the 1910s and 1920s, including large numbers of neighborhood-serving businesses like grocery stores and gas stations. Business owners tended to live in the neighborhood, and Oakland Point was noted locally for residents' ability to meet all their needs without leaving the Point. The influence of the railyards continued to decline in the 1920s as trucking began to compete with rail freight and ferry service became an increasingly significant part of the Southern Pacific Railroad's business. Passenger service soon declined as well with the opening of the Bay Bridge between Oakland and San Francisco in 1936, and the local service stopped in 1941.[4]

The City of Oakland was zoned in the 1930s, by which time it was one of the largest cities in California. Oakland Point was zoned industrial (a designation retained until 1974). By the 1930s, a number of houses in the Point had deteriorated, and residential redevelopment began in 1939 with the construction of large housing projects like Campbell Village and Peralta Villa. These housing projects were controversial among Oakland Point residents, many of whom regarded them as an insidious attempt at racial segregation. Objectors pointed out that the locations chosen for the projects contained large numbers of Black residents, while whiter blocks in worse condition were allowed to remain. The 1939 studies that justified the projects explicitly mapped "non-white families" alongside factors like disease and substandard housing. At least half of the displaced residents were homeowners with limited options to buy elsewhere, and attempts to force the projects to integrate were only moderately successful. During World War II, Oakland shipyards sent recruiters to the south and more than 50,000 Black people moved to the East Bay. High demand for housing led to further rapid residential redevelopment as single-family houses were divided into multiple units and commercial buildings were converted to housing. Many houses in Oakland Point had separate basement units added in the 1940s. Moore Shipyards built its own housing project to accommodate wartime employees in 1942, and there were several other temporary dormitories for wartime workers in industrial neighborhoods.[5]

Historically an integrated area, black residents became a larger percentage of the population in West Oakland as southerners moving to the Bay Area for defense work displaced communities in East Oakland, Richmond, and other cities across the region. Oakland Point's Black population reached a majority of around 80 percent in 1950 and remained around the same until at least the 1980s. The Oakland City Council designated West Oakland as "blighted" in 1949, leading to additional demolitions that decreased its population. Redevelopment projects of the ensuing decades continued to target West Oakland's Black population. In the 1950s, Cypress Freeway construction cut through the neighborhood and isolated it from the rest of the city. 500 homes were demolished for the US Postal Distribution Center in 1960, and much of the neighborhood's commercial core on 7th Street (which has been home to a lively cultural scene) was destroyed in 1970 to make way for the Bay Area Rapid Transit (BART) station. By the end of the 1960s – 1970s era of urban renewal, more than 800 businesses had been closed, 2,500 houses had been demolished, and almost 5,000 households had been pushed out.[6]

Redevelopment was a devastating blow to a community that had been hit hard by the shrinking railroad industry and loss of industrial jobs in the decades following the end of World War II. Redlining meant that West Oakland homeowners were excluded from federally insured mortgages. Of the 137 groceries serving in West Oakland in 1960, just 22 remained by 1980, and many of these businesses had been replaced by liquor stores. Social problems followed disinvestment and redevelopment. Oakland, and particularly West Oakland, was hit hard by the drug epidemics of the 1970s and 1980s, with drugs sold openly on many corners and violence following the drug trade.

The large office buildings, hotels, and convention center facilities that brought economic revitalization to downtown Oakland during this era did not bring similar benefits to West Oakland.[7]

The Loma Prieta earthquake in 1989 destroyed a number of historic buildings in Oakland Point and the Cypress Freeway, which collapsed, killing 42 people. Oakland Point residents organized and successfully pushed Caltrans to re-route I-880 around the neighborhood, turning the space previously used by the Freeway into a greenway called the Mandela Parkway. Gentrification due to the Bay Area's tech economy began to affect Oakland in the 1990s and escalated after 2000. An eviction crisis led to unprecedented levels of homelessness in the city, and the Black population has consistently declined in numbers for decades. By 2010, Oakland's Black population was smaller than the white population for the first time since 1970, and by 2020 only about one out of four households in West Oakland was Black.[8]

Block 703

Block 703, which is bounded by Cedar, 9th, 10th, and Pine streets, was first developed for housing in the 19th century. The Standard Oil Company was the first to develop a warehouse on the southwest corner of the block around 1902. It was a valuable location for industrial development due to its proximity to the railroad tracks and waterfront. With the construction of more warehouses, industrial spurs were developed to connect the warehouses to the railroad tracks. The Spears-Wells Machinery Company developed multiple warehouses on the southwest half of block 703, at addresses 1830 9th Street, 1832 9th Street, and 1824 9th Street. Independent Iron Works had a warehouse to the east of the Spears-Wells assembling warehouse. On the northeast half of block 703, the Irving Subway Grating Company developed a large warehouse at 1819 10th Street and 1849 10th Street in 1949. Houses remained on the east end of Block 703, bordering Pine Street. In the 1990s, the original Standard Oil Company warehouse on the southwest corner was demolished. [9]

Spears-Wells Machinery Company

Charles Alvah Spears was the Vice-President of Spears-Wells Machinery Company. Prior to Spear-Wells Machinery Company, Charles Spears owned Graves-Spears Road Machinery Company in the 1910s. For years, Charles A. Spears was involved in the Oakland Chamber of Commerce's roads committee. He also was on the executive committee to plan the All-Western Road Show in San Francisco, which was a conference for contractors and those who dealt in highway building. I. M. Wells was his partner, and Secretary of the company. Ira Moore Wells (1887 – 1981) was born in Hawaii and attended technical school in Minneapolis as a young man. Wells, who was often present when company machinery was being used in road construction, appears to have been the technical expert in the partnership. In 1919, Spears-Wells Machinery Company began manufacturing farm machinery in Oakland, establishing an office on Twelfth Street and the factory in the brick Standard Oil facility at the corner of Cedar and Ninth streets (which had fallen into disuse after Standard Oil opened a new plant in Richmond). By September of that year, the company was installing its own machinery in the facility. Additional buildings were also constructed, with a total expenditure of $50,000 to develop the plant. The company made a graders, oilers, and other large equipment for road-building, which it shipped all over the Western US. In 1920, it claimed to be the only company west of Chicago manufacturing road-building equipment. [10]

Business was good in the 1920s, and the company added a 5640 square feet of floor space as well as new machinery in 1927 in order to increase production by 30 percent. Aerial photographs show that by 1931, there was a small addition (use for machinery storage) to the south of the original building as well as several large new buildings to the east including a brick machine shop adjacent corrugated metal buildings used as assembly and shop areas. The company appears to have remained active through the late 1950s. [11]

The warehouse located at 1822 9th Street, in the same block as 1819 10th Street, was used in the 1940s as a warehouse for Independent Iron Works Ltd. Prior to this warehouse, the land was owned by Edwin A. Newton and his wife. They sold the property to Independent Iron Works, Ltd. In 1942.[12]

The building was constructed by the Independent Iron Works company as a warehouse. At the time, it was across the street from the company's primary warehouses and manufacturing plant. Independent Iron Works was a steel manufacturing company founded in the 1920s by Henry Gede and William George Meagher. Henry Gede (1893-1979) was born in San Jose and worked at Moore Dry-dock in Oakland as a young man. In 1918, Henry Gede married Valeta Elder. He was co-owner of the Independent Iron Works until he retired in 1954; he died in 1979. William G. Meagher (1894-1973) was born in Port Angeles, Washington and moved to California around 1918. He was married to Jane A. Kelly-Meagher (1898-1963) and they had three sons. His son, William G. Meagher Jr., became vice-president for the Independent Iron Works company, working alongside his father.[13]

The company started out in fairly small facilities on the block bounded by Pine, Eighth, Ninth, and Cedar streets. The plant appears to have expanded gradually over the 1930s, and eventually occupied the entire block as well as an office on 8th Street. By 1939, the plant had 250 employees. The company fabricated all sorts of steel products: structural steel beams for buildings, bridge girders, and small pre-fabricated buildings like gas stations and restrooms. With US entry into World War II, Independent Iron Works expanded into the war work market, competing with the likes of Bethlehem Steel and Kaiser Steel. It supplied prefabricated parts to at least ten local plants that produced war materiel, and also manufactured its own metal barges. Many of the items it manufactured were for US Navy or Merchant Marine ships including ladders, ships' doors, shelving, and sea chests. The warehouse north of 9th Street was developed as part of this expansion. [14]

After the war, Independent Iron Works went back to manufacturing ordinary consumer products, adding new products like barbells. Forty years after the company was started, the Meaghers sold it to Vinnell Steel in 1961. Vinnell Steel, which was based in Irwindale, California, was itself acquired by a larger company a few years later. By 1969, the Independent Iron Works main plant on Pine Street had been shuttered. The main plant was demolished in the late 1990s. [15]

Irving Subway Grating Company

Walter E. Irving (1874 – 1955) established Irving Iron Works in Long Island, New York in 1902. Irving lived with his wife Charlotte and their children in Darien, Connecticut. An engineer who graduated from Rensselaer Polytechnic Institute in 1896, Irving was an innovator and inventor, introducing wire mesh grating systems for the New York City subway system in 1912. The firm changed its name to Irving Subway Grating Company, and began producing open-mesh decking for bridges. At the start of World War II, the company introduced innovative portable landing mats that were utilized by the US Army Air Corps to quickly create airfields.[16]

Irving Subway Grating Company opened its West Coast factory in Emeryville in 1943, where it manufactured the landing mats as well as steel grating for industrial floors and bridges. During World War II, the company was the principal supplier of portable airstrips in the Pacific. In 1949, the company outgrew its Emeryville factory and built its 23,000 square foot, corrugated metal plant on 10th St. In the 1950s, J. C. Lynn was the president of the Irving Subway Grating Company's western division until he died in 1954. James E. Irving succeeded J. C. Lynn as president of the western division of Irving Subway Grating Company in 1955. James Irving (1907 – 1991) was Walter in Charlotte Irving's eldest son. He began his working life as an apprentice in a box factory before becoming a salesman for the family firm and working his way into management. He married Cecile Cottrell in 1933, and the couple lived in Darien until Irving Subway Grating Company opened its West Coast division. He was also the executive vice president and general manager of the parent company in Long Island, New York.[17]

In 1952, the Irving Subway Company warehouse at 1819 10th Street was used by the American Committee for Protection of the Foreign Born for a meeting to help with those who faced deportation. The chairman for that meeting was Henry Saunders, and attorney from

Oakland who specialized in the legal matters for left-wing labor unions and Communist Party members. That same month, the Bay Area annual festival for the International Workers Order was held at this address. Around one-hundred people attended this gathering, most of them supporters of the Communist Party of California.[18]

When James Irving was appointed Chairman of the Board for the company, Charles M. Thomson was elected president of the Irving Subway Grating Company's western division in the 1960s. Harsco Corporation acquired Irving Subway Grating and another company, Gary Gratings, in 1965; Kerrigan Iron Works Company was purchased by Harsco a year later. In 1966, the company expanded its Oakland facility by purchasing the adjacent property to at 1832 Ninth Street from Spears-Wells Machinery Company. The brick warehouse that had been constructed by Spears-Wells Machinery Company between 1919 and 1927 was demolished in 1967. In 1969, the company changed its name to IKG to reflect the names of the firms it had merged.[19]

IKG continue to operate the plant into the 1980s, and constructed a new corrugated metal warehouse at 1832 9th St. in 1985. By the end of the decade, the facility had been shuttered and Joe Clar and Sons, a scrap metal business, moved into 1819 10th St. in 1991. Between 1993 and 2000, 1820 and 1824 9th St. were later used by a company who gave lessons in trapeze and other circus performing arts. The old brick warehouse constructed by Standard Oil Company in 1902 was demolished between 1993 and 2000.

Evaluation:

The National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible.

Criterion A/1: 1819 10th Street is not associated with events that have made a significant contribution to the broad patterns of our history. The property is generally associated with the industrial development of West Oakland during the twentieth century. However, research has revealed no indication that any of the companies located on the block made important contributions history Irving Subway Grating Company did produce portable landing mats that were important to the US war effort, however they did not move to the site until after World War II. Likewise, Independent Iron Works contributed to Bay Area shipbuilding during the war, but its warehouse at the corner of Pine and 9th streets on the subject property was not its primary facility. Research has not revealed that the property is significant within the context of World War II defense production or any other historic context. Therefore, the property is recommended not eligible to the NRHP or CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. Research has not revealed any strong connection between the owners and managers of the various companies and the subject property; nor are these managers important historical figures. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: 1819 10th Street is not significant for its architecture. The warehouses on property that were constructed within the historic period exhibit the typical characteristics of utilitarian buildings of the era. They are simple rectangular buildings with gabled roofs and corrugated metal cladding. They lack decorative features or associations with particular architectural styles. Nor do they possess unique engineering or other design features. For these reasons, the property is recommended ineligible to the NRHP or CRHR under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. The buildings at 1819 10th Street are examples of a well-understood type of construction and do not appear to be a principal source of important information in this regard.

Page 14 of 14 *Resource Name or # (Assigned by recorder) 1819 10th Street
*Recorded by Kara Brunzell *Date: November 22, 2021 ☒ Continuation ☐ Update

The property is recommended not eligible for listing on the NRHP or CRHR and therefore does not qualify as a historical resource under CEQA.

HAYWARD CA 94544
Ownership: private

6. Present use: Industry/manufacturing
Original use: Commerce/warehouse

DESCRIPTION

7a. Architectural Style: 19th century utilitarian

7b. Briefly describe the present physical appearance and any major alterations:

918 Cedar Street, the Standard Oil Warehouse, is a one-story rectangular brick building, 100′ x 75′, with a single arched opening for grade level entry on the north side and platform level openings on the east side. Elsewhere the sixteen-inch brick walls laid in common bond with a header course for every 5 stretcher courses have no openings. The walls are tied at the corners where circular iron tie-plates with star patterns are visible. Along the exposed west side, and presumably the east, and in scattered locations elsewhere, vertical rows of smaller iron tie plates are visible. These are imperfectly lined up and may have been added. As they are in regularly spaced columns, they appear to be part of a system tying the outside walls to some interior framing.

Inside, a single row of wood columns running north and south through the center of the building supports a structure of two parallel gabled roof sections which meet at the line of columns. The interior is lit by skylights. It has a wood floor. The gable ends of the roof are hidden by twin stepped parapets, which have slight corbeling at their tops.

SIGNIFICANCE

19. Briefly state historical and/or architectural importance (include dates, events, and persons associated with the site):

918 Cedar Street, the Standard Oil Warehouse, was built in 1889 as the Oakland substation of the Standard Oil Company of Iowa. Iowa Standard, as it was called, was an affiliate of the main branch of the Standard Oil Company and was set up in 1885 to market Standard Oil products in the western United States (information on Standard Oil comes from Gerald T. White, "Formative Years in the Far West," N.Y., 1962). The company had only a legal connection to the State of Iowa and was administered in San Francisco and New York. It established a basis for overcoming the competition from the Pacific Coast Oil Company, a California company with a refinery in Alameda and a distribution system established in 1880. Standard Oil products, primarily kerosene for illumination and various oils for lubricating machinery, had previously been distributed in the West through various wholesalers. The new marketing system which produced this warehouse was an important step in the creation of a completely integrated national corporation, a corporation that would control not only the sources of the raw material, processing of the raw material, and transportation of the raw material and finished products, but now also the marketing and distributing of

7b. Physical Description (continued)

The exterior of the building today is marked with large, fading, painted signs advertising the "Spears Wells Machinery Company" (the occupant in the 1920s-50s). Portions of the parapet wall have collapsed, some apparently in the October 1989 earthquake and others which have weathered much longer ago. The building's setting consists of railroad tracks and unpaved land on the west, and later factories and warehouses on the other three sides.

19. Historical and/or Architectural Importance (continued)

the finished products as well. This was at a time when there was no clear model for such a system in the petroleum products industry and few in other industries.

Prior to 1882, Standard Oil had built a small warehouse at Third and Townsend Streets in San Francisco for distribution within San Francisco. Between 1882 and 1884, it built a big new San Francisco warehouse at Fifth and Berry Streets and stations in Sacramento, Stockton, and Oakland, the better to compete with the Pacific Coast Oil Company. In 1885, this competitive relationship ended with the merger of the marketing operations of Pacific Coast Oil and Standard Oil under Iowa Standard. Following the merger, Iowa Standard was organized with six main stations: in San Francisco, Stockton, Sacramento, Los Angeles, plus Portland, and one secondary depot in Oakland. In 1886, new stations were established in San Diego and Seattle, and in 1887 the Oakland station was elevated from a depot of the San Francisco main station to a substation. In 1889, the old Oakland warehouse was vacated and the existing warehouse was built to better accommodate the needs of a substation. By 1890, there were 12 main stations and 11 substations and by 1900, 15 main stations and 58 substations between the Mexican border and Alaska. After 1900, pipelines and tank farms replaced the old warehouse system and its old facilities were gradually abandoned. This warehouse remained in the hands of Standard Oil until about 1923. About 1923 the building was sold to the Spears Wells Machinery Co. for a warehouse and shop for construction equipment. Two modifications of unknown specifics were made to the building in 1923 and 1927 under building permits for $1,500 and $5,000; they may have been interior fixtures or the reinforcing rods, since the building seems essentially unaltered. It is not known how many other of these 19th century main stations, substations, or depots may be left standing; this was the only one ever in Oakland.

The building appears to have been organized so that rail deliveries of company products from Cleveland could be made on a platform along the east side of the building, from a spur off the adjacent Southern Pacific railroad, and horse-drawn wagon and tank deliveries could be made through the street-level entry on the north side. (There was a stable and wagon shed on the yard to the east.) Standard Oil products came in cases of cans and in bulk in tank cars. Cases of cans were stacked in the warehouse and bulk liquids transferred to tanks in the warehouse. Bulk liquids were pumped from tanks to barrels (which may have been made at the site) or tank wagons for delivery to customers. While the barrel was so identified with oil that it had already become the basic unit of measure in the industry, Standard Oil encouraged the sale of its bulk products by tank wagon which was cheaper and more efficient. Record keeping and administration presumably took place in an office in the warehouse. In 1894, the main station at Portland, which was larger but probably not different in kind from the Oakland substation, had 19 employees: a special agent (manager), a cashier, two clerks, an office boy, two traveling salesmen, eight warehousemen, three teamsters, and one pumper and cooper. Oakland probably had a smaller number of employees, but the same basic tasks.

19. Historical and/or Architectural Importance (continued)

The 1892-93 city directory includes a John H. McWilliams, warehouseman Standard Oil Company, living a block away at 914 (now 882) Pine.

In addition to this building's association with the Standard Oil Company and the emergence of the oil industry as a major factor in the economy of California, it is also of interest simply as one of many warehouses built in the Bay Area in the 19th century when commerce was largely based on the distribution of products made elsewhere, and as one of the very few such warehouses that survive. While 19th century San Francisco, from the Gold Rush forward, has been widely recognized as a city of warehouses, not many of these have survived in Oakland.

Its warehouse structure is distinctive. It was constructed with a minimum of openings and thicker walls than were required for its load--sixteen inches--for security against fire and theft. With petroleum products, fire was a particular danager and adjacent enterprises required protection from fires or explosions as much as the contents did from outside dangers. In addition, the columns of iron tie plates suggest that either initially or later (perhaps after the earthquake of 1906) unusual steps were taken to ensure the structural stability of the building. It may be an important example of early efforts to apply engineering knowledge to the problems of designing in an earthquake zone, either at the time of its initial construction or later--this can only be known by further close study of the building itself.

Thus, the Standard Oil Warehouse is a relic of a 19th century distribution system and represents the efforts of the Standard Oil Company not only to distribute its products but to arrive at an efficient overall corporate structure. It is an unprepossessing building but one which served a necessary part in an organization where the organizational structure was a newly significant feature of its success. It represents a business decision by Standard Oil that resulted in its quick dominance of the market in California. With its accommodations of both long-distance rail transportation and local wagon transporation, it is a rare surviving example of a 19th century warehouse in the Bay Area when much of the economy was based on the use of warehouses.

Its setting is only partially contributing. Railroad tracks and unpaved land to the west are what was there historically, and contribute to its significance since railroad access was the reason for siting the warehouse here. On the other three sides, the building is now surrounded by larger warehouses, which are compatible in kind but relatively recent, and conceal it from view from all sides except the tracks; when built, it was surrounded on the north, east, and south by houses, and probably dominated the area. The surrounding warehouses on these three sides are all post-1923, the end of the building's Standard Oil era, and do not constitute contributing elements of the setting.

19. Historical and/or Architectural Importance (continued)

Altogether, the Standard Oil Warehouse is a rich artifact that has significant associations with known events, a rare surviving example of an important regional building type, and one that might yield important information about construction technology upon further investigation. As such, it appears to be eligible for the National Register at the local level under Criteria A and C.

19. Historical and/or Architectural Importance (continued)

A series of articles in the Oakland Enquirer in the fall of 1893 provides additional information about the operations of the Standard Oil warehouse, and about the way its corporate presence was received in Oakland. The fullest report is on September 7, under the heading "SUED AGAIN. The Standard Oil Company is After Oakland. It Will Fight the Ordinance for the Removal of Its Big Tanks."

> ...The City of Oakland in October, 1889, designated certain land as available for the storage of kerosene. These lots were at once bought by the Standard Oil Company. It erected warehouses and built three great tanks, one holding 8000 gallons, another 10,000 and a third 140,000 gallons. The company spent $20,000 in making the warehouses secure and arranging fixtures that would expedite the handling of the oil. A side track was built so that a car could be switched to the warehouse and the oil pumped to it from the great tank. There was also apparatus to enable the twenty odd delivery wagons of the company to get their loads easily before they started on their tours of the grocery stores and residences of the city.
>
> Shortly after the establishment of the warehouse suit were instituted to have it abated as a nuisance. This was in April. The complainants were M. Nightingale and J.E. Saulpaugh. They claimed that the storing of such a large quantity of oil near the city was a menace to its safety. ...
>
> ...City Council passed an ordinance rescinding the ordinance of 1889 fixing the site of the warehouses. The new ordinance set aside certain lots on the overflowed marshland. The land is submerged at high tide. To enable the company to bring its wagons to the tanks would require the expenditure of large sums of money. For these reasons the Standard Oil Company wants the courts to decide that the ordinance of May 15, 1893, is not binding.
>
> The monopolistic corporation also urges that the owners of the designated lots have raised the price to an unconscionable figure.... It is claimed that the proceedings are not so much against the company as a nuisance as against a hated corporation.

The parallel to the city's continuing litigation with Southern Pacific over the waterfront was not overlooked in this or subsequent reports. On Sept. 9 Mayor Pardee was reported as assuring Standard Oil that city crews would not take direct action to abate the tanks as they had SP's fence across the foot of Broadway, which was on city property.

Complainants Nightingale and Saulpaugh are identified in city directories as Miss Margaret Nightingale of 1816 Taylor (9th) Street, and James E. Saulpaugh,

Oakland

The Oakland area was originally inhabited by Ohlone people. Northern Alameda County was part of Rancho San Antonio, a vast tract of land granted to the Peralta family (who lived in San José) in 1820. Like other Mexican land grant recipients, the Peraltas had difficulty holding onto their land after California entered the United States in 1850. When the Gold Rush brought large numbers of Americans to California in 1849, the East Bay became an important transit station for passengers and cargo. American hunters and fortune-seekers began squatting in the area that would become Oakland. Horace Carpentier was one of these squatters, and after obtaining a lease from the Peralta family incorporated Oakland in 1852. Carpentier received an extremely valuable grant for the use of most of its waterfront at the first meeting of the city trustees.[1]

Oakland Point is located about two miles west of the original City of Oakland. The Point is notable for its position as the closest land location to San Francisco. In the 1850s, the area was occupied by small farm plots and cut off from the rest of the city by a large marsh, with more marshes to the north and south. These marshes were initially used as dumps and sewage outlets before their development for industrial uses in the twentieth century. In the 1860s, Rodmond Gibbons and partners developed the Bay Street Wharf and the San Francisco and Oakland Railroad at the Point. The railroad included a commuter line that met the ferry at the wharf. Railroad service began in 1862 and was expanded to the east in 1864 and the west in 1868. In 1869 the Central Pacific Railroad connected Oakland Point to the transcontinental railroad. Former mayor Horace Carpentier (who had incorporated Oakland and received a grant to most of its waterfront in 1852) formed a partnership with the Central Pacific Railroad in 1869. He subsequently deeded most of the waterfront to the Central Pacific Railroad, allowing Oakland to become the western terminus of the railroad, with transcontinental shipping passing through, but preventing other development in the area. The railroad tracks and pier system were expanded in 1870, 1871, and 1879-1881; at one point, the piers extended two miles into the water.[2]

Railroad development in the area led to rapid residential growth; Oakland Point's development boomed in the 1870s, and the area was home to a significant portion of Oakland's population. There were two large-scale developers, John Winfield Pearson and John Ziegenbein, who built large tracts in Oakland Point over the decades. The neighborhood was largely built out by the 1890s; 70 percent of buildings extant in 1990 were built before 1889. Large numbers of Oakland Point residents were railroad employees through the 1930s (until the 1920s, railroad workers were required to live west of Adeline Street). The Pullman Palace Car Company, which employed exclusively Black porters, arrived in 1869, giving rise to the beginnings of Oakland's large and early Black population. The Pullman Company employed around 30% of the local Black population as late as 1929. Many Oakland Point residents of this era were lodgers and moved frequently, especially those who worked for the railroad. The Point was also a convenient residential area for San Francisco commuters. Early Oakland Point included a notably large population of working women; an 1880-1881 city directory reported at least fifteen businesses owned by women. Oakland Point during the nineteenth century was dominated by Americans who had moved to Oakland from northern states and immigrants from northwestern Europe, with small but visible Black and Chinese communities. By 1900, there were significant Irish, British, German, and Scandinavian populations as well as over 1000 Black residents (nearly 20 times the 1870 Black population). The early twentieth century saw large increases in the Italian and Slavic populations. The surrounding city grew significantly at this time; Oakland's population doubled between 1900 and 1910 as a result of the 1906 San Francisco earthquake. The Point's Black population also continued to grow and included homeowners and business owners. The Pacific Coast Real Estate and Employment Company was established in 1907 to serve this growing community. The Oakland and East Bay Negro Business League, the first organization of its kind in the region, was formed in 1919. Oakland Point was known in the 1920s and 1930s for its Black music venues and nightclubs; touring performers were barred from most hotels and generally stayed with residents. Oakland Point was highly praised by residents in the first decades of the twentieth century for its racial diversity.[3]

By 1910, the Western Pacific Railroad had broken the Southern Pacific Railroad (successor to the Central Pacific Railroad) monopoly in court. This action allowed the Western Pacific to construct its own pier to the south of the existing pier and begin its own service to Oakland, operating as the main freight and passenger route from the Bay Area to Northeastern California. Oakland Point's hold on the railroad industry was also diluted by the Southern Pacific Railroad's conversion of local passenger service from steam to electric, which

required more widely-scattered headquarters. There were several electrical power stations in the region, and lineman had to maintain long overhead power lines, so electrical service maintenance was dispersed rather than concentrated in the rail yards. The Southern Pacific Railroad built a car shop in Alameda, and the Oakland Point area began to open to other kinds of development; by the 1910s, most new construction in Oakland Point was for industrial properties, located around the edges of the neighborhood's residential center. This included the establishment of shipyards and shipping terminals, which expanded significantly during World War I. During this time, Oakland became one of the foremost shipbuilding centers in the nation; in 1920, their peak year, Oakland shipyards employed more men than every other industry combined. Oakland Point also developed a number of local businesses in the 1910s and 1920s, including large numbers of neighborhood-serving businesses like grocery stores and gas stations. Business owners tended to live in the neighborhood, and Oakland Point was noted locally for residents' ability to meet all their needs without leaving the Point. The influence of the railyards continued to decline in the 1920s as trucking began to compete with rail freight and ferry service became an increasingly significant part of the Southern Pacific Railroad's business. Passenger service soon declined as well with the opening of the Bay Bridge between Oakland and San Francisco in 1936, and the local service stopped in 1941.[4]

The City of Oakland was zoned in the 1930s, by which time it was one of the largest cities in California. Oakland Point was zoned industrial (a designation retained until 1974). By the 1930s, a number of houses in the Point had deteriorated, and residential redevelopment began in 1939 with the construction of large housing projects like Campbell Village and Peralta Villa. These housing projects were controversial among Oakland Point residents, many of whom regarded them as an insidious attempt at racial segregation. Objectors pointed out that the locations chosen for the projects contained large numbers of Black residents, while whiter blocks in worse condition were allowed to remain. The 1939 studies that justified the projects explicitly mapped "non-white families" alongside factors like disease and substandard housing. At least half of the displaced residents were homeowners with limited options to buy elsewhere, and attempts to force the projects to integrate were only moderately successful. During World War II, Oakland shipyards sent recruiters to the south and more than 50,000 Black people moved to the East Bay. High demand for housing led to further rapid residential redevelopment as single-family houses were divided into multiple units and commercial buildings were converted to housing. Many houses in Oakland Point had separate basement units added in the 1940s. Moore Shipyards built its own housing project to accommodate wartime employees in 1942, and there were several other temporary dormitories for wartime workers in industrial neighborhoods.[5]

Historically an integrated area, black residents became a larger percentage of the population in West Oakland as southerners moving to the Bay Area for defense work displaced communities in East Oakland, Richmond, and other cities across the region. Oakland Point's Black population reached a majority of around 80 percent in 1950 and remained around the same until at least the 1980s. The Oakland City Council designated West Oakland as "blighted" in 1949, leading to additional demolitions that decreased its population. Redevelopment projects of the ensuing decades continued to target West Oakland's Black population. In the 1950s, Cypress Freeway construction cut through the neighborhood and isolated it from the rest of the city. 500 homes were demolished for the US Postal Distribution Center in 1960, and much of the neighborhood's commercial core on 7th Street (which has been home to a lively cultural scene) was destroyed in 1970 to make way for the Bay Area Rapid Transit (BART) station. By the end of the 1960s – 1970s era of urban renewal, more than 800 businesses had been closed, 2,500 houses had been demolished, and almost 5,000 households had been pushed out.[6]

Redevelopment was a devastating blow to a community that had been hit hard by the shrinking railroad industry and loss of industrial jobs in the decades following the end of World War II. Redlining meant that West Oakland homeowners were excluded from federally insured mortgages. Of the 137 groceries serving in West Oakland in 1960, just 22 remained by 1980, and many of these businesses had been replaced by liquor stores. Social problems followed disinvestment and redevelopment. Oakland, and particularly West Oakland, was hit hard by the drug epidemics of the 1970s and 1980s, with drugs sold openly on many corners and violence following the drug trade. The large office buildings, hotels, and convention center facilities that brought economic revitalization to downtown Oakland during this era did not bring similar benefits to West Oakland.[7]

The Loma Prieta earthquake in 1989 destroyed a number of historic buildings in Oakland Point and the Cypress Freeway, which collapsed, killing 42 people. Oakland Point residents organized and successfully pushed Caltrans to re-route I-880 around the neighborhood, turning the space previously used by the Freeway into a greenway called the Mandela Parkway. Gentrification due to the Bay Area's tech economy began to affect Oakland in the 1990s and escalated after 2000. An eviction crisis led to unprecedented levels of homelessness in the city, and the Black population has consistently declined in numbers for decades. By 2010, Oakland's Black population was smaller than the white population for the first time since 1970, and by 2020 only about one out of four households in West Oakland was Black.[8]

767 Pine Street

The first building on the property was small residential building constructed in the early 1880s. The building was square in plan and set well back from the street, perhaps to take advantage of a lot that was somewhat wider than others on the block. In 1883, the house was advertised as a rooming house. In 1930, Joseph (1894-1961) and Louise Pine rented the property with their two sons, Leslie and Leroy Pine. Joe Pine worked as a truck driver for a draying company. They moved to Myrtle Street in 1938. It was home to Andrew Brown and Mary Alice Jones in 1945, shortly before it was converted into a church. [9]

At the end of 1945, the Mt. Moriah (Mariah) Baptist Church applied to remodel the house at 767 Pine Street for use as a neighborhood church. Reverend R. H. Sims, Jr. was the pastor of the Mt. Moriah Baptist Church. A Black man, he apparently moved from Pittsburg in 1945 in order to establish a Baptist congregation in the neighborhood to serve its Black residents. Research did not reveal details of his biography. Irwin M. Johnson, a prolific Oakland architect best known for residential construction, was hired for the remodel. The modest project appears to have roughly doubled the size of the small house, extending it toward the street. The small church building apparently did not attract the interest of local newspapers, and research has not revealed any historic-era descriptions or photographs. A small building behind the main church was constructed for use as a church school, and at some point a small belfry addition was constructed adjacent to Pine Street. A few years after its establishment, a second church with the same name was started in central Oakland, Rev. Sims may have moved to the new church. [10]

By 1975, the name of the congregation had changed to St. Luke Missionary Baptist Church. The institution appears to have continued to serve the local Black community, although little is known about its history. In 1975, Aristade Green, a local contractor who was also a deacon in the church, stuccoed the front of the building and replaced two of its original windows with aluminum sliding-sash windows; the other sides were later stuccoed as well. Green and his wife Hazel were Louisiana natives who relocated to Oakland after World War II, where Aristade began working as a builder. In the late 1970s, Green constructed a small addition on its north elevation. Later, Oakland-based evangelist Altha Washington was involved with the congregation. Born in Texas in 1897, she married Elliott Washington, who served in World War I and then worked as a Pullman Porter. Although Altha did not call herself a professional minister, she gained some renown as an evangelist and preacher in the 1960s and 1970s. In the mid-1980s, J. W. Morrison was the pastor, apparently a part-time position since he also led a Baptist church in Vallejo. Claude Mason was the pastor in 2019. In 2021, the property appears to be abandoned. [11]

Evaluation:

The National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible.

Criterion A/1: The church at 767 Pine Street is not associated with events that have made a significant contribution to the broad patterns of our history. The property is generally associated with the residential development of the Oakland Point neighborhood in West Oakland and with its Black community. Research has not revealed that the property is significant within that or any other historic context. Therefore, the property is recommended not eligible to the NRHP or CRHR under Criterion A/1.

HRI # ______
Trinomial ______

Page 8 of 8 *Resource Name or # (Assigned by recorder) 767 Pine Street
*Recorded by Kara Brunzell *Date: November 22, 2021 ☒ Continuation ☐ Update

Criterion B/2: The property is not associated with the life of persons important to our history. The families who lived on the property were not significant contributors to Oakland's development, and research has revealed no important professional accomplishments or lasting impact on local history. Nor do the pastors associated with the church appear to have been historically significant individuals. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: 767 Pine Street is not significant for its architecture. Originally a modest dwelling, the building has been altered many times over the decades and is not a good example of any historic architectural style. For these reasons, the property is ineligible to the NRHP or CRHR under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 767 Pine Street is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

The property is recommended not eligible for listing on the NRHP or CRHR and therefore does not qualify as a historical resource under CEQA.

The two-story commercial building, which exhibits elements of Streamline Moderne architecture, has a trapezoidal plan and flat roof. It is clad in enameled metal. Streamline Moderne decorative features are concentrated at the curved northwest corner. Its main entrance faces the corner and is fitted with double metal commercial doors; it is accessed via a wide set of terrazzo steps. The main façade features two columns on either side of the entrance which are wrapped with gold and white square panels; they support a curved Streamline Moderne awning and are flanked with curved windows fitted with glass block. Fenestration consists of steel casement windows fitted with steel security screens on the first floor. The rear (south) elevation, which faces a fenced parking lot, is stuccoed and has a secondary entrance. The stuccoed east elevation has large window openings fitted with glass block. The building is in good condition.

B10. Significance (continued):

Oakland

The Oakland area was originally inhabited by Ohlone people. Northern Alameda County was part of Rancho San Antonio, a vast tract of land granted to the Peralta family (who lived in San José) in 1820. Like other Mexican land grant recipients, the Peraltas had difficulty holding onto their land after California entered the United States in 1850. When the Gold Rush brought large numbers of Americans to California in 1849, the East Bay became an important transit station for passengers and cargo. American hunters and fortune-seekers began squatting in the area that would become Oakland. Horace Carpentier was one of these squatters, and after obtaining a lease from the Peralta family incorporated Oakland in 1852. Carpentier received an extremely valuable grant for the use of most of its waterfront at the first meeting of the city trustees.[1]

Oakland Point is located about two miles west of the original City of Oakland. The Point is notable for its position as the closest land location to San Francisco. In the 1850s, the area was occupied by small farm plots and cut off from the rest of the city by a large marsh, with more marshes to the north and south. These marshes were initially used as dumps and sewage outlets before their development for industrial uses in the twentieth century. In the 1860s, Rodmond Gibbons and partners developed the Bay Street Wharf and the San Francisco and Oakland Railroad at the Point. The railroad included a commuter line that met the ferry at the wharf. Railroad service began in 1862 and was expanded to the east in 1864 and the west in 1868. In 1869 the Central Pacific Railroad connected Oakland Point to the transcontinental railroad. Former mayor Horace Carpentier (who had incorporated Oakland and received a grant to most of its waterfront in 1852) formed a partnership with the Central Pacific Railroad in 1869. He subsequently deeded most of the waterfront to the Central Pacific Railroad, allowing Oakland to become the western terminus of the railroad, with transcontinental shipping passing through, but preventing other development in the area. The railroad tracks and pier system were expanded in 1870, 1871, and 1879-1881; at one point, the piers extended two miles into the water.[2]

Railroad development in the area led to rapid residential growth; Oakland Point's development boomed in the 1870s, and the area was home to a significant portion of Oakland's population. There were two large-scale developers, John Winfield Pearson and John Ziegenbein, who built large tracts in Oakland Point over the decades. The neighborhood was largely built out by the 1890s; 70 percent of buildings extant in 1990 were built before 1889. Large numbers of Oakland Point residents were railroad employees through the 1930s (until the 1920s, railroad workers were required to live west of Adeline Street). The Pullman Palace Car Company, which employed exclusively Black porters, arrived in 1869, giving rise to the beginnings of Oakland's large and early Black population. The Pullman Company employed around 30% of the local Black population as late as 1929. Many Oakland Point residents of this era were lodgers and moved frequently, especially those who worked for the railroad. The Point was also a convenient residential area for San Francisco commuters. Early Oakland Point included a notably large population of working women; an 1880-1881 city directory reported at least fifteen businesses owned by women. Oakland Point during the nineteenth century was dominated by Americans who had moved to Oakland from northern states and immigrants from northwestern Europe, with small but visible Black and Chinese communities. By 1900, there were significant Irish, British, German, and Scandinavian populations as well as over 1000 Black residents (nearly 20 times the 1870 Black population). The early twentieth century saw large increases in the Italian and Slavic populations. The surrounding city grew significantly at this time; Oakland's population doubled between 1900 and 1910 as a result of the 1906 San Francisco earthquake. The Point's Black population also continued to grow and included homeowners and business owners. The Pacific Coast Real Estate and Employment Company was established in 1907 to serve this growing community. The Oakland and East Bay Negro Business League, the first organization of its kind in the region, was formed in 1919. Oakland Point was known in the 1920s and 1930s for its Black music venues and nightclubs; touring performers were barred from most hotels and generally stayed with residents. Oakland Point was highly praised by residents in the first decades of the twentieth century for its racial diversity.[3]

By 1910, the Western Pacific Railroad had broken the Southern Pacific Railroad (successor to the Central Pacific Railroad) monopoly in court. This action allowed the Western Pacific to construct its own pier to the south of the existing pier and begin its own service to Oakland, operating as the main freight and passenger route from the Bay Area to Northeastern California. Oakland Point's hold on the railroad industry was also diluted by the Southern Pacific Railroad's conversion of local passenger service from steam to electric, which required more widely-scattered headquarters. There were several electrical power stations in the region, and lineman had to maintain long overhead power lines, so electrical service maintenance was dispersed rather than concentrated in the rail yards. The Southern Pacific Railroad built a car shop in Alameda, and the Oakland Point area began to open to other kinds of development; by the 1910s, most new construction in Oakland Point was for industrial properties, located around the edges of the neighborhood's residential center. This included the establishment of shipyards and shipping terminals, which expanded significantly during World War I. During this time, Oakland became one of the foremost shipbuilding centers in the nation; in 1920, their peak year, Oakland shipyards employed more men than every other industry combined. Oakland Point also developed a number of local businesses in the 1910s and 1920s, including large numbers of neighborhood-serving businesses like grocery stores and gas stations. Business owners tended to live in the neighborhood, and Oakland Point was noted locally for residents' ability to meet all their needs without leaving the Point. The influence of the railyards continued to decline in the 1920s as trucking began to compete with rail freight and ferry service became an increasingly significant part of the Southern Pacific Railroad's business. Passenger service soon declined as well with the opening of the Bay Bridge between Oakland and San Francisco in 1936, and the local service stopped in 1941.[4]

The City of Oakland was zoned in the 1930s, by which time it was one of the largest cities in California. Oakland Point was zoned industrial (a designation retained until 1974). By the 1930s, a number of houses in the Point had deteriorated, and residential redevelopment began in 1939 with the construction of large housing projects like Campbell Village and Peralta Villa. These housing projects were controversial among Oakland Point residents, many of whom regarded them as an insidious attempt at racial segregation. Objectors pointed out that the locations chosen for the projects contained large numbers of Black residents, while whiter blocks in worse condition were allowed to remain. The 1939 studies that justified the projects explicitly mapped "non-white families" alongside factors like disease and substandard housing. At least half of the displaced residents were homeowners with limited options to buy elsewhere, and attempts to force the projects to integrate were only moderately successful. During World War II, Oakland shipyards sent recruiters to the south and more than 50,000 Black people moved to the East Bay. High demand for housing led to further rapid residential redevelopment as single-family houses were divided into multiple units and commercial buildings were converted to housing. Many

houses in Oakland Point had separate basement units added in the 1940s. Moore Shipyards built its own housing project to accommodate wartime employees in 1942, and there were several other temporary dormitories for wartime workers in industrial neighborhoods.[5]

Historically an integrated area, black residents became a larger percentage of the population in West Oakland as southerners moving to the Bay Area for defense work displaced communities in East Oakland, Richmond, and other cities across the region. Oakland Point's Black population reached a majority of around 80 percent in 1950 and remained around the same until at least the 1980s. The Oakland City Council designated West Oakland as "blighted" in 1949, leading to additional demolitions that decreased its population. Redevelopment projects of the ensuing decades continued to target West Oakland's Black population. In the 1950s, Cypress Freeway construction cut through the neighborhood and isolated it from the rest of the city. 500 homes were demolished for the US Postal Distribution Center in 1960, and much of the neighborhood's commercial core on 7th Street (which has been home to a lively cultural scene) was destroyed in 1970 to make way for the Bay Area Rapid Transit (BART) station. By the end of the 1960s – 1970s era of urban renewal, more than 800 businesses had been closed, 2,500 houses had been demolished, and almost 5,000 households had been pushed out.[6]

Redevelopment was a devastating blow to a community that had been hit hard by the shrinking railroad industry and loss of industrial jobs in the decades following the end of World War II. Redlining meant that West Oakland homeowners were excluded from federally insured mortgages. Of the 137 groceries serving in West Oakland in 1960, just 22 remained by 1980, and many of these businesses had been replaced by liquor stores. Social problems followed disinvestment and redevelopment. Oakland, and particularly West Oakland, was hit hard by the drug epidemics of the 1970s and 1980s, with drugs sold openly on many corners and violence following the drug trade. The large office buildings, hotels, and convention center facilities that brought economic revitalization to downtown Oakland during this era did not bring similar benefits to West Oakland.[7]

The Loma Prieta earthquake in 1989 destroyed a number of historic buildings in Oakland Point and the Cypress Freeway, which collapsed, killing 42 people. Oakland Point residents organized and successfully pushed Caltrans to re-route I-880 around the neighborhood, turning the space previously used by the Freeway into a greenway called the Mandela Parkway. Gentrification due to the Bay Area's tech economy began to affect Oakland in the 1990s and escalated after 2000. An eviction crisis led to unprecedented levels of homelessness in the city, and the Black population has consistently declined in numbers for decades. By 2010, Oakland's Black population was smaller than the white population for the first time since 1970, and by 2020 only about one out of four households in West Oakland was Black.[8]

1791 8th Street

The commercial/office building at 1791 8th Street (800 Pine Street) was originally constructed in 1907 to serve as the West Oakland Athletic Club. A wood-frame building with projecting square window bays on the second floor, only its footprint was retained when it was remodeled to its current form in 1942 by Mac D. Perkins. Mac Dudley Perkins (1897-1989) was an architect and engineer. Born in Colorado, he attended Massachusetts Institute of technology and graduated in 1922. Mac Perkins married Eleanor Hobbs in 1923. They moved to Berkely in the 1924 and had a son, David H. Perkins. Perkins had a practice as consulting engineer in San Francisco. During World War II, he also worked for the Navy. He was part of a team of architects and engineers who designed the Art Deco Monterey County Courthouse, completed in 1943. He won an award as the structural engineer on the Hope Lutheran Church of San Francisco, designed with noted modernist Mario Corbett in 1954. [9]

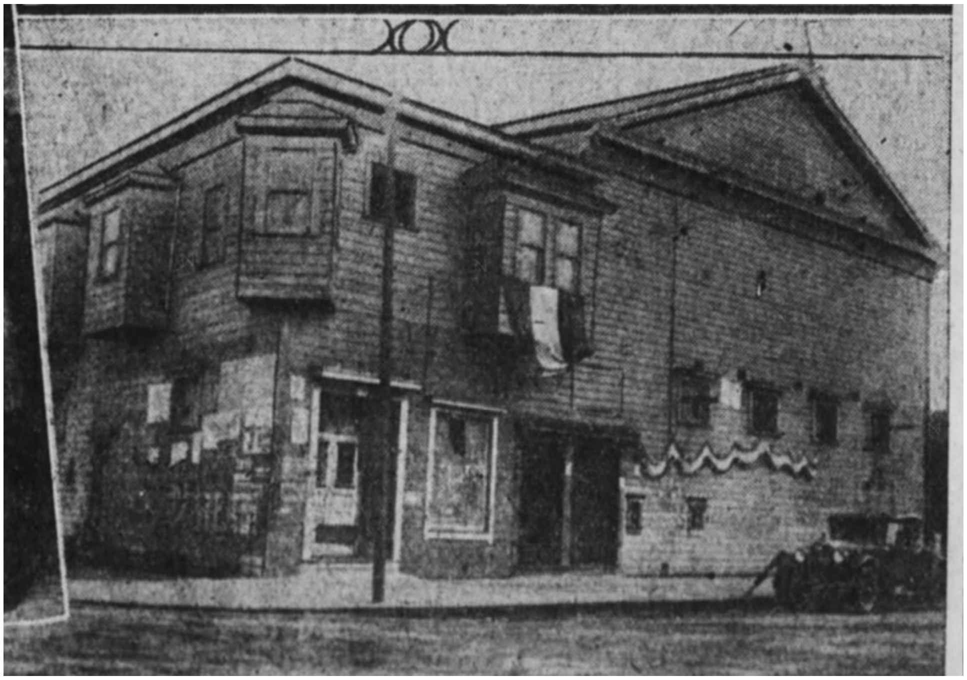

Figure 1: Subject building c1925 prior to being remodeled into its current form (Oakland Tribune).

The building was used by the Independent Iron Works company as an office space. At the time, it was across the street from the company warehouses and manufacturing plant. Independent Iron Works was a steel manufacturing company founded in the 1920s by Henry Gede and William George Meagher. Henry Gede (1893-1979) was born in San Jose and worked at Moore Dry-dock in Oakland as a young man. In 1918, Henry Gede married Valeta Elder. He was co-owner of the Independent Iron Works until he retired in 1954; he died in 1979. William G. Meagher (1894-1973) was born in Port Angeles, Washington and moved to California around 1918. He was married to Jane A. Kelly-Meagher (1898-1963) and they had three sons. His son, William G. Meagher Jr., became vice-president for the Independent Iron Works company, working alongside his father.[10]

The company started out in fairly small facilities on the block bounded by Pine, Eighth, Ninth, and Cedar streets (across the street to the northwest of the subject building). The plant appears to have expanded gradually over the 1930s, and eventually occupied the entire block as well as a warehouse north of Ninth Street. By 1939, the plant had 250 employees. The company fabricated all sorts of steel products: structural steel beams for buildings, bridge girders, and small pre-fabricated buildings like gas stations and restrooms. With US entry into World War II, Independent Iron Works expanded into the war work market, competing with the likes of Bethlehem Steel and Kaiser Steel. It supplied prefabricated parts to at least ten local plants that produced war materiel, and also manufactured its own metal barges. Many of the items it manufactured were for US Navy or Merchant Marine ships including ladders, ships' doors, shelving, and sea chests. [11]

By late 1942, the expanding steel plant across the street had pushed out the old boxing arena at the 1791 8th Street. Its interior had been converted to use as a paint shop, but it was lacking structurally; beams were strengthened and framing added that would allow installation of ribbon bands of steel-sash windows. Floors and partitions were installed to convert the interior to use as Independent Iron Works office headquarters. The project appears to have been completed in 1943. [12]

After the war, Independent Iron Works went back to manufacturing ordinary consumer products, adding new products like barbells. Forty years after the company was started, the Meaghers sold it to Vinnell Steel in 1961. Vinnell Steel, which was based in Irwindale,

California, was itself acquired by a larger company a few years later. By 1969, the Independent Iron Works plant on Pine Street had been shuttered. The main plant was demolished in the late 1990s. [13]

In the 1980s, the office building was used by the Rich and Famous Theatre Company, started by Diana D. Duffer. More recently, the building has been used as an art studio.[14]

Evaluation:

The National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) require that a significance criterion from A-D or 1-4 (respectively) be met for a resource to be eligible.

Criterion A/1: 1791 8th Street is associated with events that have made a significant contribution to the broad patterns of our history. It was the office for Independent Iron Works, a small local steel fabrication company that expanded into war work during World War II. The company played a small but significant role in the production of ships and barges that were used in the US war effort, and is associated with the important role of the East Bay as a locus of the industrial power that underpinned the war effort. 1791 8th Street was used as a paint shop early in the war as the plant was expanding, and then remodeled into its current form to serve as administrative offices for the company in 1943. Its plant, originally located across the street, has been demolished, leaving the office building the only remnant of the company in the built environment. Therefore, the property is recommended eligible to the NRHP and CRHR under Criterion A/1.

Criterion B/2: The property is not associated with the life of persons important to our history. William Meagher and Henry Gede were successful businessmen, but do not appear to have been technical innovators in the steel manufacturing field. Research has revealed no evidence that indicates that either man had a lasting impact on the steel business. Therefore, the property lacks the strength of association required for eligibility under Criterion B/2. The property is recommended not eligible to the NRHP or CRHR under Criterion B/2.

Criterion C/3: 1791 8th Street is significant for its architecture. It is an excellent if rather simple example of Streamline Moderne architecture, a relatively rare style that was popular for only a brief time. Its curved corner at the main entryway with character-defining curved awning and glass block are strong elements of the style. Because of its association with war work, it was constructed in 1943, a time when almost no office or commercial buildings were constructed in the US because of material shortages caused by the war. Furthermore, because its steel-sash windows were in all likelihood fabricated across the street at the Independent Iron Works plant, the architecture of the building is associated with the purpose of the company. For these reasons, the property is eligible to the NRHP and CRHR under Criterion C/3.

Criterion D/4: In rare instances, buildings themselves can serve as sources of important information about historic construction materials or technologies and be significant under Criterion D/4. 1791 8th Street is an example of a well-understood type of construction and does not appear to be a principal source of important information in this regard.

Historic integrity is defined as the authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during its historic period. There are seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association. Loss of integrity, if sufficiently great, overwhelms significance, rendering a property ineligible for historic listing. 1791 8th Street has not been moved and therefore retains integrity of location. The composition of elements that constitute the form, plan, space, structure, and style of the building have not been altered. The building's integrity of materials and workmanship is evident in the survival of original exterior details. The property retains sufficient significant physical characteristics from its original construction to convey its historic qualities and therefore retains integrity of feeling. Continued use as commercial/art studio space allows it to convey integrity of association. Therefore, the building conveys its historic significance through all seven aspects of integrity.

The property is recommended eligible for listing on the NRHP and CRHR and therefore qualifies as a historical resource under CEQA.

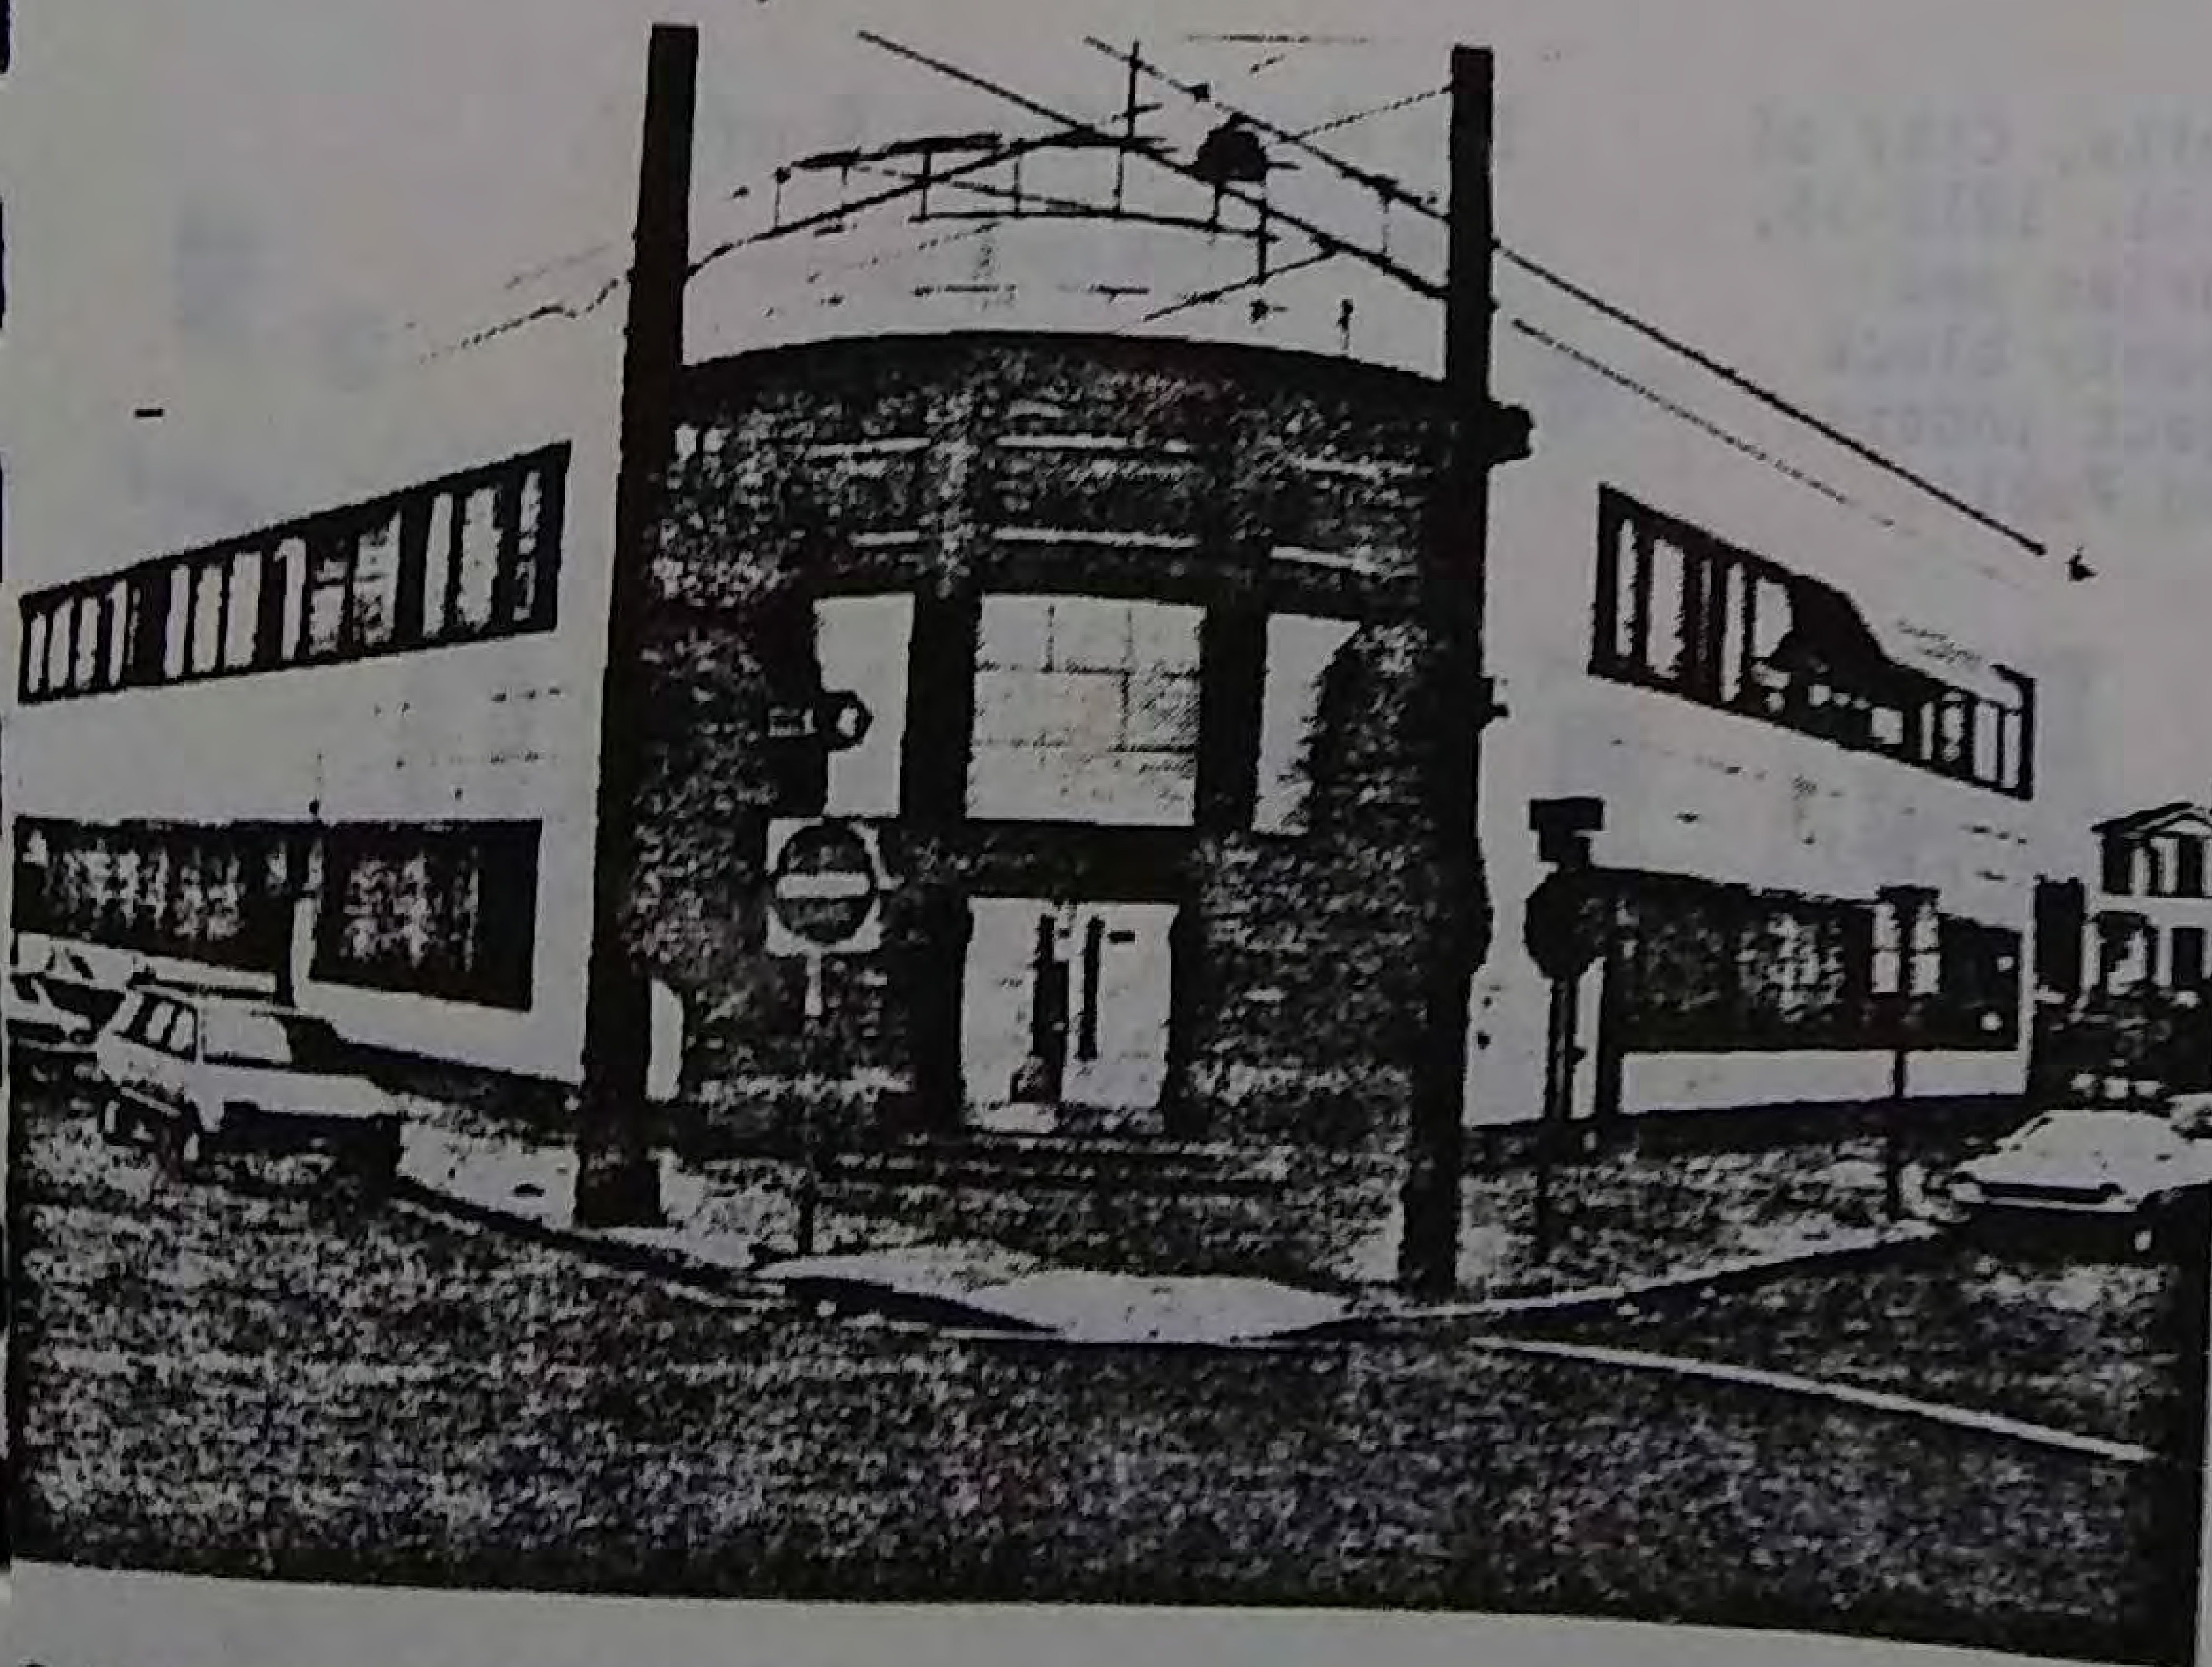
DESCRIPTION

7a. Architectural Style: Streamlined Moderne

7b. Briefly describe the present physical appearance and any major alterations:

1791 8TH ST is a Streamlined Moderne office building, originally Colonial Revival meeting hall. It is two stories, flatiron shape, on a corner lot. It has a flat parapet, monumental entry, and bands of windows. Exterior walls are enameled metal and steel sash. Roof is composition. Foundation is concrete. The building has glass block and terrazzo. Present use is office building. The setting is densely built up, industrial, residential.

Visible alterations include security grilles, awnings. The building is in good condition; its integrity is excellent.



8. Construction Date: 1944-45
incorporating 1907

SIGNIFICANCE

19. Briefly state historical and/or architectural importance (include dates, events, and persons associated with the site):

1791 8TH ST, the Independent Iron Works office, is a very good example of a Streamlined Moderne office building, originally Colonial Revival meeting hall. It was built in 1944-45, architect M.D. Perkins (engineer) and builder unknown. It incorporates an earlier one-story wood-frame building constructed in 1907 for the West Oakland Athletic Club. Historically the building reflects industrial development in Oakland, World War II (wartime housing, industries, migrations, postwar building boom), and civic institutions and activities (politics, religion, education, etc.).

Although its architectural integrity has been maintained, this building does not meet the criteria for individual listing on the National Register of Historic Places since it is less than 50 years old and does not appear to be of exceptional importance. It is unlikely to meet the criteria when it does reach 50 years because it appears to lack sufficient design distinction and historical associations. It is not located within a National Register eligible district.

Subject:	RE: Request For Section 106 Review: The Phoenix Mixed-Use Affordable Housing
Date:	Monday, June 6, 2022 12:13:13 PM

Good afternoon Janis,

Unfortunately, due to an extremely high workload, I was unable to review this project within the 30-day comment period allowed under the Section 106 regulations. Please proceed pursuant to 36 CFR Part 800.3(c)(4) *Failure of the SHPO/THPO to respond.* You can include this correspondence in the environmental record to demonstrate the City Oakland's efforts to consult under Section 106 of the National Historic Preservation Act.

Feel free to contact me directly if you have any questions about this approach.

All the best,
Shannon

Subject: Request For Section 106 Review: The Phoenix Mixed-Use Affordable Housing

Good afternoon
On behalf of the City of Oakland and the East Bay Asian Local Development Corporation, attached please a request for Section 106 review of the cultural resources study conducted for the proposed Phoenix Mixed-Use Affordable Housing in Oakland, Alameda County, California.

This letter, along with the Cultural Resources Assessment Report prepared for the project, are being sent to you via Hightail, a secure file transfer system due to the large size of the document. Please let me know that you have received the report.

If you have any questions about the project, please contact Heather Klein with the City of Oakland, at (510)
238-3659 or hklein@oaklandca.gov .

Best regards

FINAL GEOTECHNICAL INVESTIGATION
PROPOSED RESIDENTIAL DEVELOPMENT
THE PHOENIX – PHASE I
9th and Pine Streets
Oakland, California

1.0 INTRODUCTION

This report presents the results of the final geotechnical investigation performed by Rockridge Geotechnical, Inc. for Phase I of the proposed development (The Phoenix) to be constructed west of Pine Street between Shorey and 9th streets in Oakland, California. The Phase I parcel occupies the southern portion of the development and is a trapezoidal-shaped parcel with maximum plan dimensions of about 280 by 170 feet, and encompasses an area of about 0.9 acres. The Phase I site is bordered by Pine Street on the southeast, Shorey Street on the south, Frontage Road on the west, and Phase II of The Phoenix development on the north, as shown on Site Location Map, Figure 1 and Site Plan, Figure 2. We previously performed a preliminary geotechnical investigation for the site development, the results of which were presented in our report dated December 29, 2017.

The site is relatively level and is currently occupied by concrete slabs from former warehouse buildings across the entire site. Based on our review of preliminary drawings by David Baker Architects dated August 9, 2019 and our discussions with Urban Designs LLC, we understand the Phase I, will consist of a three- to four-story residential building, a two-story administration building, landscaping areas, and a drive aisle with surface parking along the western site boundary. Both buildings will be constructed at-grade.

Alameda County Department of Environmental Health (ACDEH) is overseeing environmental investigation and cleanup activities at the site under Site Cleanup Program (SCP) case number RO 0003269. Environmental contaminants identified at the site include lead impacted soil in the upper 1 foot and PCE/TCE soil gas (P&D Environmental, 2019).

2.0 SCOPE OF SERVICES

During our preliminary investigation, we explored subsurface conditions by advancing seven cone penetration tests (CPTs) across the Phase I and Phase II sites.

Our final geotechnical investigation was performed in accordance with our proposal October 29, 2019. Our final geotechnical investigation included further exploring subsurface conditions across the entire site (Phase I and Phase II) by advancing an additional 12 CPTs, performing four hand-auger borings, and performing laboratory testing on select soil samples. We used the data collected during our field investigation to perform engineering analyses to develop conclusions and recommendations regarding:

- site seismicity and seismic hazards, including the potential for liquefaction and liquefaction-induced ground failure
- the most appropriate foundation type(s) for the proposed buildings
- design criteria for the recommended foundation type(s), including vertical and lateral capacities
- estimates of static and seismically induced foundation settlement
- rigid and flexible pavement design
- design groundwater level
- subgrade preparation for floor slabs, pavements, and exterior concrete flatwork
- site grading and excavation, including criteria for fill quality and compaction
- 2019 California Building Code (CBC) site class and design spectral response acceleration parameters (mapped values)
- soil corrosivity
- construction considerations.

3.0 FIELD INVESTIGATION AND LABORATORY TESTING

We explored the subsurface conditions at the site by performing cone penetration tests (CPTs) and hand-auger borings. Prior to our field investigation, we:

- Reviewed the soil and groundwater management plan prepared by P&D Environmental[1]
- Obtained a drilling permit from the Alameda County Public Works Agency (ACPWA)
- Contacted Underground Service Alert (USA) to notify them of our work
- Retained a professional utility locator to check that the investigation locations were clear of existing underground utilities
- Cored through the existing concrete slab at investigation locations

Additional details of our field investigations and laboratory testing are presented in this section.

3.1 Cone Penetration Tests

Cone penetration tests were performed across the entire during two mobilizations:

> Preliminary Investigation - Seven CPTs, designated CPT-1 through CPT-7, were advanced on December 4, 2017 by Gregg Drilling and Testing, Inc.
>
> Final (Current) Investigation - Twelve CPTs, designated CPT-8 through CPT-19, were advanced on November 19-20, 2019 by ConeTec, Inc.

CPTs were advanced to depths between 30 and 100 feet below ground surfaces (bgs) at the approximate locations shown on the Site Plan, Figure 2.

The CPTs were performed with a truck-mounted rig hydraulically pushing a 1.7-inch-diameter cone-tipped probe into the ground. The probe measured tip resistance, pore water pressure, and frictional resistance on a sleeve behind the cone tip. Electrical sensors within the cone continuously measured these parameters for the entire depth advanced, and the readings were digitized and recorded by a computer. Accumulated data were processed by computer to provide engineering information such as soil behavior types, correlated strength characteristics, and estimated liquefaction resistance of the soil encountered. Upon completion, the CPT holes were tremie-grouted with neat cement grout in accordance with ACPWA requirements. In addition,

---

[1] *Soil and Groundwater Management Plan, County File # RO 3269, Project # 0772*, prepared by P&D Environmental, Inc. and dated December 1, 2017

specialized CPT equipment was used to measure shear wave velocities in CPT-15 and obtain a soil sample from CPT-19 at a depth of approximately 25 feet bgs.

We judge that the results of CPT-6, CPT-7, and CPT-16 through CPT-19 are the most applicable CPTs for Phase I. The logs of these CPTs, showing tip resistance, friction ratio, and pore pressure, as well as interpreted soil behavior type, are presented in Appendix A on Figures A-1 through A-6.

3.2 Hand-Auger Borings and Laboratory Testing

To obtain shallow soil samples we advanced four borings immediately adjacent to CPTs, designated HA-8, HA-9, HA-13, and HA-17, at the approximate locations shown on Figure 2. The borings were advanced to a depth of about 5 feet bgs using a three-inch-diameter hand auger. Soil samples were obtained at approximately one-foot intervals for visual classification and laboratory testing. Soil cuttings were drummed and left on site, and the borings were backfilled with neat cement grout.

In the laboratory, soil samples were tested to measure moisture content, Atterberg limits (plasticity index), fines content, and corrosivity. HA-17 was performed within the Phase I area and is presented in Appendix B on Figure B-1. The soil encountered was classified in accordance with the classification chart shown on Figure B-2. Geotechnical laboratory test results are presented on the boring logs and on Figure B-3. Corrosion test results are presented on Figure B-4.

4.0 SUBSURFACE CONDITIONS AND SITE GEOLOGY

This section summarizes subsurface conditions at the site based on available geologic data from others and subsurface information from this investigation.

4.1 Subsurface Soil Conditions

As presented on Figure 3, the Regional Geologic Map, the site is mapped in a zone of Merritt sand (Qs) (Graymer, 2006). Based on the results of our geotechnical investigation, we conclude that the site is generally underlain by a layer of loose to medium dense sand, which is typically 4 to 7 feet thick. This layer could represent (i) geologically young material, (ii) reworked native material, or (iii) fill and is underlain by Merritt sand. The Merritt sand consists of sand, silty sand, and clayey sand which are typically dense to very dense with occasional medium dense layers. At CPT-16, the Merritt sand extends to a depth of about 63 feet bgs and is underlain by the San Antonio formation. The San Antonio formation typically consists of very stiff to hard clays with occasional interbeds of dense to very dense sand. The San Antonio formation extends to at least 100 feet bgs at the site (at CPT-16), the deepest depth explored. Bedrock is estimated to be about 500 feet bgs (Rogers & Figueres, 1991)

4.2 Groundwater Conditions

Groundwater levels were indirectly measured in CPTs by performing pore-pressure dissipation in CPTs-16, -17, and -19. The measured groundwater levels at the time of testing varied between about 9.5 and 10 feet bgs.

We also reviewed the results of environmental borings performed across the entire site in 1999 by IT Corporation (26 hollow-stem auger borings to approximately 11.5 feet bgs) and in 2018 by P&D Environmental, Inc. (9 hand auger borings to about 11 feet bgs). Groundwater was initially encountered in these borings at depths ranging from about 8 to 10 feet bgs. P&D Environmental noted that the groundwater level was observed to rise to about 6 to 7 feet bgs prior to grouting after being left open for a few hours.

Based on the existing groundwater level data, we conclude a design high groundwater level of 4 feet bgs should be used for design of the project. The groundwater level at the site is expected to fluctuate several feet seasonally with potentially larger fluctuations annually, depending on the amount of rainfall.

5.0 SEISMIC CONSIDERATIONS

The San Francisco Bay Area is considered to be one of the more seismically active regions in the world. We evaluated the potential for earthquake-induced geologic hazards including ground shaking, ground surface rupture, liquefaction,[2] lateral spreading,[3] cyclic densification[4]. The results of our evaluation regarding seismic considerations for the project site are presented in the following sections.

5.1 Regional Seismicity and Faulting

The site is located in the Coast Ranges geomorphic province of California that is characterized by northwest-trending valleys and ridges. These topographic features are controlled by folds and faults that resulted from the collision of the Farallon plate and North American plate and subsequent strike-slip faulting along the San Andreas fault system. The San Andreas fault is more than 600 miles long from Point Arena in the north to the Gulf of California in the south. The Coast Ranges province is bounded on the east by the Great Valley and on the west by the Pacific Ocean.

The major active faults in the area are the Hayward, San Andreas, and Mount Diablo faults. These and other faults of the region are shown on Figure 4. The fault systems in the Bay Area consist of several major right-lateral strike-slip faults that define the boundary zone between the Pacific and the North American tectonic plates. Numerous damaging earthquakes have occurred along these fault systems in recorded time. For these and other active faults within a 50-kilometer radius of the site, the distance from the site and estimated mean characteristic moment

---

[2] Liquefaction is a phenomenon where loose, saturated, cohesionless soil experiences temporary reduction in strength during cyclic loading such as that produced by earthquakes.

[3] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[4] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing ground-surface settlement.

magnitude[5] [Working Group on California Earthquake Probabilities (WGCEP, 2008) and Cao et al. (2003)] are summarized in Table 1.

TABLE 1
Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude
Total Hayward	7.7	East	7.00
Total Hayward-Rodgers Creek	7.7	East	7.33
N. San Andreas - Peninsula	21	West	7.2
N. San Andreas (1906 event)	21	West	8.05

West Napa	40	North	6.7
Monte Vista-Shannon	42	South	6.50
Greenville Connected	42	East	7.00
Great Valley 5, Pittsburg Kirby Hills	46	East	6.70
Point Reyes	49	West	6.90

In the past 200 years, four major earthquakes (i.e., Magnitude > 6) have been recorded on the San Andreas fault. In 1836, an earthquake with an estimated maximum intensity of VII on the

---

[5] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

Modified Mercalli (MM) Intensity Scale occurred east of Monterey Bay on the San Andreas fault (Toppozada and Borchardt, 1998). The estimated moment magnitude, M_w, for this earthquake is about 6.25. In 1838, an earthquake occurred on the Peninsula segment of the San Andreas fault. Severe shaking occurred with an MM of about VIII-IX, corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), an M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The Loma Prieta Earthquake of October 17, 1989 had an M_w of 6.9 and occurred about 94 kilometers south of the site. On August 24, 2014 an earthquake with an estimated maximum intensity of VIII (severe) on the MM scale occurred on the West Napa fault. This earthquake was the largest earthquake event in the San Francisco Bay Area since the Loma Prieta Earthquake. The M_w of the 2014 South Napa Earthquake was 6.0.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake ($M_w = 6.2$).

The U.S. Geological Survey's 2014 Working Group on California Earthquake Probabilities has compiled the earthquake fault research for the San Francisco Bay area in order to estimate the probability of fault segment rupture. They have determined that the overall probability of moment magnitude 6.7 or greater earthquake occurring in the San Francisco Region during the next 30 years (starting from 2014) is 72 percent. The highest probabilities are assigned to the Hayward fault, Calaveras fault, and the northern segment of the San Andreas fault. These probabilities are 14.3, 7.4, and 6.4 percent, respectively.

5.2 Geologic Hazards

During a major earthquake on a segment of one of the nearby faults, strong to very strong ground shaking is expected to occur at the project site. Strong shaking during an earthquake can result in ground failure such as that associated with soil liquefaction, lateral spreading, and cyclic densification. We used the results of the borings and CPTs to evaluate the potential of these phenomena occurring at the project site.

5.2.1 Ground Shaking

The ground shaking intensity felt at the project site will depend on: 1) the size of the earthquake (magnitude), 2) the distance from the site to the fault source, 3) the directivity (focusing of earthquake energy along the fault in the direction of the rupture), and 4) subsurface conditions. The site is approximately 8 kilometers from the Hayward fault and 21 kilometers from the San Andreas fault. Therefore, the potential exists for a large earthquake to induce strong to very strong ground shaking at the site during the life of the project.

5.2.2 Liquefaction and Associated Hazards

When a saturated, cohesionless soil liquefies, it experiences a temporary loss of shear strength created by a transient rise in excess pore pressure generated by strong ground motion. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits. Flow failure, lateral spreading, differential settlement, loss of bearing strength, ground fissures and sand boils are evidence of excess pore pressure generation and liquefaction. The site mapped within a liquefaction hazard zone, as shown on Figure 5 from the map titled *State of California, Seismic Hazard Zones, Oakland West Quadrangle, Official Map*, dated February 14, 2003 and prepared by the California Geological Survey (CGS).

Liquefaction susceptibility was assessed using the software CLiq v3.0.2.4 (GeoLogismiki, 2019). CLiq uses measured field CPT data and assesses liquefaction potential, including post-earthquake vertical settlement, given a user-defined earthquake magnitude and peak ground acceleration (PGA). Our liquefaction analyses were performed using the methodology proposed by Boulanger & Idriss (2014). We used the relationship proposed by Zhang et al. (2002) to estimate post-liquefaction volumetric strains and corresponding ground surface settlement; volumetric strains were then modified using the methodology proposed by Çetin et al. (2009) to account for the depth of the liquefiable layers.

Our analyses were performed using an in-situ groundwater depth of 10 feet bgs and "during earthquake" groundwater depth of 6 feet bgs. In accordance with the 2019 CBC, we used a peak ground acceleration of 0.70 times gravity (g) in our liquefaction evaluation; this peak ground acceleration is consistent with the Maximum Considered Earthquake Geometric Mean (MCE_G) peak ground acceleration adjusted for site effects (PGA_M). We also used a moment magnitude 7.33 earthquake, which is consistent with the mean characteristic moment magnitude for the Hayward fault, as presented in Table 1.

The results of our liquefaction analysis indicate there is are layers of potentially liquefiable material where the upper loose/medium dense sand layer extends below the assumed groundwater table and at a depth of about 26 feet bgs, and is about 2 feet thick. We estimate total "free-field" ground surface settlements associated with liquefaction (referred to as post-liquefaction reconsolidation) within these layers after a major event on a nearby fault will be less than about 1/2 inch,. with differential settlements of about 1/4 inch over a horizontal distance of 30 feet.

Considering the depth and plasticity of the potentially liquefiable soil layers, we conclude the risk of lateral spreading is low.

5.2.3 Cyclic Densification

Cyclic densification (also referred to as differential compaction) of non-saturated sand (sand above groundwater table) can occur during an earthquake, resulting in settlement of the ground surface and overlying improvements. The loose to medium dense undocumented fill material in the upper 5 to 6 feet of the site is potentially susceptible to cyclic densification. We estimate up to 2 inches of ground surface settlement where this layer is not improved or removed, as discussed further in Section 6.1.

5.2.4 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. We therefore conclude the risk of fault offset at the site from a known active fault is very low. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure from previously unknown faults is also very low.

6.0 DISCUSSION AND CONCLUSIONS

From a geotechnical standpoint, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concerns at the site are the presence of 5 to 7 feet of loose to medium dense sand blanketing the site, some of which may consist of undocumented fill, and providing adequate foundation support for the proposed building. These and other geotechnical issues as they pertain to the proposed development are discussed in the remainder of this section.

6.1 Foundations and Settlement

The results of field investigation indicate the site is blanketed by 5 to 7 feet of loose to medium dense sand. If the proposed buildings supported on this layer in its current condition, we conclude the buildings may experience erratic performance due to the inherent variability of these materials and the potential for excessive settlement under static and seismic load conditions. To create a more homogeneous subgrade that will provide uniform support for the proposed improvements, we conclude the upper layer of loose/medium dense sand should be over-excavated, moisture-conditioned, blended, and recompacted. This will require removing the upper 5 feet (as measured from existing grades) of soil across the proposed building pads, scarifying, moisture-conditioning, and compacting the exposed base of overexcavation, and replacing the material as a well-compacted engineered fill. Recompaction (densification) of the undocumented loose to medium dense soil blanketing the site will reduce the amount of anticipated settlement under static loads, as well as the cyclic densification settlement discussed in Section 5.2.3.

As an alternative to over-excavation and recompaction, the buildings may be supported on a shallow foundation provided that the upper layer of soil is otherwise improved (such as through Rapid Impact Compaction [RIC] ground improvement method) or deepened footings are used to bear below the upper layer.

RIC utilizes a track-mounted machine that imparts energy by dropping an approximately 7.5-ton weight from a controlled height of about three feet onto a patented foot. The energy is delivered at a rate of 40 to 60 blows per minute. Drop height, number of blows, and penetration per blow are monitored and/or controlled by an on-board data acquisition system. Compaction points are performed on a geometric grid, the spacing of which is determined based on the properties of the soil to be densified.

We conclude that the Merritt sand below the surficial loose/medium dense layer is capable of supporting the proposed structures on a shallow foundation system, such as conventional spread footings, without excessive settlement. Our settlement analyses indicate total and differential settlement of conventional footings bearing on undisturbed native soil or properly engineered fill, designed using the allowable bearing pressures presented in Section 7.2 of this report, will be less than 1 inch and to the order of a 1/2 inch over a 30-foot horizontal distance, respectively.

Other foundation or ground improvement systems could be designed to support the proposed buildings; however, we believe the above options represent the most feasible and economic options for the proposed project. We can provide recommendations for alternative foundations systems on request.

6.2 Construction Considerations

The soil to be excavated consists primarily of sand, which can be excavated with conventional earth-moving equipment such as loaders and backhoes. If concrete debris or former foundation elements are encountered during grading, removal will require equipment capable of breaking concrete, such as a hoe-ram.

Depending on the groundwater table at the time of construction and amount of rain, the over-excavated areas may be subject to disturbance by repeated by heavy equipment loads; this phenomenon could result in severe rutting and pumping of the exposed subgrade. If this behavior is observed, heavy rubber-tired equipment as well as vibratory rollers should be avoided

Excavations that will be entered by workers should be sloped or shored in accordance with CAL-OSHA standards (29 CFR Part 1926). The contractor should be responsible for the construction and safety of temporary slopes. We judge temporary slopes above the groundwater table with a maximum inclination of 1.5:1 (horizontal to vertical) should be stable, provided the slope is not surcharged by adjacent structures, construction equipment, or stockpiled soil.

6.3 Soil Corrosivity

Corrosivity testing was performed by Project X Corrosion of Murrieta, California on soil samples obtained from the near-surface soil during our field investigation from locations HA-9 and HA-13 at a depth of 2.5 and 2 feet bgs, respectively. The test results are presented on Figure B-4. Based on the resistivity test results, the soil samples are classified as mildly corrosive to buried steel. Based on the chloride, sulfide, and sulfate ion concentrations, and pH test results, the soil samples do not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures. Accordingly, based on the resistivity test results, any buried iron, steel, cast iron, galvanized steel, and dielectric-coated steel or iron should be properly protected against corrosion.

7.0 RECOMMENDATIONS

Recommendations for site grading, foundation design, and seismic design are presented in this section of the report.

7.1 Site Preparation and Grading

Site demolition should include the removal of existing structures, pavements, underground utilities, and foundations. In addition, any on-site areas that will receive surface improvements, such as asphalt pavement or concrete flatwork, should be overexcavated one foot below existing grade, scarified, moisture-conditioned, and recompacted. The primary purpose of the overexcavation beneath surface improvements is to check for loose fill and buried debris or foundations from previous site development or demolition.

In general, abandoned underground utilities should be removed to the property line or service connections and properly capped or plugged with concrete. Where existing utility lines are outside of the proposed building footprint and will not interfere with the proposed construction, they may be abandoned in-place if allowed by the utility company, provided they are filled with flowable grout or slurry. Voids resulting from demolition activities should be properly backfilled with compacted fill following the recommendations provided later in this section and under the observation of our field engineer.

Fill should consist of on-site soil or imported soil (select fill) that is free of organic matter, contains no rocks or lumps larger than four inches in greatest dimension, has a liquid limit of less than 40 and a plasticity index lower than 12, and is approved by the Geotechnical Engineer. Samples of proposed imported fill material should be submitted to the Geotechnical Engineer at least three business days prior to use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed imported material.

7.1.1 Subgrade Preparation

After site clearing and demolition is completed, in areas that will receive improvements (i.e. building pad, pavement, and exterior concrete flatwork) or new fill, the soil subgrade exposed by overexcavation (as described above) should be scarified to a depth of at least eight inches, moisture-conditioned, and compacted in accordance with the requirements presented below in Table 2 (Section 7.1.2).

If the over-excavation and re-compaction option is selected to mitigate the loose upper soils blanketing the building pads, as discussed in Section 6.1, the material should be removed down to at least 5 feet below existing grades, or to undisturbed native material, under the direction of our field engineer, moisture-conditioned, placed in 8-inch-thick lifts, and compacted in accordance with the recommendations in Table 2.

7.1.2 Fill Materials and Compaction Criteria

All fill should be placed in horizontal lifts not exceeding eight inches in loose thickness, moisture-conditioned, and compacted in accordance with the requirements provided below in Table 2. Each type of material is described in the following text according to its uses and specifications.

TABLE 2
Summary of Compaction Requirements

Location	Required Relative Compaction (percent)	Moisture Requirement
Clean sand or gravel (All locations)	95+	Near optimum
Building pad – low-plasticity soil	90+	Above optimum
Exterior slabs – low-plasticity soil	90+	Above optimum
Pavements – low-plasticity soil	95+	Above optimum
Pavements - aggregate base	95+	Near optimum
General fill – low-plasticity soil	90+	Above optimum
Utility trench backfill – low-plasticity	90+	Above optimum

Note: Select fill and lime-treated clay are considered low-plasticity soil.

On-site Soil

On-site soil may be used as general fill, provided the material is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, and be approved by the Geotechnical Engineer.

Select Fill

Select fill should consist of on-site or imported soil that is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, have a liquid limit less than 40 and plasticity index less than 12, and be approved by the Geotechnical Engineer. Samples of proposed select fill material should be submitted to the Geotechnical Engineer at least three business days prior to use at the site.

The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not provided, a minimum of two weeks will be required to perform any necessary analytical testing.

Aggregate Base Material

Imported aggregate base material may be used as general fill, trench backfill (above bedding materials), or as select fill beneath building pad or exterior concrete flatwork. Aggregate base should meet the requirements in the 2015 Caltrans Standard Specifications, Section 26, for Class 2 aggregate base (3/4-inch maximum).

Controlled Low-Strength Material

Controlled low-strength material (CLSM) may be considered as an alternative to fill beneath the building, concrete flatwork, or pavement. CLSM should meet the requirements in the 2015 Caltrans Standard Specifications. It is an ideal backfill material when adequate room is limited or not available for conventional compaction equipment, or when settlement of the backfill must be minimized. No compaction is required to place CLSM. CLSM should have a minimum 28-day unconfined strength of 100 pounds per square inch (psi).

7.1.3 Utility Trench Backfill

Excavations for utility trenches can be readily made with a backhoe. All trenches should conform to the current CAL-OSHA requirements. To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of clean sand or fine gravel. After the pipes and conduits are tested, inspected (if required) and approved, they should be covered to a depth of six inches with sand or fine gravel, which should be mechanically tamped.

Backfill for utility trenches and other excavations is also considered fill, and should be placed and compacted as according to the recommendations previously presented. If imported clean sand or gravel (defined as soil with less than 10 percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the improvements above the fill.

Foundations for the proposed building should be bottomed below an imaginary line extending up at a 1.5:1 (horizontal:vertical) inclination from the base of the utility trenches running parallel to the foundation. Alternatively, the portion of the utility trench (excluding bedding) that is below the 1.5:1 line can be backfilled with CLSM (see Section 7.1.2 for material requirements). If utility trenches are to be excavated below this zone-of-influence line after construction of the building foundations, the trench walls need to be fully supported with shoring until CLSM is placed.

7.1.4 Drainage and Landscaping

Positive surface drainage should be provided around the building to direct surface water away from foundations and below-grade walls. To reduce the potential for water ponding adjacent to the building, we recommend the ground surface within a horizontal distance of five feet from the building slope down away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundation and below-grade walls.

7.2 Foundation Design

Provided the estimated total and differential settlements presented in Section 6.1 are acceptable, we recommend the proposed buildings may be supported by conventional spread footings bearing on: (i) over-excavated and properly compacted fill, (ii) soil improved via Rapid Impact Compaction, or (iii) deepened footings.

Where the perimeter footing is constructed near a bio-retention area or bio-swale, the footing should be founded below an imaginary line extending up at an inclination of 1.5:1 (horizontal: vertical) from the base of the bio-retention area. Exterior perimeter footings should be bottomed at least 24 inches below the outside grade. Interior footings should be bottomed at least 18 inches below the bottom of the capillary moisture break.

Footings may be designed using an allowable bearing pressure of 4,500 pounds per square foot (psf) for dead-plus-live loads; this value may be increased by one-third for total design loads, which include wind or seismic forces. The recommended allowable bearing pressures for dead-plus-live loads and total loads include factors of safety of at least 2.0 and 1.5, respectively.

Lateral loads may be resisted by a combination of passive pressure on the vertical faces of the footings and friction between the bottoms of the footings and the supporting soil. To compute lateral resistance of footings, we recommend using an equivalent fluid weight (triangular distribution) allowable passive pressure of 300 pounds per cubic foot (pcf). Passive pressure in the upper one foot of soil should be neglected unless confined by a slab or pavement. Frictional resistance should be computed using a base friction coefficient of 0.3. The passive pressure and frictional resistance values have included a factor of safety of at least 1.5 and may be used in combination without reduction.

7.2.1 Deepened Footings

The proposed buildings may be directly supported on spread footings that derive support on firm Merritt sand layer below the loose material blanketing the site. This can be achieved by either bottoming the footings below the loose layer, which typically extends 5 to 7 feet below existing grades, or by over-excavating the loose native soil and/or undocumented fill and placing CLSM up to the design bottom-of-footing elevation.

7.2.2 Rapid Impact Compaction

We judge it is feasible to densify the upper loose soil layers in-situ by using Rapid Impact Compaction (RIC). RIC is generally suitable for densifying granular soils within 10 to 15 feet of the ground surface. Because of existing improvements surrounding the site, vibrations should be monitored, and setback from improvements should be established.

Prior to performing the production RIC at the site, a pilot-testing program should be performed to confirm the effectiveness of the proposed RIC spacing and number of passes. We should choose the locations of the test sections and review the ground improvement contractor’s submittal for the proposed test sections. CPTs should be performed before and after the testing program to quantitatively evaluate the improvement. In addition, we recommend time be included in the construction schedule for a second round of pilot-testing for a different spacing or pattern in the event the first round does not show adequate improvement. Improved soil between compaction locations should have a normalized cone tip resistance (Q_{tn}) of at least 100 in order to mitigate the potential for large and erratic settlements in the upper 5 to 7 feet of soil.

Where RIC is performed, it will cause uneven settlement of the ground surface. Consequently, fill will be required to raise site grades in these locations. Our experience at similar sites indicates that about 1 foot of fill may be required as a result for the RIC operation.

7.3 Floor Slabs

If the proposed buildings will include a concrete floor slab, the floor slabs may consist of conventional slabs-on-grade. Where water vapor transmission through the floor slab is undesirable, we recommend installing a capillary moisture break and a water vapor retarder beneath the slab-on-grade. A vapor retarder and capillary moisture break are typically not required beneath parking garage slabs because there is sufficient air circulation to allow evaporation of moisture that is transmitted through the slab; however, we recommend the vapor retarder and capillary break be installed below the slab-on-grade in utility rooms and any areas in or adjacent to the parking garage that will be used for storage and/or will receive a floor covering or coating.

A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class B vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of ASTM E1643. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The particle size of the capillary break material should meet the gradation requirements presented in Table 3.

TABLE 3

Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
1 inch	90 – 100
3/4 inch	30 – 100
1/2 inch	5 – 25
3/8 inch	0 – 6

The concrete slabs should be properly cured. Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the slabs should have a low w/c ratio - less than 0.45. Water should not be added to the concrete mix in the field. If necessary, workability should be increased by adding plasticizers. Before floor coverings are placed on the mat or on slab-on-grade floors, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

7.4 Site Retaining Walls

Site retaining walls should be designed to resist lateral earth pressures imposed by the retained soil, as well as a surcharge pressure from nearby foundations and vehicles, where appropriate. Where permanent retaining walls will be restrained from movement at the top (i.e. retaining walls with 90-degree angle turn), they should be designed for at-rest conditions. Walls retaining more than 6 feet of soil should be designed to resist seismic forces. We recommend restrained below-grade walls at the site be designed for the more critical of the following criteria:

- At-rest equivalent fluid weight of 60 pcf above the design groundwater table and 91 pcf below.
- Active pressure of 40 pcf plus a seismic increment of 20 pcf (triangular distribution) above the design groundwater level, and 82 pcf plus a seismic increment of 10 pcf (triangular distribution) below.

We recommend restrained walls be designed using an at-rest equivalent fluid weight of 60 pcf. Retaining walls that are unrestrained at the top should be designed for active conditions using an active equivalent fluid weight of 40 pcf. Where there will be passenger vehicular traffic behind the top of a permanent wall within a horizontal distance equal to 1.5 times the height of the wall, the wall should be designed for vehicular surcharge of 50 psf over the entire wall height. Higher surcharge pressures may be required, if garbage truck or fire truck loading is anticipated behind the walls. Where existing foundations are supported above a “zone-of-influence” line extending up from a permanent wall at an inclination of 1.5:1 (horizontal:vertical), the wall should be designed for a surcharge pressure—we can evaluate the design surcharge pressure on a case-by-case basis, if needed.

The design earth pressures recommended above are applicable to drained soil conditions. Although the permanent walls will likely be above the groundwater level, water can accumulate behind the walls from other sources, such as rainfall, irrigation, and broken water lines. All retaining walls designed using the recommended earth pressures presented above should be backdrained. One acceptable method for backdraining a retaining wall is to place a prefabricated drainage panel against the back of the wall. The drainage panel should extend down to a perforated PVC collector pipe at the base of the wall. The pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material or 3/4-inch drain rock wrapped in filter fabric (Mirafi NC or equivalent). A proprietary, prefabricated collector drain system, such as Tremdrain Total Drain, AdvanEdge, or Hydroduct Coil, designed to work in conjunction with the drainage panel may be used in lieu of the perforated pipe surrounded by gravel described above. The pipe should be sloped to drain by gravity to a suitable outlet.

7.5 Pavement Design

Design recommendations for asphalt concrete and Portland cement concrete pavements and concrete pavers are presented in the following sections.

7.5.1 Flexible (Asphalt Concrete) Pavement Design

The State of California flexible pavement design method was used to develop the recommended asphalt concrete pavement sections. For pavement design, we assumed a resistance value (R-value) of 30, which is appropriate for the relatively clean sand at the site. Recommended pavement sections for traffic indices ranging from 4.5 to 7.5 are presented in Table 4.

TABLE 4
AC Pavement Sections

TI	Asphaltic Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	5.5
5.0	3.0	5.5
5.5	3.0	7.0
6.0	3.5	7.5
6.5	4.0	8.0
7.0	4.0	9.5
7.5	4.5	10

The upper eight inches of the subgrade and any material placed as part of the required overexcavation should be moisture-conditioned and compacted in accordance with requirements presented in Table 2 in Section 7.1. The aggregate base should be moisture-conditioned to near optimum and compacted to at least 95 percent relative compaction.

Where pavements are adjacent to irrigated landscaped areas, curbs adjacent to those areas should extend through the aggregate base and at least three inches into the underlying soil to reduce the potential for irrigation water to infiltrate into the pavement section. Where pavements are adjacent to storm water treatment facilities, such as bio-swales, flow-through planters, or bio-retention basins, or any other landscaped areas in which a significant thickness of loose, uncompacted soil will be present, the curbs may need to extend deeper.

7.5.2 Rigid (Portland Cement Concrete) Pavement

Concrete pavement design is based on a maximum single-axle load of 20,000 pounds and a maximum tandem axle load of 32,000 pounds and light truck traffic (i.e., a few trucks per week). The recommended rigid pavement section for these axle loads is five inches of Portland cement concrete over six inches of Class 2 aggregate base. Where fire truck traffic is expected, the pavement section should consist of six inches of Portland cement concrete over six inches of Class 2 aggregate base. .

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at maximum spacing of 12.5 and 15 feet for 5-inch-thick and 6-inch-thick pavement sections, respectively. Where the outer edge of a concrete pavement meets asphalt concrete pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. For areas that will receive weekly garbage truck traffic, we recommend the slab be reinforced with a minimum of No. 4 bars at 16-inch spacing in both directions. Recommendations for subgrade preparation and aggregate base compaction for concrete pavement are the same as those described above for asphalt concrete pavement.

7.6 Seismic Design

We anticipate that the proposed buildings will be designed under the 2019 version of the California Building Code (CBC), which is based on the guidelines contained within *ASCE 7-16*. The latitude and longitude of the site are 37.8091° and -122.3035°, respectively. Measured shear wave velocities at the site are consistent with Site Class D classification. Therefore, we recommend Site Class D be used for structural design of the buildings.

Assuming the seismic response coefficient (C_S) value will be calculated as outlined in *ASCE 7-16*, *Section 11.4.8, Exception 2*, we recommend the following seismic design parameters:

- $S_S = 1.500g$, $S_1 = 0.600g$
- $F_a = 1.0$, $F_v = 1.7$

- S_{MS} = 1.50g, S_{M1} = 1.020g
- S_{DS} = 1.00g, S_{D1} = 0.680g
- Seismic Design Category D for Risk Factors I, II, and III

In lieu of adjusting the C_s value, our scope can be revised to include a site-specific ground motion hazard analysis, if desired from a structural engineering standpoint.

8.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

Prior to construction, Rockridge Geotechnical, Inc. should review the project plans and specifications to verify that they conform to the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing during site preparation, placement and compaction of fill, and installation of foundations. These observations will allow us to compare actual with anticipated soil conditions and to verify that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

9.0 LIMITATIONS

This geotechnical study has been conducted in accordance with the standard of care commonly used as state-of-practice in the profession. No other warranties are either expressed or implied. The recommendations made in this report are based on the assumption that the subsurface conditions do not deviate appreciably from those disclosed in the test borings and CPTs. If any variations or undesirable conditions are encountered during construction, we should be notified so that additional recommendations can be made. The foundation recommendations presented in this report are developed exclusively for the proposed development described in this report and are not valid for other locations and construction in the project vicinity.

APPENDIX B

FINAL GEOTECHNICAL INVESTIGATION
PROPOSED RESIDENTIAL DEVELOPMENT
THE PHOENIX – PHASE I
9th and Pine Streets
Oakland, California

1.0 INTRODUCTION

This report presents the results of the final geotechnical investigation performed by Rockridge Geotechnical, Inc. for Phase I of the proposed development (The Phoenix) to be constructed west of Pine Street between Shorey and 9th streets in Oakland, California. The Phase I parcel occupies the southern portion of the development and is a trapezoidal-shaped parcel with maximum plan dimensions of about 280 by 170 feet, and encompasses an area of about 0.9 acres. The Phase I site is bordered by Pine Street on the southeast, Shorey Street on the south, Frontage Road on the west, and Phase II of The Phoenix development on the north, as shown on Site Location Map, Figure 1 and Site Plan, Figure 2. We previously performed a preliminary geotechnical investigation for the site development, the results of which were presented in our report dated December 29, 2017.

The site is relatively level and is currently occupied by concrete slabs from former warehouse buildings across the entire site. Based on our review of preliminary drawings by David Baker Architects dated August 9, 2019 and our discussions with Urban Designs LLC, we understand the Phase I, will consist of a three- to four-story residential building, a two-story administration building, landscaping areas, and a drive aisle with surface parking along the western site boundary. Both buildings will be constructed at-grade.

Alameda County Department of Environmental Health (ACDEH) is overseeing environmental investigation and cleanup activities at the site under Site Cleanup Program (SCP) case number RO 0003269. Environmental contaminants identified at the site include lead impacted soil in the upper 1 foot and PCE/TCE soil gas (P&D Environmental, 2019).

2.0 SCOPE OF SERVICES

During our preliminary investigation, we explored subsurface conditions by advancing seven cone penetration tests (CPTs) across the Phase I and Phase II sites.

Our final geotechnical investigation was performed in accordance with our proposal October 29, 2019. Our final geotechnical investigation included further exploring subsurface conditions across the entire site (Phase I and Phase II) by advancing an additional 12 CPTs, performing four hand-auger borings, and performing laboratory testing on select soil samples. We used the data collected during our field investigation to perform engineering analyses to develop conclusions and recommendations regarding:

- site seismicity and seismic hazards, including the potential for liquefaction and liquefaction-induced ground failure
- the most appropriate foundation type(s) for the proposed buildings
- design criteria for the recommended foundation type(s), including vertical and lateral capacities
- estimates of static and seismically induced foundation settlement
- rigid and flexible pavement design
- design groundwater level
- subgrade preparation for floor slabs, pavements, and exterior concrete flatwork
- site grading and excavation, including criteria for fill quality and compaction
- 2019 California Building Code (CBC) site class and design spectral response acceleration parameters (mapped values)
- soil corrosivity
- construction considerations.

3.0 FIELD INVESTIGATION AND LABORATORY TESTING

We explored the subsurface conditions at the site by performing cone penetration tests (CPTs) and hand-auger borings. Prior to our field investigation, we:

- Reviewed the soil and groundwater management plan prepared by P&D Environmental[1]
- Obtained a drilling permit from the Alameda County Public Works Agency (ACPWA)
- Contacted Underground Service Alert (USA) to notify them of our work
- Retained a professional utility locator to check that the investigation locations were clear of existing underground utilities
- Cored through the existing concrete slab at investigation locations

Additional details of our field investigations and laboratory testing are presented in this section.

3.1 Cone Penetration Tests

Cone penetration tests were performed across the entire during two mobilizations:

> Preliminary Investigation - Seven CPTs, designated CPT-1 through CPT-7, were advanced on December 4, 2017 by Gregg Drilling and Testing, Inc.
>
> Final (Current) Investigation - Twelve CPTs, designated CPT-8 through CPT-19, were advanced on November 19-20, 2019 by ConeTec, Inc.

CPTs were advanced to depths between 30 and 100 feet below ground surfaces (bgs) at the approximate locations shown on the Site Plan, Figure 2.

The CPTs were performed with a truck-mounted rig hydraulically pushing a 1.7-inch-diameter cone-tipped probe into the ground. The probe measured tip resistance, pore water pressure, and frictional resistance on a sleeve behind the cone tip. Electrical sensors within the cone continuously measured these parameters for the entire depth advanced, and the readings were digitized and recorded by a computer. Accumulated data were processed by computer to provide engineering information such as soil behavior types, correlated strength characteristics, and estimated liquefaction resistance of the soil encountered. Upon completion, the CPT holes were tremie-grouted with neat cement grout in accordance with ACPWA requirements. In addition,

---

[1] *Soil and Groundwater Management Plan, County File # RO 3269, Project # 0772*, prepared by P&D Environmental, Inc. and dated December 1, 2017

specialized CPT equipment was used to measure shear wave velocities in CPT-15 and obtain a soil sample from CPT-19 at a depth of approximately 25 feet bgs.

We judge that the results of CPT-6, CPT-7, and CPT-16 through CPT-19 are the most applicable CPTs for Phase I. The logs of these CPTs, showing tip resistance, friction ratio, and pore pressure, as well as interpreted soil behavior type, are presented in Appendix A on Figures A-1 through A-6.

3.2 Hand-Auger Borings and Laboratory Testing

To obtain shallow soil samples we advanced four borings immediately adjacent to CPTs, designated HA-8, HA-9, HA-13, and HA-17, at the approximate locations shown on Figure 2. The borings were advanced to a depth of about 5 feet bgs using a three-inch-diameter hand auger. Soil samples were obtained at approximately one-foot intervals for visual classification and laboratory testing. Soil cuttings were drummed and left on site, and the borings were backfilled with neat cement grout.

In the laboratory, soil samples were tested to measure moisture content, Atterberg limits (plasticity index), fines content, and corrosivity. HA-17 was performed within the Phase I area and is presented in Appendix B on Figure B-1. The soil encountered was classified in accordance with the classification chart shown on Figure B-2. Geotechnical laboratory test results are presented on the boring logs and on Figure B-3. Corrosion test results are presented on Figure B-4.

4.0 SUBSURFACE CONDITIONS AND SITE GEOLOGY

This section summarizes subsurface conditions at the site based on available geologic data from others and subsurface information from this investigation.

4.1 Subsurface Soil Conditions

As presented on Figure 3, the Regional Geologic Map, the site is mapped in a zone of Merritt sand (Qs) (Graymer, 2006). Based on the results of our geotechnical investigation, we conclude that the site is generally underlain by a layer of loose to medium dense sand, which is typically 4 to 7 feet thick. This layer could represent (i) geologically young material, (ii) reworked native material, or (iii) fill and is underlain by Merritt sand. The Merritt sand consists of sand, silty sand, and clayey sand which are typically dense to very dense with occasional medium dense layers. At CPT-16, the Merritt sand extends to a depth of about 63 feet bgs and is underlain by the San Antonio formation. The San Antonio formation typically consists of very stiff to hard clays with occasional interbeds of dense to very dense sand. The San Antonio formation extends to at least 100 feet bgs at the site (at CPT-16), the deepest depth explored. Bedrock is estimated to be about 500 feet bgs (Rogers & Figueres, 1991)

4.2 Groundwater Conditions

Groundwater levels were indirectly measured in CPTs by performing pore-pressure dissipation in CPTs-16, -17, and -19. The measured groundwater levels at the time of testing varied between about 9.5 and 10 feet bgs.

We also reviewed the results of environmental borings performed across the entire site in 1999 by IT Corporation (26 hollow-stem auger borings to approximately 11.5 feet bgs) and in 2018 by P&D Environmental, Inc. (9 hand auger borings to about 11 feet bgs). Groundwater was initially encountered in these borings at depths ranging from about 8 to 10 feet bgs. P&D Environmental noted that the groundwater level was observed to rise to about 6 to 7 feet bgs prior to grouting after being left open for a few hours.

Based on the existing groundwater level data, we conclude a design high groundwater level of 4 feet bgs should be used for design of the project. The groundwater level at the site is expected to fluctuate several feet seasonally with potentially larger fluctuations annually, depending on the amount of rainfall.

5.0 SEISMIC CONSIDERATIONS

The San Francisco Bay Area is considered to be one of the more seismically active regions in the world. We evaluated the potential for earthquake-induced geologic hazards including ground shaking, ground surface rupture, liquefaction,[2] lateral spreading,[3] cyclic densification[4]. The results of our evaluation regarding seismic considerations for the project site are presented in the following sections.

5.1 Regional Seismicity and Faulting

The site is located in the Coast Ranges geomorphic province of California that is characterized by northwest-trending valleys and ridges. These topographic features are controlled by folds and faults that resulted from the collision of the Farallon plate and North American plate and subsequent strike-slip faulting along the San Andreas fault system. The San Andreas fault is more than 600 miles long from Point Arena in the north to the Gulf of California in the south. The Coast Ranges province is bounded on the east by the Great Valley and on the west by the Pacific Ocean.

The major active faults in the area are the Hayward, San Andreas, and Mount Diablo faults. These and other faults of the region are shown on Figure 4. The fault systems in the Bay Area consist of several major right-lateral strike-slip faults that define the boundary zone between the Pacific and the North American tectonic plates. Numerous damaging earthquakes have occurred along these fault systems in recorded time. For these and other active faults within a 50-kilometer radius of the site, the distance from the site and estimated mean characteristic moment

---

[2] Liquefaction is a phenomenon where loose, saturated, cohesionless soil experiences temporary reduction in strength during cyclic loading such as that produced by earthquakes.

[3] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[4] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is compacted by earthquake vibrations, causing ground-surface settlement.

magnitude[5] [Working Group on California Earthquake Probabilities (WGCEP, 2008) and Cao et al. (2003)] are summarized in Table 1.

TABLE 1

Regional Faults and Seismicity

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Mean Characteristic Moment Magnitude

Great Valley 5, Pittsburg Kirby Hills	46	East	6.70
Point Reyes	49	West	6.90

In the past 200 years, four major earthquakes (i.e., Magnitude > 6) have been recorded on the San Andreas fault. In 1836, an earthquake with an estimated maximum intensity of VII on the

---

[5] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

Modified Mercalli (MM) Intensity Scale occurred east of Monterey Bay on the San Andreas fault (Toppozada and Borchardt, 1998). The estimated moment magnitude, M_w, for this earthquake is about 6.25. In 1838, an earthquake occurred on the Peninsula segment of the San Andreas fault. Severe shaking occurred with an MM of about VIII-IX, corresponding to an M_w of about 7.5. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas fault from Shelter Cove to San Juan Bautista approximately 470 kilometers in length. It had a maximum intensity of XI (MM), an M_w of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The Loma Prieta Earthquake of October 17, 1989 had an M_w of 6.9 and occurred about 94 kilometers south of the site. On August 24, 2014 an earthquake with an estimated maximum intensity of VIII (severe) on the MM scale occurred on the West Napa fault. This earthquake was the largest earthquake event in the San Francisco Bay Area since the Loma Prieta Earthquake. The M_w of the 2014 South Napa Earthquake was 6.0.

In 1868, an earthquake with an estimated maximum intensity of X on the MM scale occurred on the southern segment (between San Leandro and Fremont) of the Hayward fault. The estimated M_w for the earthquake is 7.0. In 1861, an earthquake of unknown magnitude (probably an M_w of about 6.5) was reported on the Calaveras fault. The most recent significant earthquake on this fault was the 1984 Morgan Hill earthquake ($M_w = 6.2$).

The U.S. Geological Survey's 2014 Working Group on California Earthquake Probabilities has compiled the earthquake fault research for the San Francisco Bay area in order to estimate the probability of fault segment rupture. They have determined that the overall probability of moment magnitude 6.7 or greater earthquake occurring in the San Francisco Region during the next 30 years (starting from 2014) is 72 percent. The highest probabilities are assigned to the Hayward fault, Calaveras fault, and the northern segment of the San Andreas fault. These probabilities are 14.3, 7.4, and 6.4 percent, respectively.

5.2 Geologic Hazards

During a major earthquake on a segment of one of the nearby faults, strong to very strong ground shaking is expected to occur at the project site. Strong shaking during an earthquake can result in ground failure such as that associated with soil liquefaction, lateral spreading, and cyclic densification. We used the results of the borings and CPTs to evaluate the potential of these phenomena occurring at the project site.

5.2.1 Ground Shaking

The ground shaking intensity felt at the project site will depend on: 1) the size of the earthquake (magnitude), 2) the distance from the site to the fault source, 3) the directivity (focusing of earthquake energy along the fault in the direction of the rupture), and 4) subsurface conditions. The site is approximately 8 kilometers from the Hayward fault and 21 kilometers from the San Andreas fault. Therefore, the potential exists for a large earthquake to induce strong to very strong ground shaking at the site during the life of the project.

5.2.2 Liquefaction and Associated Hazards

When a saturated, cohesionless soil liquefies, it experiences a temporary loss of shear strength created by a transient rise in excess pore pressure generated by strong ground motion. Soil susceptible to liquefaction includes loose to medium dense sand and gravel, low-plasticity silt, and some low-plasticity clay deposits. Flow failure, lateral spreading, differential settlement, loss of bearing strength, ground fissures and sand boils are evidence of excess pore pressure generation and liquefaction. The site mapped within a liquefaction hazard zone, as shown on Figure 5 from the map titled *State of California, Seismic Hazard Zones, Oakland West Quadrangle, Official Map*, dated February 14, 2003 and prepared by the California Geological Survey (CGS).

Liquefaction susceptibility was assessed using the software CLiq v3.0.2.4 (GeoLogismiki, 2019). CLiq uses measured field CPT data and assesses liquefaction potential, including post-earthquake vertical settlement, given a user-defined earthquake magnitude and peak ground acceleration (PGA). Our liquefaction analyses were performed using the methodology proposed by Boulanger & Idriss (2014). We used the relationship proposed by Zhang et al. (2002) to estimate post-liquefaction volumetric strains and corresponding ground surface settlement; volumetric strains were then modified using the methodology proposed by Çetin et al. (2009) to account for the depth of the liquefiable layers.

Our analyses were performed using an in-situ groundwater depth of 10 feet bgs and "during earthquake" groundwater depth of 6 feet bgs. In accordance with the 2019 CBC, we used a peak ground acceleration of 0.70 times gravity (g) in our liquefaction evaluation; this peak ground acceleration is consistent with the Maximum Considered Earthquake Geometric Mean (MCE_G) peak ground acceleration adjusted for site effects (PGA_M). We also used a moment magnitude 7.33 earthquake, which is consistent with the mean characteristic moment magnitude for the Hayward fault, as presented in Table 1.

The results of our liquefaction analysis indicate there is are layers of potentially liquefiable material where the upper loose/medium dense sand layer extends below the assumed groundwater table and at a depth of about 26 feet bgs, and is about 2 feet thick. We estimate total "free-field" ground surface settlements associated with liquefaction (referred to as post-liquefaction reconsolidation) within these layers after a major event on a nearby fault will be less than about 1/2 inch,. with differential settlements of about 1/4 inch over a horizontal distance of 30 feet.

Considering the depth and plasticity of the potentially liquefiable soil layers, we conclude the risk of lateral spreading is low.

5.2.3 Cyclic Densification

Cyclic densification (also referred to as differential compaction) of non-saturated sand (sand above groundwater table) can occur during an earthquake, resulting in settlement of the ground surface and overlying improvements. The loose to medium dense undocumented fill material in the upper 5 to 6 feet of the site is potentially susceptible to cyclic densification. We estimate up to 2 inches of ground surface settlement where this layer is not improved or removed, as discussed further in Section 6.1.

5.2.4 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no known active or potentially active faults exist on the site. We therefore conclude the risk of fault offset at the site from a known active fault is very low. In a seismically active area, the remote possibility exists for future faulting in areas where no faults previously existed; however, we conclude the risk of surface faulting and consequent secondary ground failure from previously unknown faults is also very low.

6.0 DISCUSSION AND CONCLUSIONS

From a geotechnical standpoint, we conclude the site can be developed as planned, provided the recommendations presented in this report are incorporated into the project plans and specifications and implemented during construction. The primary geotechnical concerns at the site are the presence of 5 to 7 feet of loose to medium dense sand blanketing the site, some of which may consist of undocumented fill, and providing adequate foundation support for the proposed building. These and other geotechnical issues as they pertain to the proposed development are discussed in the remainder of this section.

6.1 Foundations and Settlement

The results of field investigation indicate the site is blanketed by 5 to 7 feet of loose to medium dense sand. If the proposed buildings supported on this layer in its current condition, we conclude the buildings may experience erratic performance due to the inherent variability of these materials and the potential for excessive settlement under static and seismic load conditions. To create a more homogeneous subgrade that will provide uniform support for the proposed improvements, we conclude the upper layer of loose/medium dense sand should be over-excavated, moisture-conditioned, blended, and recompacted. This will require removing the upper 5 feet (as measured from existing grades) of soil across the proposed building pads, scarifying, moisture-conditioning, and compacting the exposed base of overexcavation, and replacing the material as a well-compacted engineered fill. Recompaction (densification) of the undocumented loose to medium dense soil blanketing the site will reduce the amount of anticipated settlement under static loads, as well as the cyclic densification settlement discussed in Section 5.2.3.

As an alternative to over-excavation and recompaction, the buildings may be supported on a shallow foundation provided that the upper layer of soil is otherwise improved (such as through Rapid Impact Compaction [RIC] ground improvement method) or deepened footings are used to bear below the upper layer.

RIC utilizes a track-mounted machine that imparts energy by dropping an approximately 7.5-ton weight from a controlled height of about three feet onto a patented foot. The energy is delivered at a rate of 40 to 60 blows per minute. Drop height, number of blows, and penetration per blow are monitored and/or controlled by an on-board data acquisition system. Compaction points are performed on a geometric grid, the spacing of which is determined based on the properties of the soil to be densified.

We conclude that the Merritt sand below the surficial loose/medium dense layer is capable of supporting the proposed structures on a shallow foundation system, such as conventional spread footings, without excessive settlement. Our settlement analyses indicate total and differential settlement of conventional footings bearing on undisturbed native soil or properly engineered fill, designed using the allowable bearing pressures presented in Section 7.2 of this report, will be less than 1 inch and to the order of a 1/2 inch over a 30-foot horizontal distance, respectively.

Other foundation or ground improvement systems could be designed to support the proposed buildings; however, we believe the above options represent the most feasible and economic options for the proposed project. We can provide recommendations for alternative foundations systems on request.

6.2 Construction Considerations

The soil to be excavated consists primarily of sand, which can be excavated with conventional earth-moving equipment such as loaders and backhoes. If concrete debris or former foundation elements are encountered during grading, removal will require equipment capable of breaking concrete, such as a hoe-ram.

Depending on the groundwater table at the time of construction and amount of rain, the over-excavated areas may be subject to disturbance by repeated by heavy equipment loads; this phenomenon could result in severe rutting and pumping of the exposed subgrade. If this behavior is observed, heavy rubber-tired equipment as well as vibratory rollers should be avoided

Excavations that will be entered by workers should be sloped or shored in accordance with CAL-OSHA standards (29 CFR Part 1926). The contractor should be responsible for the construction and safety of temporary slopes. We judge temporary slopes above the groundwater table with a maximum inclination of 1.5:1 (horizontal to vertical) should be stable, provided the slope is not surcharged by adjacent structures, construction equipment, or stockpiled soil.

6.3 Soil Corrosivity

Corrosivity testing was performed by Project X Corrosion of Murrieta, California on soil samples obtained from the near-surface soil during our field investigation from locations HA-9 and HA-13 at a depth of 2.5 and 2 feet bgs, respectively. The test results are presented on Figure B-4. Based on the resistivity test results, the soil samples are classified as mildly corrosive to buried steel. Based on the chloride, sulfide, and sulfate ion concentrations, and pH test results, the soil samples do not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures. Accordingly, based on the resistivity test results, any buried iron, steel, cast iron, galvanized steel, and dielectric-coated steel or iron should be properly protected against corrosion.

7.0 RECOMMENDATIONS

Recommendations for site grading, foundation design, and seismic design are presented in this section of the report.

7.1 Site Preparation and Grading

Site demolition should include the removal of existing structures, pavements, underground utilities, and foundations. In addition, any on-site areas that will receive surface improvements, such as asphalt pavement or concrete flatwork, should be overexcavated one foot below existing grade, scarified, moisture-conditioned, and recompacted. The primary purpose of the overexcavation beneath surface improvements is to check for loose fill and buried debris or foundations from previous site development or demolition.

In general, abandoned underground utilities should be removed to the property line or service connections and properly capped or plugged with concrete. Where existing utility lines are outside of the proposed building footprint and will not interfere with the proposed construction, they may be abandoned in-place if allowed by the utility company, provided they are filled with flowable grout or slurry. Voids resulting from demolition activities should be properly backfilled with compacted fill following the recommendations provided later in this section and under the observation of our field engineer.

Fill should consist of on-site soil or imported soil (select fill) that is free of organic matter, contains no rocks or lumps larger than four inches in greatest dimension, has a liquid limit of less than 40 and a plasticity index lower than 12, and is approved by the Geotechnical Engineer. Samples of proposed imported fill material should be submitted to the Geotechnical Engineer at least three business days prior to use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to perform analytical testing on the proposed imported material.

7.1.1 Subgrade Preparation

After site clearing and demolition is completed, in areas that will receive improvements (i.e. building pad, pavement, and exterior concrete flatwork) or new fill, the soil subgrade exposed by overexcavation (as described above) should be scarified to a depth of at least eight inches, moisture-conditioned, and compacted in accordance with the requirements presented below in Table 2 (Section 7.1.2).

If the over-excavation and re-compaction option is selected to mitigate the loose upper soils blanketing the building pads, as discussed in Section 6.1, the material should be removed down to at least 5 feet below existing grades, or to undisturbed native material, under the direction of our field engineer, moisture-conditioned, placed in 8-inch-thick lifts, and compacted in accordance with the recommendations in Table 2.

7.1.2 Fill Materials and Compaction Criteria

All fill should be placed in horizontal lifts not exceeding eight inches in loose thickness, moisture-conditioned, and compacted in accordance with the requirements provided below in Table 2. Each type of material is described in the following text according to its uses and specifications.

TABLE 2
Summary of Compaction Requirements

Location	Required Relative Compaction (percent)	Moisture Requirement
Clean sand or gravel (All locations)	95+	Near optimum
Building pad – low-plasticity soil	90+	Above optimum
Exterior slabs – low-plasticity soil	90+	Above optimum
Pavements – low-plasticity soil	95+	Above optimum
Pavements - aggregate base	95+	Near optimum
General fill – low-plasticity soil	90+	Above optimum
Utility trench backfill – low-plasticity	90+	Above optimum

Note: Select fill and lime-treated clay are considered low-plasticity soil.

On-site Soil

On-site soil may be used as general fill, provided the material is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, and be approved by the Geotechnical Engineer.

Select Fill

Select fill should consist of on-site or imported soil that is free of organic matter, contain no rocks or lumps larger than three inches in greatest dimension, have a liquid limit less than 40 and plasticity index less than 12, and be approved by the Geotechnical Engineer. Samples of proposed select fill material should be submitted to the Geotechnical Engineer at least three business days prior to use at the site.

The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not provided, a minimum of two weeks will be required to perform any necessary analytical testing.

Aggregate Base Material

Imported aggregate base material may be used as general fill, trench backfill (above bedding materials), or as select fill beneath building pad or exterior concrete flatwork. Aggregate base should meet the requirements in the 2015 Caltrans Standard Specifications, Section 26, for Class 2 aggregate base (3/4-inch maximum).

Controlled Low-Strength Material

Controlled low-strength material (CLSM) may be considered as an alternative to fill beneath the building, concrete flatwork, or pavement. CLSM should meet the requirements in the 2015 Caltrans Standard Specifications. It is an ideal backfill material when adequate room is limited or not available for conventional compaction equipment, or when settlement of the backfill must be minimized. No compaction is required to place CLSM. CLSM should have a minimum 28-day unconfined strength of 100 pounds per square inch (psi).

7.1.3 Utility Trench Backfill

Excavations for utility trenches can be readily made with a backhoe. All trenches should conform to the current CAL-OSHA requirements. To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of clean sand or fine gravel. After the pipes and conduits are tested, inspected (if required) and approved, they should be covered to a depth of six inches with sand or fine gravel, which should be mechanically tamped.

Backfill for utility trenches and other excavations is also considered fill, and should be placed and compacted as according to the recommendations previously presented. If imported clean sand or gravel (defined as soil with less than 10 percent fines) is used as backfill, it should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements, resulting in damage to the improvements above the fill.

Foundations for the proposed building should be bottomed below an imaginary line extending up at a 1.5:1 (horizontal:vertical) inclination from the base of the utility trenches running parallel to the foundation. Alternatively, the portion of the utility trench (excluding bedding) that is below the 1.5:1 line can be backfilled with CLSM (see Section 7.1.2 for material requirements). If utility trenches are to be excavated below this zone-of-influence line after construction of the building foundations, the trench walls need to be fully supported with shoring until CLSM is placed.

7.1.4 Drainage and Landscaping

Positive surface drainage should be provided around the building to direct surface water away from foundations and below-grade walls. To reduce the potential for water ponding adjacent to the building, we recommend the ground surface within a horizontal distance of five feet from the building slope down away from the building with a surface gradient of at least two percent in unpaved areas and one percent in paved areas. In addition, roof downspouts should be discharged into controlled drainage facilities to keep the water away from the foundation and below-grade walls.

7.2 Foundation Design

Provided the estimated total and differential settlements presented in Section 6.1 are acceptable, we recommend the proposed buildings may be supported by conventional spread footings bearing on: (i) over-excavated and properly compacted fill, (ii) soil improved via Rapid Impact Compaction, or (iii) deepened footings.

Where the perimeter footing is constructed near a bio-retention area or bio-swale, the footing should be founded below an imaginary line extending up at an inclination of 1.5:1 (horizontal: vertical) from the base of the bio-retention area. Exterior perimeter footings should be bottomed at least 24 inches below the outside grade. Interior footings should be bottomed at least 18 inches below the bottom of the capillary moisture break.

Footings may be designed using an allowable bearing pressure of 4,500 pounds per square foot (psf) for dead-plus-live loads; this value may be increased by one-third for total design loads, which include wind or seismic forces. The recommended allowable bearing pressures for dead-plus-live loads and total loads include factors of safety of at least 2.0 and 1.5, respectively.

Lateral loads may be resisted by a combination of passive pressure on the vertical faces of the footings and friction between the bottoms of the footings and the supporting soil. To compute lateral resistance of footings, we recommend using an equivalent fluid weight (triangular distribution) allowable passive pressure of 300 pounds per cubic foot (pcf). Passive pressure in the upper one foot of soil should be neglected unless confined by a slab or pavement. Frictional resistance should be computed using a base friction coefficient of 0.3. The passive pressure and frictional resistance values have included a factor of safety of at least 1.5 and may be used in combination without reduction.

7.2.1 Deepened Footings

The proposed buildings may be directly supported on spread footings that derive support on firm Merritt sand layer below the loose material blanketing the site. This can be achieved by either bottoming the footings below the loose layer, which typically extends 5 to 7 feet below existing grades, or by over-excavating the loose native soil and/or undocumented fill and placing CLSM up to the design bottom-of-footing elevation.

7.2.2 Rapid Impact Compaction

We judge it is feasible to densify the upper loose soil layers in-situ by using Rapid Impact Compaction (RIC). RIC is generally suitable for densifying granular soils within 10 to 15 feet of the ground surface. Because of existing improvements surrounding the site, vibrations should be monitored, and setback from improvements should be established.

Prior to performing the production RIC at the site, a pilot-testing program should be performed to confirm the effectiveness of the proposed RIC spacing and number of passes. We should choose the locations of the test sections and review the ground improvement contractor's submittal for the proposed test sections. CPTs should be performed before and after the testing program to quantitatively evaluate the improvement. In addition, we recommend time be included in the construction schedule for a second round of pilot-testing for a different spacing or pattern in the event the first round does not show adequate improvement. Improved soil between compaction locations should have a normalized cone tip resistance (Q_{tn}) of at least 100 in order to mitigate the potential for large and erratic settlements in the upper 5 to 7 feet of soil.

Where RIC is performed, it will cause uneven settlement of the ground surface. Consequently, fill will be required to raise site grades in these locations. Our experience at similar sites indicates that about 1 foot of fill may be required as a result for the RIC operation.

7.3 Floor Slabs

If the proposed buildings will include a concrete floor slab, the floor slabs may consist of conventional slabs-on-grade. Where water vapor transmission through the floor slab is undesirable, we recommend installing a capillary moisture break and a water vapor retarder beneath the slab-on-grade. A vapor retarder and capillary moisture break are typically not required beneath parking garage slabs because there is sufficient air circulation to allow evaporation of moisture that is transmitted through the slab; however, we recommend the vapor retarder and capillary break be installed below the slab-on-grade in utility rooms and any areas in or adjacent to the parking garage that will be used for storage and/or will receive a floor covering or coating.

A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class B vapor retarders stated in ASTM E1745. The vapor retarder should be placed in accordance with the requirements of ASTM E1643. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The particle size of the capillary break material should meet the gradation requirements presented in Table 3.

TABLE 3

Gradation Requirements for Capillary Moisture Break

Sieve Size	Percentage Passing Sieve
1 inch	90 – 100
3/4 inch	30 – 100
1/2 inch	5 – 25
3/8 inch	0 – 6

The concrete slabs should be properly cured. Concrete mixes with high water/cement (w/c) ratios result in excess water in the concrete, which increases the cure time and results in excessive vapor transmission through the slab. Therefore, concrete for the slabs should have a low w/c ratio - less than 0.45. Water should not be added to the concrete mix in the field. If necessary, workability should be increased by adding plasticizers. Before floor coverings are placed on the mat or on slab-on-grade floors, the contractor should check that the concrete surface and the moisture emission levels (if emission testing is required) meet the manufacturer's requirements.

7.4 Site Retaining Walls

Site retaining walls should be designed to resist lateral earth pressures imposed by the retained soil, as well as a surcharge pressure from nearby foundations and vehicles, where appropriate. Where permanent retaining walls will be restrained from movement at the top (i.e. retaining walls with 90-degree angle turn), they should be designed for at-rest conditions. Walls retaining more than 6 feet of soil should be designed to resist seismic forces. We recommend restrained below-grade walls at the site be designed for the more critical of the following criteria:

- At-rest equivalent fluid weight of 60 pcf above the design groundwater table and 91 pcf below.
- Active pressure of 40 pcf plus a seismic increment of 20 pcf (triangular distribution) above the design groundwater level, and 82 pcf plus a seismic increment of 10 pcf (triangular distribution) below.

We recommend restrained walls be designed using an at-rest equivalent fluid weight of 60 pcf. Retaining walls that are unrestrained at the top should be designed for active conditions using an active equivalent fluid weight of 40 pcf. Where there will be passenger vehicular traffic behind the top of a permanent wall within a horizontal distance equal to 1.5 times the height of the wall, the wall should be designed for vehicular surcharge of 50 psf over the entire wall height. Higher surcharge pressures may be required, if garbage truck or fire truck loading is anticipated behind the walls. Where existing foundations are supported above a “zone-of-influence” line extending up from a permanent wall at an inclination of 1.5:1 (horizontal:vertical), the wall should be designed for a surcharge pressure—we can evaluate the design surcharge pressure on a case-by-case basis, if needed.

The design earth pressures recommended above are applicable to drained soil conditions. Although the permanent walls will likely be above the groundwater level, water can accumulate behind the walls from other sources, such as rainfall, irrigation, and broken water lines. All retaining walls designed using the recommended earth pressures presented above should be backdrained. One acceptable method for backdraining a retaining wall is to place a prefabricated drainage panel against the back of the wall. The drainage panel should extend down to a perforated PVC collector pipe at the base of the wall. The pipe should be surrounded on all sides by at least four inches of Caltrans Class 2 permeable material or 3/4-inch drain rock wrapped in filter fabric (Mirafi NC or equivalent). A proprietary, prefabricated collector drain system, such as Tremdrain Total Drain, AdvanEdge, or Hydroduct Coil, designed to work in conjunction with the drainage panel may be used in lieu of the perforated pipe surrounded by gravel described above. The pipe should be sloped to drain by gravity to a suitable outlet.

7.5 Pavement Design

Design recommendations for asphalt concrete and Portland cement concrete pavements and concrete pavers are presented in the following sections.

7.5.1 Flexible (Asphalt Concrete) Pavement Design

The State of California flexible pavement design method was used to develop the recommended asphalt concrete pavement sections. For pavement design, we assumed a resistance value (R-value) of 30, which is appropriate for the relatively clean sand at the site. Recommended pavement sections for traffic indices ranging from 4.5 to 7.5 are presented in Table 4.

TABLE 4
AC Pavement Sections

TI	Asphaltic Concrete (inches)	Class 2 Aggregate Base R = 78 (inches)
4.5	2.5	5.5
5.0	3.0	5.5
5.5	3.0	7.0
6.0	3.5	7.5
6.5	4.0	8.0
7.0	4.0	9.5
7.5	4.5	10

The upper eight inches of the subgrade and any material placed as part of the required overexcavation should be moisture-conditioned and compacted in accordance with requirements presented in Table 2 in Section 7.1. The aggregate base should be moisture-conditioned to near optimum and compacted to at least 95 percent relative compaction.

Where pavements are adjacent to irrigated landscaped areas, curbs adjacent to those areas should extend through the aggregate base and at least three inches into the underlying soil to reduce the potential for irrigation water to infiltrate into the pavement section. Where pavements are adjacent to storm water treatment facilities, such as bio-swales, flow-through planters, or bio-retention basins, or any other landscaped areas in which a significant thickness of loose, uncompacted soil will be present, the curbs may need to extend deeper.

7.5.2 Rigid (Portland Cement Concrete) Pavement

Concrete pavement design is based on a maximum single-axle load of 20,000 pounds and a maximum tandem axle load of 32,000 pounds and light truck traffic (i.e., a few trucks per week). The recommended rigid pavement section for these axle loads is five inches of Portland cement concrete over six inches of Class 2 aggregate base. Where fire truck traffic is expected, the pavement section should consist of six inches of Portland cement concrete over six inches of Class 2 aggregate base. .

The modulus of rupture of the concrete should be at least 500 psi at 28 days. Contraction joints should be constructed at maximum spacing of 12.5 and 15 feet for 5-inch-thick and 6-inch-thick pavement sections, respectively. Where the outer edge of a concrete pavement meets asphalt concrete pavement, the concrete slab should be thickened by 50 percent at a taper not to exceed a slope of 1 in 10. For areas that will receive weekly garbage truck traffic, we recommend the slab be reinforced with a minimum of No. 4 bars at 16-inch spacing in both directions. Recommendations for subgrade preparation and aggregate base compaction for concrete pavement are the same as those described above for asphalt concrete pavement.

7.6 Seismic Design

We anticipate that the proposed buildings will be designed under the 2019 version of the California Building Code (CBC), which is based on the guidelines contained within *ASCE 7-16*. The latitude and longitude of the site are 37.8091° and -122.3035°, respectively. Measured shear wave velocities at the site are consistent with Site Class D classification. Therefore, we recommend Site Class D be used for structural design of the buildings.

Assuming the seismic response coefficient (C_S) value will be calculated as outlined in *ASCE 7-16*, *Section 11.4.8, Exception 2*, we recommend the following seismic design parameters:

- $S_S = 1.500g$, $S_1 = 0.600g$
- $F_a = 1.0$, $F_v = 1.7$

- S_{MS} = 1.50g, S_{M1} = 1.020g
- S_{DS} = 1.00g, S_{D1} = 0.680g
- Seismic Design Category D for Risk Factors I, II, and III

In lieu of adjusting the C_s value, our scope can be revised to include a site-specific ground motion hazard analysis, if desired from a structural engineering standpoint.

8.0 GEOTECHNICAL SERVICES DURING CONSTRUCTION

Prior to construction, Rockridge Geotechnical, Inc. should review the project plans and specifications to verify that they conform to the intent of our recommendations. During construction, our field engineer should provide on-site observation and testing during site preparation, placement and compaction of fill, and installation of foundations. These observations will allow us to compare actual with anticipated soil conditions and to verify that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

9.0 LIMITATIONS

This geotechnical study has been conducted in accordance with the standard of care commonly used as state-of-practice in the profession. No other warranties are either expressed or implied. The recommendations made in this report are based on the assumption that the subsurface conditions do not deviate appreciably from those disclosed in the test borings and CPTs. If any variations or undesirable conditions are encountered during construction, we should be notified so that additional recommendations can be made. The foundation recommendations presented in this report are developed exclusively for the proposed development described in this report and are not valid for other locations and construction in the project vicinity.

Oakland, CA 94612
david.chen@ebaldc.org

Subject: **Phoenix Supportive Housing**
HUD Environmental Noise Analysis
Salter Project 20-0170

Dear David:

We have reviewed the City's comments on the Housing and Urban Development (HUD) Environmental Noise Analysis as it relates to our environmental noise study for the project. This report addresses the City's comments and HUD requirements.

CRITERIA

HUD defines areas exposed to less than DNL[1] 65 dB as "Acceptable". Areas exposed to noise levels between DNL 65 and 75 dB are defined as "Normally Acceptable". Areas exposed to DNL greater than 75 dB are considered "Unacceptable".

HUD has a goal stating that indoor noise levels should not exceed DNL 45 dB. This is consistent with the California Building Code (Title 24).

HUD also has a goal for outdoor-use spaces, which states that the DNL should not exceed 65 dB. We have applied this goal to the central courtyard accessible to the residents.

---

[1] Day-Night Average Sound Level (DNL) – A descriptor established by the U.S. Environmental Protection Agency to represent a 24-hour average noise level with a 10 dB penalty applied to noise occurring during the nighttime hours (10 p.m. to 7 a.m.) to account for the increased sensitivity of people during sleeping hours.

NOISE ENVIRONMENT

The project consists of a new affordable modular apartment building in West Oakland. Interstate 880 (I-880) is approximately 220 feet to the west, Frontage Road is approximately 115 feet to the west, 7th Street is approximately 450 feet to the south, and BART tracks are approximately 600 feet to the south.

The noise environment at the site is predominantly controlled by traffic on I-880 and Frontage Road. Due to the barrier wall along the west project boundary, these roadways contribute more to the noise environment at higher elevations.

We have completed the assessment at seven Noise Assessment Locations (NAL), which are shown in **Figure 1**.

- NAL1: West facade
- NAL2: North facade
- NAL3: East facade closest to Pine Street
- NAL4: South facade furthest from Shorey Street
- NAL5: East facade furthest from Pine Street
- NAL6: South facade closest to Shorey Street
- NAL7: Central courtyard

ANALYSIS

Exterior Noise

We used the DNL Calculator and Barrier Performance Module (BPM) to analyze exterior noise levels at the building facades and the outdoor use space. The analysis uses published traffic volumes (2017 AADT) from the California Department of Transportation (DOT) for I-880, Port of Oakland traffic data for Frontage Road[2], the provided 2018 AADT for 7th Street, and BART train schedules.

The traffic volume increase along I-880 and Frontage Road is based on the California Department of Transportation (DOT) historical average of a 3-percent increase per year, which accounts for a 1 dB noise level increase over 10 years. The West Oakland Environmental Impact Report assumes a 3.95-percent increase in total traffic volume on local roads (i.e., 7th Street) by 2035[3].

---

[2] Email from Audrey Harris at the Department of Transportation, 13 September 2022.

[3] A 3.95-percent increase in traffic equates to approximately 0.2 dB increase in noise.

We understand that traffic was reduced during the 2020 COVID-19 pandemic. However, we assume that traffic patterns have resumed near to their pre-pandemic levels and the 3-percent annual increase on major roadways (i.e., 1 dB increase in noise over 10 years), as well as a 3.95-percent increase on local roads by 2035, is considered conservative.

Per HUD guidelines, FAA-regulated airfields within 15 miles of the project site must be assessed as potential noise generators. The Oakland and San Francisco International Airports are approximately 7 miles and 13 miles away, respectively. However, the project site is not within the noise contours of either airport. Therefore, aircraft noise was not included in this analysis.

At the central courtyard (NAL7), the noise level is calculated to be less than DNL 65 dB, which is considered “Acceptable” per the HUD guidelines.

See **Appendix A** for the HUD DNL calculations. See **Appendix B** for the BPM calculations. Since the HUD Exchange tools do not allow for a detailed analysis of the barrier effects from each noise source, we have included **Appendix C** with a comprehensive table of DNL and BPM calculations at each NAL that accurately reflects the expected noise levels around the project site. See **Appendix D** for the Oakland and San Francisco airport noise contour maps.

Interior Noise

Our analysis of interior noise levels using the Sound Transmission Classification Assessment Tool (STraCAT) is based on the Site Permit Set dated 15 November 2019.

At the west facade (NAL1), the noise level is calculated to be DNL 78 dB, which is considered “Unacceptable”. The STraCAT was used at NAL1 to show how interior noise levels can meet DNL 45 dB with the planned upgraded exterior wall assembly and STC[5] 40 windows.

At the north facade (NAL2) and the south facade (NAL6), noise levels are calculated to be between DNL 72 and 74 dB, which are considered “Normally Unacceptable”. The STraCAT was used at NAL2 and NAL6 to show how interior noise levels can meet DNL 45 dB with the planned exterior wall and windows assemblies.

At the east facades (NAL3 and NAL5) and the south facade (NAL4), noise levels are calculated to be between DNL 59 and 62 dB, which are considered “Acceptable”. Therefore, no further analysis with the STraCAT is needed for NAL3, NAL4, and NAL5.

---

[5] STC (Sound Transmission Class) – A single-number rating defined in ASTM E90 that quantifies the airborne sound insulating performance of a partition under laboratory conditions. Increasing STC ratings correspond to improved airborne sound insulation.

See **Appendix E** for the STraCAT calculations at NAL1, NAL2, and NAL6. At each NAL, noise can be reduced to meet the HUD and CBC requirement of DNL 45 dB inside residences. These calculations are in line with the noise measurements conducted at the site and the window STC recommendations given in our Environmental Noise Study (dated 2 April 2020).

* * *

This concludes our HUD Environmental Noise Analysis for the Phoenix Supportive Housing project. Should you have any questions, please give us a call.

Best,

HUD DNL Calculations

NAL1 (West)

Home (/) > Programs (/programs/) > Environmental Review (/programs/environmental-review/) > DNL Calculator

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the **Day/Night Noise Level Calculator Electronic Assessment Tool Overview (/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/)**.

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the **Day/Night Noise Level Calculator Electronic Assessment Tool Overview (/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/)**.

Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

APPENDIX B

HUD Barrier Performance Module

NAL1 - 7th Street

Barrier Performance Module

This module provides to the user a measure on the barrier's effectiveness on noise reduction. A list of the input/output variables and their definitions, as well as illustrations of different scenarios are provided.

Calculator

View Day/Night Noise Level Calculator (/programs/environmental-review/dnl-calculator/)

View Descriptions of the Input/Output variables.

Note: Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the Input and Output variables with the mouse.

WARNING: If there is direct line-of-sight between the Source and the Observer, the module will report erroneous attenuation. “Direct line-of-sight” means if the 5’ tall Observer can see the noise Source (cars, trucks, trains, etc.) over the Barrier (wall, hill/excavation, building, etc.), the current version of Barrier Performance Module will not accurately calculate the attenuation provided. In this instance, there is unlikely to be any appreciable attenuation.

Note: Barrier height must block the line of sight

Input Data

H	12	**R^1**	50
S	2	**D^1**	490
O	55	**α**	90

Barrier Performance Module

This module provides to the user a measure on the barrier's effectiveness on noise reduction. A list of the input/output variables and their definitions, as well as illustrations of different scenarios are provided.

Calculator

View Day/Night Noise Level Calculator (/programs/environmental-review/dnl-calculator/)

View Descriptions of the Input/Output variables.

Note: Tool tips, containing field specific information, have been added in this tool and may be accessed by hovering over the Input and Output variables with the mouse.

WARNING: If there is direct line-of-sight between the Source and the Observer, the module will report erroneous attenuation. "Direct line-of-sight" means if the 5' tall Observer can see the noise Source (cars, trucks, trains, etc.) over the Barrier (wall, hill/excavation, building, etc.), the current version of Barrier Performance Module will not accurately calculate the attenuation provided. In this instance, there is unlikely to be any appreciable attenuation.

Note: Barrier height must block the line of sight

MEMORANDUM

TO: Whom it May Concern

FROM: William Gilchrist, Director of Planning and Building
City of Oakland

DATE: November 7 2022

RE: Special Environmental Clearance and Waiver of EIS for Phoenix Affordable Housing Project, 801 Pine Street, Oakland, CA 94607

The Environmental Assessment conducted for the Phoenix Affordable Housing project contains a Noise Assessment prepared per HUD guidelines for new construction of housing at the above-named address. Based upon this Assessment, the proposed site is impacted by external future noise that has a rating of up to **78 DNL** which is "Normally Unacceptable" per HUD Guidelines.

Under authority granted to me under 24 CFR Part 51, Section 51.104 (b)(1) and in order to provide a relatively noise free environment for the proposed project's residents, I am requiring the following noise mitigations be included in the final project:

1. The minimum STC ratings for windows for NAL1 shall be STC 40, for NAL2 shall be STC 31, and for NAL 6 shall be STC 34 (see attached map for NAL locations and corresponding walls).
2. The minimum STC ratings for walls for NAL1 shall be STC 53, and for NAL2 and NAL6 shall be STC 40.
3. To maintain a habitable interior environment, all units shall be mechanically ventilated so that windows and doors can be kept closed at the occupant's discretion to control noise intrusion indoors.
4. Any deviation from the inputs used in the attached *Figure 19, Description of Noise Attenuation* for building materials, such as stucco siding, will require that the project demonstrate that interior noise levels will remain at 45 dBA or lower.

Under my authority as Certifying Officer and Environmental Clearance Officer, per 24 CFR Section 51.104(b)(1), I am waiving the requirement to prepare an EIS for the project as it has been demonstrated to me that the noise exposure of the proposed living areas on site can be adequately mitigated, and no other issues or statutes were found to be of concern in the Environmental Assessment which would merit preparation of an EIS.

William Gilchrist, Director of Planning and Building Date

Description of Noise Attenuation Measures
(Acoustical Construction)

Part I

Project Name: Phoenix Affordable Housing Project

Location: Oakland California

Sponsor/Developer: East Bay Asian Local Development Corporation

Noise Level (From NAG): 78 (NAL1), 73 (NAL2), 75 (NAL3) dBA DNL Attenuation Required: 33 dBA (NAL1), 28 (NAL2), 30 (NAL3)

Primary Noise Source(s): I-880, Frontage Road

Part II

1. For wall(s) facing and parallel to the noise source(s) (or closest to parallel:
   - a. Description of wall construction*: Insulated staggered-stud assembly With three total layers
   - b. STC rating for wall (rated for no windows or doors): 53 (NAL1), 40 (NAL2), 40 (NAL3)
   - c. Description of windows: Vinyl, dual-pane
   - d. STC rating for window type: 40 (NAL1), 31 (NAL2), 34 (NAL3)
   - e. Description of doors: Vinyl, dual-pane
   - f. STC rating for doors: NA
   - g. Percentage of wall (per wall, per dwelling unit) composed of windows: 38.7% (NAL1 and NAL2), 25.3 (NAL3)% and doors: 0%
   - h. Combined STC rating for wall component: 43 (NAL1), 34 (NAL2), 37 (NAL3)
2. For walls perpendicular to noise source(s):
   - a. Description of wall construction*: Stucco exterior siding, insulated wood stud, and gypsum board interior
   - b. STC rating for wall (rated for no windows or doors): 53 (NAL1), 40 (NAL2), 40 (NAL3)
   - c. Description of windows: Vinyl, dual-pane
   - d. STC rating for window type: 40 (NAL1), 31 (NAL2), 34 (NAL3)
   - e. Description of doors: Vinyl, dual-pane
   - f. STC rating for doors: NA
   - g. Percentage of wall (per wall, per dwelling unit) composed of windows: 8.7% (NAL1 and NAL2), 25.3 (NAL3)% and doors: 0%
   - h. Combined STC rating for wall component: 43 (NAL1), 34 (NAL2), 37 (NAL3)
3. Roofing component (if overhead attenuation is required to aircraft noise):
   - a. Description of roof construction: N/A
   - b. STC rating (rated as if no skylights or other openings): N/A
   - c. Description of skylights or overhead windows: N/A
   - d. STC rating for skylights or overhead windows: N/A
   - e. Percentage of roof composed of skylights or windows (per dwelling unit): N/A
   - f. Percentage of roof composed of large uncapped openings such as chimneys: N/A
   - g. Combined STC rating for roof component: N/A
4. Description of type of mechanical ventilation provided: Satisfactory forced air mechanical ventilation system.

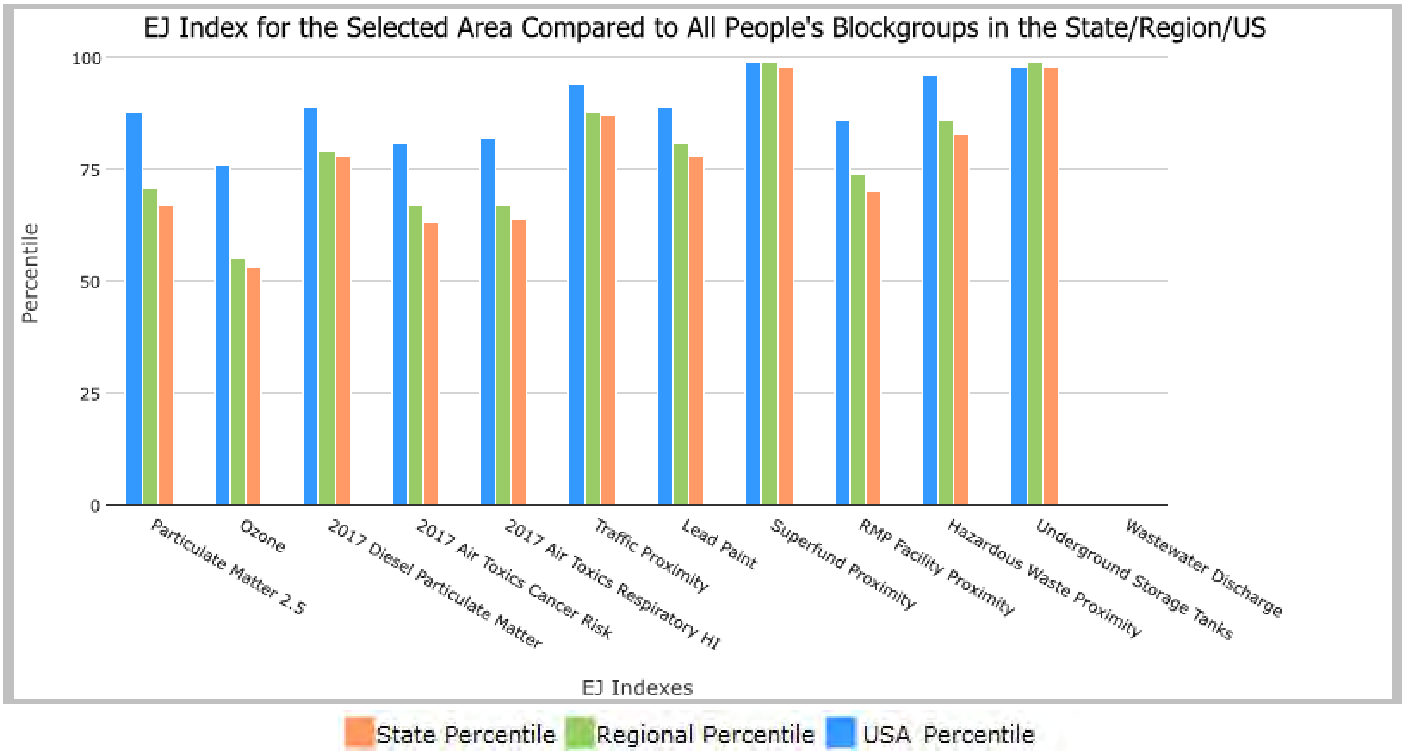
EJ Index for Hazardous Waste Proximity	83	86	96
EJ Index for Underground Storage Tanks	98	99	98
EJ Index for Wastewater Discharge	N/A	N/A	N/A



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's 2017 Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

APPENDIX K

PROJECT AGREEMENTS

AGREEMENT REGARDING SHARED FACILITIES

THIS AGREEMENT REGARDING SHARED FACILITIES (this "Agreement") is made as of August 26, 2022, by and between Urban Designs LLC, a California limited liability company ("Urban"), and Phoenix 801 Pine, LP, a California limited partnership ("Phoenix"), with reference to the following facts:

WHEREAS, Urban is the owner of certain real property located in Oakland, California, having Alameda County Assessor Parcel Number 006-0047-001 (the "Property");

WHEREAS, Urban has filed an application with the City of Oakland (the "City") to subdivide the Property (the "Subdivision") as depicted on the tentative parcel map attached hereto as Exhibit A (the "Parcel Map");

WHEREAS, Urban and Phoenix are parties to that certain Purchase and Sale Agreement and Joint Escrow Instructions dated as of August 12, 2019 (as amended, the "Purchase and Sale Agreement"), pursuant to which Urban has agreed to sell to Phoenix, and Phoenix has agreed to purchase from Urban, the portion of the Property identified on the Parcel Map as "Parcel 1" (the "Housing Parcel") upon the completion of the Subdivision;

WHEREAS, the Parcel Map establishes easements over and across the Housing Parcel and other parcels resulting from the Subdivision (together with the Housing Parcel, the "Parcels") for utilities and pedestrian and vehicular access (the "Easements");

WHEREAS, the City's approval of the Parcel Map is conditioned upon the construction of a shared driveway within the Easements (the "Shared Driveway") and the recording of an agreement for the maintenance of the Shared Driveway (the "Maintenance Agreement");

WHEREAS, Urban and Phoenix desire to enter into this Agreement in order to memorialize certain agreements relating to the Easements, Shared Driveway and Maintenance Agreement.

NOW, THEREFORE, in consideration of the mutual covenants contained in this Amendment, the Seller and Buyer agree as follows:

1. Recitals. The parties hereby acknowledge the truth of the foregoing recitals, which are hereby incorporated into this Agreement.

2. Agreement. Following the Subdivision, each owner of a Parcel shall be responsible, at its own cost, for the maintenance of the portion of Shared Facilities (defined below) located at such owner's Parcel. Urban covenants and agrees not to record a Maintenance Agreement or to bind the owner of any Parcel to any other agreement which contravenes or conflicts with foregoing. As used herein, the term "Shared Facilities" shall mean the Shared Driveway and any utilities, landscaping or other improvements constructed within the Easements for the benefit of more than one Parcel.

3. Conflicts. In the event of any conflict between the terms and conditions of this Agreement and the terms and conditions of the Purchase and Sale Agreement, the terms and conditions of this Agreement shall control.

IN WITNESS WHEREOF, the Parties have executed this Amendment as of the date first set forth above.

Re: Request for Modification to the Conditions of Approval for the Phoenix PUD, PLN 18252F01

The East Bay Asian Local Development Corporation is requesting amendments to the Conditions of Approval for the Phoenix PUD, approved by the Planning Commission December 18, 2018, Case File PUD 18252 F01, 801 Pine Street.

This request is processed as an administrative amendment under **Oakland Planning Code Section 17.140.110 Adherence to approved plan, and modification thereof,** which provides that minor changes in an approved preliminary or final development plan may be approved by the Director of City Planning if such changes are consistent with the purposes and general character of the development plan. The changes proposed meet this requirement because they are limited to processing and timing rather than substantive modifications.
The request is to: 1) designate responsibility for required improvements to the developers of Phase I and Phases 2-4 to allow the improvements affecting the entire PUD site to be implemented with development of each phase.
The amended conditions provide alternate ways to process the information needed by the City for adequate and complete project review.

Five site specific conditions of approval are amended. They are presented in the attached document titled *"STANDARD CONDITIONS OF APPROVAL Approved December 19, 2018, Amended November 3, 2022."*

Summary of Amended Conditions
Condition 18: Allows public improvements to be constructed independently for each Final Development Permit.
Condition 20 Allows site remediation to occur for each parcel.
Condition 21: Requires public improvements (on- and off-site) on a per parcel basis prior to Building Permit for each phase.

Condition 22: Requires a binding maintenance agreement for the Shared Access Facility for each parcel as shown on the Tentative Parcel Map.
Condition 23: Requires a registered professional civil engineer to certify completion of the Shared Access Facility for each parcel and requires certification of landscaping and performance bonding for grading and other associated improvements for each parcel.

The amended document includes an Applicant and/or Contractor Statement which you will need to sign and return to the Planning Division. Please send the signed copy to Rebecca Lind, Planner IV. A signed copy of the amended conditions will also need to be submitted as part of the building permit application consistent with COA #6.

APPROVED BY: Date Nov 3, 2022

Catherine Payne

Catherine Payne
Development Planning Manager

ATTACHMENT B

CONDITIONS OF APPROVAL

1. Approved Use

The project shall be constructed and operated in accordance with the authorized use as described in the approved application materials, and staff report dated December 19, 2018, and the approved plans, dated received December 13, 2018, as amended by the following conditions of approval and mitigation measures, if applicable ("Conditions of Approval" or "Conditions") as amended November 3, 2022.

2. Effective Date, Expiration, Extensions and Extinguishment

This Approval shall become effective immediately, unless the Approval is appealable, in which case the Approval shall become effective in ten (10) calendar days unless an appeal is filed.

Unless a different termination date is prescribed, this Approval shall expire two years from the Approval date, or from the date of the final decision in the event of an appeal, unless within such period a complete building permit application has been filed with the Bureau of Building and diligently pursued towards completion, or the authorized activities have commenced in the case of a permit not involving construction or alteration. This approval is subject to a phasing plan that includes five phases (noted on the plans as "Parcel 1 (which includes entire site remediation and all public on- and off-site infrastructure improvements", "Future Building A", "Future Building B", "Future Building C" and "Future Maker Space"), each subject to approval of a Final Development Permit. An application for a Final Development Permit for each subsequent phase shall be submitted and deemed complete within two years of the deemed complete date for the previous phase Final Development Permit. In any case, the last Final Development Permit application shall be submitted to the City of Oakland and deemed complete within ten years of this approval. Upon written request and payment of appropriate fees submitted no later than the expiration date of this Approval, the Director of City Planning or designee may grant a one-year extension of this date, with additional extensions subject to approval by the approving body.

Expiration of any necessary building permit or other construction-related permit for this project may invalidate this Approval if said Approval has also expired. If litigation is filed challenging this Approval, or its implementation, then the time period stated above for obtaining necessary permits for construction or alteration and/or commencement of authorized activities is automatically extended for the duration of the litigation.

3. Compliance with Other Requirements

The project applicant shall comply with all other applicable federal, state, regional, and local laws/codes, requirements, regulations, and guidelines, including but not limited to those imposed by the City's Bureau of Building, Fire Marshal, Department of Transportation, and Public Works Department. Compliance with other applicable requirements may require changes to the approved use and/or plans. These changes shall be processed in accordance with the procedures contained in Condition #4.

.

4. Minor and Major Changes

a. Minor changes to the approved project, plans, Conditions, facilities, or use may be approved administratively by the Director of City Planning.

b. Major changes to the approved project, plans, Conditions, facilities, or use shall be reviewed by the Director of City Planning to determine whether such changes require submittal and approval of a revision to the Approval by the original approving body or a new independent permit/approval. Major revisions shall be reviewed in accordance with the procedures required for the original permit/approval. A new independent permit/approval shall be reviewed in accordance with the procedures required for the new permit/approval.

5. Compliance with Conditions of Approval

a. The project applicant and property owner, including successors, (collectively referred to hereafter as the "project applicant" or "applicant") shall be responsible for compliance with all the Conditions of Approval and any recommendations contained in any submitted and approved technical report at his/her sole cost and expense, subject to review and approval by the City of Oakland.

b. The City of Oakland reserves the right at any time during construction to require certification by a licensed professional at the project applicant's expense that the as-built project conforms to all applicable requirements, including but not limited to, approved maximum heights and minimum setbacks. Failure to construct the project in accordance with the Approval may result in remedial reconstruction, permit revocation, permit modification, stop work, permit suspension, or other corrective action.

c. Violation of any term, Condition, or project description relating to the Approval is unlawful, prohibited, and a violation of the Oakland Municipal Code. The City of Oakland reserves the right to initiate civil and/or criminal enforcement and/or abatement proceedings, or after notice and public hearing, to revoke the Approval or alter these Conditions if it is found that there is violation of any of the Conditions or the provisions of the Planning Code or Municipal Code, or the project operates as or causes a public nuisance. This provision is not intended to, nor does it, limit in any manner whatsoever the ability of the City to take appropriate enforcement actions. The project applicant shall be responsible for paying fees in accordance with the City's Master Fee Schedule for inspections conducted by the City or a City-designated third-party to investigate alleged violations of the Approval or Conditions.

6. Signed Copy of the Approval/Conditions

A copy of the Approval letter and Conditions shall be signed by the project applicant, attached to each set of permit plans submitted to the appropriate City agency for the project, and made available for review at the project job site at all times.

7. Blight/Nuisances

The project site shall be kept in a blight/nuisance-free condition. Any existing blight or nuisance shall be abated within sixty (60) days of approval, unless an earlier date is specified elsewhere.

8. Indemnification

a. To the maximum extent permitted by law, the project applicant shall defend (with counsel acceptable to the City), indemnify, and hold harmless the City of Oakland, the Oakland City Council, the Oakland Redevelopment Successor Agency, the Oakland City Planning Commission, and their respective agents, officers, employees, and volunteers (hereafter collectively called "City") from any liability, damages, claim, judgment, loss (direct or indirect), action, causes of action, or proceeding (including legal costs, attorneys' fees, expert witness or consultant fees, City Attorney or staff time, expenses or costs) (collectively called “Action”) against the City to attack, set aside, void or annul this Approval or implementation of this Approval. The City may elect, in its sole discretion, to participate in the defense of said Action and the project applicant shall reimburse the City for its reasonable legal costs and attorneys' fees.

b. Within ten (10) calendar days of the filing of any Action as specified in subsection (a) above, the project applicant shall execute a Joint Defense Letter of Agreement with the City, acceptable to the Office of the City Attorney, which memorializes the above obligations. These obligations and the Joint Defense Letter of Agreement shall survive termination, extinguishment, or invalidation of the Approval. Failure to timely execute the Letter of Agreement does not relieve the project applicant of any of the obligations contained in this Condition or other requirements or Conditions of Approval that may be imposed by the City.

9. Severability

The Approval would not have been granted but for the applicability and validity of each and every one of the specified Conditions, and if one or more of such Conditions is found to be invalid by a court of competent jurisdiction this Approval would not have been granted without requiring other valid Conditions consistent with achieving the same purpose and intent of such Approval.

10. Special Inspector/Inspections, Independent Technical Review, Project Coordination and Monitoring.

The project applicant may be required to cover the full costs of independent third-party technical review and City monitoring and inspection, including without limitation, special inspector(s)/inspection(s) during times of extensive or specialized plan-check review or construction, and inspections of potential violations of the Conditions of Approval. The project applicant shall establish a deposit with Engineering Services and/or the Bureau of Building, if directed by the Director of Public Works, Building Official, Director of City Planning, Director of Transportation, or designee, prior to the issuance of a construction-related permit and on an ongoing as-needed basis.

11. Public Improvements

The project applicant shall obtain all necessary permits/approvals, such as encroachment permits, obstruction permits, curb/gutter/sidewalk permits, and public improvement ("p-job") permits from the City for work in the public right-of-way, including but not limited to, streets, curbs, gutters, sidewalks, utilities, and fire hydrants. Prior to any work in the public right-of- way, the applicant shall submit plans for review and approval by the Bureau of Planning, the Bureau of Building, Engineering Services, Department of Transportation, and other City departments as required. Public improvements shall be designed and installed to the satisfaction of the City.

12. Compliance Matrix

The project applicant shall submit a Compliance Matrix, in both written and electronic form, for review and approval by the Bureau of Planning and the Bureau of Building that lists each Condition of Approval (including each mitigation measure if applicable) in a sortable spreadsheet. The Compliance Matrix shall contain, at a minimum, each required Condition of Approval, when compliance with the Condition is required, and the status of compliance with each Condition. For multi-phased projects, the Compliance Matrix shall indicate which Condition applies to each phase. The project applicant shall submit the initial Compliance Matrix prior to the issuance of the first construction-related permit and shall submit an updated matrix upon request by the City.

13. Construction Management Plan

Prior to the issuance of the first construction-related permit, the project applicant and his/her general contractor shall submit a Construction Management Plan (CMP) for review and approval by the Bureau of Planning, Bureau of Building, and other relevant City departments such as the Fire Department, Department of Transportation, and the Public Works Department as directed. The CMP shall contain measures to minimize potential construction impacts including measures to comply with all construction-related Conditions of Approval (and· mitigation measures if applicable) such as dust control, construction emissions, hazardous materials, construction days/hours, construction traffic control, waste reduction and recycling, stormwater pollution prevention, noise control, complaint management, and cultural resource management (see applicable Conditions below). The CMP shall provide project-specific information including descriptive procedures, approval documentation, and drawings (such as a site logistics plan, fire safety plan, construction phasing plan, proposed truck routes, traffic control plan, complaint management plan, construction worker parking plan, and litter/debris clean-up plan) that specify how potential construction impacts will be minimized and how each construction-related requirement will be satisfied throughout construction of the project.

14. Standard Conditions of Approval / Mitigation Monitoring and Reporting Program (SCAMMRP)

a. All mitigation measures identified in the 801 Pine Street CEQA Analysis are included in the Standard Condition of Approval / Mitigation Monitoring and Reporting Program (SCAMMRP) which is included in these Conditions of Approval and are incorporated herein by reference, as Attachment C as Conditions of Approval of the project. The Standard Conditions of Approval identified in the 801 Pine Street CEQA Analysis document are also included in the SCAMMRP, and are, therefore, incorporated into these Conditions by reference but are not repeated in these Conditions. To the extent that there is any inconsistency between the SCAMMRP and these Conditions, the more restrictive Conditions shall govern. In the event a Standard Condition of Approval or mitigation measure recommended in the 801 Pine Street CEQA Analysis document has been inadvertently omitted from the SCAMMRP, that Standard Condition of Approval or mitigation measure is adopted and incorporated from the 801 Pine Street CEQA Analysis document into the SCAMMRP by reference and adopted as a Condition of Approval. The project applicant and property owner shall be responsible for compliance with the requirements of any submitted and approved technic.al reports, all applicable mitigation measures adopted, and with all Conditions of Approval set forth herein at his/her sole cost and expense, unless otherwise expressly provided in a specific mitigation measure or Condition of Approval, and subject to the review and approval by the City of Oakland. The SCAMMRP identifies the timeframe and responsible party for implementation and monitoring for each Standard Condition of Approval and mitigation measure. Unless otherwise specified, monitoring of compliance with the Standard Conditions of Approval and mitigation measures will be the responsibility of the Bureau of Planning, with overall authority concerning compliance residing with the Environmental Review Officer. Adoption of the SCAMMRP will constitute fulfillment of the CEQA monitoring and/or reporting requirement set forth in section 21081.6 of CEQA.

b. Prior to the issuance of the first construction-related permit, the project applicant shall pay the applicable mitigation and monitoring fee to the City in accordance with the City's Master Fee Schedule.

PROJECT SPECIFIC CONDITIONS

15. **Subsequent Design Review Committee Approval Required for Final Development Plans**
Prior to Building Permit For ~~/or Phase 1 and~~ Each Applicable Subsequent Phase

The applicant shall obtain Design Review approval from the Design Review Committee prior to approval of each FDP, with the exception of the Phase 1 FDP. The applicant will be required to present a project design that, in the discretion of the Design Review Committee, satisfies all applicable Design Review findings that are the subject of this project.

The Phase 1 FDP shall be subject to review by the Design Review Committee following approval by the Planning Commission to resolve design issues identified in the Planning Commission staff report and any other design issues identified by the Planning Commission at the time of Phase 1 FDP approval.

16. **Construction of Supportive and Affordable Housing (Phase 1) of Project Prior to Construction of Subsequent Phases**
The applicant shall construct the Supportive and Affordable Housing portion of the Project (Phase 1) prior to the construction of any other Phase of the project.

17. **Execution and Recordation of Deed Restriction for Supportive and Affordable Housing for Phase 1 Parcel**
Prior to Building Permit/or Phase 1

The applicant shall execute and record a deed restriction on the property requiring that at least 50 units on Parcel 1 (Phase 1) be supportive housing and that at least 51 units on Parcel 1 (Phase 1) be affordable housing for residents making less than 60% of the local AMI. The deed restrictions shall stipulate that they run with the land, and inure to the benefit of, and are binding upon, Parcel 1 property owners and their respective grantees, heirs, successors and assigns.

18. **Subsequent Approval for Shared Access Facility (Driveway) from Departments of Transportation and Fire Required**
Prior to Building Permit for ~~Phase 1~~ Each Phase

The applicant will be required to obtain all necessary approvals from the City's Department of Transportation and Department of Fire with regard to the Shared Access ~~Driveway~~ Facility being proposed. ~~as part of this project.~~ For parking and access to Parcel 1, all necessary approvals must be obtained prior to Building Permit approval for Phase

1. For parking and access for each subsequent phase, all Shared Access Facility approvals shall be obtained prior to Building Permit for each such phase.

19. Improvements-Ongoing

The approval of this development application does not constitute approval of public improvements. It is the applicant's responsibility to seek and service any required permits from the appropriate departments or agencies.

20. Site Remediation

Prior to Building Permit for Each Phase

All site remediation required for Parcel 1 shall be approved and completed ~~as part of Phase 1 of the project.~~ prior to obtaining a Building Permit for Parcel 1. Site remediation for Parcels 2-4 shall be approved and completed prior to Building Permit approval for each Parcel.

21. Public Improvements

All public improvements (on-and off-site) related to the ~~PUD~~ FDP for Parcel 1 shall be constructed ~~as part of Phase I~~ prior to obtaining a Building Permit for Phase 1. This includes the portions of the Stormwater Treatment and Management Plan, Stormwater Detail, Erosion Control Plan, Erosion Detail and Grading and Utility Plan applicable to Parcel 1. All public improvements for Parcels 2-4 shall be constructed prior to obtaining a Building Permit for each subsequent phase for those parcels.

22. Property Maintenance Agreement and On-Going Owner Responsibility

Prior to issuance of a Certificate of Occupancy for the first units in each phase.

Applicants for ~~a~~ the Shared Access Facility (driveway) shown on Tentative Parcel Map #10835, shall submit for approval a binding maintenance agreement for the portion of the Shared Access Facility ~~(driveway)~~ providing access to the relevant parcel. The agreement shall provide for maintenance, parking restrictions and vehicle allocation, landscape, utility and driveway gate maintenance for each separate parcel and shall be required upon completion of each phase of development. Upon City staff approval, the proposed agreement shall be recorded by the applicant within thirty (30) days with the Alameda County Recorder's office. In addition, applicants for a Shared Access Facility shall provide documentation of continuing liability insurance coverage for each separate parcel. Documentation of insurance coverage shall include the written undertaking of each insurer to give the City thirty (30) days' prior written notice of cancellation, termination, or material change of such insurance coverage.

23. Certification

Prior to ~~construction of~~ final inspection for each phase of the Shared Access Facility

Prior to ~~construction of~~ final inspection for each phase of the Shared Access Facility, applicants for each proposed phase shall retain a California registered professional civil engineer to certify, upon completion of the improvements required for each separate parcel that the ~~access facility~~ Shared Access Facility was constructed in accordance with the approved project plans and construction standards. This requirement may be modified or waived at the discretion of the Director of Public Works, based on the topography or geotechnical considerations. Applicants may also be required to show assurance of performance bonding for grading and other associated improvements. In addition, prior to the installation of the landscaping for each phase, applicants shall retain a landscape architect or other qualified individual to certify upon completion that the landscaping was installed in accordance with the project's approved landscape plan.

Applicant Statement
I have read and accept responsibility for the Conditions of Approval. I agree to abide by and conform to the Conditions of Approval, as well as to all provisions of the Oakland Planning Code and Oakland Municipal Code pertaining to the project.
