COMBINED NOTICE OF AVAILABILITY OF THE DRAFT ENVIRONMENTAL IMPACT REPORT AND NOTICE OF PUBLIC HEARINGS ON THE UPTOWN MIXED-USE PROJECT

PROJECT TITLE: Uptown Mixed-Use Project
CASE NO: ER03-0007
PROJECT SPONSOR: Uptown Partners, LLC c/o Forest City Residential West

PROJECT LOCATION: The project site is located on a nine block, 15-acre site in the Uptown District of the City of Oakland, California. Blocks 1-6 are generally bounded by Thomas L. Berkley Way (20th Street) on the north, Telegraph Avenue on the east, 18th Street on the south, and San Pablo Avenue on the west. The Fox Theater is not a part of the project site. Blocks 7 and 8 are located on the north side of Thomas L. Berkley Way (20th Street); Block 7 is west of Telegraph Avenue and Block 8 is east of Telegraph Avenue. Block 9 is located on the southeastern corner of Telegraph Avenue and 22nd Street.

BRIEF DESCRIPTION OF PROJECT: The proposed project entails the construction of approximately 1000 apartments and 270 condominiums; 1,050 student beds/faculty units; 43,000 square feet of commercial space; 1,959 parking spaces; and a 25,000 square foot public park.

ENVIRONMENTAL REVIEW: Based on the preliminary project description, it was determined that the project may have significant environmental impacts. A focused **Draft Environmental Impact Report** (DEIR) was then prepared for the above project, under the requirements of the California Environmental Quality Act (CEQA), pursuant to Public Resources Code Section 21159.25 . The DEIR analyzes potentially significant impacts in the following environmental categories: land use plans and policies; population, employment, and housing; hydrology and flooding; transportation, circulation, and parking; air quality; noise; hazardous materials; infrastructure and utilities; paleontological and cultural resources; visual and aesthetic resources/shade and shadow analysis; and wind. Copies of this document are available for review or distribution to interested parties at no charge at the Community and Economic Development Agency, Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612, Monday through Friday, 8:30 a.m. to 5:00 p.m.

PUBLIC HEARINGS: The Oakland Landmark Preservation Advisory Board will conduct a public hearing on the project on October 6, 2003, at 4:00 p.m. in Hearing Room 1, City Hall, One City Hall Plaza. The Oakland City Planning Commission will conduct a public hearing on the DEIR and the zoning permits for the project on October 15, 2003, at 6:30 p.m. in Hearing Room 1, City Hall, One City Hall Plaza. Public comments are invited on the DEIR and the zoning permits for the project. Comments on the DEIR should focus on the sufficiency of the DEIR in discussing possible impacts on the environment, ways in which adverse effects might be minimized, and alternatives to the project in light of the EIR's purpose to provide useful and accurate information about such factors.

Comments may be made at the public hearing described above, or in writing. There is no fee for commenting, and all comments received will be considered by the City prior to finalizing the EIR and making a decision on the project. Written comments on the DEIR and the zoning permits should be sent to the attention of **Lynn Warner, Planner IV, City of Oakland Community and Economic Development Agency, Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612**, no later than 4:00 p.m. on Monday, November 3, 2003. If you challenge the environmental document or any discretionary permits in court you may be limited to raising only those issues raised at the City Planning Commission public hearing described above, or in written correspondence received by the Community and Economic Development Agency on or prior to November 3, 2003. The Planning Commission will consider certification of a Final Environmental Impact Report (FEIR) for the project and render a decision on the zoning permits for the project at a later meeting date to be determined. For further information, please call Lynn Warner, at (510) 238-3941.

TABLES

I. INTRODUCTION

A. PURPOSE OF THE EIR

In compliance with the California Environmental Quality Act (CEQA), this Draft Environmental Impact Report (EIR) describes the environmental consequences of the proposed Uptown Mixed Use Project (Project). This EIR is designed to inform City staff, the Planning Commission, Redevelopment Agency, City Council, other responsible and interested agencies, and the general public of the proposed Project and the potential environmental consequences of Project approval. The City of Oakland (City) is the lead agency for environmental review of the proposed Project.

B. PROPOSED PROJECT

The Project site, which consists of a nine-block area, is located within the Uptown District of Oakland, as shown in Figure I-1. The proposed Project includes the following components: approximately 1,300 residential units; 1,050 student beds and faculty units; and 43,000 feet of commercial space. Associated Project components include a 25,000 square-foot public park; 1,959 parking spaces; and the development of one public street within the Project site. The additional public street is intended to shorten block lengths and provide enhanced access within the Project site. Implementation of the proposed Project would result in the development of a mixed-use neighborhood in the Uptown District. Please refer to Chapter III, Project Description, for more details.

C. EIR SCOPE

This EIR is a focused EIR prepared pursuant to California Environmental Quality Act (CEQA)/Public Resources Code Section 21159.25 (commonly referred to as Assembly Bill 436). The following discussion: 1) defines a focused EIR and discusses the relevant provisions of Section 21159.25; 2) describes the approach the EIR's authors have used in preparing a focused EIR that is consistent with the provisions of Section 21159.25; and 3) summarizes the environmental topics that are addressed in the EIR.

1. Focused EIR

This EIR is a focused EIR as authorized by State of California Public Resources Code Section 21159.25 (commonly referred to as Assembly Bill 436) and authorized by Oakland City Council Resolution No. 76896 (included in Appendix A). Pursuant to Section 21159.25, focused EIRs may be prepared for projects located in specified areas of downtown Oakland (including the Uptown area) where the proposed project consists of multiple-family residential development, or residential and retail mixed-use development where less than 25 percent of the total floor area of the project will be used for retail uses. In such an EIR, no discussion is required of alternatives to the project, cumulative impacts of the project or growth inducing impacts of the project. Assembly Bill 436, which allows the use of focused EIRs in specific areas of downtown Oakland, was approved by the

Figure I-1: Location Map

8x11 B&W

California State Legislature in September 2001, signed by the Governor in October 2001 and is now codified in the Public Resources Code, in Section 21159.25. Subsequently, the City Council adopted Resolution No. 76896 which authorizes the use of focused EIRs for four target areas within downtown Oakland where housing is encouraged. Resolution No. 76896, as adopted by the City Council, states that the Council authorizes the Planning Commission, at its sole discretion, to conduct a public hearing in the intent to use AB 436 (Public Resources Code Section 21159.25) for a specific project. The Planning Commission held such a hearing on March 19, 2003, and adopted a Notice of Intent to Use AB 436 for the Uptown Project. Table I-1 lists the criteria for use of a focused EIR and summarizes applicable findings adopted by the Planning Commission.

The EIR, which was prepared and certified for the Land Use and Transportation Element (LUTE) of the Oakland General Plan, is used as one of the bases for this environmental review. Cumulative impacts and growth-inducing impacts in downtown Oakland have been analyzed in the General Plan LUTE EIR, and repeatedly in numerous EIRs completed for projects in the downtown area. The analysis included in Chapter IV.B, Population, Employment and Housing, of this EIR provides a confirmation that the proposed Uptown Project falls within the City's employment and population projections to the year 2025. Similarly, the LUTE EIR contained an analysis of alternatives and, pursuant to Public Resources Code Section 21159.25, no further consideration of alternatives is required. Both the LUTE EIR and this EIR identify mitigation measures to reduce or eliminate potentially significant environmental impacts. The LUTE EIR, which was certified by the Oakland City Council in 1998, is hereby incorporated by reference into this EIR.[1] In addition, to ensure a comprehensive analysis, this focused EIR includes a cumulative analysis.

2. Scope of the Focused EIR

The City circulated a Notice of Preparation (NOP) notifying responsible agencies and interested parties that an EIR would be prepared using Section 21159.25 and indicating the environmental topics that were anticipated to be addressed in this EIR. The NOP and Initial Study were published on February 26, 2003, and mailed to public agencies, organizations, and individuals likely to be interested in the potential impacts of the Project. Comments on the NOP were received by the City and considered during the preparation of the EIR. A copy of the NOP and each comment letter received is provided in Appendix A of this EIR. Comments were received from the following agencies and organizations: 1) Regional Water Quality Control Board; 2) City of Alameda; 3) Friends of the Oakland Fox; 4) State of California Department of Transportation (Caltrans); 5) Bay Area Air Quality Management District; 6) Oakland Heritage Alliance; 7) Alameda County Congestion Management Agency; and 8) East Bay Municipal Utility District. Comments were received from the following individuals: 1) Christopher Pederson; and 2) Joyce Roy.

The following topics are addressed as separate sections in Chapter IV of this EIR:

- Land Use
- Population, Employment and Housing
- Hydrology and Water Quality
- Transportation, Circulation and Parking

---

[1] The LUTE EIR is available for review at 250 Frank Ogawa Plaza, Suite 3330, Oakland, CA 94612. A summary of the LUTE EIR impacts and mitigation measures is provided in Appendix A of this EIR.

Table I-1: Public Resources Code Section 21159.25 Criteria

Criteria	Applicability to Uptown Project
The project consists of multiple-family residential development, or residential and retail mixed-use development where less than 25 percent of the total floor area of the project will be used as retail space.	The Project consists of mixed-use development where less than 25 percent of the total floor area of the Project will be used for retail. Per the submitted application, 43,000 square feet of the Project will be built as retail space while over 1 million square feet of residential space will be built for the +1,300 residential units plus the student housing. This amount of residential space excludes parking structures. Therefore, less than 25 percent of the total floor area will be used for retail space.
The City has an average population density of at least 5,000 persons per square mile.	Based on the 2000 U.S. Census and the City of Oakland statistical profile, the average population density of Oakland is approximately 7,425 persons per square mile which exceeds 5,000 persons per square mile.
The project is consistent with the general plan, any applicable specific plan and community plan, and zoning ordinance, including any variance that is properly granted pursuant to that zoning ordinance, an environmental impact report was prepared for the general plan, and the application for the project is deemed complete pursuant to Section 65943 of the Government Code within three years of the date this section is effective.	The Project is consistent with numerous objectives and policies of the General Plan. The Project supports the vision and goals for the Downtown Showcase District, particularly by promoting the role of Downtown as a mixture of vibrant and unique districts, increasing both the daytime and nighttime population of Downtown through new housing opportunities and encouraging housing that is located within walking distance of BART and other transit facilities. The General Plan contains numerous policies that pertain to the residential and retail development in the Uptown area. City staff made a determination that the proposed Project is consistent with numerous policies of the land use and transportation element General Plan as part of their March 19, 2003 staff report. Analysis for consistency with the other elements of the General Plan is included in Section IV.A, Land Use, of this EIR. Additionally, as part of Resolution No. 76896, the City Council adopted a finding that the Oakland General Plan, Zoning Ordinance and related policies are consistent with the principals that encourage compact development. An environmental impact report was previously prepared and certified for the General Plan Land Use and Transportation Element, and the application for environmental review for the Uptown Project was deemed complete on March 12, 2003.
The lead agency cannot make the finding described in subdivision (c) of Section 21157.1, a negative declaration or mitigated negative declaration cannot be prepared pursuant to Section 21080, 21157.5, or 21158, and Section 21166 does not apply.	The City of Oakland as the lead agency has determined that an environmental impact report shall be prepared for the proposed Project because potentially significant environmental impacts resulting from the proposed Project have been identified and it is uncertain whether there are feasible mitigation measures to reduce these impacts to a less than significant level.
The project meets one or both of the following conditions: (A) The parcel on which the project is to be developed is surrounded by immediately contiguous urban development. (B) The parcel on which the project is to be developed is, or has been previously, developed with urban uses.	The site of the proposed Project is surrounded by urban development that is immediately contiguous to the Project site.
The density of the project is at least 40 units per net acre.	The Project proposes 1,300 dwelling units plus 1,050 students beds/faculty units. Even excluding the student housing the Project proposes over 73 units per net acre.
The parcel on which the project is to be developed is within one-half mile of an existing rail transit station.	The 19th Street BART station is located approximately one block (800 feet) from the nearest part of the Project site, and

Table I-1 *continued*

Criteria	Applicability to Uptown Project
	approximately four blocks (2,200 feet) from the farthest part of the Project site. Hence, all portions of the Project site are located within a ½-mile of an existing rail transit station.
The project can be adequately served by existing utilities and municipal services, and there will be adequate capacity for infrastructure, utilities, and services to serve other projects approved and proposed in the service area.	Existing utilities and municipal services adequately serve the Project site. Additionally, there is adequate capacity for infrastructure, utilities and services to serve other projects approved and proposed in the service area based on the adopted General Plan and EIR that was certified for the General Plan. (Refer to General Plan Land Use and Transportation Element, Volume 2, Supporting Information.)
The project does not include a single level building that exceeds 100,000 square feet.	The Project contains multiple-story buildings and does not include a single-level building that exceeds 100,000 square feet based on the current Project description.
The project is located in one of the following central business district housing target areas: (A) The Valdez cluster, which is ... (B) The Uptown cluster, which is bounded on the west by Castro Street, on the south by 14th Street from Castro Street to Jefferson Street and 16th Street and Broadway from 16th Street to 22nd Street, and on the north by 22nd Street. (C) The 11th Street cluster, which is … (D) The Old Oakland cluster, which is ….	The site of the proposed Project is located within the Uptown cluster target area.

Source: City of Oakland staff, 2003.

- Air Quality
- Noise
- Hazards and Hazardous Materials
- Utilities and Infrastructure
- Historic Architectural, Archaeological and Paleontological Resources
- Aesthetic Resources
- Wind
- Shade and Shadow

Potential adverse environmental impacts related to the topics listed below were determined to be less-than-significant on the basis of environmental evaluation in the Initial Study. No comments that were received on the NOP provided any information that would affect the analysis and conclusions in the Initial Study with respect to these topics.

- Agricultural Resources
- Biological Resources
- Geology and Soils
- Mineral Resources

- Public Services
- Recreation

D. REPORT ORGANIZATION

This EIR is organized into the following chapters:

- *Chapter I – Introduction:* Discusses the overall EIR purpose; provides a summary of the proposed action and environmental review process; identifies potentially significant issues and concerns; and summarizes the organization of the EIR.
- *Chapter II – Summary:* Provides a summary of the impacts that would result from implementation of the proposed Project, and describes mitigation measures recommended to reduce or avoid significant impacts.
- *Chapter III – Project Description:* Provides a description of the Project site, site development history, Project objectives, required approval process, and details of the Project itself.
- *Chapter IV – Setting, Impacts and Mitigation Measures:* Describes the following for each environmental technical topic: existing conditions (setting); potential environmental impacts and their level of significance; and mitigation measures recommended to address identified impacts. Potential adverse impacts are identified by levels of significance, as follows: less-than-significant impact (LTS), significant impact (S), and significant and unavoidable impact (SU). The significance of each impact is categorized before and after implementation of any recommended mitigation measure(s).
- *Chapter V – Report Preparation:* Identifies staff involved in preparation of the EIR, references used, and persons and organizations contacted.

II. SUMMARY

A. PROJECT UNDER REVIEW

This Draft EIR has been prepared to evaluate the environmental impacts of the Uptown Mixed Use Project (proposed Project). A more detailed description of the proposed Project is provided in Chapter III, Project Description.

B. SUMMARY OF IMPACTS AND MITIGATION MEASURES

This summary provides an overview of the analysis contained in Chapter IV, Setting, Impacts, and Mitigation Measures. CEQA requires a summary to include discussion of: 1) potential areas of controversy; 2) significant impacts of the Project; and 3) significant unavoidable impacts of the Project. Because this EIR was prepared pursuant to AB 436, alternatives to the proposed Project were not addressed in this EIR and are not included in this summary.

1. Potential Areas of Controversy

The potential areas of controversy surrounding the Uptown Mixed Use Project that were identified as part of the EIR scoping and Notice of Preparation (NOP) process and are evaluated in Chapter IV of this EIR are listed below:

- land use compatibility
- removal of affordable housing
- contaminated groundwater
- stormwater
- transit
- traffic on local roads and highways
- air pollution
- noise exposure
- soil contamination
- water and wastewater infrastructure capacity
- demolition of historic buildings
- relation of the Project to surrounding historic neighborhoods
- visual impacts
- wind intensification
- new shadows

2. Significant and Less-Than-Significant Impacts

Under CEQA, a significant impact on the environment is defined as: a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.[1]

As discussed in Chapter IV of this EIR, implementation of the proposed Project has the potential to result in adverse environmental impacts in several areas. Impacts associated with the following environmental topics would be significant without the implementation of mitigation measures, but would be reduced to a less-than-significant level if the mitigation measures recommended in this EIR are implemented:

- *Hydrology and Water Quality*
- *Transportation, Circulation and Parking* (except for the intersection of Frontage Road/West Grand Avenue)
- *Air Quality* (construction period)
- *Noise*
- *Hazards and Hazardous Materials*
- *Historic Architectural, Archeological and Paleontological Resources* (for all resources except the Great Western Power Company Building)
- *Aesthetic Resources*
- *Wind*

Impacts associated with the following environmental topics would be considered less than significant and would not require any mitigation measures based on the identified criteria of significance:

- *Land Use*
- *Population, Employment and Housing*
- *Infrastructure and Utilities*
- *Shade and Shadow*

3. Significant Unavoidable Impacts

As discussed in Chapter IV of this EIR, the proposed Project would result in significant unavoidable impacts in the following topical areas:

- Transportation (intersection of Frontage Road/West Grand Avenue)
- Air Quality (operation period impacts related to regional emissions)
- Historic Architectural Resources (Great Western Power Company Building)

C. SUMMARY TABLE

Information in Table II-1, Summary of Impacts and Mitigation Measures, has been organized to correspond with the environmental issues discussed in Chapter IV. The table is arranged in four

---

[1] CEQA Sections 21060.5 and 21068.

columns: 1) impacts; 2) level of significance prior to mitigation measures; 3) mitigation measures; and 4) level of significance after mitigation. Levels of significance are categorized as follows: SU = Significant and Unavoidable; S = Significant; and LTS = Less Than Significant. For a complete description of potential impacts and recommended mitigation measures, please refer to the specific discussions in Chapter IV.

Table II-1: Summary of Impacts and Mitigation Measures

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
A. LAND USE			
The Project would not result in any significant impacts related to land use.			
B. POPULATION, EMPLOYMENT AND HOUSING			
The Project would not result in any significant impacts related to population, employment, and housing.			
C. HYDROLOGY AND WATER QUALITY			
HYD-1: Construction activities for the Project could result in degradation of water quality in Lake Merritt and the Bay by reducing the quality of storm water runoff.	S	HYD-1**:** The applicant shall prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) designed to reduce potential impacts to surface water quality through the construction and life of the Project. The SWPPP would act as the overall program document to provide measures to mitigate significant water quality impacts associated with implementation of the Project. The SWPPP shall include specific and detailed Best Management Practices (BMPs) required to mitigate significant construction-related pollutants. These controls shall include practices to minimize the contact of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, paints, solvents, adhesives) with storm water. The SWPPP shall specify properly designed centralized storage areas that keep these materials out of the rain. An important component of the storm water quality protection effort will be the education of the site supervisors and workers. To educate on-site personnel and maintain awareness of the importance of storm water quality protection, site supervisors shall conduct regular tailgate meetings to discuss pollution prevention. The frequency of the meetings and required personnel attendance list shall be specified in the SWPPP. The SWPPP shall specify a monitoring program to be implemented by the construction site supervisor, and must include both dry and wet weather inspections. City of Oakland personnel shall conduct regular inspections to ensure compliance with the SWPPP.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
HYD-1 *continued*		BMPs to reduce erosion of exposed soil may include, but are not limited to: soil stabilization controls, watering for dust control, perimeter silt fences, placement of hay bales, and sediment basins. The potential for erosion is generally increased when grading occurs during the rainy season, as disturbed soil can be exposed to rainfall and storm runoff. If grading must be conducted during the rainy season, the primary BMPs selected shall focus on erosion control, that is, keeping sediment on the site. End-of-pipe sediment control measures (e.g., basins and traps) shall be used only as secondary measures. Access to and egress from the construction site shall be carefully controlled to minimize off-site tracking of sediment (this BMP is particularly important since much of the earthwork will involve loading trucks for off-site transport of soil excavated for the below-ground parking structures). Vehicle and equipment wash down facilities shall be designed to be accessible and functional both during dry and wet conditions. The SWPPP shall be reviewed for completeness by the City of Oakland, Public Works Agency, Environmental Services Division prior to approval of grading plans.	
HYD-2: Post-construction operation of the Project could result in degradation of water quality in Lake Merritt due to a net decrease in the quality of storm water runoff.	S	HYD-2**:** The applicant shall comply with the requirements of the 2003 Alameda County *Stormwater Management Plan* and/or the RWQCB Revised Order 01-024 (NPDES Permit No. CAS029718), as appropriate, based on the timing of construction. As applicable, the applicant shall incorporate measures to mitigate potential degradation of runoff water quality from all portions of the completed development, including roof and sidewalk runoff. The final design team for the Project should include all applicable measures from *Start at the Source*, Design Guidance Manual for Stormwater Quality Protection, which may include, but not be limited to pervious pavements, hybrid parking lots, vegetated swales, biofilters, roof drainage to landscaped areas, minimization of directly connected impervious surfaces, and infiltration islands. The Project compliance with requirements for post-construction stormwater controls shall be reviewed by the City of Oakland, Public Works Agency, Environmental Services Division prior to approval of grading plans.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
HYD-3: Dewatering effluent may contain contaminants and if not properly managed could cause impacts to the environment.	S	HYD-3**:** The SWPPP shall include requirements for the proper management of dewatering effluent as necessary to mitigate significant impacts to the environment. The Hazards section of this DEIR (Mitigation Measure HAZ-1b) addresses and mitigates potential impacts associated with health and safety impacts to site workers and the public associated with the dewatering effluent. At minimum, all dewatering effluent will be contained prior to discharge to allow the sediment to settle out, and filtered, if necessary, to ensure that only clear water is discharged to the storm or sanitary sewer system. Alternatively, effluent can be hauled off-site by tanker truck for disposal. Based on the historical land uses at the Project site and groundwater sampling of the existing network of monitoring wells, it is possible that groundwater underlying each of the parcels has been impacted by chemical releases. All dewatering effluent will be analyzed by a State-certified laboratory for the suspected pollutants (at minimum, petroleum hydrocarbons, solvents, and metals) prior to discharge. Based on the results of the analytical testing and the concentrations of pollutants identified, if any, the applicant will dispose of the water in one (or more) of the following ways: a) Discharge the water to the storm drain under permit from the RWQCB. It is unlikely that the RWQCB would allow discharge of any untreated dewatering effluent that contained detectable concentrations of chemical pollutants and that for these types of discharges, alternative disposal options may be required; b) Discharge the water to the sanitary sewer system under permit from the East Bay Municipal Utilities District; c) Haul the water to a licensed off-site disposal facility for treatment and disposal under appropriate manifest. The Project proponent shall demonstrate to the City of Oakland, Planning and Development Department that appropriate permits have been acquired prior to discharge of any dewatering effluent.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
D. TRANSPORTATION, CIRCULATION AND PARKING			
TRANS-1: The addition of Project traffic to the Year 2010 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/Thomas L. Berkley Way (20th Street). The intersection was identified as operating at LOS C in the Year 2010 No Project Condition in the PM peak hour. The addition of Project traffic would result in the intersection operating at LOS F in the PM peak hour.	S	TRANS-1: Optimization of the signal timing at the intersection of San Pablo and Thomas L. Berkley Way (20th Street) would improve function to a LOS D in the PM peak hour. This intersection functions as an integrated signal system with other intersections in the downtown area. To mitigate the Project's impact at this location and others, the City shall prepare a signal optimization and coordination plan for the area bounded by San Pablo Avenue, Grand Avenue, Telegraph Avenue, and 17th Street prior to Project occupancy. The plan shall address the timing and equipment requirements, as necessary for all of the signalized intersections located within this area. The Project applicant shall fund its fair share cost of the preparation of this plan and the implementation of the signal timing program. Implementation of the signal optimization program may also involve the purchase and installation of interconnection hardware (i.e. modems, microwave antennas, etc). Given that the Project sponsor is responsible for only a portion of this mitigation measure, implementation of this set of improvements will be funded fully by one or a combination of the following means: 1. The Project sponsor shall fully fund the costs of the signalization improvements and be reimbursed through other fair-share contributions as future projects occur that fall within the City's thresholds of significance. 2. The City, at their sole discretion, shall establish a Traffic Improvement Program and concurrent Traffic Impact Fee Ordinance to fund the mitigation measure. 3. The Redevelopment Agency, at their sole discretion, shall contribute funds to the costs of implementation.	LTS
TRANS-2: The addition of Project traffic to the Year 2010 Baseline condition would result in a significant adverse impact at the intersection of Telegraph Avenue/19th Street. The intersection was identified as operating at LOS D in the Year 2010 No Project Condition in the AM and PM peak hours. The addition of Project traffic would result in the intersection operating at LOS F in both the AM and PM peak hours.	S	TRANS-2: Optimization of the signal timing at the intersection of Telegraph and 19th Street would improve the function to LOS C in both the AM or PM peak hours. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
TRANS-3: In the 2010 No Project and Plus Project scenarios, the Frontage Road/West Grand Avenue intersection would operate at LOS F in the PM peak hour. The Project would cause the total intersection delay for the critical movements to increase by two or more seconds and result in a significant impact.	S	TRANS-3: Widen the intersection to add a second exclusive left turn lane in the eastbound direction and an exclusive right turn lane in the westbound direction. The intersection would operate at LOS D in the PM peak hour with these improvements. The intersection of Frontage Road and West Grand Avenue is located on an elevated structure which is within the jurisdiction of Caltrans. The proposed mitigation measures would require the widening of the existing elevated structure and modification of the traffic signal. The second exclusive left turn lane in the eastbound direction and the exclusive right turn lane in the westbound direction should each be 300 feet in length with a 90-foot taper. Widening of the existing structure would require additional support columns and the acquisition of right of way underneath the structure. In addition, the connector from Interstate 880 to Interstate 80 structure exists above this intersection. Columns supporting this elevated connector may have to be relocated to widen the Frontage Road/West Grand Avenue intersection. At this time, the implementation of this mitigation measure would not be economically feasible. Because this intersection is located outside of the City of Oakland's jurisdiction and because it is not economically feasible, it is significant and unavoidable.	SU
TRANS-4: In the PM peak hour, the San Pablo/27th Street intersection would operate at LOS E in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause the total intersection average vehicle delay to increase by six or more seconds.	S	TRANS-4: Optimization of the signal timing at the intersection of San Pablo and 27th Street would improve function to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-5: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/West Grand Avenue. The intersection was identified as operating at LOS F in the Year 2025 No Project Condition in the PM peak hour. The addition of Project traffic would cause the total intersection average vehicle delay to increase by two or more seconds.	S	TRANS-5: Optimization of the signal timing at the intersection of San Pablo and West Grand Avenue would improve the function to a LOS E in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
TRANS-6: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/Thomas L. Berkley Way (20th Street). The intersection was identified as operating at LOS C in the Year 2025 No Project Condition in the PM peak hour. The addition of Project traffic would result in the intersection operating at LOS F.	S	TRANS-6: Optimization the signal timing at the intersection of San Pablo and Thomas L. Berkley Way (20th Street). By optimizing the signal timing splits, the intersection would improve the function to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-7: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of Telegraph Avenue/West Grand Avenue. The intersection was identified as operating at LOS E in the Year 2025 No Project Condition in the AM peak hour. The addition of Project traffic would cause an increase in the average delay for critical movements to increase by more than six seconds in the AM peak hour.	S	TRANS-7: Optimization of the signal timing and changing the cycle length to 65 seconds at this intersection would mitigate the delay that would result from the proposed Project. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-8: With the Project, the Telegraph Avenue/Thomas L. Berkley Way (20th Street) intersection LOS would degrade from LOS E to LOS F in the AM peak hour. In the PM peak hour, the Telegraph Avenue/Thomas L. Berkley Way (20th Street) intersection would operate at LOS F in the Year 2025 No Project and Year 2025 Plus Project scenarios.	S	TRANS-8: Optimization of the signal timing in the AM peak hour and changing the cycle length to 70 seconds at this intersection would mitigate the Projects increase in delay. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-9: The Telegraph Avenue/William Street intersection would operate at LOS F in the PM peak hour in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause the total intersection average delay to increase by two or more seconds. In addition, the Project would increase average delay for the critical movements by four or more seconds.	S	TRANS-9: Changing the cycle length to 80 seconds and optimizing signal timing would improve the function of this intersection to LOS C in the PM peak hour. By optimizing the signal timing splits and changing the signal cycle, the Projects increase in delay would be mitigated. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
TRANS-10 The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the Telegraph Avenue/19th Street intersection. With the Project, the intersection LOS would degrade from LOS E to LOS F in the AM peak hour. In the PM peak hour, the Telegraph Avenue/19th Street intersection would operate at LOS F in the Year 2025 No Project and Year 2025 Plus Project scenarios. In addition, the Project would increase average delay for the critical movements by four or more seconds in the PM peak hour. Both of these changes are considered to be significant adverse impacts based on City standards.	S	TRANS-10: The Project shall provide for the following two improvements. • Optimize the signal timing at the intersection of Telegraph and 19th Street. Since this intersection also functions as part of an integrated signal system in downtown Oakland, Mitigation Measure TRANS-1B shall also be implemented. • Restripe the westbound 19th Street approach to provide two exclusive through lanes and an exclusive right turn lane. With these improvements, the intersection would operate at LOS C in the AM peak hour and LOS E in the PM peak hour. The restriping of the westbound 19th Street approach to the intersection to provide two exclusive through lanes and an exclusive right turn lane would require the elimination of six metered parking spaces on the northern side of 19th Street between Telegraph and Broadway. With the existing roadway width available the two through lanes would each be 11 feet wide and the right turn lane would be 10 feet wide, which would satisfy City standards of 10-foot lanes. Metered parking would remain on the southern side of 19th Street.	LTS
TRANS-11 The Frontage Road/West Grand Avenue intersection would operate at LOS F in the AM and PM peak hours in Year 2025 No Project and Year 2025 plus Project conditions. The Project would cause the total intersection average vehicle delay to increase by two or more seconds in the AM and PM peak hours. In addition, the Project would increase in average delay for critical movements by four or more seconds.	S	TRANS-11: Widen the eastbound approach to accommodate two left turn lanes, two through lanes, and a right turn lane. Widen the southbound approach would need to accommodate a right turn lane, a left turn lane, and a shared through/right turn lane. In addition, the northbound approach should be converted from a left turn lane, a through lane, and a shared through/right turn lane to a left turn lane, a shared through/right turn lane, and a right turn lane. With the proposed improvements, the intersection would operate at LOS C in the AM peak hour and LOS D in the PM peak hour.	SU

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
TRANS-11 *continued*		The intersection of Frontage Road and West Grand Avenue is located on an elevated structure which is within the jurisdiction of Caltrans. The proposed mitigation measures would require the expansion of the existing elevated structure and modification of the traffic signal. Widening of the existing structure would require additional support columns and the acquisition of right of way underneath the structure. In addition, the connector from Interstate 880 to Interstate 80 structure exists above this intersection. Columns supporting this elevated connector may have to be relocated to pursue the widening of the Frontage Road/West Grand Avenue intersection. The implementation of this mitigation measure would not be economically feasible. Because this intersection is located outside of the City of Oakland's jurisdiction and because it is not economically feasible, it is significant and unavoidable.	
TRANS-12: The addition of Project traffic at the Mandela Parkway/West Grand Avenue intersection would cause the service level to degrade from LOS D in the Year 2025 No Project Condition to LOS E in the Year 2025 with Project Condition during the PM peak hour.	S	TRANS-12: Changing the cycle length to 110 seconds, providing protected left turn phases on the eastbound and westbound approaches, and optimizing the signal timing would improve the function of this intersection to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-13: The Harrison/Grand Avenue intersection was found to operate at LOS E in the Year 2025 No Project and Year 2025 with Project Conditions during the PM peak hour. The Project would cause an increase in the average delay for critical movements by more than six seconds in the PM peak hour.	S	TRANS-13: Changing the cycle length to 110 seconds and optimizing the signal timing splits would mitigate the Project's impact. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS
TRANS-14: In the PM peak hour, the Castro Street/17th Street /I-980 Off-Ramp intersection would operate at LOS E in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause an increase in the average delay for the critical movements of six or more seconds.	S	TRANS-14: Optimization of the intersection's signal timing at this intersection would improve the function of this intersection to operate at LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
E. AIR QUALITY			
AIR-1: Activities associated with demolition, site preparation and construction would generate short-term emissions of criteria pollutants, including suspended and inhalable particulate matter and equipment exhaust emissions.	S	AIR-1: Implementation of the following mitigation measures would reduce this impact to a less-than-significant level. • The basic and enhanced control measures listed in Table IV.E-9 shall be implemented during construction of the proposed Project. • Any temporary haul roads to the soil stockpile area shall be routed away from existing neighboring land uses. Any temporary haul roads shall be surfaced with gravel and regularly watered to control dust or treated with an appropriate dust suppressant. • Water sprays shall be utilized to control dust when material is being added or removed from the stockpile. When the stockpile is undisturbed for more than 1 week, the storage pile shall be treated with a dust suppressant or crusting agent to eliminate wind-blown dust generation. • All neighboring properties located within 500 feet of property lines shall be provided with the name and phone number of a designated construction dust control coordinator who will respond to complaints within 24 hours by suspending dust-producing activities or providing additional personnel or equipment for dust control as deemed necessary. The phone number of the BAAQMD pollution complaints contact shall also be provided. The dust control coordinator shall be on-call during construction hours. The coordinator shall keep a log of complaints received and remedial actions taken in response. This log shall be made available to City staff upon its request. The above mitigation measures include all feasible measures for construction emissions identified by the BAAQMD. According to the District's threshold of significance for construction impacts, implementation of the measures would reduce construction impacts of the proposed Project to a less-than-significant level.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
<u>AIR-2</u>: Development of the Uptown Project would result in increased regional emissions of criteria air pollutants exceeding BAAQMD Thresholds.	S	<u>AIR-2</u>: To the extent permitted by law, the Uptown Project shall be required to implement Transportation Control Measures (TCMs) as recommended by the BAAQMD. However, the City of Oakland will implement as feasible on the basis that this Project is an infill mixed-used development project that in and of itself supports many Smart Growth Principals. Measures that the City may require the Project to implement, or that are already proposed as part of the Project, include the following: • *Transit Measures:* (i) Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc. (Effectiveness 0.5 percent - 2 percent of all trips, BAAQMD *CEQA Guidelines*); (ii) Design and locate buildings to facilitate transit access (e.g., locate building entrances near transit stops, eliminate building setbacks, etc.) (Effectiveness 0.1 percent - 0.5 percent of all trips, BAAQMD *CEQA Guidelines*). • *Services Measures:* (i) Provide on-site shops and services for employees, such as cafeteria, bank/ATM, dry cleaners, convenience market, etc. (Effectiveness 0.5 percent - 5 percent of work trips, BAAQMD *CEQA Guidelines*); (ii) Provide on-site child care, or contribute to off-site childcare within walking distance. (Effectiveness 0.1 percent - 1 percent of work trips, BAAQMD *CEQA Guidelines*). • *Bicycle and Pedestrian Measures:* (i) Provide secure, weather-protected bicycle parking for employees (Effectiveness 0.5 percent - 2 percent of work trips, BAAQMD *CEQA Guidelines*); (ii) Provide safe, direct access for bicyclists to adjacent bicycle routes (Effectiveness 0.5 percent - 2 percent of work trips, BAAQMD *CEQA Guidelines*); (iii) Provide showers and lockers for employees bicycling or walking to work (Effectiveness 0.5 percent – 2 percent of work trips, BAAQMD *CEQA Guidelines*); (iv) Provide secure short-term bicycle parking for retail customers or non-commute trips (Effectiveness 1 percent – 2 percent of non-work trips, BAAQMD *CEQA Guidelines*); (v) Provide direct, safe, attractive pedestrian access from Planning Area to transit stops and adjacent development (Effectiveness 0.5 percent - 1.5 percent of all trips, BAAQMD *CEQA Guidelines*).	SU

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
AIR-2 *continued*		Implementation of the measures detailed above would help minimize this impact, but not reduce it to a less-than-significant level. Therefore, Impact AIR-2 will remain significant and unavoidable.	
F. NOISE			
NOISE-1: Noise levels from construction activities may range up to 91 dBA L_{max} at the nearest land uses to the Project site for limited time periods during the duration of construction for certain activities such as pile driving or the use of other heavy equipment..	S	NOISE-1a: Standard construction activities shall be limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday. No construction activities shall be allowed on weekends until after the buildings are enclosed without prior authorization of the Building Services and Planning Divisions of the Community and Economic Development Agency.	LTS
		NOISE-1b: To reduce daytime noise impacts due to construction, to the maximum feasible extent, the City shall require the applicant to develop a site-specific noise reduction program, subject to city review and approval, which includes the following measures: • Signs shall be posted at the construction site that include permitted construction days and hours, a day and evening contact number for the job site, and a day and evening contact number for the City in the event of problems; • An on-site complaint and enforcement manager shall be posted to respond to and track complaints; • A pre-construction meeting shall be held with the job inspectors and the general contractor/on-site Project manager to confirm that noise mitigation and practices are completed prior to the issuance of a building permit (including construction hours, neighborhood notification, posted signs, etc.); • Equipment and trucks used for Project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds, wherever feasible);	

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
NOISE-1 *continued*		• Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for Project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed-air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed-air exhaust shall be used; this muffler can lower noise levels where feasible, which could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible; and • Stationary noise sources shall be located as far from sensitive receptors as possible, and they shall be muffled and enclosed within temporary sheds, or insulation barriers or other measures shall be incorporated to the extent feasible.	
		NOISE-1c: If pile-driving occurs as part of the Project, it shall be limited to between 8:00 a.m. and 4:00 p.m., Monday through Friday, with no pile driving permitted between 12:30 and 1:30 p.m. No pile driving shall be allowed on Saturdays, Sundays, or holidays.	
		NOISE-1d: To further mitigate potential pile-driving and/or other extreme noise-generating construction impacts, a set of site-specific noise attenuation measures shall be completed under the supervision of a qualified acoustical consultant. This plan shall be submitted for review and approval by the City to ensure that maximum feasible noise attenuation is achieved. These attenuation measures shall include as many of the following control strategies as feasible and shall be implemented prior to any required pile-driving activities: • Implement "quiet" pile-driving technology, where feasible, in consideration of geotechnical and structural requirements and conditions; • Erect temporary plywood noise barriers around the entire construction site; • Utilize noise control blankets on the building structure as it is erected to reduce noise emission from the site;	

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
NOISE-1 *continued*		• Evaluate the feasibility of noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings; and • Monitor the effectiveness of noise attenuation measures by taking noise measurements. • A third-party peer review, paid for by the applicant, shall be required to assist the City in evaluating the feasibility and effectiveness of the noise reduction plan submitted by the applicant. • A special inspection deposit is required to ensure compliance with the noise reduction plan. The amount of deposit shall be determined by the Building Official and the deposit shall be submitted by the project sponsor concurrent with submittal of the noise reduction plan.	
		NOISE-1e: A process with the following components shall be established for responding to and tracking complaints pertaining to pile-driving construction noise: • A procedure for notifying City Building Division staff and Oakland Police Department; • A list of telephone numbers (during regular construction hours and off-hours); • A plan for posting signs on-site pertaining to complaint procedures and who to notify in the event of a problem; • Designation of a construction complaint manager for the Project; and • Notification of neighbors within 300 feet of the Project construction area at least 30 days in advance of pile-driving activities. Construction period impacts would still occur with implementation of the measures detailed above. However, because they would be short-term in duration, the City considers this a less-than-significant impact.	

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
NOISE-2: Local traffic will generate long-term noise levels exceeding *Normally Acceptable* and *Conditionally Acceptable* noise levels on the Project site.	S	NOISE-2: Once the project design is finalized and the location of specific uses are determined, the project applicant shall have an acoustical analysis prepared that details noise reduction requirements and noise insulation features necessary to achieve acceptable interior and exterior noise levels. The requirements shall be sufficient to achieve a minimum of 45 dBA for all interior building spaces and shall achieve either Normally Acceptable or Conditionally Acceptable ranges for exterior uses according to the applicable land use category as set forth in Table IV.F-4. Measures to reduce the interior noise levels may include: • To meet the City's 45 dBA CNEL interior noise standard, building facade upgrades will be required for building located along Telegraph Avenue. All windows facing Telegraph Avenue must have a sound transmission class (STC) of 31 or greater. • All of the proposed buildings on the project site shall be designed and constructed with ventilation systems, to achieve the indoor fresh-air ventilation requirements specified in Chapter 35 of the Uniform Building Code, to achieve the 45 dBA CNEL interior noise standard.	LTS
		Measures to reduce the exterior noise levels may include: • The inclusion of plexiglass enclosures for outdoor patio and balcony areas at a height of 5 feet (i.e., to shield balconies and or outdoor patio areas) would provide 5dBA or more in noise reduction for outdoor use areas.	
		Implementation of the above mitigation measure would reduce this impact to a less-than-significant level by achieving, at a minimum, *Conditionally Acceptable* noise levels.	
NOISE-3: Long-term stationary noise sources on the Project site could potentially generate noise levels in excess of the thresholds set in Section 17.120.050 of the City's Planning Code.	S	NOISE-3: The following measures are required for the operations of the proposed Project: • All on-site stationary noise sources shall comply with the standards listed in Section 17.120.050 of the City's Planning Code; and • Loading docks or loading areas and noise-generating equipment associated with the retail uses will be located as far as practical from all existing and planned residential properties.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
NOISE-3 *continued*		Implementation of the above mitigation measure would reduce the impact to below a level of significance.	
G. HAZARDS AND HAZARDOUS MATERIALS			
HAZ-1: Development of the Project could expose construction workers and/or the general public to hazardous materials from contaminated soil and groundwater during construction activities.	S	HAZ-1a: Prior to issuing any grading, demolition or building permits for the proposed Project affecting Project site Blocks 3 through 9, an environmental investigation shall be conducted at the site by a qualified environmental professional. The environmental investigation shall implement appropriate sampling recommendations presented in previously conducted Phase I site assessment(s) prepared for the Project site, as summarized in Table IV.G-3, in order to adequately characterize subsurface conditions of the site. Environmental investigation workplans shall be submitted to the City of Oakland and RWQCB for review and approval. Information from the environmental investigation shall be used to develop and implement site-specific health and safety plans for construction workers and best management practices (e.g., dust control, storm water runoff control, etc.) appropriate to protect the general public.	LTS
		HAZ-1b: Prior to issuing any grading, demolition, or building permit for the proposed Project, a site-specific Health and Safety Plan (HSP) shall be prepared by a qualified industrial hygienist. At a minimum, the HSP shall summarize information collected in environmental investigations for the Project site, including soil and groundwater quality data; establish soil and groundwater mitigation and control specifications for grading and construction activities, including health and safety provisions for monitoring exposure to construction workers; provide procedures to be undertaken in the event that previously unreported contamination is discovered; incorporate construction safety measures for excavation activities; establish procedures for the safe storage and use of hazardous materials at the Project site, if necessary; provide emergency response procedures; and designate personnel responsible for implementation of the Plan. The HSP shall be designed to prevent potential exposures to construction workers above established OSHA Permissible Exposure Limits. The Plan shall be submitted to the City of Oakland for review and approval.	

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
HAZ-1 *continued*		HAZ-1c: Prior to issuing any grading, demolition, or building permit for the proposed Project, a Soil and Groundwater Management Plan (Plan) shall be prepared. The Plan shall include procedures for managing soils and groundwater removed from the site to ensure that any excavated soils and/or dewatered groundwater with contaminants are stored, managed, and disposed of safely, in accordance with applicable regulations. The Plan will incorporate notification and dust mitigation requirements of the BAAQMD (including Title 17, CCR Section 93105). Dewatering procedures will incorporate regulatory requirements for groundwater discharge to storm or sanitary sewers, as outlined in Mitigation Measure HYD-3. The Plan shall be submitted to the City of Oakland and RWQCB for review and approval and shall be implemented throughout all phases of Project development.	
HAZ-2: Development of blocks with soil and/or groundwater contamination could expose future residents and workers to potentially hazardous concentrations of contaminants.	S	HAZ-2a: Covenants, codes, and restrictions for the proposed Project shall strictly prohibit the use of groundwater at the Project site for drinking, irrigation, or industrial purposes. Any dewatering activities required at the Project site following construction activities shall be required to be carried out under the Soil and Groundwater Management Plan prepared for the Project (Mitigation Measure HAZ-1c).	LTS
		HAZ-2b: Prior to issuing any permits for construction within the Project site, a Human Health Risk Assessment (HHRA) shall be conducted and/or updated by a qualified environmental professional. This HHRA shall employ methodology from the *City of Oakland Urban Land Redevelopment: Guidance Document* for the Oakland Risk Based Corrective Action (RBCA) program to evaluate potential health risks from petroleum hydrocarbons, metals, solvents, and other volatile organic compounds in soils and groundwater. Depending on the findings of the HHRA, recommendations may be made for administrative or engineering controls to minimize public exposure to hazardous materials, if warranted. These controls could potentially include vapor barriers for building foundations, encapsulation of the site with building foundations and paved parking surfaces to prevent exposure to soils, and implementation of an Operations and Maintenance Plan to insure prescribed controls are implemented and maintained. The controls shall ensure that any potential added health	

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
HAZ-2 *continued*		risks to future site users are reduced to a cumulative risk of less than 1 x 10^{-5} (a calculated risk of 1 in 100,000 persons exposed) for carcinogens and a cumulative hazard index of 1.0. The HHRA shall be submitted to the City of Oakland and RWQCB for review and approval.	
HAZ-3: Improper use or transport of hazardous materials during construction activities could result in releases affecting construction workers and the general public.	S	HAZ-3**:** The implementation of Mitigation Measure HAZ-1b would require a Site Safety Plan/Soil and Groundwater Management Plan (Plan). The Plan will establish procedures for the safe storage and use of hazardous materials at the Project site, if necessary; provide emergency response procedures; and designate personnel responsible for implementation of the Plan. No other mitigation is required.	LTS
HAZ-4: Demolition of buildings that contain lead-based paint and asbestos-containing building materials would release airborne lead and asbestos particles, which may adversely affect construction workers and the public.	S	HAZ-4: All asbestos-containing materials shall be abated by a certified asbestos abatement contractor in accordance with construction worker health and safety regulations and the regulations and notification requirements of the Bay Area Air Quality Management District (BAAQMD) (29 CFR 1926.1101; 40 CFR 61 and 152; Title 8 CCR Section 1529; BAAQMD Regulation 11, Rule 2). The removal and disposal of lead-based paint within the Project site shall be completed in accordance with federal and State construction worker health and safety regulations (29 CFR, Part 1926.62; Title 8, CCR Section 532.1; CDHS Training, Certification and Workpractices Rule).	LTS
HAZ-5: Development of the Project could result in hazardous emissions or the handling of hazardous materials, substances, or waste within ¼-mile of a proposed school.	S	HAZ-5: Implementation of existing regulatory requirements for school siting, and preparation and implementation of a Site Safety Plan/Soil and Groundwater Management Plan (Mitigation Measure HAZ-1b) and lead and asbestos regulations (Mitigation Measure HAZ-4) would reduce this impact to a less-than-significant level. No additional mitigation is required.	LTS
H. UTILITIES AND INFRASTRUCTURE			
The Project would not result in any significant impacts related to infrastructure and utilities.			

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
I. HISTORIC ARCHITECTURAL, ARCHAEOLOGICAL AND PALEONTOLOGICAL RESOURCES			
<u>HIST-1</u>: Ground-disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could adversely impact paleontological resources.	S	<u>HIST-1a</u>: A paleontological resources monitoring plan shall be developed in consultation with a qualified paleontologist prior to Project-related ground-disturbing activities. This monitoring plan shall incorporate the findings of Project-specific geotechnical investigations to identify the location and depth of deposits that have a high likelihood of containing paleontological resources and that may be encountered by Project activities. This information will indicate the depth of overlying non-sensitive soils (i.e., artificial fill and prior disturbance) within the Project area to allow a more effective determination of where paleontological monitoring is appropriate.	LTS
		<u>HIST-1b</u>: A qualified paleontologist shall monitor all ground-disturbing activity that occurs at depths within the Project area determined to be sensitive in the paleontological monitoring plan. Monitoring shall continue until, in the paleontologist's opinion, significant, nonrenewable paleontological resources are unlikely to occur. In the event that paleontological resources are encountered during excavation, all work within 50 feet of the find shall be redirected until the monitor has evaluated the situation and provided recommendations for the protection of, or mitigation of adverse effects to, significant paleontological resources. Mitigation for impacts to significant paleontological resources shall include thorough documentation of the find and its immediate context to recover scientifically-valuable information. Upon completion of paleontological monitoring, a monitoring report shall be prepared. This scope of this report shall be approved by the City, but at a minimum the report will document the methods, results, and recommendations of the monitoring paleontologist.	
<u>HIST-2</u>: Ground-disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could adversely impact cultural resources .	S	<u>HIST-2</u>: A qualified archaeologist shall monitor all ground-disturbing activities in the Project area until, in the archaeologist's opinion, a depth has been reached at which potentially-significant archaeological deposits are unlikely to occur.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
HIST-2 *continued*		Should an archaeological deposit be encountered by Project activities, the monitor shall be empowered to halt construction in the vicinity of the find. Construction activities shall be redirected and a qualified archaeologist shall: 1) evaluate the archaeological deposit to determine if it meets the CEQA definition of a historical or archaeological resource; and 2) make recommendations about the treatment of the deposit, as warranted. If the deposit does not meet the CEQA definition of a historical or archaeological resource, then no further study or protection of the deposit is necessary. If the deposit does meet the CEQA definition of a historical or archaeological resource, then it shall be avoided by Project activities. If avoidance is not feasible, then effects to the deposit shall be mitigated through a data recovery strategy developed by the evaluating archaeologist. Mitigation of impacts to significant archaeological deposits through data recovery will recover scientifically-valuable information. This mitigation may include, but is not limited to, a thorough recording of the resource on DPR Form 523 records, or archaeological excavation. If archaeological excavation is the only feasible method of data recovery, then such excavation shall conform to the provisions of CEQA Guidelines §15126.4(b)(3)(C). Upon completion of such archaeological monitoring, evaluation, or data recovery mitigation, the archaeologist shall prepare a report documenting the methods, results, and recommendations of the investigation, and submit this report to the NWIC.	
HIST-3: Ground-disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could disturb human remains, including those interred outside of formal cemeteries.	S	HIST-3: Should human remains be encountered by Project activities, construction activities shall be halted and the County Coroner notified immediately. If the human remains are of Native American origin, the Coroner must notify the Native American Heritage Commission (NAHC) within 24 hours of this identification, and a qualified archaeologist should be contacted to evaluate the situation. The NAHC will identify a Native American Most Likely Descendent (MLD) to inspect the site and provide recommendations for the proper treatment of the remains and associated grave goods. The archaeologist shall recover scientifically-valuable information, as appropriate and in accordance with the recommendations of the MLD.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
HIST-4a *continued*		Upon completion of such analysis, as appropriate, the archaeologist shall prepare a report documenting the methods and results of the investigation. This report shall be submitted to the NWIC.	
HIST-4a *(Variant 1: Demolition; Variant 2: Partial Demolition)*: The proposed Project may result in full or partial demolition of the Great Western Power Company Building, which is a local historical resource.	S	HIST-4a *(Variant 1 and 2)*: The following measures shall be implemented to preserve information about the resource for further study: • Record the Great Western Power Company Building in accordance with the procedures of the Historical American Buildings Survey (HABS) through measured drawings, written histories, and large-format photographs; • Prepare a history of the Great Western Power Company Building that incorporates oral history, documentary research, and architectural information; • Prepare a brochure, regarding the building's historical association with one of three major early 20th century northern California power companies, to be made available at local libraries and museums; • If full demolition of the building occurs, salvage architectural elements from the building, including hardware, doors, paneling, fixtures, and equipment, and incorporate these elements into new construction; and • Curate all materials, notes, and reports at the OHR, and submit copies to the NWIC. Even with extensive documentation, however, the demolition of the building or portions of the building would result in the loss of a historic resource that is associated with significant historical events and is an example of outstanding design and function. Therefore, the demolition or partial demolition of the building would remain a significant and unavoidable impact.	SU

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
HIST-4b *(Variant 3: Preservation)*: Modification and reuse of the Great Western Power Company Building could adversely affect a historical resource.	S	HIST-4b *(Variant 3)*: Any modifications to the exterior of the building that may be proposed as part of its preservation and reuse shall be developed in consultation with staff at the Planning Department and a qualified historic preservation architect to determine an appropriate treatment strategy. In the event that this measure is determined feasible and is implemented, Mitigation Measure HIST-5 shall also be implemented to ensure that development on the adjacent properties does not adversely impact the building's integrity.	SU
HIST-5 *(Variant 3)*: Site clearance within the Project area adjacent to the Great Western Power Company Building could adversely impact a historical resource.	S	HIST-5 *(Variant 3)*: The following two-part mitigation measure shall be implemented: • The building's urban setting on the portion of Block 7 fronting Thomas L. Berkley Way (20th Street) shall be documented prior to Project implementation. At a minimum, this documentation shall include panoramic streetscape photographs and an interpretive display that shall provide an overview of the former urban context and describe how this context contributed to the building's significance. This information shall be presented in an on-site display at the preserved Great Western Power Company Building to enable a viewer to easily associate the former setting with the existing building (i.e., panoramic streetscape photographs to show the building within the former street frontage). Upon completion of this documentation, a copy of all notes, photographs, and analysis shall be archived at the OHR and submitted to the NWIC.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
HIST-5 *continued*		- The City shall ensure that the designs for new adjacent buildings are evaluated with respect to minimizing setting impacts on the historic resource. Project buildings adjacent to the Great Western Power Company Building shall be designed in a manner that minimizes inappropriate differences in mass and scale, if feasible. For example, designs could call for adjacent buildings to step-up to the height of the tallest Project element north of 20th Street, thereby reducing a potentially abrupt contrast between new buildings and the two-story Great Western Power Company Building. If the designs for the adjacent buildings follow the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Preservation of Historic Buildings, then the Project will have a less-than-significant impact, pursuant to CEQA §15064.5(b)(3).	
		However, if it is not feasible to minimize material impairment of the resource, then the impact would remain significant and unavoidable.	SU
HIST-6: Site clearance within the Project area could adversely impact four Potential Designated Historic Properties (PDHPs) in the Project area.	LTS	HIST-6: If the relocation of the PDHPs proposed for demolition on the Project site is not feasible, the buildings shall be documented at a level of detail commensurate with their local importance. At a minimum, this effort shall include photo-documentation, as well as local oral history about the past uses and occupants of the buildings. This documentation shall be planned in consultation with OCHS in order to: 1) identify those qualities that support and justify the property's local significance; and 2) efficiently record and disseminate such information in a way that most effectively offsets the loss of such buildings. At the completion of this documentation, all notes, photographs, and analysis shall be archived at the OHR, and a complete copy shall be submitted to the NWIC.	LTS
HIST-7: Project demolition and construction could adversely impact the setting of the 19th and San Pablo Commercial District.	S	HIST-7: No mitigation measure is necessary to address the less-than-significant impact.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
HIST-8: Project demolition and construction could result in a significant cumulative impact on the 19th and San Pablo Commercial District.	S	HIST-8: The City shall inform the applicant for the Thomas L. Berkley Square Project of the potential cumulative impact prior to the implementation of the Uptown Mixed-Use Project. The City shall consult with both Project applicants to establish a fair division of responsibility to fund mitigation measures to preserve information about the 19th and San Pablo Commercial District for future study. These mitigation measures shall include the following: • Record the 19th and San Pablo Commercial District in accordance with the procedures of HABS through measured drawings, written histories, and large-format photographs; • Prepare a history of the 19th and San Pablo Commercial District that incorporates oral history, documentary research, and architectural information; • Prepare a brochure, regarding the district's historical association with turn-of-the-century Oakland commerce, to be made available at local libraries and museums; • Salvage architectural elements from the buildings proposed for demolition, including hardware, doors, paneling, fixtures, and equipment, and incorporate these elements into new construction; and • Curate all materials, notes, and reports at the OHR, and submit copies to the NWIC. Even with extensive documentation, however, a cumulative impact will result from the demolition of 66 percent of the 19th and San Pablo Commercial District's contributing buildings. This loss of contributing buildings will materially affect the district's ability to convey its historical significance, which will result in a significant, unavoidable cumulative impact.	SU
HIST-9: Site clearance within the Project area could adversely impact historical buildings resources inventoried by the OCHS.	LTS	HIST-9: No mitigation measure is necessary to address the less-than-significant impact.	LTS
HIST-10: The construction of Project buildings could adversely impact historic architectural resources adjacent to the Project area.	LTS	HIST-10: No mitigation measure is necessary to address the less-than-significant impact.	LTS
HIST-11: The proposed Project could impact the setting of the Fox Oakland Theater.	LTS	HIST-11: No mitigation measure is necessary to address this less-than-significant impact.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
HIST-12: The proposed Project could impact the operations of the Fox Oakland Theater and, therefore, indirectly impact its architectural qualities.	LTS	HIST-12: No mitigation measures is necessary for this less-than-significant impact.	LTS
HIST-13: The enhancement of streetscape features and lighting on streets fronting the Project area may impact historical resources, including elements of the Uptown Shopping/ Entertainment Historic District and the Fox Oakland Theater.	S	HIST-13: Prior to Project initiation, the plan for the enhancement of street features and lighting on Telegraph Avenue shall be reviewed by planning staff to ensure that it conforms to the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Preservation of Historic Buildings.* Conformance with these guidelines will ensure that these improvements are compatible with nearby historical resources, and will mitigate potential Project effects to less-than-significant levels.	LTS
J. AESTHETIC RESOURCES			
AES-1: The proposed Project would alter the intrinsic architectural character of the Project site and its surroundings.	S	AES-1: The following measures shall be incorporated into the final Project design: • Create streetscape vitality and enhance the pedestrian experience through detailed treatment of building facades, including entryways, fenestration, and signage, and through the use of carefully chosen building materials, texture, and color. • Design of building facades shall include sufficient articulation and detail to avoid the appearance of blank walls or box-like forms. • Exterior materials utilized in construction of new buildings, as well as site and landscape improvements, shall be high quality and shall be selected for both their enduring aesthetic quality and for their long term durability. • Ensure that the architectural and landscape treatment of the proposed parking structure promotes human scale and pedestrian activity. • Detailed designs for the public park shall be developed. The design shall emphasize the public nature of the space and pedestrian comfort. The plaza design shall consider sun/shade patterns during mid-day hours throughout the year. The plaza design shall be sensitively integrated with the streetscape.	LTS

Table II-1 *continued*

Environmental Impacts	**Level of Significance Without Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
AES-2: The proposed development would provide additional sources of nighttime lighting in the downtown.	S	AES-2a: The specific reflective properties of Project building materials shall be assessed by the City during Design Review as part of the Project's Development Standards, Procedures and Guidelines. Design review shall ensure that the use of reflective exterior materials is minimized and that proposed reflective material would not create additional daytime or nighttime glare.	LTS
		AES-2b: Specific lighting proposals shall be reviewed and approved by the City prior to installation. This review shall ensure that any outdoor night lighting for the Project is down shielded and would not create additional nighttime glare.	
K. WIND			
WIND-1: Construction of 19-story buildings on Blocks 5 and 7 could result in wind speeds of over 36 mph.	S	WIND-1a: The final design of the high-rise buildings on Blocks 5 and 7 shall be in accordance with one or more of the following design guidelines. In addition, as part of the design review process for these high-rise buildings, a qualified wind consultant shall ensure the Project is designed in accordance with these guidelines: • Align long axis of each building along a northwest-southeast alignment to reduce exposure of the wide faces of the building to westerly or southeasterly winds. • West or southeasterly building faces shall be articulated and modulated through the use of architectural devices such as surface articulation; variation; variation of planes, wall surfaces, and heights; and the placement of setbacks and other similar features. • Utilize properly-located landscaping that mitigates high winds. Porous materials (e.g., vegetation, hedges, screens, latticework, perforated metal), which offer superior wind shelter compared to solid surfaces, shall be used. • Avoid narrow gaps between buildings where westerly or southeasterly winds could be accelerated; or • Avoid breezeways or notches at the upwind corners of the building.	LTS

Table II-1 *continued*

Environmental Impacts	Level of Significance Without Mitigation	Mitigation Measures	Level of Significance With Mitigation
WIND-1 *continued*		WIND-1b: A qualified wind consultant shall review and evaluate the final design of the high-rise buildings on Blocks 5 and 7, and shall determine whether incorporated design features would reduce wind impacts to a less-than-significant level. If the wind consultant determines that these design features would reduce wind impacts to a less-than-significant level (i.e., less than 36 mph), no further mitigation would be required. If the wind consultant determines that significant adverse wind impacts could occur, models of the proposed Blocks 5 and 7 buildings shall be subject to wind tunnel testing to determine if the buildings would result in uncomfortable or hazardous winds. The wind consultant shall work with the Project architect to develop further building design modifications that would reduce wind impacts to a less-than-significant level (i.e., standard of less than 36 mph).	
L. SHADE AND SHADOW			
The Project would not result in any significant impacts related to shade and shadows.			

III. PROJECT DESCRIPTION

This chapter describes the Uptown Mixed Use Project (Project), that is evaluated in this Environmental Impact Report (EIR). A description of the proposed Project's regional and planning context, objectives, and background is also provided, in addition to a discussion of the intended uses of the EIR, and required Project approvals and entitlements.

A. PROJECT SITE

1. Location

The Project site, which comprises approximately 15 acres, is located in the Uptown District of Oakland. The City of Oakland (City) is located in Alameda County on the eastern side of San Francisco Bay, approximately 4.5 miles east of San Francisco. The Uptown District, which was a popular shopping and entertainment destination in Oakland from the 1870s to World War II, is located immediately north of downtown. The Uptown District is currently a mixed-use neighborhood characterized by ground-floor commercial businesses, apartment buildings, parking areas, and vacant parcels. The neighborhood also contains two important historic architectural landmarks: the Fox Oakland Theater (1807 Telegraph Avenue) and the Paramount Theater (2025 Broadway Avenue). The Project site's regional and local location are illustrated in Figure I-1 included in Chapter I.

The Project site consists of a nine-block area as shown in Figure III-1. Blocks 1 through 6 are generally bounded by Thomas L. Berkley Way (20th Street) on the north, Telegraph Avenue on the east, 18th Street on the south, and San Pablo Avenue on the west. William Street and 19th Street traverse the Project site east to west, providing connections between San Pablo and Telegraph Avenues. The Fox Theater site, which is located to the east of Block 6, is not a part of the Project site. Blocks 7 and 8 are located on the north side of Thomas L. Berkley Way (20th Street); Block 7 is west of Telegraph Avenue and Block 8 is east of Telegraph Avenue. Block 9 is located on the southeastern corner of Telegraph Avenue and 22nd Street, approximately two blocks north of the other eight blocks.

Regional vehicular access to the Uptown District is via the 18th Street exit on Interstate 980 (I-980). The Project site is accessed from I-980 via 12th Street, Broadway, and Telegraph Avenue. The Project site is two blocks to the west of the 19th Street Bay Area Rapid Transit (BART) Station, which is located at the intersection of 19th Street and Broadway. In addition, the Project site is accessible by Alameda-Contra Costa Transit (AC Transit) buses, which run frequently along San Pablo Avenue and Telegraph Avenue, immediately adjacent to the Project site.

2. Site Characteristics

The nine-block Project site includes 66 individual parcels. A block-by-block list of parcel numbers, land owners, and existing land uses within the Project site is provided in Appendix B. Parking areas cover the majority of the site, including the following blocks: Block 6 and Block 5; the majority of

Figure III-1: Project Boundaries

8 ½ x 11 B&W

Block 4 and Block 2; and Block 3. Block 5 and the southern portion of Block 1 consist of vacant parcels. Commercial and residential uses are located in select areas along the site periphery.

Mixed land uses are located along the northern and western boundary of Block 1 and the northwest corner of Block 2. Sears Auto Center and an associated parking lot are located in the southeast corner of Block 4. Giant Burger, a fast food restaurant, is located in Block 9.

Consistent with the extensive site coverage that is dedicated to surface parking, the existing residential population of the Project site is relatively low. The site currently contains approximately 34 occupied single-room occupancy residential units.

A more detailed discussion of existing uses is provided in Chapter IV.A, Land Use.

B. PROJECT BACKGROUND

The Project site and the greater Uptown Area have been the subject of several other planning efforts in recent years. Past and current proposals/studies relevant to the Project site are provided below.

1. Downtown Housing Initiative

Oakland Mayor Jerry Brown and the Oakland City Council initiated the 10K Downtown Housing Initiative in 1999. The goal of the Downtown Housing Initiative is to construct approximately 6,500 market-rate housing units in order to attract 10,000 new residents to downtown Oakland. The objectives of the Downtown Housing Initiative are to increase the overall population of downtown, capitalize on the existing underutilized transit infrastructure, make downtown Oakland a more active place at night, provide needed market-rate housing, and increase the stability of downtown neighborhoods. The proposed Project will further these objectives.

As of August 2003, 11 residential projects (comprising 1,337 residential units) have been completed as part of the Downtown Housing Initiative. In addition, six projects (408 units) are under construction, ten projects (1,226 units) have received planning approvals, three projects (267 units) have submitted planning applications and five projects (1,557 units) have begun initial planning to develop proposals.[1] Consistent with CEQA and other legal requirements, the construction of housing is encouraged under the Downtown Housing Initiative through streamlined development and permitting processes, identification of key sites, and the use of incentives on a case-by-case basis.

2. Public Resources Code Section 21159.25 (Assembly Bill 436)

Public Resources Code Section 21159.25 (commonly referred to as Assembly Bill 436), passed in October 2001, allows for the preparation of focused EIRs for most infill residential projects in Downtown Oakland, including projects in the Uptown District, Old Oakland, and portions of Chinatown (see Chapter I for a more detailed discussion). Pursuant to Section 21159.25, this EIR is being prepared as a focused EIR that is tiered off of the EIR prepared for the City General Plan Land Use and Transportation Element (LUTE). Section 21159.25 allows a focused EIR to be prepared on

---

[1] City of Oakland Community and Economic Development Agency, 2003. CEDA Website: www.Business2oakland.com/main/10downtownhousinginitiative.htm.

the basis of a General Plan EIR only if the analysis in the EIR of cumulative impacts, growth inducing impacts, and irreversible significant effects on the environment is adequate. A summary of these findings from the LUTE EIR is provided in Appendix A of this EIR.

Further, an updated analysis of cumulative effects has been prepared for the topics evaluated in the focused EIR to ensure that a comprehensive analysis has been conducted.

3. Planning Efforts in the Area

In 1991, the Oakland-East Bay Galleria was proposed for the Uptown Planning Area on a site bordered by Thomas L. Berkley Way (20th Street) on the north, Broadway on the east, 17th Street on the south, and San Pablo Avenue on the west. The project would have included approximately 1.12 million square feet of retail space, 600,000 square feet of office space, and 3,000 to 4,000 parking spaces. An EIR for the project was certified in 1992. Prior to the Galleria proposal, a large retail mall project was proposed by the Rouse Company, neither of these retail proposals were constructed.

The Uptown District is also the focus of several transit and circulation improvement projects. Key projects include City-sponsored streetscape improvements along Telegraph Avenue and the AC Transit San Pablo Corridor Service and Bus Rapid Transit Project.[2]

- The *Telegraph Avenue Streetscape Improvements*, which are currently in the planning stage, would result in the integration of transit, bike, pedestrian, and vehicular facilities along a portion of Telegraph Avenue extending from 16th Street to Thomas L. Berkley Way (20th Street). Additional improvements would include streetscape beautification and traffic-calming measures.
- *AC Transit San Pablo Avenue Rapid Bus Service,* which began initial operation in June 2003, features a rapid bus route extending primarily along San Pablo Avenue from Contra Costa College in San Pablo to Jack London Square in Oakland. The service runs adjacent to the Project site. The Rapid Bus Service utilizes a traffic signal priority system and 40-foot, three-door buses to allow for maximum speed and efficiency. The buses run every 12 minutes during the peak travel period (6:00 a.m. through 7:00 p.m., Monday through Saturday) and every 15 minutes during non-peak times.
- The AC Transit Board of Directors approved a *Bus Rapid Transit* (BRT) plan for the Berkeley/Oakland/San Leandro transportation corridor on August 2, 2001. The recommended BRT alignment would extend from the downtown Berkeley BART station to the Bay Fair BART station in San Leandro and would run adjacent to the Project site along Telegraph Avenue. The BRT system would feature: 1) special transit lanes dedicated to BRT along most of the corridor; 2) traffic signal priority and coordination throughout the corridor; 3) frequent service (every 5 to 7½ minutes); 4) wide BRT station spacing (-mile to ½-mile between stations); 5) improved stations with real-time bus arrival information; 6) proof-of-payment ticket validation; and 7) low-floor, multi-door, low-emission buses. The BRT plan is currently undergoing environmental review.

---

C. PROJECT OBJECTIVES

The main objective of the Project applicant is to develop approximately 1,300 residential units, in addition to approximately 1,050 student beds/faculty units and approximately 43,000 square feet of commercial space. Other objectives of the Project are as follows:

1. Redevelop a group of blighted, underutilized sites in Oakland to create a vibrant new neighborhood.

2. Develop one new street to create a fine-grained district that is integrated with the City’s existing grid layout, create neighborhood connectivity, and encourage pedestrian activity.

3. Create a mixed-use development that highlights the neighborhood’s traditional role as an entertainment center.

4. Provide for a stable “24-hour” population in downtown Oakland.

5. Develop community-accessible open space.

6. Construct both market-rate and below-market rate housing on a site that is well-served by transit and is in proximity to downtown jobs.

7. Create a community that enhances the visual and community character of the surrounding neighborhood.

8. Develop a diversity of housing types, including students units, condominiums, family units, and studios, that can accommodate a diverse group of people/households.

9. Implement the Mayor’s and City Council’s 10K Downtown Housing Initiative.

10. Create a transit-oriented community that encourages pedestrian and bicycle access, and the use of public transportation.

11. Develop a pedestrian-friendly neighborhood that is well integrated with its surroundings.

12. Design a project that is consistent with the following General Plan policies in the Land Use and Transportation Element: T2.1; T2.2; D1.5; D6.1; D10.1; D10.2; D10.6; and D11.1.

13. Develop a project that is feasible in terms of density, building height, design, and construction. Integrate development successfully into historic urban development patterns and reestablish and strengthen connections to major transportation corridors and Central District cultural and governmental facilities.

14. Improve the existing jobs/housing balance in the greater Central District.

15. Coordinate public improvements and project sponsors improvements to create a unified urban district with regard to streetscape, connections to nearby commercial districts, transit, and entertainment uses.

16. Provide opportunity to strengthen local-serving commercial and retail activity by providing ground floor spaces for such uses.

D. PROPOSED PROJECT

This EIR considers the environmental effects of the Project proposed by Uptown Partners LLC, which comprises Forest City Residential West and California Urban Investment Partners (Project applicant). This section provides a description of the proposed Project based on information provided by the Project applicant.

1. Project Concept

The proposed Project is a mixed-use development that comprises:

- approximately 1,000 apartments and 270 condominiums;
- 1,050 student beds/faculty units;
- approximately 43,000 square feet of commercial space;
- 1,959 parking spaces; and
- a 25,000 square-foot public park.

The 43,000 square feet of commercial space would include: 1) ground floor retail space in the residential buildings proposed along Telegraph Avenue (approximately 33,000 square feet); and 2) Sears Auto Center commercial space (approximately 10,000 square feet). A new north/south street would be developed within the Project site to allow for: a smaller block size that encourages walking and biking; improved north/south circulation; pedestrian activities; and neighborhood connectivity. A more detailed block-by-block description of the proposed Project follows. The Project concept is illustrated in Figure III-2.

2. Block-Specific Development

A description of the development proposed for each proposed block is provided below and summarized in Table III-1.

a. Blocks 1 and 2. Blocks 1 and 2 are bounded by Thomas L. Berkley Way (20th Street) on the north, a proposed new street on the east, 19th Street on the south and San Pablo Avenue on the west. William Street would bisect Blocks 1 and 2. Block 1 would be to the north of William Street; Block 2 would be to the south of William Street. As noted above, a new north-south street is

Table III-1: Project Characteristics

Figure III-2: Conceptual Site Plan

8X11 B&W

proposed to provide access to the Project from Thomas L. Berkley Way (20th Street); it would separate Blocks 1 and 2 from Blocks 3 and 4 and terminate at 19th Street.

- Block 1 would contain two five-story buildings atop parking podiums. The buildings would be approximately 65 feet in height and would contain a total of 190 residential units with three courtyards. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. No retail space is proposed in this building. A single-level, approximately 190-space subterranean parking structure is proposed, located one-half story below grade.
- Two buildings are proposed for Block 2. The buildings would be five-story structures atop a parking podium, and would be approximately 65 feet in height. The structures would be separated by a landscaped pedestrian alley. Combined, the buildings would contain 190 residential units. The building in the eastern portion of the block would surround an urban courtyard. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. No retail space is proposed on Block 2. A single-level, approximately 190-space subterranean parking structure is proposed, located one-half story below grade.

b. Blocks 3 and 4. Blocks 3 and 4 are located in the eastern portion of the Project site. These blocks would be bordered by a proposed new street to the west, Thomas L. Berkley Way (20th Street) to the north, Telegraph Avenue to the east, and 19th Street to the south. William Street also bisects this area, with Block 3 to the north of William Street, and Block 4 to the south.

- Block 3 would contain a 12-story building approximately 144 feet in height. The building would contain approximately 250 residential units and 7,500 square feet of groundfloor commercial space. The residential units would surround two courtyards, and the retail space would front Telegraph Avenue. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. A three-level parking structure is proposed within the first level at-grade and two subterranean levels. The structure would contain approximately 270 parking spaces.
- Block 4 would contain a five-story building approximately 65 feet in height. The building would contain 225 residential units and 14,500 square feet of retail space on the ground floor. The residential units would surround three urban courtyards, and the retail space would front Telegraph Avenue. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. A two-level, approximately 294-space parking structure is proposed; the first level would be located one-half story below grade, the second level would be subterranean.

c. Blocks 5 and 6. Blocks 5 and 6 are located in the southern portion of the Project site. These blocks are bordered by 19th Street on the north, the Fox Theater site (which is not part of the Project site) on the east, 18th Street on the south, and San Pablo Avenue on the west. Block 5 is located on the west side of this area (adjacent to San Pablo Avenue) and Block 6 is located on the east side of this area (adjacent to the Fox Theater and a proposed new street).

- Block 5 would contain one 19-story tower approximately 250 feet in height. The buildings would contain a total of 270 condominiums. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. A three-level, approximately 270-space parking structure is also proposed, with the first level located one-half story below grade. No retail space would be located within this block.

- Block 6 would contain one five-story structure approximately 65 feet in height. Unit types include a mix of studio, townhome, live/work residential lofts, and one, two, and three-bedroom units. A one-level, approximately 145-space subterranean parking structure is proposed, located one-half story below grade. No retail space would be located within this block.

d. Blocks 7 and 8. Blocks 7 and 8 are located across Thomas L. Berkley Way (20th Street), in the northeastern portion of the Project site. Block 7 is bordered by Thomas L. Berkley Way (20th Street) on the south, Telegraph Avenue on the east, 21st Street on the north and the PG&E substation and a proposed new street on the west. Block 8 is bordered by Thomas L. Berkley Way (20th Street) on the south, Telegraph Avenue on the west, 21st Street on the north and the Paramount Theater on the east.

- A 19-story student housing tower would be constructed on Block 7. The student housing tower would contain 1,000 student beds, 11,000 square feet of commercial space, and 550 parking spaces in a five-story parking structure above grade. A five-story faculty housing building would also be constructed on Block 7. This structure would contain 50 residential units.
- Block 8 is proposed as an alternate site for the relocation of the Sears Auto Center. Block 9 (see below) is the preferred relocation site for the Sears Auto Center.

e. Block 9. Block 9 is located at the southeast quadrant of Telegraph Avenue and 22nd Street, approximately one block north of Blocks 7 and 8. The block is not contiguous with the rest of the Project site. Block 9 is the preferred site for the relocation of the Sears Auto Center, which is currently located on Block 4 on Telegraph Avenue. Building 9 would include approximately 10,000 square feet of retail space for the auto center and 50 on-site parking spaces.

3. Unit Types and Affordability

Table III-2 illustrates an approximate breakdown of unit types that would be built as part of the proposed Project. All of the units, except the 270 for-sale condominiums proposed on Block 5, would be rental units.

At least 25 percent of the units constructed as part of the proposed Project (excluding student and faculty units, but including rental and condominium uses) would be priced at affordable levels. At least 20 percent of the units would be affordable to households earning up to 50 percent of the Alameda County Median Income; 5 percent of the overall units would be affordable to households earning up to 120 percent of the Alameda County Median Income.

Table III-2: Unit Types

Type	Approx. Square Feet	% of Total Units
Studios	560	30
1 bedroom/1 bath	750	30
2 bedroom/2 bath	1,130	35
3 bedroom/3 bath	1,300	5

Source: Forest City, 2003.

4. Parks and Open Space

A 25,000 square-foot public park would be developed on the western portion of Block 3. The park would be bordered by Thomas L. Berkley Way (20th Street) on the north, the proposed new road on the west, William Street on the south and Block 3 on the east. It would be open to the public and would not be gated. Design features that would be incorporated into the park include paths, benches, a shade arbor, public art, and rolling lawns for passive seating and picnics. Plantings in the park interior would include street trees, flowering trees, large shade trees, and ground cover. The planting list emphasizes species that are drought-tolerant and that require minimal maintenance. In keeping with the intent that the park be as ecologically-sound as possible, bio-swales will be incorporated into the design to allow surface runoff to seep into the ground water system. Low-level evening lighting would also be incorporated into the park. Lighting would generally be installed along the park perimeter and would feature historic-looking bollard-type fixtures at park entryways.

5. Circulation, Parking, and Streetscape Improvements

A new north/south road would be developed within the Project site. The road would be located immediately west of the Fox Theater between 18th Street and 19th Street; north of 19th Street, the road would be aligned approximately 150 feet to the west of the portion of the road south of 19th Street, and would extend north through the Project site to 21st Street. The proposed road would be 34 feet wide and include parking on each side and a 10-foot travel lane in each direction. An 8-foot wide sidewalk would be developed on each side of the street. At intersections the curb would extend out to the edge of the parking zone to minimize the width of the street for pedestrians.

On the portion of San Pablo Avenue adjacent to the Project site, one of the northbound traffic lanes would be replaced with 47 angled parking spaces. Sidewalks that would be developed as part of the proposed Project are designed to encourage pedestrian activity; 8-foot-wide sidewalks would be developed on William Street and 10-foot-wide sidewalks would be developed on 18th Street, 19th Street, and Thomas L. Berkley Way (20th Street).

Existing streets through the Project site may be narrowed to slow traffic through the neighborhood; additional traffic-calming design features that would be incorporated into the Project include street tree wells, tree islands in parking areas, and special paving on William Street. The narrow streets would restrict traffic speed and facilitate bicycle use. Separate roadway bike lanes would not be designated for bicycle use within the Project site; however, bike lanes would be developed on Telegraph Avenue as part of the City’s Telegraph Avenue streetscape improvement project.

Ingress and egress to garages within the Project site would be concentrated on William Street. Access to Blocks 1 and 2 would be via William Street; access to Block 3 would be via Thomas L. Berkley Way (20th Street) and William Street; access to Block 4 would be via William Street and 19th Street; access to Blocks 5 and 6 would be via a new internal north/south roadway between 18th Street and 19th Street; access to the parking garage on Block 7 would be via 21st Street. The proposed Project includes 1,959 parking spaces in garages and 176 on-street parking spaces. Streetscape improvements would include a unified street tree planting, and the installation of streetlights similar to the existing “acorn” lights along 18th Street.

A 50-foot-wide area would be retained as open space immediately to the west of the Fox Theater in order to accommodate future loading and unloading activities at the theater. A linear planting area would be installed on the west side of the north/south lane adjacent to the theater to screen the loading and utility areas of the theater from the housing that would be developed within Block 6.

Approximately 1,242 parking spaces would be removed as part of implementation of the proposed Project. Proposed parking within the Project site represents a net increase of 893 parking spaces within the Project site. Parking spaces for residential and commercial uses would be provided via covered parking lots and on-street parking.

6. Population and Employment

Table III-3 details an estimate of the population and employed persons that would be generated by the proposed Project.

Table III-3: Population and Employed Persons

Type	Units	Estimate of Residents	Estimate of Employed Residents
APARTMENTS			
Total Apartments	*1,000*	*1,737*	*1,249*
CONDOMINIUMS			
Total Condominiums	*270*	*481*	*355*
STUDENT/FACULTY HOUSING			
Dorm Beds	1,000	1,000	333
Faculty Units	50	100	65
Total Student/Faculty Housing	*1,050*	*1,100*	*398*
TOTAL PROJECT	**2,320**	**3,318**	**2,002**

Note: Refer to Section IV.B, Population, Employment and Housing, for a detailed breakdown of how these numbers were estimated.
Source: Hausrath Economics Group, June 5, 2003.

7. Demolition and Construction

Demolition activities would include the removal of all existing structures on Blocks 1 through 7, including approximately 20 buildings, with the possible exception of the Greater Western Power Company Building (also known as Navlet's Florist and Nursery). The Project applicant is proposing the following three variants in regard to the Great Western Power Company Building:

- *Variant 1*: Complete demolition of the Great Western Power Company Building.
- *Variant 2:* Partial demolition of the Great Western Power Company Building.
- *Variant 3:* Preservation of the Great Western Power Company Building.

Further descriptions of these variants are included in Section IV.I, Historic Architectural, Archaeological and Paleontological Resources.

The Project also includes the removal of approximately 1,242 parking spaces that provide general public parking for downtown, and parking for the Sears department store located across Telegraph Avenue from the Project site. The removal of these parking facilities includes demolition of six surface parking lots and the Sears parking garage, located on San Pablo Avenue between 19th and William Streets. The land uses of the buildings that would be demolished include a take-out restaurant, resident hotels, vacant office space, and other miscellaneous commercial uses (including the Sears Auto Center building). Relocation of tenants from the small number of residential units located on the Project site would be undertaken in accordance with State Redevelopment Law.

Commercial relocations that would occur as part of the Project include the relocation of the Sears Auto Center from its current location at 1901 Telegraph Avenue to Block 9 at the corner of 22nd Street and Telegraph Avenue. If the Sears Auto Center moves to Block 9, the existing Giant Burger restaurant on the southeast corner of the intersection of Telegraph Avenue and 22nd Street would receive relocation assistance in accordance with State Redevelopment Law.

Construction of the proposed five-story buildings would be wood-frame over a concrete parking podium. In the five-story buildings, parking would be located below grade and one-half story above grade using concrete construction for the parking garage portion of the buildings. In the high-rise towers, concrete or steel frame construction would be used and parking would be located both below and above grade. Pile driving for building foundations may be necessary. The use of pile driving will be determined upon review of further geotechnical and structural building systems studies. For the purposes of this EIR, it is assumed that pile driving will be used during construction. Excavation depth on the Project site is anticipated to range from 7 feet to 20 feet.

8. Anticipated Project Phasing

Construction is anticipated to begin on Block 4 in September 2004 and continue to full buildout by 2010. However, this construction timeframe is estimated based on current market conditions, and could be subject to change.

E. INTENDED USE OF THIS EIR

It is anticipated that this EIR will provide environmental review for all discretionary approvals necessary for the Project. A number of permits and approvals would be required before the development of this Project could proceed. As lead agency for the proposed Project, the City of Oakland would be responsible for the majority of approvals required for development. Other agencies also have some authority related to the Project and its approvals. A list of the required permits and approvals that may be required by the City and other agencies is provided in Table III-4.

Table III-4: Required Permits and Approvals

Lead Agency	**Permit/Approval**
City of Oakland Planning Commission City Council Redevelopment Agency	• Major Conditional Use Permit for a project over 100,000 square feet in size • Demolition of Single Residency Occupancy (SRO) units • Design Review • Planned Unit Development (preliminary and final) • Minor Conditional Use Permits or Variances, if determined necessary once detailed plans are submitted • Redevelopment Agency actions, including a Disposition and Development Agreement and acquisition of land • Subdivision Maps to combine parcels, create new parcels or create condominiums, if proposed • DDA • General Plan Amendment to designate proposed park as open space
Responsible Agencies	
East Bay Municipal Utility District (EBMUD)	• Approval of water line, water hookups and review of water needs
California Department of Transportation (Caltrans)	• Approval of plans and encroachment permit for improvements located within the State right-of-way; improvements within the public right-of-way; excavation for utilities; clean-up of contamination; condemnation of property (if required); and traffic improvements (including re-paving, re-striping, signal improvements, street lights, and signal optimization)
California Regional Water Quality Control Board (RWQCB)	• National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharge • Approval and oversight of required remediation plans
Other Agencies	
SBC (prev. Pacific Bell)	• Approval of communication line improvements and connection permits
Pacific Gas & Electric (PG&E)	• Approval of natural gas improvements and connection permits
California Department of Toxic Substances Control (DTSC)	• Approval and oversight of the plan
Bay Area Air Quality Management District (BAAQMD)	• Permitting of asbestos abatement activities

IV. SETTING, IMPACTS, AND MITIGATION MEASURES

This chapter contains an analysis of each environmental topic that has been identified through environmental evaluation of the Uptown Mixed Use Project, and, as such, constitutes the major portion of this Draft EIR. Sections A through L of this chapter describe the environmental setting of the proposed Project as it relates to each specific environmental issue, the impacts resulting from implementation of the Project, and mitigation measures, as appropriate, that would reduce impacts of the Project.

DETERMINATION OF SIGNIFICANCE

Under CEQA, a significant effect is defined as a substantial, or potentially substantial, adverse change in the environment.[1] The *CEQA Guidelines* direct that this determination be based on scientific and factual data. Each impact evaluation in this chapter is prefaced by criteria of significance, which are the thresholds for determining whether an impact is significant. These criteria of significance have been developed by the City of Oakland.

ISSUES ADDRESSED IN THE DRAFT EIR

The following environmental issues are addressed in this chapter:

A. Land Use
B. Population, Employment and Housing
C. Hydrology and Water Quality
D. Transportation, Circulation and Parking
E. Air Quality
F. Noise
G. Hazards and Hazardous Materials
H. Utilities and Infrastructure
I. Historic Architectural, Archaeological and Paleontological Resources
J. Aesthetic Resources
K. Wind
L. Shade and Shadow

FORMAT OF ISSUE SECTIONS

Each environmental issue section has two main subsections: 1) Setting and 2) Impacts and Mitigation Measures. Each impacts and mitigation measures subsection is further divided into an initial discussion of *less-than-significant* impacts and a following discussion of *significant* impacts. Any

---

[1] Public Resources Code Section 21068.

identified significant impacts are numbered and shown in bold type, and the corresponding mitigation measures are numbered and indented. Significant impacts and mitigation measures are numbered consecutively within each topic and begin with a shorthand abbreviation for the impact section (e.g., LAND for Land Use). The following abbreviations are used for individual topics:

LAND:Land Use
POP:Population, Employment and Housing
HYD:Hydrology and Water Quality
TRANS:Transportation, Circulation and Parking
AIR:Air Quality
NOISE:Noise
HAZ:Hazards and Hazardous Materials
UTL:Utilities and Infrastructure
HIST:Historic Architectural, Archaeological and Paleontological Resources
AES:Aesthetic Resources
WIND:Wind
SHADE:Shade and Shadow

The following notations are provided after each identified significant impact and mitigation measure:

SU = Significant and Unavoidable
S = Significant
LTS = Less than Significant

These notations indicate the significance of the impact before and after mitigation.

A. LAND USE

This section evaluates the effects of the Uptown Mixed Use Project on land use. Potential land use impacts that would result from implementation of the proposed Project are identified, and mitigation measures are recommended, as appropriate. This section also contains a discussion of the consistency of the proposed Project with relevant land use policies. However, policy conflicts do not, in and of themselves, constitute a significant environmental impact. Policy conflicts are considered to be environmental impacts only when they would result in direct physical impacts. Therefore, land use policies are discussed in this section for informational purposes only. All other associated physical impacts are discussed in this EIR under specific issue areas such as noise, air quality and traffic.

1. Setting

The following section describes existing land uses within the Project site and its vicinity, and summarizes relevant land use policies.

a. Overview. The Project site is located in the Uptown District of Downtown Oakland, north of the Oakland City Center. The Uptown District is generally bounded by West Grand Street to the north, Broadway to the east, 17th Street to the south, and San Pablo Avenue to the west. Figure IV.A-1 provides an overview of existing land uses within and adjacent to the Project area, and illustrates the Project boundaries. The Project site (Blocks 1-9) is within a larger area known as the Uptown District. This district was historically an area known for its retail shopping and entertainment uses (Emporium, I Magnin, The Paramount and Fox Theaters). The City's redevelopment and revitalization efforts for the larger Uptown District include the Telegraph Avenue streetscape improvements, the reuse of the Fox Theater for a School of the Arts, the Alameda County Self-Sufficiency Center and associated offices, and housing at the corner of San Pablo Avenue and Thomas L. Berkley Way. The subject of this EIR includes the Project sponsor's development proposal for Blocks 1-9. To the extent that the other revitalization efforts in the District would contribute to cumulative physical impacts, this has been included as appropriate in each impact section and also incorporated into the growth projections used for the cumulative impact analysis.

(1) Project Boundaries. The Project site consists of a nine-block area, as shown in Figure III-1. Block 1 through Block 7 are generally bounded by 21st Street to the north, Telegraph Avenue and the Fox Theatre to the east, 18th Street to the south, and San Pablo Avenue and a Pacific Gas and Electric substation to the west. Block 8 is bounded by a fast food restaurant and the Paramount Theater to the north and east, Thomas L. Berkley Way (20th Street) to the south, and Telegraph Avenue to the west. Block 9 is bordered by 22nd Street to the north, a parking lot to the east and south, and Telegraph Avenue to the west.

(2) Historical Context. Prior to World War II, Downtown Oakland was the civic, entertainment, and commercial center of Oakland. The Uptown District represents a northward expansion of the Central Oakland Business District in the 1920s and 1930s. Compared to portions of Downtown further to the south, the Uptown District contained a greater proportion of entertainment and commercial land uses, and a smaller proportion of office uses. Business and population growth in Downtown slowed in the post-war era, in large part due to extensive suburbanization in the region, and the development of major shopping and entertainment centers in outlying areas. Reinvestment in the area increased in the 1980s and 1990s, with the renovation of historic buildings in Downtown, the development of Jack London Square, the new civic center at Frank H. Ogawa Plaza, and reconstruction activities in response to damage caused by the 1989 Loma Prieta Earthquake.

b. Existing Land Uses Within the Project Site. The Project site is approximately 15 acres in size and consists of a mixture of land uses, including parking, residential, and commercial uses. Buildings within the site commonly contain ground-floor commercial uses, and residential units on upper floors. Surface and multi-story parking lots comprise the majority of the Project site. Table IV.A-1 provides a summary of existing uses by block.

Table IV.A-1: Summary of Existing Uses by Block

Block #	Use	Block Size (SF)	Building Area (SF)	Residential Units	Estimated Employment
1	Vacant, commercial and residential	56,033	24,267	18	21
2	Commercial, residential and parking garage	70,493	170,150	15	5
3	Surface parking and auto repair	74,796	1,971	0	15
4	Sear's Auto Center and associated surface parking	68,000	8,000	0	22
5	Vacant	38,844	0	0	0
6	Parking	53,100	0	0	0
7	Residential and commercial[a]	98,378	83,936	0	177
8	Parking	20,255	0	0	0
9	Restaurant	21,000	2,115	0	8
	TOTAL	**500,899**	**290,439**	**33**	**248**

[a] Four units identified in Assessor's records were assumed by census enumerator to be unavailable for residence in 2000.

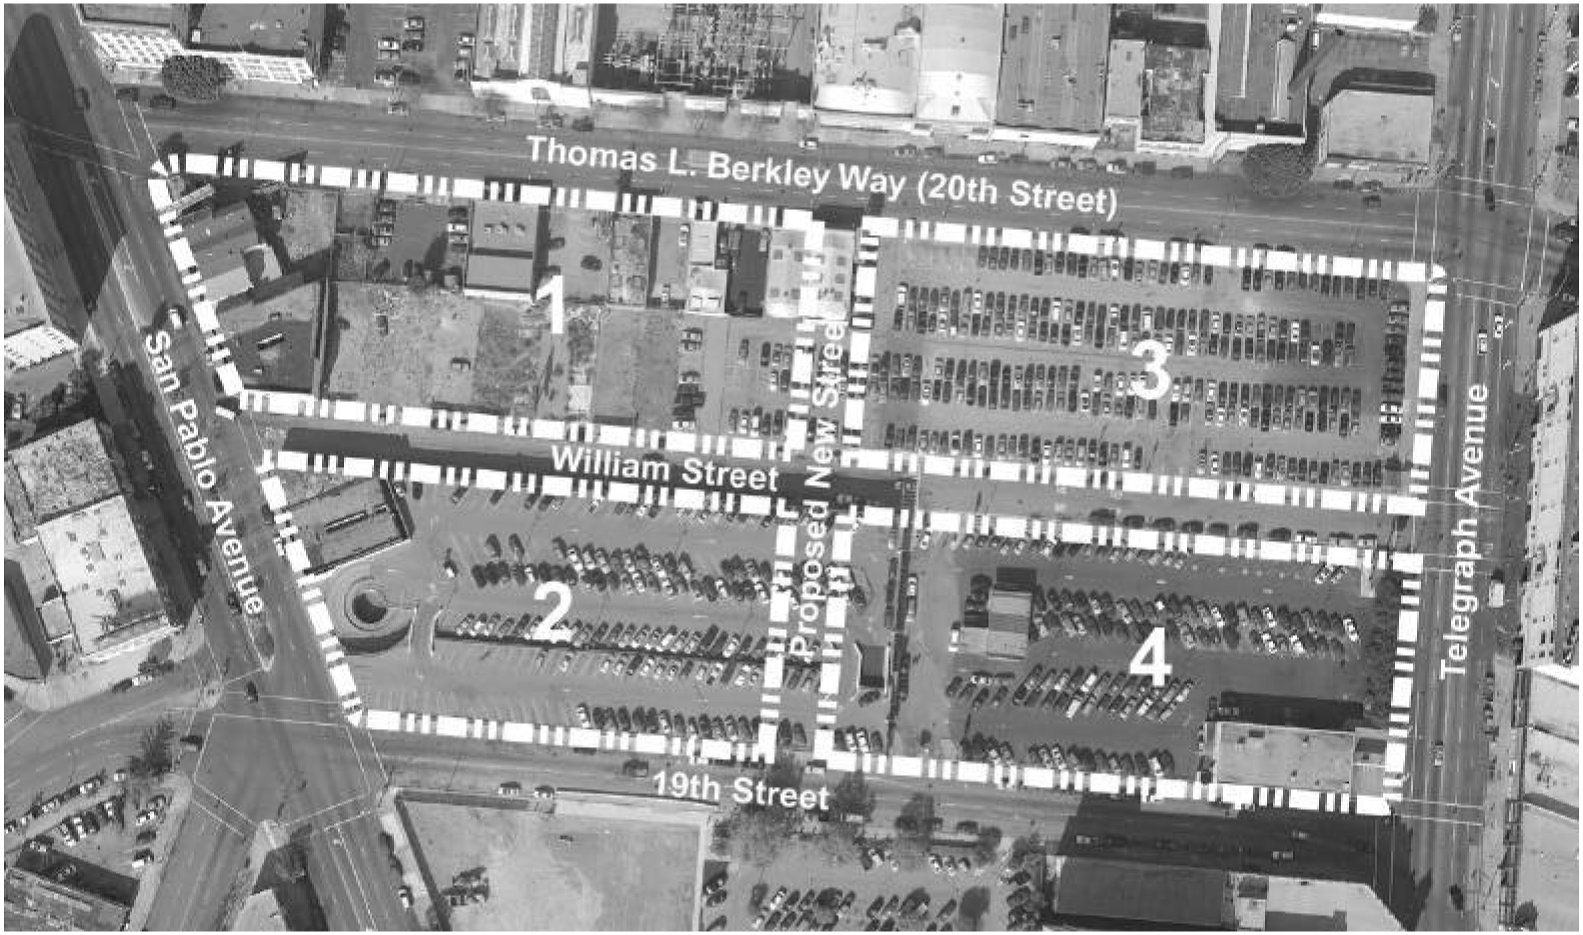
Source: Alameda County Assessor's Office; Hausrath Economic Group; and LSA Associates, Inc., 2003.

c. Existing Land Use in the Vicinity of the Project Site. The Project site represents a transition zone between more intense commercial and civic land uses to the east and south of the site, and less-intense residential, commercial, and institutional uses to the north and west. Key transit facilities in the vicinity of the Project site include BART stations located at the following locations: 1) 19th Street and Broadway; and 2) 12th Street and Broadway. The following discussion details the land uses in the vicinity of the Project site, traveling in a clock-wise direction, starting at Block 7. These land uses are shown in Figure IV.A-1. Figures IV.A-2 through IV.A-5 are aerial photos of blocks within the Project site.

Block 7 is bordered to the north by an apartment building, a house that is being converted into two condominiums, and a Young Men's Christian Association (YMCA) facility. Block 9 is bordered by a gas station to the north, and a parking garage on the east and south. Block 8 is bordered by a bar to the north, office uses to the west, and Sear's retail outlet to the south. Block 3 an 4 are bordered by street-fronting retail uses to the east. Blocks 5 and 6 are bordered by the Fox Theater to the east, an ice skating facility to the south, and office uses across San Pablo Avenue to the west. Blocks 1 and 2 are bordered by a senior residential care home, parking, and commercial uses across San Pablo Avenue to the west. Office uses (including the Oakland Post Building), the vacant Hotel Royal, a surface parking lot, and a Pacific Gas and Electric substation are located to the north of Block 1.

Figure IV.A-1: Land Use in Vicinity of Project Site

8x11 B&W



Block 1. *The northern and far western portions of Block 1 contain a variety of commercial land uses, including a barbecue eat-in restaurant, a bar, and a massage parlor. A residential hotel is located within the block on San Pablo Avenue. The southern portion of the block consists of surface parking and vacant lots (Table IV.A-2).*

Block 2. *Commercial uses are located in the far northwestern corner of Block 2. The remainder of the block consists of a parking garage (Table IV.A-2).*

Block 3. *Commercial uses fronting Thomas L. Berkley Way (20th Street) are located in the far northwestern corner of Block 3. The remainder of the block consists of surface parking (Table IV.A-2).*

Block 4. *Sears Auto Center and an associated parking lot comprise Block 4 (Table IV.A-2).*

Figure IV.A-2: Aerial Photo: Blocks 1-4

Block 5. *Block 5 consists of a paved, vacant lot. The lot is surrounded by a chain-link fence (Table IV.A-3).*
Block 6. *Block 6 contains a surface parking lot (Table IV.A-3).*

Figure IV.A-3: Aerial Photo: Blocks 5 and 6

d. Planned Land Uses. Major projects planned for the vicinity of the Project site include the Thomas L. Berkley Square Project (please refer to Appendix C for a comprehensive list of planned projects in Downtown Oakland). The Thomas L. Berkley Square Project is proposed for an approximately 1.5-acre site to the north and west of the Uptown Mixed Use Project site and is bounded by 21st Street to the north, a Pacific Gas and Electric substation to the east, Thomas L. Berkley Way (20th Street) to the south, and San Pablo Avenue to the west. The Thomas L. Berkley Square Project would include: a four-story building with 106,000 square feet of office and retail space, which would house the Alameda County Social Services Administration and the North County Self-Sufficiency Center; a parking structure containing up to 150 spaces; a public plaza; and approximately 100 residential units. The project, which is currently undergoing environmental review, is scheduled to be complete by approximately 2008.

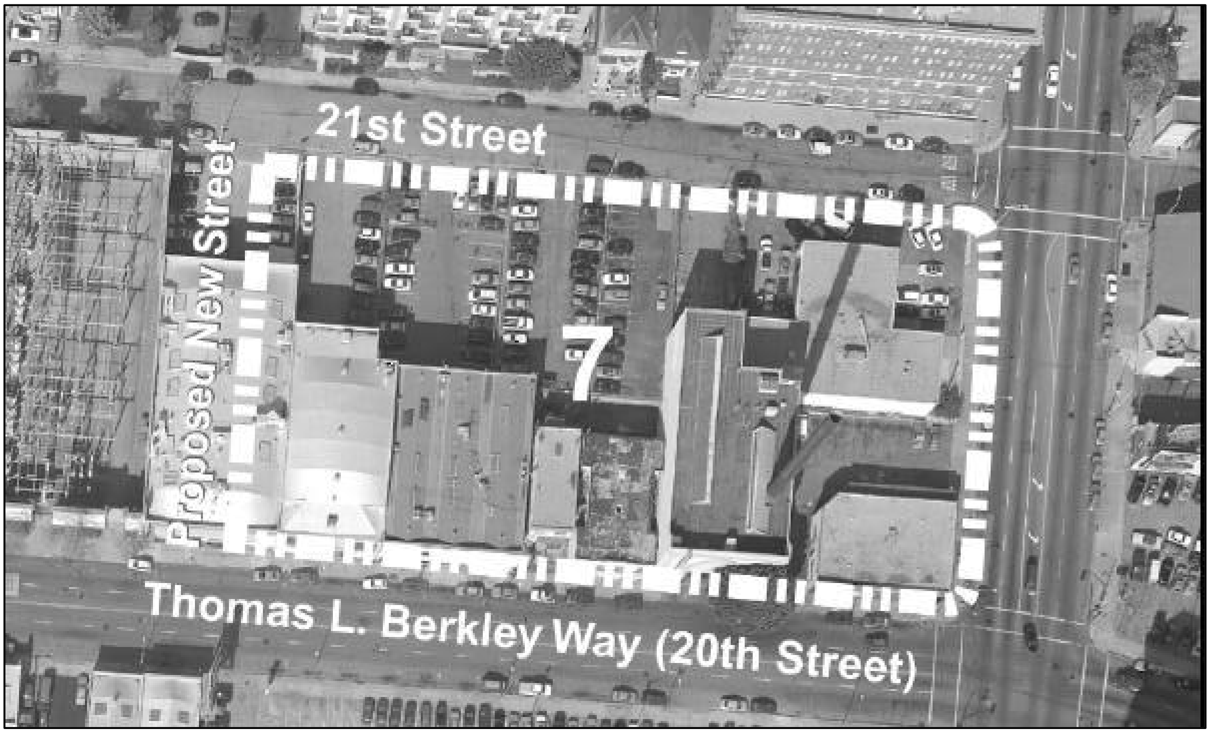
Source: Alameda County Assessor's Office, Hausrath Economic Group, LSA Associates, 2003.

3. Applicable Policies

The main guiding documents regulating land use within and around the Project site are the City General Plan (particularly the Land Use and Transportation Element, Historic Preservation Element, and the Open Space, Conservation, and Recreation Element), the City Planning Code, the City's Sustainable Development Initiative, and the Central District Urban Renewal Plan (Redevelopment Plan). The consistency of the proposed Project with other non-land use related policies is addressed in the appropriate topical sections of the EIR (e.g., air quality). Applicable land use policies from each of the documents listed above are described below.

a. City of Oakland General Plan. The City of Oakland General Plan (General Plan) is a comprehensive plan for the growth and development of the City. The General Plan includes policies related to: land use and circulation; housing; recreation, conservation and open space; noise; environmental hazards; and historic resources. These topics are addressed within individual elements of the General Plan. The General Plan Land Use and Transportation Element (LUTE) and the Open Space, Conservation and Recreation Element are both applicable to land use within the Project site and are described below.

b. Land Use and Transportation Element. The LUTE, which was adopted in March 1998, addresses land use and transportation issues in a single document. In order to accomplish a more holistic planning process that incorporates City-wide infrastructural needs with demands for neighborhood decision-making, the LUTE includes general development policies for the City, in addition to district-specific policies. The LUTE is bound by a vision for the City that includes creating: "clean and attractive neighborhoods rich in character and diversity, each with its own distinctive identity, yet well-integrated into a cohesive urban fabric" in addition to "a diverse and vibrant downtown with around-the-clock activity." The Project site is designated Central Business District in the General Plan. Figure IV.A-6 shows General Plan and Planning Code land use designations within and in the vicinity of the Project site. The General Plan states: "The Central



Block 7. *Block 7 contains a mixture of land uses fronting Thomas L. Berkley Way (20th Street) and Telegraph Avenue. Office uses are located within the western portion of the block along Thomas L. Berkley Way (20th Street). An abandoned residence and commercial building, and the Navlet's building (vacant as of June 2003) are located to the east of the office uses. A beauty supply retail outlet or store and a newspaper office are located within the block along Telegraph Avenue (Table IV.A-4).*

Figure IV.A-4: Aerial Photo: Block 7

Business District (CBD) classification is intended to encourage, support, and enhance the downtown area as a high density mixed use urban center of regional importance and a primary hub for business, communications, office, government, high technology, retail, entertainment, and transportation in Northern California. The CBD classification includes a mix of large-scale offices, and commercial, urban (high-rise), residential, institutional, open space, cultural, educational, arts, entertainment, service, community facilities, and other visitor uses.

c. City of Oakland Planning Code. The City of Oakland Planning Code (Planning Code) implements the policies of the General Plan and certain other of the City's plans, policies, and ordinances. The Planning Code divides the City into districts, each of which is assigned different regulations. These regulations direct the construction, nature, and extent of building use. Figure IV.A-6 shows General Plan and Planning Code land use designations within and around the Project site. The following portions of the Project site are designated Central Core Commercial (C-55) and Downtown Residential Open Space Combining Zone (S-17): the southern portions of Block 5 and Block 6; the portions of Blocks 7, 3, and 4 which front Telegraph Avenue; and Block 8 and Block 9.

Table IV.A-4: Existing Uses, Housing Units and Employment for Block 7

Ref. #	Use	Occupancy Status	Parcel Size (SF)	Building Size (SF/Units)	Estimated Employment
Block 7					
1	Commercial – Newspaper	Occupied	14,857	9,839	28
2	Commercial – Retail and associated parking	Occupied	10,267	3,860	9
3	Commercial – Ground Floor Residence – Second Floor	Vacant Vacant	4,500	6,337 / 4[a]	0
4	Residence	Vacant	2,967	2,890 / 4[a]	0
5	Institutional – Lodgehall or clubhouse	Occupied	11,623	7,200	25
6	Commercial – Office	Occupied	16,607	25,777	64
7	Commercial – Office	Occupied	26,930	15,400	51
8	Commercial	Vacant	10,627	13,083	0
		TOTAL BLOCK 7	**98,378**	**83,936 / 8**	**177**

[a] Four units identified in Assessor's records were assumed by census enumerator to be unavailable for residence in 2000.

Source: Alameda County Assessor's Office; Hausrath Economic Group; and LSA Associates, 2003.

The remainder of the Project site is designated Central Business District (C-51) and Downtown Residential Open Space Combining Zone (S-17).

According to the Planning Code, the C-55 zone "is intended to preserve and enhance a very high-intensity regional center of employment, shopping, culture, and recreation, and is appropriate to the core of the central district. The C-51 zone "is intended to create, preserve, and enhance areas for medium-intensity development of offices and business service activities, and is typically appropriate to the service commercial areas immediately adjoining the core of the central district." Multi-family dwellings and general retail uses are permitted in both districts.

The provisions of the S-17 zone set open space standards for residential development. The provisions specify that 75 square feet of usable open space be developed for every standard residential unit. In addition, provisions for the S-17 zone define appropriate size, shape, openness, usability, accessibility, and enclosure of open space associated with residential projects.

d. Sustainable Development Initiative. The Oakland City Council adopted a Sustainable Community Development Initiative (Initiative) in 1998. The Initiative is a program that seeks to enhance the environmental sustainability of City operations and private development within the City. The major objectives of the Initiative include the following: economic development; employment training and continuing education; encouragement of in-fill housing, mixed use development, and sustainable ("green") building; making City operations and services a model of sustainable practices; and increasing community involvement. The Sustainable Development Initiative comprises voluntary guidelines intended to preserve environmental health and increase economic development, and private developers are not required to incorporate them into projects. The following activities listed as part of the Initiative relate to the proposed Project:

- In-fill housing
- Promote mixed use development

Block 8. *Block 8 consists of a surface parking lot (Table IV.A-5).*
Block 9. *Block 9 contains Giant Burger (a fast food restaurant) and an associated surface parking lot (Table IV.A-5).*

Source: Alameda County Assessor's Office; Hausrath Economic Group; and LSA Associates, 2003.

- Establish transit villages
- Improve quality of existing housing

e. Central District Urban Renewal Plan. The Central District Urban Renewal Plan, which was adopted on June 12, 1969 and supplemented for the twelfth time on July 24, 2001, is a comprehensive plan for the redevelopment of downtown Oakland. The overarching goal of the Plan is to "eliminate urban blight within the Project Area through implementation of the concepts described in the Plan." Developers within the Central District are required to abide by the provisions of the Urban Renewal Plan. The Project site is located within the Uptown Retail Center and Rehabilitation subarea of the Central District. Land uses envisioned for the subarea include a mix of retail and entertainment uses. The Urban Renewal Plan states: "Activities and facilities located within the (Uptown Retail Center and Rehabilitation subarea) should be sited and operated in a manner which supports the creation of a distinctive and vital hub of activity in a pedestrian-friendly environment which complements the unique flavor of the Uptown Area." The major objectives of the Central District Urban Renewal Plan include the following:

1. Re-establishment of residential areas for all economic levels within specific portions of the Project Area.
2. Improved environmental design within the Project Area, including creation of a definite sense of place, clear gateways, emphatic focal points and physical design which expresses and respects the special nature of each sub-area.
3. Utilization of key transit nodes to support transit-oriented development.
4. Revitalization and strengthening of the Oakland Central District's historical role as the major regional retail center for the Metropolitan Oakland Area.
5. Provision of adequate infrastructure such as public parking, sidewalks, and traffic control.
6. A strengthening of the Project Area's existing role as an important office center for administrative, financial, business service and governmental activities.
7. Establishment of the Project Area as an important cultural entertainment center.

Table IV.A-6: Applicable Land Use Policies

Land Use and Transportation Element (LUTE)
Policy I/C3.1: Locating Commercial Business. Commercial uses, which serve long term retail needs of regional consumers and which primarily offer durable goods, should be located in areas adjacent to the I-880 freeway or at locations visible or amenable to high volumes of vehicular traffic, and accessible by multiple modes of transportation.
Policy I/C3.3: Clustering Activity in "Nodes." Retail uses should be focused in "nodes" of activity, characterized by geographic clusters of concentrated commercial activity, along corridors that can be accessed through many modes of transportation.
Policy I/C3.4: Strengthening Vitality. The vitality of existing neighborhood mixed use and community commercial areas should be strengthened and preserved.
Policy I/C3.5: Promoting Culture, Recreation, and Entertainment. Cultural, recreational, and entertainment uses should be promoted within the Downtown, particularly in the vicinity of the Fox and Paramount Theaters, and within the Jack London Square area.
Policy I/C4.1: Protecting Existing Activities. Existing industrial, residential, and commercial activities and areas which are consistent with long term land use plans for the City should be protected from the intrusion of potentially incompatible land uses.
Policy T2.1: Encouraging Transit-Oriented Development. Transit-oriented development should be encouraged at existing or proposed transit nodes, defined by the convergence of two or more modes of public transit such as BART, bus, shuttle service, light rail or electric trolley, ferry, and inter-city or commuter rail.
Policy T2.2: Guiding Transit-Oriented Development. Transit-oriented development should be pedestrian-oriented, encourage night and day time use, provide the neighborhood with needed goods and services, contain a mix of land uses, and be designed to be compatible with the character of surrounding neighborhoods.
Policy T2.3: Promoting Neighborhood Services. Promote neighborhood-serving commercial development within one-quarter to one-half mile of established transit routes and nodes.
Policy T2.3: Linking Transportation and Activities. Link transportation facilities and infrastructure improvements to recreational uses, job centers, commercial nodes, and social services (i.e., hospitals, parks, or community centers).
Policy D5.1: Encouraging Twenty-Four Hour Activity. Activities and amenities that encourage pedestrian traffic during the work week, as well as evenings and weekends should be promoted.
Policy D6.1: Developing on vacant land or to replace surface parking lots should be encouraged throughout the downtown, where possible.
Policy D10.1: Encouraging Housing. Housing in the downtown should be encouraged as a vital component of a 24-hour community presence.
Policy D10.2: Locating Housing. Housing in the downtown should be encouraged in identifiable districts, within walking distance of the 12th Street, 19th Street, City Center, and Lake Merritt BART stations to encourage transit use, and in other locations where compatible with surrounding uses.
Policy D10.6: Creating Infill Housing. Infill housing that respects surrounding development and the streetscape should be encouraged in the downtown to strengthen or create distinct districts.
Policy D11.1: Promoting Mixed-Use Development. Mixed use developments should be encouraged in the downtown for such purposes as to promote its diverse character, provide for needed goods and services, support local art and culture, and give incentive to reuse existing vacant or underutilized structures.
Policy D11.2: Locating Mixed-Use Development. Mixed use development should be allowed in commercial areas, where the residential component is compatible with the desired commercial function of the area.
Policy N1.1: Concentrating Commercial Development. Commercial development in the neighborhoods should be concentrated in areas that are economically viable and provide opportunities for smaller-scale, neighborhood-oriented retail.
Policy N3.2: Encouraging Infill Development. In order to facilitate the construction of needed housing units, infill development that is consistent with the General Plan should take place throughout the City of Oakland.
Policy N5.2: Buffering Residential Areas. Residential areas should be buffered and reinforced from conflicting uses through the establishment of performance-based regulations, the removal of non-conforming uses, and other tools.

Table IV.A-6 (continued)

Land Use and Transportation Element (LUTE)
Policy N8.1: Developing Transit Villages. "Transit Village" areas should consist of attached multi-story development on properties near or adjacent to BART stations or other well-used or high volume transit facilities, such as light rail, train, ferry stations, or multiple-bus transfer locations. While residential units should be encouraged as part of any transit village, other uses may be included where they will not negatively affect the residential living environment.
Policy N8.2: Making Compatible Interfaces Between Densities. The height of development in urban residential and other higher density residential areas should step down as it nears lower density residential areas to minimize conflicts at the interface between the different types of development.
Open Space, Conservation and Recreation Element
Policy OS-4.1: Provision of Useable Open Space. Continue to require new multi-family development to provide useable outdoor open space for its residents.
Policy OS-4.4: Elimination of Blighted Vacant Lots. Discourage property owners from allowing vacant land to become a source of neighborhood blight, particularly in residential areas with large numbers of vacant lots.
Policy OS-11.1: Access to Downtown Open Space. Provide better access to attractive, sunlit open spaces for persons working or living in downtown Oakland. The development of rooftop gardens is encouraged, especially on parking garages.

Source: City of Oakland General Plan Land Use and Transportation Element and Open Space 1998, Conservation and Recreation Element 1996, 2003.

8. Provisions of employment and other economic benefits to disadvantaged persons living within or near the Project Area.
9. Restoration of historically significant structures within the Project Area.

4. Impacts and Mitigation Measures

This subsection analyzes impacts related to land use that could result from implementation of the proposed Project. The subsection begins with the criteria of significance, which establish the thresholds for determining whether an impact is significant. The latter part of this subsection presents the impacts associated with the proposed Project. Conflicts between a project and applicable policies do not constitute physical environmental impacts in and of themselves; as such, the proposed Project's consistency with applicable policies is discussed separately from the physical land use impacts associated with the proposed Project. However, questions of policy consistency are used to inform analysis of the physical environmental implications of a project. That is, a policy inconsistency is considered to be a significant adverse environmental impact only when it is related to a policy adopted for the purpose of avoiding or mitigating and environmental effect and it is anticipated that the inconsistency would result in a significant adverse *physical* impact. The proposed Project's consistency with regional policies related to physical environmental topics (e.g., air quality, transportation, and noise) are fully analyzed and discussed in those topical sections of this EIR.

a. Criteria of Significance. Implementation of the proposed Project would have a significant effect on land use if it would:

- Physically divide an established community;
- Result in a fundamental conflict between adjacent or nearby land uses; or
- Fundamentally conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including, but not limited to the general plan, specific plan, local

coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect and actually result in a physical change in the environment.

b. Land Use Impacts and Mitigation Measures of the Proposed Project. The following discussion describes land use impacts associated with implementation of the proposed Project.

(1) Less-than-Significant Land Use Impacts. Following is a summary of the less-than-significant land use impacts that would result from implementation of the proposed Project.

Community Integrity. The physical division of an established community typically refers to the construction of a physical feature (such as an interstate highway or railroad tracks) or removal of a means of access (such as a local road or bridge) that would impair mobility within an existing community, or between a community and outlying areas. For instance, the construction of an interstate highway through an existing community may constrain travel from one side of the community to another; similarly, such construction may also impair travel to areas outside of the community.

The Project site is currently characterized by extensive surface and multi-story parking lots, “super-blocks” unbroken by north/south streets, and vacant or underutilized commercial and residential buildings. The Project site contains a small residential population of approximately 20 persons living in single residence occupancy (SRO) housing. Commercial facilities, such as office uses, restaurants, and convenience stores are dispersed within or in the immediate vicinity of the Project site. Pedestrian access through the Project site is discouraged by the presence of large expanses of parking areas and vacant buildings, thus resulting in large areas of inactivity and no clear pedestrian access. The Project site acts as a barrier to pedestrian access from the southern (more pedestrian-oriented) portion of downtown to commercial and residential areas to the north and west of the Project site.

The proposed Project would result in the demolition of land uses currently within the Project site and the development of a mixed-use neighborhood with approximately 1,300 residential units and 1,050 student beds, approximately 43,000 square feet of commercial space, and a 25,000 square-foot park. An additional north/south street would also be developed within the Project site which would extend from 21st Street to 18th Street. In addition, existing streets throughout the Project site would be narrowed, and additional traffic-calming features would be developed, including tree wells, parking area tree islands, and special paving.

Although existing land uses within the Project site would be replaced with a mixture of uses, implementation of the proposed Project would not physically divide an established community. Development of the new north/south street would create shorter blocks and a more appealing pedestrian and bicycle environment. The introduction into the Project site of a substantial population (approximately 3,300 persons) and additional commercial uses would increase round-the-clock activity within the Project site and is anticipated to result in increased safety. Streetscape improvements and development of the park would also enhance the pedestrian environment and encourage the movement of people into and through the Project site. In addition, development of higher-density land uses within the Project site would create a seamless boundary between the Project site and surrounding higher-density neighborhoods, and would encourage the movement of people throughout the Uptown District. No physical barriers would be developed within the Project site that would impede access and no existing access would be permanently removed. Therefore, implementation of the proposed

Figure IV.A-6: General Plan land Use and Zoning Designations

8x11 color

back of Figure IV.A-6

Project would enhance the community integrity of Uptown and would not result in a significant impact.

Compatibility With Surrounding Land Uses. Land uses surrounding the Project site are generally more intense than land uses within the Project site. As described above, the preponderance of parking lots and vacant buildings within the Project site has resulted in a discontinuity between surrounding neighborhoods and the Project site. Although existing land uses within the Project site are not incompatible with surrounding land uses, existing land uses do not promote the active pedestrian environment that many retail uses in the Uptown District rely upon. In addition, perceptions that the Project site is vacant or underused (due to the presence of vacant lots and the lack of "eyes on the street") discourage people from visiting the Uptown District.

Implementation of the proposed Project would intensify uses within the Project site, which would increase the cohesiveness of the Uptown District as a whole. Residential, commercial, and open space uses that are proposed as part of the Project are more compatible with surrounding uses than existing land uses within the Project site, which are mainly automobile-oriented. The mixture of uses that is proposed as part of the Project would be compatible with the mixed use districts surrounding the Project site. The introduction of a large residential population into the Project site is also anticipated to increase the viability of the Fox and Paramount Theatres, and is expected to encourage the development of other entertainment-related venues in the Uptown District. The Uptown District, which is located in close proximity to two BART stations and AC Transit bus stops, in addition to major Downtown employment centers, is an appropriate location for high-density land uses. Concentrating traffic-generating uses near transit nodes minimizes vehicle travel through established neighborhoods with minor roadways. In addition, circulation improvements within the Project site would provide enhanced connectivity to destinations surrounding the Project site, including the Civic Center and City Hall.

Proposed land uses would not be adversely affected by surrounding land uses. Surrounding land uses, which comprise commercial, residential, and institutional uses, are not of a type that would result in a fundamental land use conflict with proposed residential and commercial uses. The intensification of uses within the site would benefit surrounding neighborhoods by increasing neighborhood activity and vibrancy; similarly, the proposed Project would be enhanced by the presence of an established mixed use neighborhood in close proximity to the Project site.

(2) Significant Land Use Impacts. Implementation of the proposed Project would not result in any significant land use related public policy impacts.

c. Policy Consistency. The following discussion describes the consistency of the proposed Project with the applicable land use policies described in the setting section. As noted above, policy inconsistencies are considered significant only when they are anticipated to result in significant physical environmental impacts.

(1) City of Oakland General Plan. The proposed Project is generally consistent with the CBD designation for the Project site, which permits high-rise residential, open space, and commercial uses. In addition, the proposed Project would encourage 24-hour activity within and around the Project site and promote nearby cultural and entertainment uses. The proposed Project, which would promote transit-oriented mixed-use development, strengthen the vitality of the Uptown District, develop infill housing, and develop vacant parking lots, is consistent with the policies of the LUTE.

A minor General Plan amendment (GPA) would be required for the portion of the Project site proposed for development of the park (park land is required to have an Open Space General Plan designation). The redesignation of land set aside for open space is a city requirement and would not represent a policy conflict. The proposed Project, which would provide usable open space to local residents and downtown employees, and would result in the development of vacant, blighted lots, is anticipated to be in compliance with the Open Space, Conservation and Recreation Element.

For a description of the proposed Project's consistency with the Historic Preservation Element, please refer to Section IV.I, Historic Architectural, Archaeological and Paleontological Resources.

(2) City of Oakland Planning Code. The proposed Project, which would result in the development of a mixed-use neighborhood, is consistent with the zoning designations for the Project site, which are intended to foster the development of a mixture of medium- and high-density land uses in the vicinity of Downtown Oakland. The proposed Project would also include the development of an approximately 25,000 square foot public park, landscaped streetscapes, and numerous informal open space areas (including courtyards). Therefore, it is anticipated that the proposed Project would be in compliance with the open space requirements of the Downtown Residential Open Space Combining Zone (S-17).

(3) Sustainable Development Initiative. The proposed Project, which comprises an infill, mixed-use, transit-oriented development, is consistent with the intent and many of the objectives of the Sustainable Development Initiative, which is a voluntary program.

(4) Central District Urban Renewal Plan. The proposed Project would redevelop a site characterized by parking areas and vacant lots with a mixture of commercial, residential, and open space uses. The proposed Project, which would increase pedestrian access within the Project site and re-establish residential areas within the Uptown District, and which utilizes an environmental design-oriented approach to redevelopment, is consistent with the major objectives of the Central District Urban Renewal Plan. Consistent with the Plan, the proposed Project would support "the creation of a distinctive and vital hub of activity in a pedestrian-friendly environment which complements the unique flavor of the Uptown Area."

B. POPULATION, EMPLOYMENT AND HOUSING

This section describes the local area's existing and projected population, employment and housing statistics and evaluates impacts the Forest City Uptown Project may have on the area's population, employment and/or housing. Mitigation measures are recommended as appropriate.

1. Setting

The following sections utilize data from the U.S. Census Bureau, the Association of Bay Area Governments (ABAG), the California Department of Finance (DOF), land use data available at the City of Oakland Community and Economic Development Agency, and land use and employment data provided by Hausrath Economic Group (HEG).[1]

a. Population. Oakland is a highly urbanized city on the San Francisco Bay, directly east of San Francisco. It was incorporated in 1852. The City has historically been a mix of a transit/shipping hub with the port, railroad, and airport; educational institutions such as Mills College and the California College of Arts and Crafts; and an independent point of destination with businesses, scenic amenities such as Lake Merritt, and entertainment such as the Grand Lake Theater. From approximately 1852 through 1940, the population of Oakland grew steadily through in-migration and incorporation of adjacent towns and lands. The population boomed during WWII when the Port of Oakland voluntarily turned over to the Armed Forces, and the Oakland Army Base and the Naval Supply Base were developed. From 1945 to 1980, Oakland experienced a decline in population due to changes in the local economy, migration to suburban communities and other factors. Between 1980 and 2000, Oakland experienced significant and sustained population growth as a result of increased job and housing opportunities.

(1) Total Population. The City of Oakland had a population of 399,484 persons in 2000 according to the U.S. Census. The City of Oakland estimates that the total population will reach 425,553 by 2010 (a 6.5 percent increase from 2000 to 2010) and 443,203 by 2025 (a 4.1 percent increase from 2010 to 2025). A summary of Oakland population estimates from several sources is provided in Table IV.B-1. Bold typeface indicates estimates used for the purposes of this EIR.

The Project is within the area defined as Downtown Oakland, which had a population of 14,680 persons in 2000 according to the U.S. Census. The City of Oakland estimates that the total population will reach 25,494 by 2010 (a 73.7 percent increase from 2000 to 2010) and 31,001 by 2025 (a 21.6 percent increase from 2010 to 2025). These numbers illustrate that population growth in Downtown Oakland is projected to occur at a faster rate than that for the City as a whole.

The Project site lies within an existing urban area and contains primarily surface parking, with commercial and residential uses along the site periphery. There are currently 34 single-room occupancy (SRO) units located at the Project site, 17 of which are occupied by a total of 20 individuals.[2]

---

[1] HEG has modeled existing, short-term (2010) and long term (2025) projections for the City of Oakland to more accurately reflect the level and location of growth, and has provided a more refined data set than what is available from ABAG or DOF. This process is discussed in greater detail in Appendix D.

(2) Households. The City of Oakland contained 150,790 households in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of households will reach 158,907 by 2010 (a 5.1 percent increase from 2000 to 2010) and 169,012 by 2025 (a 6.3 percent increase from 2010 to 2025). A summary of Oakland household estimates from several sources is provided in Table IV.B-2. Bold typeface indicates estimates used for the purposes of this EIR.

Downtown Oakland had 7,736 households in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of households will reach 11,826 by 2010 (a 52.9 percent increase from 2000 to 2010) and 15,102 by 2025 (a 27.7 percent increase from 2010 to 2025). As with population growth, households in Downtown Oakland are projected to grow at a faster rate than that for the City as a whole.

Based on a survey conducted by the City of Oakland, there are 34 housing units on the Project site and 17 households.[3]

b. Employment. The civilian labor force includes: 1) those who are employed (except in the armed forces); and 2) those who are unemployed but actively seeking employment. Those who have never held a job, who have stopped looking for work, or who have been unemployed for a long period are not considered to be in the labor force.

(1) Total Jobs. The City of Oakland had 185,162 total jobs in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of jobs will reach 215,049 by 2010 (a 16.1 percent increase from 2000 to 2010) and 247,497 by 2025 (a 15.1 percent increase from 2010 to 2025). A summary of Oakland job data from several sources is provided in Table IV.B-3. Bold typeface indicates estimates used for the purposes of this EIR.

Downtown Oakland had 65,155 jobs in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of jobs will reach 81,098 by 2010 (a 24.5 percent increase from 2000 to 2010) and 89,543 by 2025 (a 10.4 percent increase from 2010 to 2025).

---

[3] Ibid.

The Project site contains primarily surface parking, with commercial and residential uses along the site periphery. The commercial uses generally consist of office, restaurants, retail, and auto repair. Based on a survey conducted by the City of Oakland, the number of jobs estimated to exist on the Project site is 247.

Table IV.B-3: Jobs Data, City of Oakland

Source: LSA Associates, Inc. 2003.

(2) Employed Residents. The City of Oakland had 174,743 employed residents in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of employed residents will reach 194,038 by 2010 (an 11.0 percent increase from 2000 to 2010) and 225,677 by 2025 (a 16.3 percent increase from 2010 to 2025). A summary of Oakland employed residents data from several sources is provided in Table IV.B-4. Bold typeface indicates estimates used for the purposes of this EIR.

Table IV.B-4: Employed Residents Data, City of Oakland

Source	2000	2010	2025
US Census 2000	**174,743**[a]	--	--
ABAG *Projections 2002*	174,743	183,800[b]	217,600[b]
Oakland Cumulative Scenario 6/9/03[c]	174,743[c]	**194,038**	**225,677**
Downtown Oakland[d]	6,311	11,971	16,549

[a] Bold numbers indicate those used for purposes of this EIR.
[b] *Oakland Cumulative Growth Scenario for Uptown Project EIR*, prepared by HEG 6/9/03.
[c] From 2000 Census.
[d] Bounded by Grand Avenue, Lake Merritt and the Channel, Oakland Estuary, and I-980 and Brush Street.

Source: LSA Associates, Inc. 2003.

Downtown Oakland had 6,311 employed residents in 2000 according to the U.S. Census. The City of Oakland estimates that the total number of employed residents will reach 11,971 by 2010 (an 89.7 percent increase from 2000 to 2010) and 16,549 by 2025 (a 38.2 percent increase from 2010 to 2025).

c. Housing Stock. The housing stock in the City of Oakland is characterized by a majority of single-family homes, a smaller percentage of multi-unit buildings, and relatively low vacancy rates. There were 157,508 housing units in Oakland in 2000 according to the 2000 U.S. Census. Of these, about 45 percent were detached single-family homes, about 4 percent were attached single-family homes, and about 50 percent were units located in multi-unit buildings. Less than one percent of all housing units consisted of mobile homes. According to the 2000 U.S. Census, 41.4 percent of all occupied housing units in Oakland are owner-occupied. The remaining 58.6 percent are renter-occupied. In the City of Oakland, the effective vacancy rate[4] was two percent for owner-occupied housing and 3 percent for renter housing according to the 2000 U.S. Census.

There are 34 rental housing units on the Project site, located within two residential hotels (SRO units). The Assessor's records indicate that there are 11 additional units in the Project site. However, LSA Associates conducted a site visit on July 8, 2003, and found each of these additional units to be vacant. As a result, they were not counted as occupied residences for existing conditions at the Project site.

---

[4] The percent of dwelling units available for occupancy excluding homes that are boarded up, used only part of the year, or sold or rented and awaiting occupancy.

2. Impacts and Mitigation Measures

This section analyzes impacts related to population, employment, and housing that could result from implementation of the proposed Project. The section begins with the criteria of significance, which establish the thresholds to determine whether an impact is significant. The latter part of this section presents the impacts associated with the proposed Project and identifies mitigation measures, as appropriate.

a. Criteria of Significance. The proposed Project would have a significant impact on population, employment, and housing if it would:

- Induce substantial population growth in an area, either directly or indirectly;
- Displace a substantial number of existing housing units, necessitating the construction of replacement units elsewhere; or
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

b. Less-than-Significant Population, Employment and Housing Impacts. The following discussion examines potential less-than-significant impacts of the proposed Project.

(1) Induce Substantial Population Growth in an Area. The proposed Project would generate housing-related population growth and some job-related housing growth, as discussed below.

Housing-Related Growth. The proposed Project would add 1,270 housing units and 1,050 Student/Faculty housing units to Oakland's existing housing stock, increasing the population by approximately 3,266. Table IV.B-5 summarizes the types of units proposed and the associated number of residents.

This population growth would represent less than one percent of the City's current population, and is well within both the growth projected by the City's Cumulative Scenario and ABAG's projections for the City over the next five years. Therefore, the Project would not result in substantial direct population growth beyond that planned for the area. In addition, the Project constitutes infill development; the Project is the redevelopment of an underutilized site, and the site is surrounded by existing developments. The Project would not require substantial infrastructure modifications (e.g., construction of new roads, sewer lines) to serve the proposed new residential units or commercial uses and therefore would not result in indirect population growth.

Job-Related Growth. Job-related growth would result from the development of up to 33,000 square feet of new retail and commercial space. This development would generate approximately 182 jobs. Table IV.B-6 details the amount of space of each proposed use and the number of jobs it would generate. In addition, as discussed above, there are currently 247 jobs provided by existing uses on the site. It is anticipated that the existing jobs on the Project site would be relocated within the proposed commercial space wherever feasible, and other jobs would be located within the Project vicinity or the greater City of Oakland.

Table IV.B-5: Population and Employed Residents Estimates for Proposed Project

Type	Units	Households/ Occ'd Units[a]	Persons Per HH[b]	Estimated Population	Employed Residents (Percent)	Employed Residents Per HH	Estimated Employed Residents
APARTMENTS							
Market Rate Apartments	750	720	1.68	1,207	77	1.30	933
Affordable: Moderate Income (up to 120% AMI)	50	49	1.98	97	73	1.45	71
Affordable: Very Low Income (up to 50% AMI)	200	196	2.21	433	57	1.25	245
Total Apartments	*1,000*	*965*	*1.80*	*1,737*	*72*	*1.29*	*1,249*
CONDOMINIUMS							
Total Condominiums	*270*	*260*	*1.85*	*481*	*74*	*1.37*	*355*
STUDENT / FACULTY HOUSING							
Dorm Beds	1,000	1,000	1.00	1,000	33	0.33	333
Faculty Units	50	50	2.00	100	65	1.30	65
Total Student/Faculty Housing	*1,050*	*1,050*	--	*1,100*	--	--	*398*
TOTAL PROJECT	**2,320**	**2,275**	--	**3,318**	--	--	**2,002**

[a] Assumes long-term, average vacancy of approximately four percent for market rate housing and two percent for affordable housing consistent with citywide data. No vacancy is assumed for the UC student dormitory and faculty housing.

[b] Estimates by Hausrath Economics Group considering Census data, in-house data and information for new housing developments, and data and projections from Association of Bay Area Governments (ABAG) Projections 2002. Persons per household for affordable housing assume number of persons equals bedrooms plus one for very low income households, as applicable. Persons per household provided is an average of persons per household for studios, one bedroom units, two bedroom units, and three bedroom units.

Source: Hausrath Economics Group, June 5, 2003.

This job-related growth would represent less than one percent of the City's current jobs, and is well within both the growth projected by the City's Cumulative Scenario and ABAG's projections for the City over the next five years. Therefore, the Project would not result in substantial direct population growth beyond that planned for the area. In addition, the Project constitutes infill development; the Project is the redevelopment of an underutilized site, and the site is surrounded by existing developments. The Project would not require substantial infrastructure modifications (e.g., construction of new roads, sewer lines) to serve the proposed new residential units or commercial uses and therefore would not result in indirect population growth.

Table IV.B-6: Employment Estimates for Proposed Project

Block/ Bldg	Use	Space (SF)	Employ-ment
3, 4	Ground floor retail/commercial[a]	22,000	63
1, 2, 3, 4, 6	Residential apartments: management and maintenance[b]		26
5	Residential condominiums: management and maintenance		7
7	Ground floor retail/commercial[a]	11,000	31
7	Student housing: management and maintenance		30
9	Relocated Auto Center	10,000	25
TOTAL PROJECT		**43,000**	**182**

[a] Assumes a mix of eating and drinking and neighborhood retail and service uses, with an average employment density of 350 square feet per employee.

[b] Includes on-site employment in leasing office, resident-only gym/recreation center, parking garage, etc.

Source: Hausrath Economics Group, June 5, 2003.

(2) Displace a Substantial Number of Existing Housing Units. The proposed Project would require the demolition of 34 housing units. Based on the 2000 U.S. Census, this is less than one-tenth of a percent of the housing units or households in Oakland; 34 SRO units is not a substantial number of housing units in Oakland. In addition, the number of housing units constructed would be greater than the number of housing units required to be demolished. The Project includes the construction of up to 1,000 apartments, 270 condominiums, 1,000 dorm beds and 50 faculty housing units. Table IV.B-5 details the types of units proposed and the affordability of each unit. Two-hundred apartments would be rented at the very low income level, 50 would be rented at the moderate income level, and 750 would be rented at market rates. Student/faculty housing would provide 1,050 housing units. The 270 condominiums would be sold at market rate.

The 34 units to be demolished consist of SRO units in two residential hotels. The City of Oakland Planning Code Section 17.102.230 requires a Conditional Use Permit for the demolition of a facility containing units such as the 34 SRO units here. The Project applicant would apply for the Conditional Use Permit under the criteria that the existing buildings are substandard, and 200 very low income units would be developed as part of the proposed Project.

(3) Displace Substantial Numbers of People. The proposed Project would include the demolition of existing uses on the site, including two residential hotels. Approximately 20 residents may be displaced. However, it is possible that some of these residents would relocate into the Project after it is constructed as it will provide 1,270 permanent housing units. Included in the proposed residents are 60 very-low income studio apartments, similar to those units being demolished. The actual number of these residents who would have to be relocated as a result of the interim loss of these units has not been quantified. However, the number would not be substantial enough to constitute a significant impact. The Redevelopment Agency will provide relocation assistance consistent with the State's redevelopment regulations.

c. Significant Population, Employment and Housing Impacts. Implementation of the proposed Project would not result in any significant population, employment or housing impacts.

C. HYDROLOGY AND WATER QUALITY

This section describes the existing hydrological setting for the Project site, including runoff, drainage, and water quality based on information available from the City of Oakland, published and unpublished reports, hazard mapping, and on-line resources. Impacts that may result from Project development are identified and mitigation measures to reduce potential impacts are recommended where appropriate.

1. Setting

a. Climate. The climate of the Oakland area is characterized as dry-summer subtropical (often referred to as Mediterranean), with cool wet winters and relatively warmer dry summers. The mean annual rainfall in the vicinity of the Project site, for the period between 1970 and 2002, was approximately 23.3 inches.[1] Analysis of long-term precipitation records indicates that wetter and drier cycles lasting several years are common in the region. Severe, damaging rain storms occur about once every three years.[2]

b. Runoff and Drainage. There are no creeks or streams crossing the Project site, which is relatively flat and largely covered with impervious surfaces (buildings and pavement). Most of the rainfall at the site encounters the impervious surfaces and flows overland into the City-maintained storm drainage system. All the runoff from the Project site parcels eventually discharges to Lake Merritt. In general, at Parcels 1 through 7, storm water flows to the east on the surface (in street-side gutters) along 18th, 19th, William, and Thomas L. Berkley Way (20th) streets. At Telegraph Avenue, the runoff enters drainage inlets and is conveyed underground in a 30-inch pipe to the north. Flow in the 30-inch pipe enters a 45-inch pipe at 21st Street and is conveyed east toward Lake Merritt. Runoff from Parcel 8 also enters the underground pipe at Telegraph Avenue. Runoff from Parcel 9 enters a drainage inlet on 22nd Street and flows east toward Lake Merritt in a 54-inch concrete pipe.[3]

c. Flooding. The Project site is not located within the 100-year flood hazard zone, as mapped by the Federal Emergency Management Agency (FEMA),[4] and therefore, according to FEMA, the site is not susceptible to regional flood hazards. It is possible that blocked storm drains could cause localized flooding during intense storms. The City of Oakland maintains a storm drainage complaint database that documents all localized flooding problems that are reported to the Public Works Department.[5] A recent database printout (June 16, 2003) did not contain any reports of past or current localized flooding problems at or adjacent to the Project site.

[5] City of Oakland, 2003, Summary- Storm Drainage Complaints, 39 pages.

The site is not located within an identified dam failure inundation hazard area.[6] Flood water associated with a catastrophic dam failure at the upper and lower Piedmont reservoirs (located about 2.5 miles east of the Project site) would flow several blocks east of the site, not directly affecting the immediate Project site, according to available mapping.

d. Coastal Hazards. The location of the Project site (about one mile from Oakland's Inner Harbor) and the elevation of the site (approximately 10 to 20 feet NGVD) would protect the site from coastal hazards, such as tsunamis, extreme high tides, or sea level rise.

e. Water Quality. The quality of surface water and groundwater in the vicinity of the Project site is affected by past and current land uses at the site and within the watershed, as well as the composition of geologic materials in the vicinity.

The water quality in Lake Merritt has been affected by urbanization within the watershed and modifications to the tidal connection to the Bay. As described by the Lake Merritt Institute, a non-profit, non-governmental organization involved in maintenance and restoration of Lake Merritt:[7]

> *Tidal flows are an important influence on water quality in Lake Merritt. As has been documented in the past, and continues to be documented today, the Lake is dependent upon flushing from the Bay to minimize water quality problems. Restricted tidal flows to and from the Bay can create low oxygen levels, increased temperature extremes, abnormal salinity levels, and other problems.*

Water quality in surface water and groundwater bodies is regulated by the State and Regional Water Quality Control Boards. The Project site is under the jurisdiction of the San Francisco Bay Regional Water Quality Control Board (RWQCB), which is responsible for implementation of State and Federal water quality protection guidelines in the vicinity of the Project site. The RWQCB implements the Water Quality Control Plan (Basin Plan),[8] a master policy document for managing water quality issues in the region. The Basin Plan establishes beneficial water uses for waterways and water bodies within the region.

As noted above, no creeks or streams cross the site. However nearby Lake Merritt is the receiving surface water body for drainage from the site (drainage at the site enters the underground storm sewer which discharges at Lake Merritt). This outfall operates in compliance with a permit granted to Alameda County, pursuant to the National Pollutant Discharge Elimination System (NPDES) Nonpoint Source Program. The County permit requires that specified performance-based water quality standards are upheld by agencies (e.g., City of Oakland Department of Public Works) operating under the permit. The designated beneficial uses for Lake Merritt include contact and non-contact water recreation, fish spawning, and wildlife habitat. Lake Merritt is designated as "impaired" by the RWQCB for floating material and organic enrichment (low dissolved oxygen) under the Clean Water Act Section 303(d).[9] The impairment of Lake Merritt has been assigned a

[7] Lake Merritt Institute, 2003, website: http://www.lakemerrittinstitute.org/info_projects3.html.

[8] San Francisco Bay Regional Water Quality Control Board, 1995, *Water Quality Control Plan*, 21 June.

[9] State of California, Regional Water Quality Control Board, San Francisco Bay Region, 1998, Section 303(d), Clean Water Act, Impaired Water Body Lists.

"low priority" by the RWQCB on the 303(d) list. The RWQCB is scheduled to begin developing a water quality management plan for Lake Merritt in 2006, completing the plan by 2010.

Runoff water quality is regulated by the Federal National Pollution Discharge Elimination System (NPDES) Nonpoint Source Program (established through the Clean Water Act); the NPDES program objective is to control and reduce pollutants to water bodies from nonpoint discharges. The main nonpoint discharge regulated by the NPDES program is stormwater runoff.

The NPDES Program is administered by the California Regional Water Quality Control Boards. The Project site would be under the jurisdiction of the San Francisco Bay RWQCB and the Alameda Countywide Clean Water Program (ACCWP). The City of Oakland is a participant in the ACCWP. The ACCWP is a function of the County government that maintains compliance with the NPDES Storm Water Discharge Permit and promotes storm water pollution prevention within that context. County compliance with the NPDES Permit is mandated by State and federal laws, statutes, and regulations.

Participating agencies (including the City of Oakland) must comply with the provisions of the County permit by ensuring that new development and redevelopment mitigate, to the maximum extent practicable, water quality impacts to storm water runoff both during construction and operation periods of projects. Alameda County is implementing the current NPDES permit for storm water discharges under the *Alameda Countywide Clean Water Program, Stormwater Management Plan.*[10] Provisions in the plan require that participating agencies:

- Work with concerned citizens to increase community awareness, everyday pollution prevention and creek preservation.
- Work with local businesses to control pollution in storm drains and creeks.
- Monitor and assess pollution problems and health of local creeks and lakes.
- Design practices for city and county government operations that contribute less pollution.

In addition, in 1994 the RWQCB staff developed its *Staff Recommendations for New and Redevelopment Controls for Storm Water Programs.* The *Staff Recommendations* specify the required BMPs for various types and sizes of new development. The proposed Project would be required to comply with the *Staff Recommendations*.

Recent changes to the permit held by the ACCWP are detailed in RWQCB Order R2-2003-0021 (NPDES Permit No. CAS0029831). Revisions that potentially apply to the proposed Project include Provision C.3, which specifies that "Permittees shall require Group 1 Projects to implement appropriate source control and site design measures and to design and implement stormwater treatment measures, to reduce the discharge of stormwater pollutants to the maximum extent practicable. Implementation of this requirement shall begin February 15, 2005."[11] The proposed Project would be considered a "Group 1 Project."

---

[10] Alameda Countywide Clean Water Program, 2003. Stormwater Management Plan, February 19.

[11] Regional Water Quality Control Board, 2003, letter submitted to Ms. Patricia McGowan of the City of Oakland from Brian Wines, RWQCB, March 28.

If construction of the proposed Project is initiated prior to February 15, 2005, the Project would be required to comply with the 1997 *Stormwater Management Plan* (SMP). However, if construction were initiated after February 15, 2005, the Project would be required to comply with the more stringent requirements of the 2003 permit.[12] Under either scenario, the RWQCB encourages projects to incorporate stormwater controls and treatment measures into all projects to the maximum extent practicable.

2. Impacts and Mitigation Measures

This section outlines potential hydrology and water quality impacts and recommends mitigation measures. Less-than-significant impacts to hydrology and water quality are listed first, followed by significant impacts.

a. Significance Criteria. The Project would have a significant impact on the environment if it would:

- Violate any water quality standards or waste discharge requirements;
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level;
- Result in substantial erosion or siltation on- or off-site that would affect the quality of receiving waters;
- Result in flooding on- or off-site;
- Create or contribute runoff which would exceed the capacity of existing or planned stormwater drainage systems;
- Create or contribute runoff which would be an additional source of polluted runoff;
- Otherwise substantially degrade water quality;
- Place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;
- Expose people or structures to a substantial risk of loss, injury or death involving flooding;
- Expose people or structures to a substantial risk of inundation by seiche, tsunami, or mudflow; or
- Fundamentally conflict with elements of the City of Oakland Oakland Creek Protection ordinance intended to protect hydrologic resources. Although there are no specific numeric/quantitative criteria to assess impacts, factors to be considered in determining significance include whether there is substantial degradation of water quality through: (a) discharging a substantial amount of pollutants into a creek; (b) significantly modifying the natural flow of the water or capacity; (c) depositing substantial amounts of new material into a creek or causing substantial bank erosion or instability; or (d) substantially endangering public or private property or threatening public health or safety.

---

[12] Wines, Brian, 2003. Water Resources Control Engineer, San Francisco Bay Regional Water Quality Control Board, personal communication with Bruce Abelli-Amen, Baseline Environmental Consulting, June 10.

b. Less-than-Significant Hydrology and Water Quality Impacts. Development of the proposed Project would not contribute to depletion of groundwater supplies or reduce the amount or quality of water available for public water supplies. The amount of impervious surfaces would not be substantially altered, and implementation of the proposed Project would not result in flooding on- or off-site. It would not place structures within the 100-year flood hazard area, would not expose people or property to flooding associated with seiches or tsunamis, and would not endanger public or private property or threaten public health or safety as a result of flooding. The proposed Project does not propose development that would substantially alter a natural water course. There are no creeks crossing the site, or nearby, and therefore potential impacts to creeks are considered less than significant.

c. Significant Hydrology and Water Quality Impacts. Two potentially significant impacts are evaluated below. With implementation of each recommended mitigation measure, these impacts would be reduced to less-than-significant levels.

Impact HYD-1: Construction activities for the Project could result in degradation of water quality in Lake Merritt and the Bay by reducing the quality of storm water runoff. (S)

Construction and grading within the Project site would require temporary disturbance of surface soils and impervious cover. During the construction period, grading and excavation activities would result in exposure of soil to runoff, potentially causing erosion and entrainment of sediment in the runoff. Soil stockpiles and excavated parcels on the Project site would be exposed to runoff and, if not managed properly, the runoff could cause erosion and increased sedimentation in water courses at or away from the Project site. The accumulation of sediment could result in blockage of flows, potentially resulting in increased localized ponding or flooding.

The potential for chemical releases is present at most construction sites. Once released, substances such as fuels, oils, paints, and solvents could be transported to nearby surface waterways and/or groundwater in storm water runoff, wash water, and dust control water, potentially reducing the quality of the receiving waters.

> Mitigation Measure HYD-1**:** The applicant shall prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) designed to reduce potential impacts to surface water quality through the construction and life of the Project. The SWPPP would act as the overall program document to provide measures to mitigate significant water quality impacts associated with implementation of the Project. The SWPPP shall include specific and detailed Best Management Practices (BMPs) required to mitigate significant construction-related pollutants. These controls shall include practices to minimize the contact of construction materials, equipment, and maintenance supplies (e.g., fuels, lubricants, paints, solvents, adhesives) with storm water. The SWPPP shall specify properly designed centralized storage areas that keep these materials out of the rain.
>
> An important component of the storm water quality protection effort will be the education of the site supervisors and workers. To educate on-site personnel and maintain awareness of the importance of storm water quality protection, site supervisors shall conduct regular tailgate

meetings to discuss pollution prevention. The frequency of the meetings and required personnel attendance list shall be specified in the SWPPP.

The SWPPP shall specify a monitoring program to be implemented by the construction site supervisor, and must include both dry and wet weather inspections. City of Oakland personnel shall conduct regular inspections to ensure compliance with the SWPPP.

BMPs to reduce erosion of exposed soil may include, but are not limited to: soil stabilization controls, watering for dust control, perimeter silt fences, placement of hay bales, and sediment basins. The potential for erosion is generally increased when grading occurs during the rainy season, as disturbed soil can be exposed to rainfall and storm runoff. If grading must be conducted during the rainy season, the primary BMPs selected shall focus on erosion control, that is, keeping sediment on the site. End-of-pipe sediment control measures (e.g., basins and traps) shall be used only as secondary measures. Access to and egress from the construction site shall be carefully controlled to minimize off-site tracking of sediment (this BMP is particularly important since much of the earthwork will involve loading trucks for off-site transport of soil excavated for the below-ground parking structures). Vehicle and equipment wash down facilities shall be designed to be accessible and functional both during dry and wet conditions.

The SWPPP shall be reviewed for completeness by the City of Oakland, Public Works Agency, Environmental Services Division prior to approval of grading plans. (LTS)

Impact HYD-2: Post-construction operation of the Project could result in degradation of water quality in Lake Merritt due to a net decrease in the quality of storm water runoff. (S)

New construction and intensified land uses at the Project site would result in increased vehicle use in the vicinity of the Project site and potential discharge of associated pollutants. Leaks of fuel or lubricants, tire wear, and fallout from exhaust contribute petroleum hydrocarbons, heavy metals, and sediment to the pollutant load in runoff being transported to receiving waters. Runoff from the proposed common landscaped areas and the parks may contain residual pesticides and nutrients. Long-term degradation of water quality runoff from the site could impact water quality in Lake Merritt and the Bay. On the other hand, since the Project proposes all new parking facilities to be below ground level, storm water runoff from parking facilities would be eliminated, potentially resulting in an improvement in runoff quality from the site relative to existing conditions.

Mitigation Measure HYD-2: The applicant shall comply with the requirements of the 2003 Alameda County *Stormwater Management Plan* and/or the RWQCB Revised Order 01-024 (NPDES Permit No. CAS029718), as appropriate, based on the timing of construction. As applicable, the applicant shall incorporate measures to mitigate potential degradation of runoff water quality from all portions of the completed development, including roof and sidewalk runoff. The final design team for the Project should include all applicable measures from *Start at the Source,* Design Guidance Manual for Stormwater Quality Protection,[13] which may include, but not be limited to pervious pavements, hybrid parking lots, vegetated swales,

---

[13] Bay Area Stormwater Management Agencies Association, 1999, *Start at the Source,* Design Guidance Manual for Stormwater Quality Protection

biofilters, roof drainage to landscaped areas, minimization of directly connected impervious surfaces, and infiltration islands.

The Project compliance with requirements for post-construction stormwater controls shall be reviewed by the City of Oakland, Public Works Agency, Environmental Services Division prior to approval of grading plans. (LTS)

Impact HYD-3: Dewatering effluent may contain contaminants and if not properly managed could cause impacts to the environment. (S)

Dewatering operations may be required during the excavation for, and construction of, the below-ground parking area. There are two general classes of pollutants that may result from dewatering operations: sediment and chemical compounds (including toxics and petroleum hydrocarbons). High sediment content in dewatering discharges is common because of the nature of the operation in which soil and water mixes in the turbulent flow of high volume pump intakes. Chemical pollutants are most commonly found in dewatering effluent in areas with a history of groundwater contamination (e.g., leaks to the subsurface from industrial sites). Much of the Project site is located in an area of confirmed or potential historic chemical releases (refer to Chapter IV.G, Hazards and Hazardous Materials, for discussion of identified areas of potential subsurface contamination). Direct discharge of dewatering effluent to the storm drainage system could result in water quality impacts to Lake Merritt .

Mitigation Measure HYD-3: The SWPPP shall include requirements for the proper management of dewatering effluent as necessary to mitigate significant impacts to the environment. The Hazards section of this DEIR (Mitigation Measure HAZ-1b) addresses and mitigates potential impacts associated with health and safety impacts to site workers and the public associated with the dewatering effluent.

At minimum, all dewatering effluent will be contained prior to discharge to allow the sediment to settle out, and filtered, if necessary, to ensure that only clear water is discharged to the storm or sanitary sewer system. Alternatively, effluent can be hauled off-site by tanker truck for disposal. Based on the historical land uses at the Project site and groundwater sampling of the existing network of monitoring wells, it is possible that groundwater underlying each of the parcels has been impacted by chemical releases. All dewatering effluent will be analyzed by a State-certified laboratory for the suspected pollutants (at minimum, petroleum hydrocarbons, solvents, and metals) prior to discharge. Based on the results of the analytical testing and the concentrations of pollutants identified, if any, the applicant will dispose of the water in one (or more) of the following ways:

a) Discharge the water to the storm drain under permit from the RWQCB. It is unlikely that the RWQCB would allow discharge of any untreated dewatering effluent that contained detectable concentrations of chemical pollutants and that for these types of discharges, alternative disposal options may be required;
b) Discharge the water to the sanitary sewer system under permit from the East Bay Municipal Utilities District;
c) Haul the water to a licensed off-site disposal facility for treatment and disposal under appropriate manifest.

The Project proponent shall demonstrate to the City of Oakland, Planning and Development Department that appropriate permits have been acquired prior to discharge of any dewatering effluent. (LTS)

D. TRANSPORTATION, CIRCULATION AND PARKING

This section describes the existing traffic and circulation, parking and transit conditions on the Project site and its vicinity and provides an analysis of the Project's potential impacts. Figure IV.D-1 shows the location of the proposed Project and adjacent street system.

This analysis evaluates the traffic-related impacts of the proposed Project during both the weekday morning and evening peak hours. Traffic impacts are assessed at 40 critical intersections in the study area for the following six scenarios:

1. Existing Conditions;
2. Existing plus Project Conditions;
3. Year 2010 Background Conditions Without Project;
4. Year 2010 Background Conditions Plus Project;
5. Year 2025 Conditions Without Project; and
6. Year 2025 Conditions Plus Project.

The Project's potential effects on transit services, pedestrian, and bicycle facilities, and on- and off-street parking are also evaluated. Measures that would mitigate these impacts to a less-than-significant level are recommended.

1. Existing Conditions

The transportation-related context in which the Uptown Project would be constructed and would operate is described below, beginning with a description of the study area and the street network that serves the Project. Next, existing levels of transit service, bicycle and pedestrian facilities, and existing off- and on-street parking in the vicinity of the Project site are described. Intersection and roadway levels of service (LOS) are then defined and current conditions are summarized. The setting subsection then discusses a series of planned transportation improvements that have been assumed to be in place as part of the traffic analysis.

a. Study Area. The proposed Project site, illustrated in Figure IV.D-1, is located in downtown Oakland and consists of nine blocks. Blocks 1-6 are located in the area bounded by San Pablo Avenue, Telegraph Avenue, 18th Street and Thomas L. Berkley Way (20th Street). Block 7 is west of Telegraph Avenue between 20th and 21st Streets. Block 8 is on the southeast corner of the Telegraph Avenue and Thomas L. Berkley Way (20th Street) intersection and Block 9 is on the southwest corner of the Telegraph Avenue/22nd Street intersection.

The intersections listed in Table IV.D-1 and illustrated in Figure IV.D-2, were identified as intersections that could be significantly impacted by the proposed Project.

All of the study intersections are signalized, except the San Pablo Avenue/William Street and San Pablo Avenue/18th Street intersections which are stop controlled on William Street and 18th Street. The 38 signalized study intersections were selected in consultation with the City of Oakland. Locations were chosen based on the signalized intersections where the Project would add 50 or more peak hour trips and where the intersection potentially would operate at an unacceptable level of service.

Additionally, the two unsignalized intersections on San Pablo Avenue (intersections 7 and 9) adjacent to the Project were analyzed.

b. Street Network. The regional and local street networks that serve the Project site are described below.

(1) Regional Roadways. The Project area is primarily served by four regional roadways, as described below.

Interstate 580 (I-580) is a regional freeway located east of the Project site, extending between Interstate 80 in Emeryville and Interstate 280 in San Jose. Four lanes are generally provided in each direction on this freeway near the Project area. Trucks are prohibited on I-580 in the downtown Oakland area. Average daily traffic on I-580 between Grand/Van Buren and Oakland/Harrison was 141,000 vehicles in 2002.[1] I-580 extends from Route 5 southwest of Vernalis to I-80 in Oakland via Dublin and Hayward. It is located 18 blocks away from the Project site. The closest ramps from I-580 to the Project site are at the Harrison Street/Oakland Avenue interchange.

Interstate 880 (I-880) is a major north-south regional freeway located west of the Project site, extending between Interstate 80 in Emeryville and Interstate 280 in San Jose. Four lanes are

---

[1] Caltrans, Year 2002 Traffic Volumes on the State Highway System.

generally provided in each direction on this freeway near the Project area. The closest exit from I-880 to the Uptown Project is Broadway (both north and south bound), which is 12 blocks from the Project site. Another freeway access is located further south at Oak Street. Average daily traffic on I-880 north of Broadway was 229,000 vehicles in 2002.[2]

Interstate 980 (I-980) is the closest freeway to the Project site and extends from I-880 to I-580/ SR-24 in Oakland. I-980 has three lanes in each direction in the general vicinity of the Project area. Average daily traffic on I-980 between 18th Street and I-580 was 121,000 vehicles in 2002.[3] To reach the site, vehicles can exit I-980 at the 17th Street/18th Street interchange, which is only three blocks from the Project. Additional access from I-980 in the study area is provided at 27th/Grand and 12th/14th Street.

State Route 24 **(SR 24)** runs from Walnut Creek in the east to Oakland on the west and has four lanes in each direction near downtown Oakland. Average daily traffic on SR-24 northeast of the 580/980 Junction was 141,000 vehicles in 2002.[4]

(2) Local Roadways. A description of the local roadways that serve the Project area is provided below.

Broadway is a major arterial that runs in a north-south direction from Jack London Square in the south to State Route 24 (SR 24) to the north. In the vicinity of the Project, Broadway consists of two through lanes in each direction. There are traffic signals at most of the major intersections along Broadway, and separate left and right turn lanes at some key intersections.

Grand Avenue runs from I-80 on the west to beyond I-580 to the east. It generally has two lanes in each direction along with a bike lane.

San Pablo Avenue borders the west side of the Project site. It begins in downtown Oakland as a cul-de-sac surrounded by a pedestrian area and travels northwesterly through Emeryville, Berkeley, and beyond. San Pablo Avenue generally has two travel lanes in each direction.

Telegraph Avenue borders the east side of the Uptown Project. It is a major north-south arterial, beginning at its intersection with Broadway in downtown Oakland and continues north into Berkeley. Generally, there are two through lanes in each direction on Telegraph.

Martin Luther King Jr. Way extends from downtown Oakland to Berkeley and is located just to the west of the Uptown Project site. It has two travel lanes in the north and south directions.

Franklin Street is a one-way street from 6th Street in the south to Broadway north of the Project. Near the Project there are three northbound traffic lanes on Franklin Street. It is located one block east of Broadway. Franklin Street forms a one-way couplet with Webster Street. These two streets

---

[2] Ibid.

[3] Ibid.

[4] Ibid.

are designed to carry much of the north/south through traffic in the downtown Oakland area and traffic signals have been coordinated to improve traffic flow.

Webster Street is a one-way street with three southbound traffic lanes, and is located one block east of Franklin Street. It provides a direct connection to the City of Alameda via the Webster Tube. Traffic signals on both Franklin and Webster are coordinated to facilitate through traffic on these two key roadways.

Harrison Street has four lanes southbound and five lanes northbound between Thomas L. Berkley Way (20th Street) and Grand Avenue. There are three lanes each direction on Harrison between Grand Avenue and 27th Street, with two lanes each direction north of 27th Street and south of Thomas L. Berkley Way (20th Street). Harrison is connected to the Posey Tube and is one-way northbound south of 10th Street. Harrison Street forms a one-way couplet with Oakland Avenue north of 29th Street, with traffic traveling southbound on Harrison and northbound on Oakland.

William Street is a westbound one-way street currently and is entirely inside the Project site. There is parking along both sides of the street. Vehicles enter the street from Telegraph Avenue and exit to San Pablo Avenue. The Uptown Project proposes to convert William Street to two-way traffic to improve access to and from the Project.

14th Street is an arterial roadway located about four blocks south of the Project site. It has two lanes in both the east and west directions and serves as a major east-west route through downtown Oakland. I-980 can be accessed from 14th Street.

17th Street is a one-way roadway in the eastbound direction. It runs from West Street west of I-980 to Lake Merritt. It ranges from two to four lanes in width.

18th Street forms the southern boundary of the Uptown Project. It runs from Wood Street on the west to Telegraph Avenue on the east. 18th Street is a two-way road west of West Street and also between Telegraph Avenue and San Pablo Avenue. It is one-way eastbound between Martin Luther King Jr. Way and San Pablo Avenue and one-way westbound between West Street and Martin Luther King Jr. Way. The two-way portion near the Project has one lane in each direction.

19th Street is a westbound one-way street which passes through the Project site and forms a couplet with 17th Street. It has two traffic lanes in the westbound direction.

Thomas L. Berkley Way (20th Street) is located on the north side of the site and has two through lanes in each direction. Buses use Thomas L. Berkley Way (20th Street) frequently, with 12 buses per hour during most of the day. All of the buses which operate on San Pablo turn onto Thomas L. Berkley Way (20th Street) before entering downtown Oakland.

27thStreet a four-lane arterial that extends from Market Street to West Grand Avenue. At the northern end, it connects to the I-980 southbound off-ramp and I-980 northbound on-ramp.

c. Existing Transit Services. Existing transit service near the Project site includes bus service provided by the Alameda-Contra Costa Counties Transit District (AC Transit) and Greyhound. It also includes rail services from Bay Area Rapid Transit (BART) and Amtrak. Each of these services is described in the following sections. A visual summary of transit services provided in the area is presented in Figure IV.D-3.

(1) AC Transit. The Project site is served by several AC Transit bus lines running through major north-south corridors: San Pablo Avenue (Line 15, 72, 72M, 72R), Telegraph Avenue (Line 40, 40L, 43) and Broadway (Line 11, 12, 51). No bus lines running east-west go through the Project site. Line 12 is the closest east-west line and runs along Grand Avenue near Lake Merritt. Table IV.D-2 describes the bus route names and service schedules.

AC Transit bus lines connect the Project site to major employment centers such as downtown Berkeley and the Oakland city center. Many bus lines are focused on serving commuter traffic. For example, Line 72R runs along San Pablo with limited stops every 12 minutes. In addition, Line 40L and 51 connect the Project site to the UC Berkeley Campus.

Most of the buses run every 5 to 15 minutes during the peak and 20 to 30 minutes during non-peak periods. The current fare for local bus service in the east bay is $1.50 for adults, $0.75 for seniors, the disabled and people between 5 to 17 years of age, and free for children under five.

Information on maximum load points was obtained from various sources compiled by AC Transit Long Range Planning & Data Analysis Department.[5] Table IV.D-3 summarizes current bus service demand near the Project. The table also shows the loading demand/capacity percentages. Southbound lines 40/40L and 72, together with northbound 43 and 51, have the highest maximum loads at 151 to 248 percent of capacity. The bus lines with the lowest loads are northbound lines 11 and 15, with maximum loads of 35 percent and 73 percent, respectively.

The ridership data suggests that bus lines running along major arterials near the site have high maximum demand/capacity ratios and over-crowding may occur. However, new routes and service schedules were implemented in July 2003 to improve bus services. The establishment of the new 72R rapid bus, together with other modifications enhancing the services, has eased some crowding issues.

(2) BART. The Bay Area Rapid Transit (BART) is an automated rapid transit system serving the three BART counties of Alameda, Contra Costa, and San Francisco as well as northern San Mateo County. The 19th Street/Oakland Station is conveniently located near the Oakland Uptown Project. Three of the five existing BART lines travel through this station:

1. Richmond – Daly City;
2. Richmond – Fremont; and
3. Pittsburg/Bay Point – Millbrae.

---

[5] Howard Der, Associate Transportation Planner of AC Transit, compiled the data file from the following sources:

- Fall 1997-Winter 1998 Systemwide Boarding & Alighting Survey
- Summer 2002-Spring 2003 APC Data Collection Units
- April 2001 Line 72 Boarding & Alighting Survey

Figure IV.D-3: Existing Transit Network

8x11

Table IV.D-2: AC Transit Service Summary

Transit Line	Route Name	Service Frequency
11	Diamond District – Downtown Oakland – Piedmont	Weekdays: 20 minutes peak and 30 minutes off peak Weekends: 1 hour
12	MacArthur BART to Downtown Oakland	Weekdays: 20 minutes peak and 30 minutes off peak Weekends: 30 minutes
15	Montclair Transit Center – Downtown Oakland – El Cerrito BART (alternate trips to Berkeley BART only)	Weekdays: 15 minutes before 7:30 p.m. and 30 minutes afterwards Weekends: 20-30 minutes
40/40L	Berkeley – Oakland – Bay Fair BART	40L has limited service stops. Weekdays: 5-20 minutes depending on stops Weekends: 20-30 minutes
43	El Cerrito – Eastmont Transit Center	Weekdays: 5-20 minutes depending on stops Weekends: 20-30 minutes during weekends
51	Alameda – Oakland – Berkeley	Weekdays: 10 to 15 minutes peak and 20 minutes off peak. Weekends: 15 to 20 minutes Hourly overnight service from 12 a.m. to 5 a.m. throughout the week
72/72M	Hill Top Mall – Oakland (72) Richmond – Oakland (72M)	Weekdays and weekends: 15 to 18 minutes (frequency of 72 and 72M combined) Hourly overnight service from 12 a.m. to 5 a.m.
72R	Along San Pablo Avenue from Contra Costa College in San Pablo to Jack London Square	Weekdays only 12 minutes from 6 a.m. to 7 p.m.

Source: AC Transit, July 2003.

BART 19th Street Station Layout. BART 19th Street station is the closest BART station to the Project site. The station is located at 1900 Broadway and has six access points:

1. Thomas L. Berkley Way (20th Street) (north access);
2. Broadway/20th Street (north access);
3. Broadway/ between 19th & Thomas L. Berkley Way (20th Street) (central access);
4. Broadway/ 19th Street (central access);
5. Broadway/17th Street (south access); and
6. Telegraph Avenue (south access).

BART trains stop two and three levels below the street. Passengers access the concourse level via stairs or escalators from the street level. In the morning, the escalators operate in ‘up’ mode to accommodate the higher number of passengers exiting to the street level. An elevator is available at 1746-1750 Broadway. At the concourse level, each of the north, south, and primary access points has a station agent booth, fare gates, phones, and ticket, change and add-fare machines. The station layout and an inventory of these items are illustrated in Figure IV.D-4.

There are 14 fare gates at the station. Two of these gates were added at the station within the last year. During the morning peak period, four entry gates and 10 exiting gates are open; in the afternoon peak period, 10 entry gates and four exiting gates are open. According to BART, the customer service standard is to clear any passenger within 1 minute with one gate being out of service. Also, the standing queues should not be longer than 15 feet or back to the escalator.[6]

Site observations were conducted during the morning peak in July 2003 to confirm existing operating characteristics at the 19th Street Station. The busiest access point is the north access to Thomas L. Berkley Way (20th Street), which also has the most fare gates (five exiting gates and two entry gates in the morning). The majority of the passengers take the shorter path to access Thomas L. Berkley Way (20th Street) using the three exiting gates to the right of the agent booth, while the two exiting gates to the left of the agent booth are underused.

---

[6] Dean Leonard, BART Manager of Schedule and Services, telephone communication, January 5, 2001.

Figure IV.D-4: 19th Street BART Station Layout-Concourse Level

size?

Passenger queues of 2 to 5 people were observed but the queue was generally moving and dissipated within 20 seconds. The Broadway/19th Street access operates with three exiting gates and one entry gate and is also well used in the morning. The demand at the south accesses at Broadway/17th Street and Telegraph Avenue is relatively light. The two south accesses combine to operate with two exiting gates and one entry gate in the morning.

Short queues (2 to 3 people) at station machines were observed due to people having difficulties using the ticketing vending machines or machines malfunctioning.

BART Ridership. April and May 2003 weekday entry/exit data was obtained from the Alameda County Planning Department of BART. At the 19th Street Station there are approximately 7,700 riders entering and 7,550 riders exiting the station on an average weekday. The morning peak hour at the station occurs between 8:00 a.m. and 9:00 a.m. and the evening peak is 5:00 p.m. to 6:00 p.m., based on the total number of passengers entering and exiting the station hourly.

Table IV.D-4 presents the number of passengers entering and exiting the 19th Street BART station during the morning and evening peak hours. As shown in Table IV.D-4, most of the passengers are exiting the station in the morning peak hour and entering the station during the evening peak hour.

Table IV.D-4: Number of Passengers Using 19th Street Station

Movement	8:00 a.m. to 9:00 a.m.	5:00 p.m. to 6:00 p.m.
Entries	552	1,728
Exits	1,702	489
Total	2,254	2,217

Source: BART, April and May 2003.

In general, queues at the entry/exit gates are longest when trains arrive because passengers alight and leave the station at the same time. Passengers entering the station typically do not create long queues because of the more random arrival pattern. Therefore, the morning exiting data has been analyzed to identify congestion in the station. Richmond-Fremont trains have the most passengers leaving at the 19th Street station in the morning peak hour (8am to 9am), with an average of 102 and a maximum of 170 alighting passengers per train. Currently, there are 10 exit gates during the morning peak. Therefore, each gate needs to handle an average of 17 passengers. All passengers can pass through the exit gate in less than 1 minute, which is one of the BART service standards.

Daily passenger loads on different BART lines vary significantly at the 19th Street Station. On the higher end, about 17,980 passengers pass through the station on the southbound Pittsburg/Bay Point – Millbrae line. On the lower end, about 3,960 passengers pass through the station on the northbound Fremont-Richmond line. The southbound trains tend to have higher passenger loads than their northbound counterparts. The existing passenger load of each line passing through the 19th Street station is summarized in Table IV.D-5.

Table IV.D-5: Daily Passengers on BART Lines Through 19th Street Station

BART Lines	Number of Passengers Passing through the 19th Street Station
Richmond - Daly City	8,930
Daly City – Richmond	7,848
Richmond – Fremont	4,655
Fremont – Richmond	3,957
Pittsburg/Bay Point – Millbrae	17,973
Millbrae - Pittsburg/Bay Point	16,224
TOTAL	**59,587**

Source: BART, April and May 2003.

During peak hours, transbay BART lines exhibit significant directional flow characteristics. Most passengers are traveling towards San Francisco in the morning and away from San Francisco in the evening. The Richmond-Fremont line, however, has a more homogeneous passenger load across time and directions. Tables IV.D-6 and IV.D-7 present detailed information about average midweek (Tuesday, Wednesday and Thursday) peak hour passenger flows and load factors on the BART lines passing through the 19th Street BART station, based on data provided by BART.

(3) Other Public Transportation. At Jack London Square, Amtrak service is available and includes commuter service between San Jose and Sacramento. In addition, ferries to San Francisco are available at Jack London Square. A Greyhound Terminal is located at 2103 San Pablo Avenue.

d. Pedestrian and Bicycle Facilities. A Class I bike path provides a completely separate right-of-way for exclusive use of bicycles and pedestrians. A Class II bike lane provides exclusive usage for bicyclists with “BIKE LANE” marking and solid white striping on the roadway. Typically, striped bike lanes are 5 to 6 feet wide. A Class III bicycle route is established by placing Bike Route signs along the roadway and pavement markings are typically not installed.

Currently, the only bicycle facility located in proximity to the proposed Uptown Project is on Grand Avenue. The type of facility ranges from a Class II bike lane to a Class III bike route (signage only) along different stretches of this road.

Figure IV.D-5 illustrates the proposed bicycle facilities near the Uptown Project that are in the City of Oakland Bicycle Master Plan, adopted in July 1999. This plan recommends Class II bike routes along San Pablo Avenue, Martin Luther King Jr. Way southwest of San Pablo Avenue, Clay Street southwest of San Pablo Avenue, and Thomas L. Berkley Way (20th Street) northeast of San Pablo Avenue. Class II bike lanes are shown on Telegraph Avenue and portions of 16th and 17th Streets. The City of Oakland plans to reconfigure Telegraph Avenue between 16th Street and Thomas L. Berkley Way (20th Street) from two travel lanes in each direction with parking along each side of the street to a single travel lane each direction with a center left turn lane and a bike lane on each side. The on-street parking will be preserved. This Project is funded and currently in design development.

The existing and proposed bicycle facilities from the Alameda Countywide Bicycle program are presented in Figure IV.D-6. Telegraph Avenue is recommended as a proposed Class II bike route according to the Alameda Countywide Bicycle Program. Limited bicycle parking is available near the 19th Street BART station. Two “U”-type bicycle racks, with a total capacity of six bikes, are located at the entrance to the station from Thomas L. Berkley Way (20th Street). A single “U” rack with capacity for three bikes is present at the Broadway entrance between 19th Street and Thomas L. Berkley Way (20th Street). Bicycles are also often locked to the fences at the various entrances to the station.

e. Parking. A description of existing on- and off-street parking within the Project vicinity is provided below.

(1) Off-Street Parking. As illustrated in Figure IV.D-7, many off-street parking spaces are present in the Project area. On the block bounded by San Pablo Avenue, Telegraph Avenue, 18th Street, and 19th Street there are 152 surface spaces. One block to the north between 19th Street and William Street, there are 758 surface and structure parking spaces. Between William Street and Thomas L. Berkley Way (20th Street) there are 321 surface spaces. On the portion of the block west

Table IV.D-6: Peak Hour Passengers and Load Factors on BART Through 19th Street Station – Before Boarding and Alighting

BART Line	Time	Passengers Per Hour	Average Load (Passengers/ BART Car)	Average Load Factors* (Passengers/Seat)
Richmond – Daly City	8-9 a.m.	2,784	71.0	101%
	5-6 p.m.	950	24.3	35%
Daly City – Richmond	8-9 a.m.	944	24.2	35%
	5-6 p.m.	2,517	64.2	92%
Richmond – Fremont	8-9 a.m.	864	44.2	63%
	5-6 p.m.	813	34.8	50%
Fremont – Richmond	8-9 a.m.	1,011	40.2	57%
	5-6 p.m.	791	36.5	52%
Pittsburg/Bay Point – Millbrae	8-9 a.m.	5,264	72.9	104%
	5-6 p.m.	1,115	23.1	33%
Millbrae – Pittsburg/Bay Point	8-9 a.m.	833	20.4	29%
	5-6 p.m.	6,900	77.8	111%

* Assuming 70 seats per car, which is the average for the BART fleet.

Source: BART, April and May 2003.

Table IV.D-7: Peak Hour Passengers and Load Factors on BART Through 19th Street Station – After Boarding and Alighting

Bart Line	Time	Passengers Per Hour	Average Load (Passengers/ Bart Car)	Average Load Factors* (Passengers/Seat)
Richmond - Daly City	8-9 a.m.	2,813	71.7	102%
	5-6 p.m.	1,166	29.8	43%
Daly City – Richmond	8-9 a.m.	694	17.8	25%
	5-6 p.m.	2,544	64.8	93%
Richmond – Fremont	8-9 a.m.	680	34.8	50%
	5-6 p.m.	1,171	49.2	70%
Fremont – Richmond	8-9 a.m.	653	25.9	37%
	5-6 p.m.	902	41.7	60%
Pittsburg/Bay Point – Millbrae	8-9 a.m.	5,071	70.2	100%
	5-6 p.m.	1,353	28.0	40%
Millbrae - Pittsburg/Bay Point	8-9 a.m.	586	14.3	20%
	5-6 p.m.	7,063	79.7	114%

* Assuming 70 seats per car, which is the average for the BART fleet.

Source: BART, April and May 2003.

of Telegraph Avenue between 20th and 21st Streets that will be part of the Uptown Project, there are 11 surface spaces.

A parking survey was conducted on Tuesday June 10, 2003 between 7:00 a.m. and 9:00 a.m. at the City Park Parking Garage, bordered by Telegraph Avenue, San Pablo Avenue, William Street, and 19th Avenue. The survey questions requested information about trip origin, trip destination, trip purpose, and frequency of parking in downtown Oakland. Over 220 people participated in the survey.

Figure IV.D-5: Existing and Planned Bicycle Facilities (City of Oakland Recommended Bikeway Network)

8x11

Figure IV.D-6: Existing and Planned Bicycle Facilities (Alameda Countywide Bicycle Program)

8x11

Tables IV.D-8 through IV.D-11 summarize the results of parking survey. The largest percentage of the people parking at the City Park parking garage come from Oakland (36%) and work in downtown Oakland (97%). Over 60 percent of the people surveyed use the garage at least five days a week.

(1) On-Street Parking. An inventory of on-street parking in the block bounded by San Pablo Avenue, 18th Street, Telegraph Avenue and Thomas L. Berkley Way (20th Street) was conducted. Figure IV.D-7 illustrates the available on-street parking in the Project area by parking type and location and Table IV.D-12 presents a summary of total number of on-street parking spaces.

The majority of on-street parking spaces in the study area are either metered parking or free parking with a time limit. Other types of available on-street spaces include unrestricted, service loading (yellow zone), passenger loading (white zone) and handicapped accessible parking (blue zone). The 202 metered parking spaces include 50 two-hour spaces, 50 one-hour spaces and two 30-minutes spaces.

f. Existing Level of Service Analysis. Traffic conditions in the study area are assessed through the evaluation of peak hour Levels of Service (LOS) at critical intersections and freeway segments. The LOS concept qualitatively characterizes traffic conditions associated with varying levels of traffic based on a quantified volume-to-capacity ratio and a measurable estimate of delay based on the degree of congestion. An LOS determination is a measure of congestion, which is the principal measure of roadway service.

Table IV.D-8: City Park Parking Garage Trip Origins

Origin	Count	Percentage
Oakland	80	36.2%
Alameda County South	51	23.1%
Contra Costa County – North	35	15.8%

(1) Intersection Level of Service Analysis. The Levels of Service criteria for signalized and unsignalized intersections are presented in Table IV.D-13. These range from LOS A, which indicates a free-flow condition, to LOS F, which indicates a jammed condition.

Figure IV.D-7: Existing Parking Condition

8x11

Traffic conditions at study intersections are evaluated for the morning and evening peak hours using the methodology of the Transportation Research Board's *1997 Highway Capacity Manual* as required by the City of Oakland. This methodology assigns a level of service based on the total delay experienced by vehicles using the intersection.

Table IV.D-12: Existing On-Street Parking

Location	Metered	No Restrictions	Yellow Zone	White Zone	Blue Zone	Total
18th Street from San Pablo to Telegraph	27	4	7	2	0	40
19th Street from San Pablo to Telegraph	39	6	2	0	0	47

Table IV.D-13: Intersection Level of Service Definitions

Level of Service	Description	Total Delay (seconds/vehicle)	
		Signalized Intersections	Unsignalized Intersections
A	Little or no delay	≤ 10.0	≤ 10.0
B	Short traffic delay	> 10.0 and ≤ 20.0	> 10.0 and ≤ 15.0
C	Average traffic delay	>20.0 and ≤ 35.0	> 15.0 and ≤ 25.0
D	Long traffic delay	> 35.0 and ≤ 55.0	> 25.0 and ≤ 35.0
E	Very long traffic delay	> 55.0 and ≤ 80.0	> 35.0 and ≤ 50.0
F	Extreme traffic delay	> 80.0	> 50.0

Source: Highway Capacity Manual, Special Report 209, Transportation Research Board, 1997.

Figures 1a and 1b, including in Appendix E, illustrate the existing lane geometry and traffic control at the study intersections. Of the 40 study intersections, 38 are signalized. Existing AM and PM peak hour traffic volumes are presented in Figures 2a and 2b (in Appendix E). Weekday traffic counts were collected in 2000 from a number of different studies, and additional counts collected specifically for this study were completed in July 2003. Using 2- to 3-year-old traffic volumes from will likely yield an overestimate of existing volume because traffic volumes were actually higher during the period prior to the current economic recession. All of the traffic counts are also included in Appendix E.

As shown in Table IV.D-14, currently one study intersection (I-880 Frontage Road and West Grand Avenue) operates at LOS E during the PM peak hour and two other study intersections operate at

Table IV.D-14: Existing Conditions - Intersection Level of Service Summary

Note:
1. Intersections 7 and 9 (San Pablo Avenue/William Street and San Pablo Avenue/18th Street) are stop controlled and traffic signals exist at the remaining 38 study intersections.
2. Intersections that currently or are projected to operate at a LOS E or F are shaded.
3. Intersections located inside the City's downtown planning area are noted as "In" in the location column, and intersections located outside the downtown area are noted as "Out".

Source: Korve Engineering, 2003.

LOS D. All other study intersections currently operate at LOS C or better during both the AM and PM peak hours.

(2) Freeway Level of Service Analysis. Tables IV.D-15 and IV.D-16 present the criteria for the freeway level of service based on density and volume-to-capacity ratio, respectively. The two freeway analysis methodologies are used in this report because the City of Oakland uses the volume-to-capacity ratio methodology and Caltrans uses the density methodology to evaluate traffic conditions on the freeway system. The volume-to-capacity ratio methodolgy required by the City of Oakland is the criteria used to determine if the Project has a significant traffic impact.

Table IV.D-15: Freeway Level of Service Definitions Based on Density

LOS	Density Range (Passenger Cars/Km/Lane)
A	0 – 7
B	> 7-11
C	> 11-16
D	> 16 – 22
E	>22 – 28
F	> 28

Source: Page 23-3, Highway Capacity Manual 2000 (Metric).

Table IV.D-17 summarizes the existing level of service (LOS) on key freeway segments near the Project, based on both the density and volume-to-capacity ratio methodologies. As indicated in the Table IV.D-17, a slightly different LOS is calculated based on the two different analysis methodologies. I-580 currently operates at LOS F in the westbound direction during the morning peak hour and at LOS F in the eastbound direction during the evening peak hour near Grand Avenue based on both analysis methodologies. Based on the density criteria, the other freeway segments operate at LOS D or better during the peak hours. However, based on the volume-to-capacity criteria, some of the freeway segments along I-880 and I-580 currently operate at LOS E.

Table IV.D-16: Freeway Level of Service Definitions Based on V/C Ratio

LOS	Volume-to-Capacity Ratio*
A	0 – 0.33
B	> 0.33 – 0.51
C	>0.51 – 0.74
D	> 0.74 – 0.91
E	> 0.91 – 1.00
F	> 1.00

* Free-flow speed is assumed to be 100 km/hr (~ 70 mile/hr).

g. Planned Transportation Improvements. The City of Oakland is considering the reconfiguration of Telegraph Avenue between 16th Street and Thomas L. Berkley Way (20th Street). Currently, Telegraph has two travel lanes in each direction with curbside parking. The plan under construction would create a road with one travel lane in each direction, a center left turn lane, and bike lanes on each side. On-street parking would be preserved. North of Thomas L. Berkley Way (20th Street), Telegraph Avenue would not be modified from its current configuration. AC Transit is considering a number of plans to modify Thomas L. Berkley Way (20th Street) between Broadway and Telegraph Avenue to improve transit operations. These plans will improve transit operations in this stretch of Thomas L. Berkley Way (20th Street) without substantially reducing its vehicular carrying capacity

2. Analysis Approach

a. Overview. Traffic impacts are assessed at 40 critical intersections in the study area for the following six scenarios:

1. Existing Conditions;
2. Existing plus Project Conditions;
3. Year 2010 Background Conditions Without Project;
4. Year 2010 Background Conditions Plus Project;

Table IV.D-17: Existing Freeway Level of Service

Note: 1. Roadway capacities assumed to be 2,000 vehicles per hour per lane for freeways.
2. The shaded cells indicate an intersection that operates at an unacceptable level.
3. Caltrans requires the use of the “density” calculation while the City of Oakland requires the “volume-to-capacity ratio” methodology. Project impacts are assessed based on the “volume-to-capacity” ratio methodology.

Source: Caltrans, 2002; Korve Engineering, 2003.

5. Year 2025 Conditions without Project; and
6. Year 2025 Conditions plus Project.

Intersection traffic volumes for Year 2010 Background are derived through the use of the Alameda County Congestion Management Agency's (ACCMA) Countywide Transportation Demand Model, with land uses within Oakland modified by the Hausrath Economic Group to reflect the City's updated growth scenario for 2010. To generate the "Year 2010 Background plus Project" scenario, traffic associated with the proposed Project is added to 2010 Background volumes. Intersection traffic volumes for Year 2025 conditions are derived using ACCMA's Countywide Transportation Demand model with land uses reflecting the City's updated growth scenario for 2025. To generate Scenario 5, traffic associated with the proposed Project is added to the 2025 baseline traffic volumes.

b. Project Description.

(1) Proposed Land Use. The proposed Uptown Project will consist of 1,000 apartments, 270 condominium units, 600 student housing apartment units, 50 faculty units, and 33,000 s.f. of retail space. The student units will be marketed particularly to UC-Berkeley students, who will be able to travel to and from campus conveniently using BART. The majority of the Project would be located in an area defined by San Pablo Avenue to the west, Thomas L. Berkley Way (20th Street) to the north, Telegraph Avenue to the east, and 18th Street to the south. The eastern half of the block between Thomas L. Berkley Way (20th Street) and 21st Street and San Pablo and Telegraph Avenues is part of the Project, as are parts of two blocks to the northeast as shown in Figure IV.D-1. The historic Fox Theatre on the corner of 18th Street and Telegraph Avenue is not part of the redevelopment proposal.

A new north-south road is planned approximately in the middle of the Project. The new road will be 34 feet wide with parking on each side and a single 10-foot travel lane in each direction. An 8-foot sidewalk is planned on each side of the street. At intersections the curb will extend out to the edge of the parking to minimize the distance for pedestrians to cross the street. The new road will be immediately west of the Fox Theatre between 18th Street and 19th Street. North of 19th Street the road will shift west approximately 150 feet and extend north through the Project to 21st Street.

On San Pablo Avenue adjacent to the Project, one of the northbound traffic lanes will be replaced with 47 angled parking spaces. No change in the southbound traffic lanes is proposed. Sidewalks in the Project area are designed to encourage pedestrian activity, with 8-foot sidewalks on William Street and 10-foot sidewalks on 18th, 19th and Thomas L. Berkley Way (20th Street).

(2) Mode Split. The modal split for trips generated by the proposed Project was developed based on information from the ACCMA model. Approximately 83 percent of all trips would be vehicular trips. BART and AC Transit are expected to serve 62 and 38 percent of the transit trips, respectively. The modal split predicted by the ACCMA model is likely conservative relative to the number of vehicle trips to be generated by the Project. Due to the location and type of Project proposed, it is likely that a higher split to transit will occur; however, the conservative prediction of the model is used in the analysis.

(3) Trip Generation. The number of vehicle trips that would be generated by the proposed Project was estimated through a trip generation analysis. Trip generation rates and inbound/outbound splits for the land uses under consideration were taken from the Institute of Transportation Engineer's, *Trip Generation Manual, Sixth Edition*. Table IV.D-18 presents the results of the Project's trip generation analysis. Based on the mode split developed for this Project, the manual's trip generation rates were discounted to account for transit trips. The Project trip generation takes into account that vehicle trips are approximately 83 percent of all the trips generated by the proposed Project.[8] In addition, 15 percent of the Project-related retail trips are estimated to be linked trips.

The proposed Project is forecast to result in a daily increase of approximately 11,360 daily vehicle trips. In the morning peak hour, it is forecast to generate approximately 808 vehicle trips (144 inbound and 664 outbound). In the evening peak hour, the Project will generate 1,052 vehicle trips (685 inbound and 367 outbound).

(4) Trip Distribution. Vehicle trips forecast to be generated by the proposed Uptown Project were assigned to the surrounding transportation network based on a distribution pattern developed specifically for this study. The pattern is based on information from the ACCMA Model. Figure IV.D-8 illustrates the Project's anticipated trip distribution pattern.

Approximately 22 percent of Project traffic is forecast to arrive from and depart via I-880, with 10 percent oriented north of the Project and 12 percent to and from I-880 south. Approximately 14 percent of Project traffic is expected to arrive from and depart to the northwest via Grand Avenue. Thirteen percent of Project traffic is forecast to arrive and depart to the southeast via I-580. As shown in Figures 4a and 4b in Appendix E, the remainder of the Project traffic is expected to be fairly evenly distributed on the other streets near the Project.

(5) Site Access. Access to the planned parking garages for the Uptown Project are illustrated in Figure IV.D-9. As shown in Figure IV.D-9, access to Parcels 1 and 2 will be provided from William Street, access to Parcel 3 will be from Thomas L. Berkley Way (20th Street) and William Street, access to Parcel 4 will be from William Street and 19th Street, and access to Parcels 5 and 6 will be from the new internal north/south roadway between 18th Street and 19th Street. The access to the parking garage for Parcel 7 will be on 21st Street.

3. Environmental Analysis

This section of the EIR contains three key subsections:

- A discussion of **significance criteria** used to determine whether the Project's effects would be considered significant.
- A discussion of the Project's **impacts and mitigation measures**.
- The **Alameda County's Congestion Management Agency's Land Use Analysis.**

a. Significance Criteria. The City of Oakland's criteria were used to determine if the Project would result in a significant traffic impact. A project would normally have a significant effect on the environment if it would cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., results in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections), or change the condition of an existing street (i.e., street closures, changing direction of travel) in a manner that

---

[8] 83 percent = conservative assumption.

BART Trips		(17)	(88)	(105)	(86)	(42)	(128)	(685)	(685)	(1,370)
AC Bus Trips		(12)	(64)	(76)	(62)	(31)	(93)	(496)	(496)	(992)
Linked Trips[c]		(3)	(2)	(5)	(9)	(10)	(19)	(106)	(106)	(212)
Total Vehicle Trips		**144**	**664**	**808**	**685**	**367**	**1,052**	**5,682**	**5,682**	**11,364**

[a] The ITE “Apartment” land use category 220 was used to complete the trip generation forecast for the “student and faculty housing” use.

[b] Transit trips are estimated to be 16 percent of all non-student residential trips generated by the proposed Project and 25 percent of the student trips. BART and AC transit are estimated to serve 62 and 38 percent of Project transit trips, respectively, based on the ACCMA’s model.

[c] 15 percent of the retail trips are assumed to be internal linked trips.

Source: ITE, *Trip Generation,* 6th Edition, 1997; Korve Engineering, 2003.

would substantially affect access or traffic load and capacity of the street system. Adverse affects to the surrounding transit system were also taken into account. Overloading of the BART or AC Transit system routes would be considered a significant impact.

The specific criteria utilized for this analysis are listed below:

- At a signalized intersection located outside of the downtown area, the Project would cause the existing or future baseline level of service (LOS) to degrade to worse than LOS D.
- At a signalized intersection located within the downtown area, the Project would cause the existing or future baseline level of service (LOS) to degrade to worse than LOS E.
- At a signalized intersection located outside of the downtown area where the existing or future baseline level of service is LOS E, the Project would cause the total intersection average vehicle delay to increase by four or more seconds, or degrade to worse than LOS E (i.e., F).
- At a signalized intersection (in any area), where the existing or future baseline level of service is LOS E, the Project would cause an increase in the average delay for any of the critical movements of six seconds or more, or degrade to worse than LOS E (i.e., F).
- At a signalized intersection (in any area), where the existing or future baseline level of service is LOS F, the Project would cause: (a) the total intersection average vehicle delay to increase by two or more seconds, (b) an increase in average delay for any of the critical movements of four seconds or more, or (c) increase the volume-to-capacity (V/C) ratio by 3 percent (but only if the delay values cannot be measured accurately).

- Cause a roadway segment on the Metropolitan Transportation System to operate at LOS F or increase the V/C ratio by more than 3 percent for a roadway segment that would operate at LOS F without the Project.
- Substantially increase traffic hazards to motor vehicles, bicycles, or pedestrians due to a design feature (e.g., sharp curves or dangerous intersections) that does not comply with Caltrans design standards or incompatible uses (e.g., farm equipment).
- Generate added transit ridership that would increase the average ridership on AC Transit by 3 percent at bus stops where the average load factor with the Project in place would exceed 125 percent over a peak 30-minute period.
- Generate added transit ridership that would increase the peak hour average ridership on BART by 3 percent where the passenger volume would exceed the standing capacity of BART trains.
- Generate added transit ridership that would increase the peak hour average ridership at a BART station by 3 percent where average waiting time at fare gates would exceed 1 minute.

b. Traffic Operations with Project Analysis.

(1) Existing plus Project Traffic Operations. Figures 3a and 3b in Appendix E illustrate the Existing plus Project traffic volumes. Figures 4a and 4b in Appendix E present the AM and PM peak hour Project traffic volumes at the 40 study intersections. The Project traffic volumes were developed by assigning the peak hour Project traffic presented in Table IV.D-19 to the study intersections based on the Project traffic distribution pattern illustrated in Figure IV.D-8. The Existing plus Project Conditions assume the proposed roadway configuration changes on Telegraph Avenue, San Pablo Avenue and Williams Street.

Existing plus Project Intersection Level of Service Analysis. Vehicle trips forecast to be generated by the proposed Uptown Project were assigned to the surrounding transportation network based on a distribution pattern developed specifically for this study. As shown in Table IV.D-19, the Broadway/West Grand Avenue intersection would operates at LOS D during the PM peak hour and LOS C during the AM peak hour with and without traffic associated with the Project. The other study intersections all currently operate at LOS C or better during both the AM and PM peak hours with or without traffic associated with the Project.

Existing plus Project Conditions Freeway Level of Service Analysis. The level of service on the freeway system has been evaluated based on the volume-to-capacity ratio methodology utilized by the City of Oakland and the density methodology utilized by Caltrans. The volume-to-capacity ratio methodology used by the City of Oakland is the criteria used to determine if the Project results in a significant traffic impact. Table IV.D-20 summarizes the peak hour freeway level of service analysis in Existing Conditions with and without the proposed Project based on the density methodology. Table IV.D-20 also presents the percentage of Project traffic on each freeway segment that was evaluated. The percentage of Project traffic on the studied freeway segments ranges from 0.00 to 2.52 percent. The addition of Project traffic does not change the service level on any of the freeway segments. Table IV.D-21 presents the existing freeway analysis based on the volume-to-capacity ratio analysis methodology. The addition of Project traffic does not change the LOS on any freeway segment.

Table IV.D-19: Existing plus Project Intersection Level of Service Summary

Source: Korve Engineering, 2003.

Existing plus Project Conditions Impacts and Mitigation Measures. The Uptown Project was not found to significantly impact the freeway system in the Existing plus Project condition. The additional trips generated by proposed Project will increase delays at the study intersections during the peak periods. However, based on the significance criteria described in this report and the existing plus Project traffic analysis, the Uptown Project would not result in significant adverse impacts to any intersections under the Existing plus Project scenario.

(2) Year 2010 Traffic Operations. Based on the Alameda County Congestion Management Agency's (ACCMA) Countywide Transportation Demand Model's forecasts, increases in traffic levels at each study intersection were estimated. Figures 5a and 5b in Appendix E illustrate the Year 2010 Baseline traffic volumes without the proposed Project. The Year 2010 Baseline traffic volumes were developed based on growth factors developed from the ACCMA model data and reflect the increase in traffic from all planned development that would impact the study area. Figures 6a and 6b in Appendix E present the AM and PM peak hour Project traffic volumes at the 40 study intersections. The Project traffic volumes were developed by assigning the peak hour Project traffic presented in Table IV.D-18 to the study intersections based on the Project traffic distribution pattern illustrated in Figure IV.D-8. Figures 6a and 6b in Appendix E illustrate the Year 2010 Baseline plus Project traffic volumes.

Intersection Level of Service Analysis. As illustrated in Table IV.D-22, the anticipated growth in traffic to the Year 2010 without the proposed Uptown Project is expected to result in the Frontage Road/West Grand Avenue intersection operating at LOS F and the Lake Park Avenue/Lake Shore Avenue intersection operating at LOS E. The other 38 study intersections are expected to operate at LOS D or better during both the morning and evening peak hours.

The addition of the Uptown Project traffic to the "Year 2010 Baseline" results in two study intersections operating at LOS E and three intersections operating at LOS F, based on existing signal timing. However, optimizing the signal timing improves all the study intersections to a satisfactory condition (LOS D or better), except the Frontage Road/Grand Avenue intersection which is forecast to operate at LOS F during the evening peak hour in 2010 with or without the Uptown Project. Level of Service calculation worksheets for each of the traffic analysis scenarios are attached in Appendix B.

Freeway Level of Service Analysis. The level of service on the freeway system has been evaluated based on the volume-to-capacity ratio methodology utilized by the City of Oakland and the density methodology utilized by Caltrans. Table IV.D-23 summarizes the peak hour freeway level of service analysis in 2010 with and without the proposed Project based on the density methodology. Table IV.D-23 also presents the percentage of Project traffic on each freeway segment that was evaluated. The percentage of Project traffic on the studied freeway segments in 2010 ranges from 0.00 to 2.46 percent. The few segments on I-880 and I-980 where the Project will add more than 1 percent to the background 2010 volume all operate at an acceptable level of service. Therefore, the proposed Project does not significantly impact the freeway system. Table IV.D-24 presents the 2010 freeway analysis based on the volume-to-capacity analysis methodology.

As shown in Table IV.D-24, the addition of Project traffic theoretically changes the LOS on I-880 near Oak Street from LOS E to F. At this location the volume-to-capacity ratio is 1.00 both with and without the Project traffic, but with the addition of Project traffic it slightly exceeds 1.00 (the calculated v/c ratio is 1.00018). The Project only increases the traffic by 0.36 percent at this location

Table IV.D-22: 2010 Intersection Level of Service Summary

as shown in Table IV.D-24 and therefore the Project is not expected to significantly impact the freeway operations. No other changes in level of service on the studied freeway segments are anticipated with the addition of Uptown Project traffic.

Year 2010 Impacts and Mitigation Measures. The Uptown Project will not significantly impact the freeway system. The additional trips generated by proposed Project will deteriorate service levels at some of the study intersections during the peak periods. Based on the significant traffic impact criteria described in this report and the 2010 traffic analysis, the Uptown Project will have a significant impact at three study intersections. Table IV.D-25 summarizes the delay and level of service at

Table IV.D-25: 2010 Intersection LOS Summary With Mitigation

	Intersection	Peak Hour	Intersection LOS (Average Vehicle Delay in seconds)					
			Existing Timing		**Optimized Timing**		**With Intersection Improvements**	
			No Project	**With Project**	**No Project**	**With Project**	**No Project**	**With Project**
6	San Pablo Avenue/Thomas L. Berkley Way (20th Street) *	AM	B (18.0)	C (21.9)	NR	NR	NR	NR
		PM	C (26.5)	F (85.4)	C (21.5)	D (42.8)	NR	NR
14	Telegraph Avenue/19th Street *	AM	D (52.9)	F (114.9)	B (14.1)	C (22.3)	NR	NR
		PM	D (43.5)	F (81.5)	B (19.7)	C (36.2)	NR	NR
23	Frontage Road/West Grand Ave	AM	C (33.0)	C (33.9)	NR	NR	C (27.2)	C (27.5)
		PM	F (103.4)	F (106.4)	F (101.4)	F (104.0)	D (38.2)	D (38.4)

Note: 1. NR = Not Required.
2 Intersections that currently or are projected to operate at a LOS E or F are shaded.
3 Study intersections that are located within the City of Oakland's downtown area are noted with an asterisk (*) after the intersection name.

Source: Korve Engineering, 2003.

the three impacted intersections based on existing traffic signal timing, optimized traffic signal timing, and intersection improvements, if required.

Each of the intersections impacted by the Project is described below, along with the recommend mitigation measures.

San Pablo Avenue/Thomas L. Berkley Way (20th Street)

Impact TRANS-1: The addition of Project traffic to the Year 2010 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/Thomas L. Berkley Way (20th Street). The intersection was identified as operating at LOS C in the Year 2010 No Project Condition in the PM peak hour. The addition of Project traffic would result in the intersection operating at LOS F in the PM peak hour. (S)

Mitigation Measure TRANS-1: Optimization of the signal timing at the intersection of San Pablo and Thomas L. Berkley Way (20th Street) would improve function to a LOS D in the PM peak hour. This intersection functions as an integrated signal system with other intersections in the downtown area. To mitigate the Project's impact at this location and others, the City shall prepare a signal optimization and coordination plan for the area bounded by San Pablo Avenue, Grand Avenue, Telegraph Avenue, and 17th Street prior to Project occupancy. The plan shall address the timing and equipment requirements, as necessary for all of the signalized intersections located within this area. The Project applicant shall fund its fair share cost of the preparation of this plan and the implementation of the signal timing program. Implementation of the signal optimization program may also involve the purchase and installation of interconnection hardware (i.e. modems, microwave antennas, etc).

Given that the Project sponsor is responsible for only a portion of this mitigation measure, implementation of this set of improvements will be funded fully by one or a combination of the following means:

1. The Project sponsor shall fully fund the costs of the signalization improvements and be reimbursed through other fair-share contributions as future projects occur that fall within the City's thresholds of significance.

2. The City, at their sole discretion, shall establish a Traffic Improvement Program and concurrent Traffic Impact Fee Ordinance to fund the mitigation measure.

3. The Redevelopment Agency, at their sole discretion, shall contribute funds to the costs of implementation. (LTS)

The implementation of Mitigation Measure TRANS-1 would not lead to any adverse impacts.

Telegraph Avenue/19th Street

Impact TRANS-2: The addition of Project traffic to the Year 2010 Baseline condition would result in a significant adverse impact at the intersection of Telegraph Avenue/19th Street. The intersection was identified as operating at LOS D in the Year 2010 No Project Condition in the AM and PM peak hours. The addition of Project traffic would result in the intersection operating at LOS F in both the AM and PM peak hours. (S)

> Mitigation Measure TRANS-2: Optimization of the signal timing at the intersection of Telegraph and 19th Street would improve the function to LOS C in both the AM or PM peak hours. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-2 would not lead to any adverse impacts.

Frontage Road/West Grand Avenue

Impact TRANS-3: In the 2010 No Project and Plus Project scenarios, the Frontage Road/West Grand Avenue intersection would operate at LOS F in the PM peak hour. The Project would cause the total intersection delay for the critical movements to increase by two or more seconds and result in a significant impact. (S)

> Mitigation Measure TRANS-3: Widen the intersection to add a second exclusive left turn lane in the eastbound direction and an exclusive right turn lane in the westbound direction. The intersection would operate at LOS D in the PM peak hour with these improvements.
>
> The intersection of Frontage Road and West Grand Avenue is located on an elevated structure which is within the jurisdiction of Caltrans. The proposed mitigation measures would require the widening of the existing elevated structure and modification of the traffic signal. The second exclusive left turn lane in the eastbound direction and the exclusive right turn lane in the westbound direction should each be 300 feet in length with a 90-foot taper. Widening of the

existing structure would require additional support columns and the acquisition of right of way underneath the structure. In addition, the connector from Interstate 880 to Interstate 80 structure exists above this intersection. Columns supporting this elevated connector may have to be relocated to widen the Frontage Road/West Grand Avenue intersection. At this time, the implementation of this mitigation measure would not be economically feasible. Because this intersection is located outside of the City of Oakland's jurisdiction and because it is not economically feasible, it is significant and unavoidable. (SU)

(3) Year 2025 Traffic Operations. Traffic increases for each study intersection were estimated based on the Alameda County Congestion Management Agency's (ACCMA) Countywide Transportation Demand Model. The "Year 2025 No Project" traffic volumes are shown in Figures 7a and 7b in Appendix E. The "Year 2025 With Project Traffic" volumes are illustrated in Figures 8a and 8b in Appendix E. This cumulative scenario includes all development contemplated in the study area.

Intersection Level of Service Analysis. Table IV.D-26 summarizes the intersection Level of Service analysis for the 2025 peak hour traffic conditions with and without the proposed Uptown Project. The existing traffic signal timing was used in this analysis. Level of Service calculation worksheets for each of the analysis scenarios are attached in Appendix E.

In the "Year 2025 No Project" scenario, eight of the study intersections are forecast to operate at LOS E and five additional intersections are expected to operate at LOS F during at least one of the peak periods based on existing traffic signal timing. Optimizing the traffic signal timing results in two intersections operating at LOS E and one intersection (Frontage Road/West Grand Avenue) operating at LOS F in 2025 without the proposed Project.

The addition of Uptown Project traffic to the 2025 background traffic volumes results in ten intersections operating at LOS E and six intersections operating at LOS F based on existing signal timing. Optimizing the traffic signal timing results in four intersections operating at LOS E and two intersections operating at LOS F. The other 34 study intersections are forecast to operate at LOS D or better in the area outside the downtown area or LOD E or better in the downtown area in 2025 with the completion of the Uptown Project and the optimization of traffic signal timing where required. With optimized traffic signal timing, the addition of Project-related traffic in the 2025 analysis year results in three study intersections (Telegraph Avenue/West Grand Avenue and Broadway/West Grand Avenue) deteriorating from LOS D to LOS E and one study intersection (Telegraph Avenue/Thomas L. Berkley Way (20th Street)) deteriorating from LOS E to LOS F.

Freeway Level of Service Analysis. Table IV.D-27 summarizes the peak hour freeway level of service analysis in 2025 with and without the proposed Project based on the density methodology. Table IV.D-27 also presents the percentage of Project traffic on each freeway segment that was evaluated. The percentage of Project traffic on the studied freeway segments in 2025 ranges from 0.00 to 2.17 percent. The few segments on I-880 and I-980 where the Project will add more than 1 percent to the background 2025 volume all operate at an acceptable level of service (LOS D or better) based on the anticipated density of traffic on the highway. Therefore, the proposed Project does not significantly impact the freeway system. Table IV.D-28 presents the 2025 freeway analysis based on the volume-to-capacity analysis methodology.

Table IV.D-26: 2025 Intersection Level of Service Summary

			Intersection LOS (Average Vehicle Delay in Seconds)

3. Study intersections that are located within the City of Oakland's downtown area are noted with an asterisk (*) after the intersection name.

Source: Korve Engineering, 2003.

2025 Traffic Impacts and Mitigations. The additional trips generated by the Uptown Project will not significantly impact the freeway system. However based on the City of Oakland's traffic impact criteria, the Project will result in a significant traffic impact at 11 of the 40 study intersections based on the 2025 intersection level of service analysis. Table IV.D-29 presents the LOS and average vehicle delay for the impacted study intersections.

The impacted intersections and the recommended mitigation measures are presented below.

San Pablo Avenue/27th Street

Impact TRANS-4: In the PM peak hour, the San Pablo/27th Street intersection would operate at LOS E in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause the total intersection average vehicle delay to increase by six or more seconds. (S)

> Mitigation Measure TRANS-4: Optimization of the signal timing at the intersection of San Pablo and 27th Street would improve function to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-2 would not lead to any adverse impacts.

San Pablo Avenue/West Grand Avenue

Impact TRANS-5: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/West Grand Avenue. The intersection was identified as operating at LOS F in the Year 2025 No Project Condition in the PM peak hour. The addition of Project traffic would cause the total intersection average vehicle delay to increase by two or more seconds. (S)

> Mitigation Measure TRANS-5: Optimization of the signal timing at the intersection of San Pablo and West Grand Avenue would improve the function to a LOS E in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-5 would not lead to any adverse impacts

San Pablo Avenue/Thomas L. Berkley Way (20th Street)

Impact TRANS-6: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of San Pablo Avenue/Thomas L. Berkley Way (20th Street). The intersection was identified as operating at LOS C in the Year 2025 No Project Condition in the PM peak hour. The addition of Project traffic would result in the intersection operating at LOS F. (S)

> Mitigation Measure TRANS-6: Optimization the signal timing at the intersection of San Pablo and Thomas L. Berkley Way (20th Street). By optimizing the signal timing splits, the

intersection would improve the function to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-6 would not lead to any adverse impacts.

Telegraph Avenue/West Grand Avenue

Impact TRANS-7: The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the intersection of Telegraph Avenue/West Grand Avenue. The intersection was identified as operating at LOS E in the Year 2025 No Project Condition in the AM peak hour. The addition of Project traffic would cause an increase in the average delay for critical movements to increase by more than six seconds in the AM peak hour. (S)

Mitigation Measure TRANS-7: Optimization of the signal timing and changing the cycle length to 65 seconds at this intersection would mitigate the delay that would result from the proposed Project. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-7 would not lead to any adverse impacts.

Telegraph Avenue/Thomas L. Berkley Way (20th Street)

Impact TRANS-8: With the Project, the Telegraph Avenue/Thomas L. Berkley Way (20th Street) intersection LOS would degrade from LOS E to LOS F in the AM peak hour. In the PM peak hour, the Telegraph Avenue/Thomas L. Berkley Way (20th Street) intersection would operate at LOS F in the Year 2025 No Project and Year 2025 Plus Project scenarios. (S)

Mitigation Measure TRANS-8: Optimization of the signal timing in the AM peak hour and changing the cycle length to 70 seconds at this intersection would mitigate the Projects increase in delay. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-8 would not lead to any adverse impacts.

Telegraph Avenue/William Street

Impact TRANS-9: The Telegraph Avenue/William Street intersection would operate at LOS F in the PM peak hour in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause the total intersection average delay to increase by two or more seconds. In addition, the Project would increase average delay for the critical movements by four or more seconds. (S)

> Mitigation Measure TRANS-9: Changing the cycle length to 80 seconds and optimizing signal timing would improve the function of this intersection to LOS C in the PM peak hour. By optimizing the signal timing splits and changing the signal cycle, the Projects increase in delay would be mitigated. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-9 would not lead to any adverse impacts.

Telegraph Avenue/19th Street

Impact TRANS-10 The addition of Project traffic to the Year 2025 Baseline condition would result in a significant adverse impact at the Telegraph Avenue/19th Street intersection. With the Project, the intersection LOS would degrade from LOS E to LOS F in the AM peak hour. In the PM peak hour, the Telegraph Avenue/19th Street intersection would operate at LOS F in the Year 2025 No Project and Year 2025 Plus Project scenarios. In addition, the Project would increase average delay for the critical movements by four or more seconds in the PM peak hour. Both of these changes are considered to be significant adverse impacts based on City standards. (S)

> Mitigation Measure TRANS-10: The Project shall provide for the following two improvements.
>
> - Optimize the signal timing at the intersection of Telegraph and 19th Street. Since this intersection also functions as part of an integrated signal system in downtown Oakland, Mitigation Measure TRANS-1B shall also be implemented.
> - Restripe the westbound 19th Street approach to provide two exclusive through lanes and an exclusive right turn lane.
>
> With these improvements, the intersection would operate at LOS C in the AM peak hour and LOS E in the PM peak hour.
>
> The restriping of the westbound 19th Street approach to the intersection to provide two exclusive through lanes and an exclusive right turn lane would require the elimination of six metered parking spaces on the northern side of 19th Street between Telegraph and Broadway. With the existing roadway width available the two through lanes would each be 11 feet wide and the right turn lane would be 10 feet wide, which would satisfy City standards of 10-foot lanes. Metered parking would remain on the southern side of 19th Street. (LTS)

Frontage Road/West Grand Avenue

Impact TRANS-11 The Frontage Road/West Grand Avenue intersection would operate at LOS F in the AM and PM peak hours in Year 2025 No Project and Year 2025 plus Project conditions. The Project would cause the total intersection average vehicle delay to increase by two or more seconds in the AM and PM peak hours. In addition, the Project would increase in average delay for critical movements by four or more seconds. (S)

> Mitigation Measure TRANS-11: Widen the eastbound approach to accommodate two left turn lanes, two through lanes, and a right turn lane. Widen the southbound approach would need to accommodate a right turn lane, a left turn lane, and a shared through/right turn lane. In addition, the northbound approach should be converted from a left turn lane, a through lane, and a shared through/right turn lane to a left turn lane, a shared through/right turn lane, and a right turn lane. With the proposed improvements, the intersection would operate at LOS C in the AM peak hour and LOS D in the PM peak hour.
>
> The intersection of Frontage Road and West Grand Avenue is located on an elevated structure which is within the jurisdiction of Caltrans. The proposed mitigation measures would require the expansion of the existing elevated structure and modification of the traffic signal. Widening of the existing structure would require additional support columns and the acquisition of right of way underneath the structure. In addition, the connector from Interstate 880 to Interstate 80 structure exists above this intersection. Columns supporting this elevated connector may have to be relocated to pursue the widening of the Frontage Road/West Grand Avenue intersection. The implementation of this mitigation measure would not be economically feasible. Because this intersection is located outside of the City of Oakland's jurisdiction and because it is not economically feasible, it is significant and unavoidable. (SU)

Mandela Parkway/West Grand Avenue

Impact TRANS-12: The addition of Project traffic at the Mandela Parkway/West Grand Avenue intersection would cause the service level to degrade from LOS D in the Year 2025 No Project Condition to LOS E in the Year 2025 with Project Condition during the PM peak hour. (S)

> Mitigation Measure TRANS-12: Changing the cycle length to 110 seconds, providing protected left turn phases on the eastbound and westbound approaches, and optimizing the signal timing would improve the function of this intersection to a LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-12 would not lead to any adverse impacts.

Harrison Street/Grand Avenue

Impact TRANS-13: The Harrison/Grand Avenue intersection was found to operate at LOS E in the Year 2025 No Project and Year 2025 with Project Conditions during the PM peak hour. The Project would cause an increase in the average delay for critical movements by more than six seconds in the PM peak hour. (S)

> Mitigation Measure TRANS-13: Changing the cycle length to 110 seconds and optimizing the signal timing splits would mitigate the Project's impact. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-13 would not lead to any adverse impacts.

Castro Street/17th Street/I-980 Off Ramp

Impact TRANS-14: In the PM peak hour, the Castro Street/17th Street /I-980 Off-Ramp intersection would operate at LOS E in the Year 2025 No Project and Year 2025 Plus Project scenarios. The Project would cause an increase in the average delay for the critical movements of six or more seconds. (S)

> Mitigation Measure TRANS-14: Optimization of the intersection's signal timing at this intersection would improve the function of this intersection to operate at LOS D in the PM peak hour. Preparation and implementation of the signal optimization and coordination plan detailed in Mitigation Measure TRANS-1 will ensure that this impact is reduced to a less-than-significant level. (LTS)

The implementation of Mitigation Measure TRANS-14 would not lead to any adverse impacts

(4) Parking Impacts and Mitigations. Table IV.D-30 summarizes the vehicle parking requirements for the proposed Project. The adequacy of on-site parking is evaluated by comparing the City of Oakland's Planning Code requirements with the planned on-site parking that will be provided by the Project. The City's parking requirements are based on the zoning designation for the property. The proposed Project is located in two zoning areas. The portion of the Project along Telegraph Avenue and 18th Street is in zone "C-55/S-17" and the rest of the Project is in zone "C-51/S-17." All of the planned retail uses will be located in the C-55 zone, which is in the CBD area and does not require any parking.

Table IV.D-30: Summary of Project Parking Requirements – City of Oakland Code

Land Use	Size	Parking Requirement	Parking Spaces Required
Apartments	1,000 units	1 stall per DU	1,000
Condominiums	270 units	1 stall per DU	270
Student Housing	600 units	1 stall per 2 units	300
Faculty Housing	50 units	1 stall per DU	50
Retail	33,000 sf	Not Required	0
		Total	**1,620**

Source: City of Oakland Municipal Code Title 17 Chapter 116.060; Korve Engineering, 2003.

According to City code the Uptown Project will require a total of 1,620 vehicle parking spaces. The proposed Project will provide adequate parking to comply with the City of Oakland's zoning requirements. In addition to the on-site parking provided for the Project there would be 176 on-street parking spaces (including service area) provided within the right-of-way of the proposed streets within the Project and along the Project frontage on San Pablo Avenue. The on-street parking spaces will primarily be used by visitors.

Currently there are 1,242 parking spaces on the Uptown Project site that will be removed when the Project is constructed. The majority of the people that currently use this parking are expected to use transit in the future, or utilize other parking facilities in the area.

The proposed Project will meet the City's planning code requirements for on-site parking and will provide sufficient parking for the proposed Project's residents and tenants. As a result, no significant impacts related to parking will occur.

(5) Pedestrian/Bicycle Facility Impacts and Mitigations. Pedestrian access within the Project site will be provided by interconnected sidewalks and pedestrian courts.

Table IV.D-31 summarizes the City of Oakland recommended provisions for bicycle parking for projects in the downtown area. Class I bicycle parking spaces are located in a secured area (e.g. lockers). Class II bicycle parking spaces are located on-street (e.g. racks).

Table IV.D-31: Summary of Project Bicycle Parking – Recommended by the City of Oakland

Land Use	Size	Class I Parking Requirement	Class II Parking Spaces Required
Apartments	1,000 units	1 stall per 3 DU	1 stall per DU
Condominiums	270 units	1 stall per 3 DU	1 stall per DU
Student Housing	1000 beds	1 stall per 2 beds	1 stall per 2 units
Faculty Housing	50 units	1 stall per 2 DU	1 stall per DU
Retail	33,000 sf	1 space per 30 employees	1 space per 3000 sf of restaurant space or minimum of 4

Source: Public Works Agency, City of Oakland

Table IV.D-32 summarizes the total number of bicycle parking facilities recommended by the City of Oakland for each Project block. The residential portion of the Uptown Project would need to provide a total of 947 Class I bicycle parking spaces and 156 Class II bicycle parking spaces to satisfy the City's recommendation. The commercial portion of the Uptown Project would need to provide a total of four Class I bicycle parking spaces and 16 Class II bicycle parking spaces to satisfy the City's recommendation.

(6) Site Access and Internal Circulation Impacts and Mitigations. Several new north/south roadways will be constructed on-site in order to provide internal circulation and access to the planned parking garages. The Project driveway on 21st Street serving Parcel 7 will have the largest number of Project trips. This access is expected to operate at an acceptable level of service because 21st Street is a one-way street so access to and from the Project will be restricted to right-turn-only movements. The Project access serving Parcels 5 and 6 just west of the Fox Theatre would serve the second largest number of vehicles. Full movements in and out of the driveway will be permitted on to the new "Lane C." This driveway and the remaining Project driveways were found to function at LOS B or better with full build out of Project traffic. No additional site access or internal circulation improvements were found to be necessary.

c. Transit. The City of Oakland considers the potential impacts related to transit to be significant where a Project:

- Increases the peak hour average ridership on BART by 3 percent where the passenger volume would exceeds the standing capacity of BART trains; or
- Increases the peak hour average ridership at a BART station by 3 percent where average waiting time at fare gates would exceed 1 minute; and
- Increases the average ridership on AC Transit lines by 3 percent at bus stops where the average load factor with the Project in place would exceed 125 percent over a peak 30-minute period.

The proposed Project is forecast to result in 1,464 BART trips and 897 AC Transit bus trips to and from the proposed Project site on an average weekday. In the morning peak hour, the proposed Project is forecast to generate approximately 112 BART trips (18 inbound, 94 outbound) and 69 AC Transit bus trips (11 inbound, 58 outbound). In the evening peak commute hour, the Project would generate roughly 137 BART trips (92 inbound, 45 outbound) and 84 AC Transit bus trips (56

Table IV.D-32: Summary of Project Bicycle Parking – Recommended by the City of Oakland

Block	Residential Parking – Class I	Residential Parking – Class II	Commercial Parking – Class I	Commercial Parking – Class II	Total – Class I	Total – Class II
1	63	13	0	0	63	13
2	63	13	0	0	63	13
3	83	17	1	3	84	19
4	75	15	2	5	77	20
5	90	18	0	0	90	18
6	48	10	0	0	46	10
7	525	70	1	4	526	74
8 and 9	0	0	0	4	0	4
Total	**947**	**156**	**4**	**16**	**949**	**171**

Source: Public Works Agency, the City of Oakland.

inbound, 28 outbound). It is important to note that the majority of both the vehicle and transit trips generated by the Project are in the off-peak direction, which will result in better utilization of the existing transportation system in downtown Oakland.

(1) Project BART Ridership. The potential Project-related impacts on both BART lines and the BART station were investigated. The anticipated BART trips were assigned to each of the BART lines at the 19th Street Station based on the existing ridership share of each line. Table IV.D-33 presents the number of passengers from the Uptown Project that are expected to use each BART line, along with the Project-related percentage increase in passengers and the load factor with the Project. The number of new Project-related trips assigned to a BART line ranges from 1 to 48, which will result in less than a 1 percent increase in ridership. The increases are all less than the 3 percent that the City of Oakland has identified as the threshold of significant impact on BART service. In addition, load factors on all lines are below 115 percent for lines in the East bay and 135 percent for transbay lines with the completion of the proposed Uptown Project. It is therefore in compliance with the performance measures of BART described in the 2001 Congestion Management Program (CMP 2001) of the Alameda County Congestion Management Agency (ACCMA).[9]

During the morning peak hour (8:00 a.m. to 9:00 a.m.), passengers entering the 19th Street BART station will increase by approximately 17 percent due to the Project. Currently, most riders exit the 19th Street BART station during morning peak hour. Therefore, the increase in passengers entering the station during the morning peak hour will help balance the inflow and outflow of passengers. The Project is expected to add on average less than one person per gate per minute. Since the current waiting time at fare gates is less than 15 seconds during the morning peak,[10] the waiting time is

---

[9] Chapter 4. Congestion Management Program, 2001. Alameda County Congestion Management Agency

[10] A maximum of eight people were observed waiting at the BART ticket gates during the morning peak hour, based on a site observation conducted on Tuesday, August 12, 2003. The last person in the queue took 15 seconds to pass through the gate. During the evening peak hour, the largest observed queue was four people. The last person in the longest line took 9 seconds to pass through the gate during the evening peak. An average of approximately 3 to 4 people waiting at the exit gates was observed during the morning peak hour, with an average queue of two people during the evening peak hour.

Table IV.D-33: Project BART Ridership

		Passengers From Project		Project Related Percentage Increase in Passengers		Load Factor With Project	
BART Lines	**Time**	**Alighting**	**Boarding**	**Before Alighting**	**After Alighting**	**Before Alighting**	**After Alighting**
Richmond – Daly City	8-9 a.m.	4	25	0.15%	0.90%	102%	103%
	5-6 p.m.	7	4	0.70%	0.32%	35%	43%
Daly City –Richmond	8-9 a.m.	1	6	0.15%	0.90%	35%	26%
	5-6 p.m.	18	8	0.70%	0.32%	92%	93%
Richmond–Fremont	8-9 a.m.	1	6	0.15%	0.90%	31%	24%
	5-6 p.m.	6	4	0.75%	0.32%	49%	70%
Fremont–Richmond	8-9 a.m.	2	6	0.15%	0.90%	57%	37%
	5-6 p.m.	6	3	0.75%	0.32%	52%	59%

	5-6 p.m.	8	4	0.75%	0.32%	28%	33%
Millbrae–Pittsburg / Bay Point	8-9 a.m.	1	5	0.15%	0.90%	29%	21%
	5-6 p.m.	48	23	0.70%	0.32%	112%	114%

Source: Korve Engineering, 2003.

expected to still be below 1 minute (the threshold of significance set by the City of Oakland concerning waiting time at BART gates) with the addition of anticipated BART riders from the Uptown Project.

During the evening peak hour (5:00 p.m. to 6:00 p.m.), passengers exiting the 19th Street BART station will increase by approximately 19 percent due to the Project. Currently, most riders enter the station during the evening peak hour. Therefore, the Project-related increase in passengers exiting the station during evening peak hour will help balance the inflow and outflow of passengers. On average, the Uptown Project will result in six more people from a train on the busiest line and these people will disperse to 10 exit gates. The current maximum wait time to pass through the exit gates is approximately 10 seconds, therefore the Uptown Project is not expected to impact the operation of the 19th Street BART station.

The Project impact on the 19th Street BART station by new entering passengers is shown in Table IV.D-34, and the Project impact on exiting passengers is shown in Table IV.D-35.

(2) Project AC Transit Ridership. The potential Project-related impacts on AC Transit were evaluated by calculating the total number of bus trips generated by the Project and then distributing the bus trips to the bus lines near the Project based on their current peak hour riderships. The percentage increase of riders on each bus line was computed to determine if it exceeds the 3 percent threshold of significance set by the City of Oakland concerning impacts on bus services.

Table IV.D-34: 19th Street BART Station Entry Gates

	Time	Existing Number of Passengers	New Passengers	Project Related Percentage Increase in Passengers	Average Passengers Per Gate Per Minute With The Project	Average Passengers Per Gate Per Minute Added By The Project
Entries	8-9 a.m.	552	94	17.1%	2.7	0.4
	5-6 p.m.	1,728	45	2.6%	3.0	0.1

	5-6pm	489	92	18.7%	27	5.8

* Pittsburg/Bay Point–Millbrae line for AM and Millbrae–Pittsburg/Bay Point line for PM.

Source: BART, April and May 2003; Korve Engineering, 2003.

Referring to Table IV.D-36, the Project is expected to increase the ridership of bus lines #11 and #12 by more than 3 percent. However, these bus lines have relatively low maximum load factors that are all considerably below the maximum desirable load factor of 125 percent. The percentage increases of riders due to the Uptown Project will be below 3 percent for all the other bus lines near the Project.

The maximum load factors are high on bus lines 40/40L, 43, 51 and 72 based on the most recent data from AC Transit that has been collected in the last couple of years. To improve bus service in the area, AC Transit introduced a set of service improvements on June 31, 2003. Improvements included increasing the frequency of bus #51 during peak periods and replacing the old 72L and 73 bus lines with 72M and 72R in order to strengthen services along San Pablo Avenue. In addition, there are seven other bus lines not included in Table IV.D-31 that run a few blocks from the Project site. Some Project-related bus trips are expected to use these additional bus lines. Therefore, the actual new maximum load factors are expected to be significantly lower than those calculated from AC Transit data.

(3) Transit Impacts and Mitigation Measures. The proposed Project would result in less than a 1 percent increase in the ridership on any BART line at the 19th Street station. Therefore, no significant Project related impact to BART is anticipated. As shown in Table IV.D-36, the Uptown Project will not increase the ridership on an AC Transit route by 3 percent where the maximum load factor with the Project completed will exceed 125 percent. Therefore, the proposed Project would not impact AC Transit.

Table IV.D-36: AC Transit Ridership

Line	Direction	AM Peak New Riders	AM Peak Percent Increase	AM Peak New Maximum Load Factor	PM Peak New Riders	PM Peak Percent Increase	PM Peak New Maximum Load Factor
11	NB	1	3.5%	38%	1	5.5%	26%
	SB	1	2.5%	35%	5	4.0%	108%
12	NB	2	3.1%	48%	2	3.6%	55%
	SB	2	3.1%	57%	1	3.8%	33%
15	NB	3	2.2%	78%	3	2.9%	61%
	SB	(No data available)					
40/40L	NB	6	2.7%	124%	5	2.9%	113%
	SB	6	2.1%	162%	6	2.8%	129%
43	NB	6	2.6%	168%	7	2.8%	176%
	SB	5	2.3%	143%	5	2.6%	117%
51	NB	5	2.6%	128%	8	2.1%	265%
	SB	5	2.7%	123%	4	2.7%	115%

	SB	12	2.7%	190%	4	2.7%	65%

Source: Howard Der, AC Transit Long Range Planning & Data Analysis Department. Korve Engineering, 2003.

The Project will primarily result in increased ridership on BART and AC Transit in the off-peak direction, therefore utilizing available capacity in the existing transit system. All the potential transit impacts are below the threshold of significance set by the City of Oakland and do not exceed the ACCMA performance measures outlined in the 2001CMP; therefore, significant impacts related to transit are anticipated as a result of the Uptown Project.

3. ACCMA Land Use Analysis

This section provides a summary of the traffic operations analysis based on the Alameda County Congestion Management Agency (ACCMA)'s model with the ACCMA land use projections. Based on the ACCMA's model without the City's land-use assumptions, traffic volume increases for each study intersection were estimated. The ACCMA's Model with ACCMA's land use generally results in lower traffic levels than that of the City of Oakland's updated land use.

Table IV.D-37 summarizes the LOS and average vehicle delay for the 2010 and 2025 analysis based on the ACCMA land use projections. The delays are generally slightly less than the delays based on the City of Oakland's updated land use.

A comparison of the traffic analysis based on the ACCMA and City of Oakland's updated land uses, indicate that ten of the study intersections would operate at a better level of service during at least one of the peak periods based on the ACCMA land uses.

The ACCMA analysis identified no additional Project-related traffic impacts.

Table IV.D-37: Summary Level of Service Analysis – ACCMA Land Use

			Intersection LOS (Average Vehicle Delay in Seconds)				
				Year 2010		Year 2025

E. AIR QUALITY

This section describes existing air quality conditions in the region and the Oakland area. Impacts that may result from Project are identified, and mitigation measures to reduce potential impacts are recommended where feasible.

1. Setting

This setting subsection begins with a brief review of the five key issues addressed in this air quality analysis. It then summarizes the ambient standards, regulatory framework, and attainment status of the San Francisco Bay Area. The subsection concludes with the area's existing climate and general air quality conditions.

a. Air Quality Issues. Five key air quality issues are of greatest concern in this analysis: construction equipment exhaust, CO hotspots, vehicle emissions, fugitive dust, and odors.

(1) Construction Equipment Exhaust. Construction activities cause combustion emissions from utility engines, heavy-duty construction vehicles, equipment which hauls materials to and from construction sites and motor vehicles that transport construction crews. Exhaust emissions from construction activities vary daily as construction activity levels change. The use of construction equipment results in localized exhaust emissions.

(2) Fugitive Dust. Fugitive dust emissions are generally associated with demolition, land clearing, exposure of soils to the air, and cut and fill operations. Dust generated during construction varies substantially on a project by project basis, depending on the level of activity, soils types, specific construction operations, and weather conditions. Particulate matter (or PM_{10}) is the specific emission of concern. However, there are a number of feasible control measures that can be implemented to significantly reduce PM_{10} emissions from construction. Rather than attempting to provide detailed quantification of anticipated construction emissions from projects, the BAAQMD suggests the following:

> "The determination of significance with respect to construction emissions should be based on a consideration of the control measures to be implemented. From the Districts' perspective, quantification of emissions is not necessary, although a lead agency may elect to do so. If all of the control measures indicated as appropriate, depending on the size of the project are implemented, then air pollution from emissions from construction activities would be considered a less-than-significant impact."[1]

(3) Vehicle Emissions. Long-term air emission impacts are those associated with changes in automobile travel within the City. Mobile source emissions would result from vehicle trips associated with increased vehicular travel. As is true throughout much of the U.S., motor vehicle use is projected to increase substantially in the region.

(4) Local Carbon Monoxide Hotspots. Local air quality is most affected by CO emissions from motor vehicles. CO is typically the pollutant of greatest concern because it is created in

---

[1] Bay Area Air Quality Management District, 1996. *BAAQMD CEQA Guidelines Assessing the Air Quality Impacts of Projects and Plans*. April. (Amended in December 1999.)

abundance by motor vehicles and it does not readily disperse into the air. Because CO does not readily disperse, areas of vehicle congestion can create “pockets” of high CO concentration called “hot spots.”

While CO transport is limited, it does disperse with distance from the source under normal meteorological conditions. However, under certain extreme meteorological conditions, CO concentrations near congested roadways or intersections may reach unhealthful levels affecting local sensitive receptors (e.g., residents, schoolchildren, the elderly, hospital patients, etc). Typically, high CO concentrations are associated with roadways or intersections operating at unacceptable levels of service or with extremely high traffic volumes.

(5) Odors. Odors are also an important element of local air quality conditions. Specific activities allowed within many land use categories can raise concerns on the part of nearby neighbors. Major sources of odors include restaurants, manufacturing plants, and agricultural operations, though industrial facilities within Oakland can also produce unacceptable levels of odors. While sources that generate objectionable odors must comply with air quality regulations, the public’s sensitivity to locally produced odors often exceeds regulatory thresholds and complaints result.

b. Air Quality Standards, Regulatory Framework, and Attainment Status. Air quality standards, the regulatory framework, and State and federal attainment status are discussed below.

(1) Air Quality Standards. Both the State and federal governments have established health-based Ambient Air Quality Standards for six air pollutants: carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter (PM). In addition, the State has set standards for sulfates, hydrogen sulfide, vinyl chloride and visibility reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety.

In addition to *primary* and *secondary* Ambient Air Quality Standards, the State of California has established a set of *episode* criteria for O_3, CO, NO_2, SO_2, and PM. These criteria refer to episode levels representing periods of short-term exposure to air pollutants that actually threaten public health. Health effects are progressively more severe as pollutant levels increase from Stage One to Stage Three.

California Ambient Air Quality Standards and National Ambient Air Quality Standards for the criteria air pollutants are listed in Table IV.E-1. Health effects of these criteria pollutants are described in Table IV.E-2.

(2) Regulatory Framework. The Bay Area Air Quality Management District (BAAQMD) is primarily responsible for regulating air pollution emissions from stationary sources (e.g., factories) and indirect sources (e.g., traffic associated with new development), as well as for monitoring ambient pollutant concentrations. Indirect sources are facilities that do not have equipment that directly emits substantial amounts of pollution, but that attract large numbers of mobile sources of pollution. The California Air Resources Board and the U.S. Environmental Protection Agency regulate direct emissions from motor vehicles.

Table IV.E-1: Air Quality Standards

Pollutant	Averaging Time	California Standards	Federal Standards
Carbon Monoxide (CO)	8-hour	9 ppm	9 ppm
	1-hour	20 ppm	35 ppm
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	—	0.053 ppm
	1-hour	0.25 ppm	—
Ozone (O_3)	1-hour	0.09 ppm	0.12 ppm
	8-hour	—	0.08 ppm
Lead (Pb)	Quarterly	—	1.5 µg/m^3
	30-day	1.5 µg/m^3	—
Particulate Matter (PM_{10})	24-hour	50 µg/m^3	150 µg/m^3
	Annual Arithmetic Mean	20 µg/m^3	50 µg/m^3
Particulate Matter ($PM_{2.5}$)	Annual Arithmetic Mean	12 µg/m^3	15 µg/m^3
	24-hour	—	65 µg/m^3
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	—	0.03 ppm
	24-hour	0.04 ppm	0.14 ppm
	3-hour	—	0.50 ppm
	1-hour	0.25 ppm	—

Notes:
ppm = parts per million
µg/m^3 = micrograms per cubic meter

Source: U.S. Environmental Protection Agency and California Air Resources Board, 2003.

Federal Clean Air Act. The Federal 1970 Clean Air Act authorized the establishment of national health-based air quality standards and also set deadlines for their attainment. The Federal Clean Air Act Amendments of 1990 changed deadlines for attaining National Ambient Air Quality Standards as well as the remedial actions required of areas of the nation that exceed the standards. Under the Clean Air Act, State and local agencies in areas that exceed the National Ambient Air Quality Standards are required to develop State Implementation Plans to show how they will achieve the National Ambient Air Quality Standards for ozone (O_3) by specific dates.

The Clean Air Act requires that projects receiving federal funds demonstrate conformity to the approved State Implementation Plan and local air quality attainment plan for the region. Conformity with the State Implementation Plan requirements would satisfy the Clean Air Act requirements.

California Clean Air Act. In 1988, the California Clean Air Act required that all air districts in the State endeavor to achieve and maintain California Ambient Air Quality Standards for O_3, CO, SO_2 and NO_2 by the earliest practical date. Plans for attaining California Ambient Air Quality Standards were submitted to the California Air Resource Board by June 30, 1991, 1994, 1997 and 2000. The California Clean Air Act provided districts with new authority to regulate indirect sources and mandates that air quality districts focus particular attention on reducing emissions from

Table IV.E-2: Health Effects of Major Criteria Pollutants

Pollutants	Sources	Primary Effects
Carbon Monoxide (CO)	• Incomplete combustion of fuels and other carbon-containing substances, such as motor exhaust. • Natural events, such as decomposition of organic matter.	• Reduced tolerance for exercise. • Impairment of mental function. • Impairment of fetal development. • Death at high levels of exposure. • Aggravation of some heart diseases (angina).
Nitrogen Dioxide (NO_2)	• Motor vehicle exhaust. • High temperature stationary combustion. • Atmospheric reactions.	• Aggravation of respiratory illness. • Reduced visibility. • Reduced plant growth. • Formation of acid rain.
Ozone (O_3)	• Atmospheric reaction of organic gases with nitrogen oxides in sunlight.	• Aggravation of respiratory and cardiovascular diseases. • Irritation of eyes. • Impairment of cardiopulmonary function. • Plant leaf injury.
Lead (Pb)	• Contaminated soil.	• Impairment of blood function and nerve construction. • Behavioral and hearing problems in children.
Fine Particulate Matter (PM_{10})	• Stationary combustion of solid fuels. • Construction activities. • Industrial processes. • Atmospheric chemical reactions.	• Reduced lung function. • Aggravation of the effects of gaseous pollutants. • Aggravation of respiratory and cardiorespiratory diseases. • Increased cough and chest discomfort. • Soiling. • Reduced visibility.
Fine Particulate Matter ($PM_{2.5}$)	• Fuel combustion in motor vehicles, equipment, and industrial sources. • Residential and agricultural burning. • Industrial processes. • Also formed from photochemical reactions of other pollutants, including NO_X, sulfur oxides, and organics.	• Increases respiratory disease. • Lung damage. • Cancer and premature death. • Reduces visibility and results in surface soiling.
Sulfur Dioxide (SO_2)	• Combustion of sulfur-containing fossil fuels. • Smelting of sulfur-bearing metal ores. • Industrial processes.	• Aggravation of respiratory diseases (asthma, emphysema). • Reduced lung function. • Irritation of eyes. • Reduced visibility. • Plant injury. • Deterioration of metals, textiles, leather, finishes, coatings, etc.

Source: California Air Resources Board, 2002.

transportation and area-wide emission sources. Each district plan is to achieve a 5 percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each nonattainment pollutant or its precursors. Additional physical or economic development within the region would tend to impede the emissions reduction goals of the California Clean Air Act.

(3) Attainment Status Designations. The California Air Resources Board is required to designate areas of the state as attainment, nonattainment or unclassified for any state standard. An "attainment" designation for an area signifies that pollutant concentrations did not violate the standard for that pollutant in that area. A "nonattainment" designation indicates that a pollutant concentration violated the standard at least once, excluding those occasions when a violation was caused by an exceptional event, as defined in the criteria. An "unclassified" designation signifies that data does not support either an attainment or nonattainment status. The California Clear Air Act divides districts into moderate, serious, and severe air pollution categories, with increasingly stringent control requirements mandated for each category.

The U.S. Environmental Protection Agency designates areas for O_3, CO, and NO_2 as either "does not meet the primary standards," or "cannot be classified" or "better than national standards." For SO_2, areas are designated as "does not meet the primary standards," "does not meet the secondary standards," "cannot be classified" or "better than national standards." In 1991, new nonattainment designations were assigned to areas that had previously been classified as Group I, II, or III for PM_{10} based on the likelihood that they would violate national PM_{10} standards. All other areas are designated "unclassified."

Table IV.E-3 provides a summary of the attainment status for the San Francisco Bay Area with respect to national and State ambient air quality standards.

c. Existing Climate and Air Quality. The following provides a discussion of the regional air quality, local climate and air quality in the Northern Alameda and Western Contra Costa Counties subregion of the San Francisco Bay Area, and air pollution climatology.

(1) Air Pollution Climatology. The amount of a given air pollutant in the atmosphere is determined by the amount of pollutant released and the atmosphere's ability to transport and/or dilute that pollutant. The major determinants of transport and dilution are wind, atmospheric stability, terrain and for photochemical pollutants, sunshine.

(2) Regional Air Quality. The City of Oakland is located in the San Francisco Bay Area, a large shallow air basin ringed by hills that taper into a number of sheltered valleys around the perimeter. Two primary atmospheric outlets exist: the Golden Gate, a direct outlet to the Pacific Ocean, and the west delta region of the Sacramento and San Joaquin Rivers.

The City of Oakland is within the jurisdiction of the BAAQMD, which regulates air quality in the San Francisco Bay Area. Air quality conditions in the San Francisco Bay Area have improved significantly since the District was created in 1955. Ambient concentrations of air pollutants and the number of days during which the region exceeds air quality standards have fallen dramatically. In June 1995, the Bay Area was designated as being in attainment for the federal O_3 standard. However, the U.S. Environmental Protection Agency changed the Bay Area back to nonattainment status in August 1998 due to new exceedances of the standard in 1995 and 1996. The BAAQMD submitted an Ozone

Table IV.E-3: Bay Area Attainment Status as of January 2003

		California Standards[a]		National Standards[b]	
Pollutant	**Averaging Time**	**Concentration**	**Attainment Status**	**Concentration**	**Attainment Status**
Carbon Monoxide (CO)	8-Hour	9.0 ppm (10 mg/m^3)	Attainment	9 ppm (10 mg/m^3)	Attainment[c]
	1-Hour	20 ppm (23 mg/m^3)	Attainment	35 ppm (40 mg/m^3)	Attainment
Nitrogen Dioxide (NO_2)	Annual Mean	Not Applicable	Not Applicable	0.053 ppm (100 µg/m^3)	Attainment
	1-Hour	0.25 ppm (470 µg/m^3)	Attainment	Not Applicable	Not Applicable
Ozone (O_3)	8-Hour	Not Applicable	Not Applicable	0.08 ppm	Unclassified
	1-Hour	0.09 ppm (180 µg/m^3)	Nonattainment	0.12 ppm (235 µg/m^3)	Nonattainment[d]
Particulate Matter (PM_{10})	Annual Mean	20 µg/m^3	Nonattainment[e]	50 µg/m^3	Attainment
	24-Hour	50 µg/m^3	Nonattainment	150 µg/m^3	Unclassified
Particulate Matter – Fine ($PM_{2.5}$)	Annual Mean	12 µg/m^3	Nonattainment	15 µg/m^3	Unclassified
	24-Hour	Not Applicable	Not Applicable	65 µg/m^3	Unclassified
Sulfur Dioxide (SO_2)	Annual Mean	Not Applicable	Not Applicable	80 µg/m^3 (0.03 ppm)	Attainment
	24-Hour	0.04 ppm (105 µg/m^3)	Attainment	365 µg/m^3 (0.14 ppm)	Attainment
	1-Hour	0.25 ppm (655 µg/m^3)	Attainment	Not Applicable	Not Applicable

[a] California standards for O_3, CO (except Lake Tahoe), SO_2 (1-hour and 24-hour), NO_2 and PM_{10} are values that are not to be exceeded. If the standard is for a 1-hour, 8-hour, or 24-hour average, then some measurements may be excluded. In particular, measurements are excluded that ARB determines would occur less than once per year on the average.

[b] National standards other than for O_3 and those based on annual averages or annual arithmetic means are not to be exceeded more than once a year. For example, the O_3 standard is attained if, during the most recent 3-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one.

[c] In April 1998, the Bay Area was redesignated to Attainment for the national 8-hour CO standard.

[d] In June 1995, the Bay Area was redesignated to Attainment for the national O_3 standard. However, the Environmental Protection Agency changed the Bay Area back to Nonattainment in August 1998, due to new exceedances in 1995 and 1996.

[e] In June 2002, CARB established new annual standards for $PM_{2.5}$ and PM_{10}. As of July 2003, the BAAQMD did not have sufficient monitoring data for $PM_{2.5}$ to determine the region's attainment status with respect to these national standards. The EPA plans to propose an implementation rule for $PM_{2.5}$ in September 2003 and issue the final $PM_{2.5}$ implementation rule in September 2004. The EPA is then expected to make final designations in December 2004.

Notes: Lead (Pb) is not listed in the above table because it has been in attainment since the 1980s.

ppm = parts per million
mg/m^3 = milligrams per cubic meter
µg/m^3 = micrograms per cubic meter

Source: Bay Area Air Quality Management District, Bay Area Attainment Status as of January 2003, and Henry Hilken of the District.

Attainment Plan (1999 Plan) to the U.S. Environmental Protection Agency in August of 1999 to set policies and guidelines aimed at reducing O_3 in the Bay Area by November 15, 2000. The U.S. Environmental Protection Agency approved parts and disapproved parts of the 1999 Ozone Plan for failing to ensure attainment status for O_3. As a result, the U.S. Environmental Protection Agency recommended to the federal government that it withhold transportation funding for specific projects within the Bay Area. The BAAQMD has developed and adopted a new plan (2001 Ozone Plan) to correct the deficiencies of the 1999 Ozone Plan and respond to the finding of failure to achieve attainment status for O_3. The new plan was adopted in October 2001 by the BAAQMD's Governing Board and was approved by the California Air Resources Board in November 2001. As of January 2003, the plan is still under review by the Environmental Protection Agency.

Levels of PM_{10} in the Bay Area currently exceed California Clean Air Act standards and, therefore, the area is considered a nonattainment area for this pollutant relative to the State standards. PM_{10} levels monitored at the Fremont (Chapel Way) and Concord (2975 Treat Boulevard) stations (two closest monitoring stations with PM_{10} data) exceeded the State's standard in 2000 and 2001, but were below the State's standard in 2002. The Bay Area is an unclassified area for the federal PM_{10} standard. The federal standard was not exceeded at either of these monitoring stations in the past three years (2000 through 2002).

No exceedances of the State or federal CO standards have been recorded at any of the region's monitoring stations since 1991. The Bay Area is currently considered a maintenance area for State and federal CO standards.

The BAAQMD's Bay Area Clean Air Plans for 1991, 1994, 1997 and 2000 contain districtwide control measures to reduce CO and O_3 precursor emissions. Generally, the State standards for these pollutants are more stringent than the national standards.

Exceedances of air quality standards in the San Francisco Bay Area occur primarily during meteorological conditions conducive to high pollution levels, such as cold, windless winter nights or hot, sunny summer afternoons.

(3) Local Climate and Air Quality. The Project site is located in the Northern Alameda and Western Contra Costa Counties subregion of the San Francisco Bay Area. This climatological subregion stretches from Richmond to San Leandro. Its western boundary is defined by San Francisco Bay and its eastern boundary by the Oakland-Berkeley Hills. The Oakland-Berkeley Hills have a ridge line height of approximately 1,500 feet, a significant barrier to air flow.

In this subregion, marine air traveling through the Golden Gate, as well as across San Francisco and through the San Bruno Gap, is a dominant weather factor. The Oakland-Berkeley Hills cause the westerly flow of air to split off to the north and south of Oakland, which causes diminished wind speeds. The prevailing winds for most of this subregion are from the west.

Temperatures in this subregion have a narrow range due to the proximity of the moderating marine air. Maximum temperatures in summer average in the mid-70's, with minimums in the mid-50's. Average winter highs are in the mid- to high-50's, with lows in the low- to mid-40's.

The air pollution potential is lowest for those parts of the subregion that are closest to the bay, due largely to good ventilation and less influx of pollutants from upwind sources. The occurrence of light winds in the evenings and early mornings occasionally causes elevated pollutant levels. The air pollution potential at the northern (Richmond) and southern (Oakland, San Leandro) parts of this subregion is marginally higher than communities nearer the Golden Gate, because of the lower frequency of strong winds.

This subregion contains a variety of industrial air pollution sources, some of which are quite close to residential areas. The subregion is also traversed by frequently congested major freeways. Traffic and congestion, and the motor vehicle emissions they generate, are increasing.

Pollutant monitoring results for the years 2000 to 2002 (see Tables IV.E-4 through IV.E-7) at the Oakland (Alice Street), Concord (2975 Treat Boulevard),[2] Oakland (6701 International Boulevard), and Fremont (Chapel Way)[3] ambient air quality monitoring stations indicate that air quality in the Project area has generally been good in recent years. As indicated in the monitoring results, 18 or fewer violations per year of State PM_{10} standard during the 3-year period were recorded and no violations of federal PM_{10} standard were recorded. The federal $PM_{2.5}$ standard was not exceeded during the 3-year period and no data is available for the number of days the State $PM_{2.5}$ standard was exceeded. State and federal 1-hour O_3 standards have not been exceeded at these monitoring stations. Federal 8-hour O_3 standards have not been exceeded at these monitoring stations in the past three years. CO and NO_2 standards were not exceeded in this area during the 3-year period. SO_2 monitored at the Oakland-International Boulevard station did not exceed the State or federal standards in the past three years.

2. Impacts and Mitigation Measures

This section evaluates potential air quality impacts associated with the Specific Plan and identifies mitigation measures to address these impacts, as necessary.

a. Significance Criteria. The Uptown Project would result in a significant impact if it would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations;
- Create objectionable odors affecting a substantial number of people;
- Contribute to CO concentrations exceeding the State ambient air quality standard of 9 ppm averaged over 8 hours and 20 ppm for 1 hour;

- Result in total emissions of ROG, NO_x, or PM_{10} of 15 tons per year or greater, or 80 pounds (36 kilograms) per day or greater;
- Result in potential to expose persons to substantial levels of TACs, such that the probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 10 in one million;
- Result in ground level concentrations of non-carcinogenic toxic air contaminants such that the Hazard Index would be greater than 1 for the MEI; or
- Result in a fundamental conflict with the local general plan, when the general plan is consistent with the regional air quality plan. When the general plan fundamentally conflicts with the regional air quality plan, then if the contribution of the proposed Project is cumulatively considerable when analyzed the impact to air quality should be considered significant.

For project-level impact analysis, the BAAQMD provides various thresholds and tests of significance. For ROG, NOx and PM_{10}, a net increase of 80 pounds per day is considered significant, while for CO, an increase of 550 pounds per day would be considered significant if it leads to or contributes to CO concentrations exceeding the State Ambient Air Quality Standard of 9 ppm averaged over 8 hours and 20 ppm for 1 hour (i.e., if it creates a “hot spot”). Generally, if a project results in an increase in ROG, NOx, or PM_{10} of more than 80 pounds per day, then it would also be considered to contribute considerably to a significant cumulative effect. For projects that would not lead to a significant increase of ROG, NOx, or PM_{10} emissions, the cumulative effect is evaluated based on a determination of the consistency of the project with the regional Clean Air Plan. These criteria recommended by the BAAQMD are consistent with the criteria used by the City of Oakland, listed above.

Impacts from $PM_{2.5}$ emissions have not been analyzed quantitatively as there are no recommended significance thresholds from the BAAQMD or the City of Oakland. Also, the air quality models that are used to estimate emissions of ROG, NOx, CO and PM_{10} currently do not have the capability to estimate $PM_{2.5}$ separately. Therefore, impacts from $PM_{2.5}$ emissions from the Project (particularly the diesel particulate matter) have been analyzed qualitatively.

b. Less-than-Significant Air Quality Impacts.

(1) Local Plan Consistency. The population in the City of Oakland is expected to grow from 399,484 people under the existing condition (2000) to 443,203 people in year 2025. The projected growth is 43,717 people over a 23-year period. This amounts to approximately a 0.4 percent annual growth rate.

The Bay Area 2000 Clean Air Plan (CAP) does not list growth or growth rates in population or vehicle miles traveled (VMT) by each City. However, based on the Association of Bay Area Governments (ABAG) projections, total population in Alameda County is projected to grow from 1,453,000 people in year 2000 to 1,556,600 people in year 2010. This growth rate is approximately 7.1 percent over a 10-year period, or approximately 0.7 percent a year.

Figure 3 on page 6 of the Bay Area 2000 CAP depicts the growth in population, vehicles, and vehicle miles traveled in the Bay Area. This figure shows that VMT growth (80 percent growth from 1980 to 2006, or approximately 2.3 percent a year) outpaced population growth (40 percent growth from 1980 to 2006, or approximately 1.3 percent a year) in the Bay Area. Although there is no comparable figure to show such growth for the City of Oakland, it is assumed that the City generally falls within such growth rates.

The proposed Project will add 1,300 residential units and 1,050 student/faculty beds to the City. The proposed Project will increase the City's population by approximately 3,266 people. This growth is consistent with what is anticipated under the City's General Plan and falls within the population projections prepared by ABAG. The proposed Uptown Project will not require any amendments to the City's General Plan. As a result, it will not conflict with the Bay Area 2000 CAP. In addition, the proposed Project is a mixed-use development along a major set of transit corridors. Therefore, the Project will be moving residents closer to the downtown work area potentially reducing the vehicle miles traveled within the City.

(2) Carbon Monoxide Concentrations. Traffic generated by the proposed Project would contribute to local carbon monoxide concentrations. On the local scale the pollutant of greatest concern is carbon monoxide. Concentrations of this pollutant are related to the levels of traffic and congestion along streets and at intersections. The CALINE-4 computer simulation model was used to evaluate nine intersections near the Project site. These intersections were selected on the basis of PM peak hour level of service.

The results of the CALINE-4 modeling for the nine selected intersections are shown in Table IV.E-8. Concentrations are shown for three scenarios:

- Existing Traffic (Year 2003)
- Year 2025 Without Project
- Year 2025 With Project

The predicted 1-hour concentrations in Table IV.E-8 are to be compared to the State and federal ambient 1-hour air quality standards of 20 ppm and 35 ppm, respectively. Predicted 8-hour concentrations in Table IV.E-8 are to be compared to the State and federal 8-hour standards of 9 ppm. Existing concentrations meet all ambient air quality standards.

Concentrations in 2025 are predicted to be lower than year 2003 concentrations, despite increased traffic, due to gradual reductions in emission rates for vehicles resulting from State-mandated emission control programs for automobiles. Concentrations are anticipated to remain well below the applicable standards. The impact of the proposed Project on local carbon monoxide concentrations would be considered less than significant and no mitigation would be required.

(3) Odor Nuisance Problems. Though offensive odors from stationary sources rarely cause any physical harm, they still remain unpleasant and can lead to public distress generating citizen complaints to local governments. The occurrence and severity of odor impacts depend on the nature, frequency and intensity of the source; wind speed and direction; and the sensitivity of receptors. Odor impacts should be considered for any proposed new odor sources located near existing receptors, as well as any new sensitive receptors located near existing odor sources. Generally, increasing the distance between a receptor and the source to an acceptable level will mitigate odor impacts. No new stationary odor sources are proposed as part of the proposed Project. Therefore, there would be no odor-related impacts on sensitive receptors.

Table IV.E -8: Worst-Case Carbon Monoxide Concentrations near Selected Intersections[a]

	Existing (2003)		Year 2025 Without Project		Year 2025 With Project

c. Significant Air Quality Impacts and Mitigation Measures. The proposed Project would result in two significant impacts related to air quality as described below.

<u>Impact AIR-1</u>: Activities associated with demolition, site preparation and construction would generate short-term emissions of criteria pollutants, including suspended and inhalable particulate matter and equipment exhaust emissions. (S)

Project-related construction activities would include site preparation, earthmoving and general construction. Site preparation includes activities such as general land clearing and grubbing. Earthmoving activities include cut and fill operations, trenching, soil compaction and grading. General construction includes adding improvements such as roadway surfaces, structures and facilities. The emissions generated from these construction activities include:

- Dust (including PM_{10} and $PM_{2.5}$) primarily from "fugitive" sources (i.e., emissions released through means other than through a stack or tailpipe) such as soil disturbance;
- Combustion emissions of criteria air pollutants (ROG, NO_x, CO, SO_x, PM_{10}) primarily from operation of heavy equipment construction machinery (primarily diesel operated), portable auxiliary equipment and construction worker automobile trips (primarily gasoline operated); and
- Evaporative emissions (ROG) from asphalt paving and architectural coating applications.

Demolition may result in airborne entrainment of asbestos, a toxic air contaminant, particularly where structures built prior to 1980 are being demolished. Some structural components of the buildings to be demolished may contain hazardous materials such as asbestos used in insulation, fire retardants, or building materials (floor tile, roofing, etc.) and lead-based paint. If asbestos were found to be present in building materials to be removed, demolition and disposal would be required to be conducted in accordance with procedures specified by Regulation 11, Rule 2 (Asbestos Demolition, Renovation and Manufacturing) of BAAQMD's regulations. Therefore, the required compliance with existing regulations would ensure that the potential for public health hazards associated with airborne asbestos fibers or lead dust would be at a less than significant level.

Construction-related fugitive dust emissions would vary from day to day, depending on the level and type of activity, silt content of the soil, and the weather. In the absence of mitigation, construction activities may result in significant quantities of dust, and as a result, local visibility and PM_{10} and $PM_{2.5}$ concentrations may be adversely affected on a temporary and intermittent basis during the construction period. In addition, the fugitive dust generated by construction would include not only PM_{10}, but also larger particles, which would fall out of the atmosphere within several hundred feet of the site and could result in nuisance-type impacts. The BAAQMD's approach to analyses of fugitive dust emissions from construction is to emphasize implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. The District considers any project's construction related impacts to be less than significant if the required dust-control measures are implemented. Without these measures, the impact is generally considered to be significant, particularly if sensitive land uses are located in the project vicinity. In the case of this Project, residential land uses are located as close as 50 feet from the boundaries of the Project site. Therefore, without mitigation, the impact of fugitive dust emissions would be considered significant.

Construction activities would also result in the emission of ROG, NO_x, CO, SO_x and PM_{10} from equipment exhaust, construction-related vehicular activity and construction worker automobile trips. Emission levels for construction activities would vary depending on the number and type of equipment, duration of use, operation schedules, and the number of construction workers. Criteria pollutant emissions of ROG and NO_x from these emission sources would incrementally add to the regional atmospheric loading of ozone precursors during Project construction. BAAQMD CEQA Guidelines recognize that construction equipment emits ozone precursors, but indicate that such emissions are included in the emission inventory that is the basis for regional air quality plans. Therefore, construction emissions of ROG and NO_x are not expected to impede attainment or maintenance of ozone standards in the Bay Area (BAQMD, 1999). The impact of construction equipment exhaust emissions would therefore be less than significant.

During construction various diesel-powered vehicles and equipment would be in use. In 1998 the CARB identified particulate matter from diesel-fueled engines as a toxic air contaminant (TAC). CARB has completed a risk management process that identified potential cancer risks for a range of activities using diesel-fueled engines.[4] High volume freeways, stationary diesel engines and facilities attracting heavy and constant diesel vehicle traffic (distribution centers, truckstop) were identified as having the highest associated risk. BAAQMD CEQA Guidelines identify the following types of facilities as a potential for exposing sensitive receptors to high levels of diesel exhaust:

- Truck stop
- Warehouse/Distribution Center
- Large retail or industrial facility

---

[4] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000.

- High volume transit center
- School with high volume of bus traffic
- High volume highway
- High volume arterial/roadway with high level of diesel traffic

Health risks from Toxic Air Contaminants are a function of both concentration and duration of exposure. Unlike the above types of sources, construction diesel emissions are temporary, affecting an area for a period of days or perhaps weeks. Additionally, construction related sources are mobile and transient in nature, and the bulk of the emission occurs within the project site at a substantial distance from nearby receptors. As a result, health risks from construction emissions of diesel particulate are not considered significant.

> Mitigation Measure AIR-1: Implementation of the following mitigation measures would reduce this impact to a less-than-significant level.
>
> - The basic and enhanced control measures listed in Table IV.E-9 shall be implemented during construction of the proposed Project.
> - Any temporary haul roads to the soil stockpile area shall be routed away from existing neighboring land uses. Any temporary haul roads shall be surfaced with gravel and regularly watered to control dust or treated with an appropriate dust suppressant.
> - Water sprays shall be utilized to control dust when material is being added or removed from the stockpile. When the stockpile is undisturbed for more than 1 week, the storage pile shall be treated with a dust suppressant or crusting agent to eliminate wind-blown dust generation.
> - All neighboring properties located within 500 feet of property lines shall be provided with the name and phone number of a designated construction dust control coordinator who will respond to complaints within 24 hours by suspending dust-producing activities or providing additional personnel or equipment for dust control as deemed necessary. The phone number of the BAAQMD pollution complaints contact shall also be provided. The dust control coordinator shall be on-call during construction hours. The coordinator shall keep a log of complaints received and remedial actions taken in response. This log shall be made available to City staff upon its request.
>
> The above mitigation measures include all feasible measures for construction emissions identified by the BAAQMD. According to the District's threshold of significance for construction impacts, implementation of the measures would reduce construction impacts of the proposed Project to a less-than-significant level. (LTS)

Impact AIR-2: Development of the Uptown Project would result in increased regional emissions of criteria air pollutants exceeding BAAQMD Thresholds. (S)

New emissions from the proposed Project would be from direct and indirect sources. Direct emissions consist of emissions from on-site combustion for space- and water-heating, fireplace use, and other minor sources. The overwhelming source of emissions would be indirect (i.e., related to auto and truck traffic generated by Project land uses).

Table IV.E-9: Feasible Control Measures for Construction Emissions of PM_{10}

Basic Control Measures - The following controls should be implemented at all construction sites.
• Water all active construction areas at least twice daily. • Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard. • Pave, apply water three times daily, or apply (nontoxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites. • Sweep daily (with water sweepers) all paved access roads, parking areas, and staging areas at construction sites. • Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.
Enhanced Control Measures - The following measures should be implemented at construction sites greater than 4 acres in area.
• All "Basic" control measures listed above. • Hydroseed or apply (nontoxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more). • Enclose, cover, water twice daily or apply (nontoxic) soil binders to exposed stockpiles (dirt, sand, etc.) • Limit traffic speeds on unpaved roads to 15 mph. • Install sandbags or other erosion control measures to prevent silt runoff to public roadways. • Replant vegetation in disturbed areas as quickly as possible.
Optional Control Measures - The following control measures are strongly encouraged at construction sites that are large in area, located near sensitive receptors or which for any other reason may warrant additional emissions reductions.
• Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site. • Install wind breaks, or plant trees/vegetative wind breaks at windward side(s) of construction areas. • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 mph. • Limit the area subject to excavation, grading, and other construction activity at any one time.

Source: BAAQMD, 1999.

The URBEMIS2002 model was used to calculate emissions from all vehicle trips to or from the Project site. This analysis was based on Project buildout and assumed a year 2005 vehicle population.

Daily emissions associated with Project vehicle use are shown in Table IV.E-10. Pollutants shown include carbon monoxide, reactive organic gases (ROG) and oxides of nitrogen (NO_x) (two precursors of ozone), and PM_{10} (particulate matter, 10 micron). As shown, emissions associated with the proposed Project would exceed the BAAQMD thresholds of significance.

Table IV.E-10: Regional Vehicular Emissions

	Emissions (pounds/day)			
	ROG	**CO**	**NO_x**	**PM_{10}**
Project Emissions	131.2	1,446.0	183.2	99.6
BAAQMD Thresholds	80	550	80	80

Source: LSA Associates, Inc., 2003.

Once operational, the primary source of $PM_{2.5}$ emissions from the Project would be from the diesel fueled trucks delivering materials and services to businesses of the Project area. However, since no large commercial retail spaces are proposed as part of this Project, the number of truck trips associated with Project operation is not anticipated to be significant (less than six). Additionally, the number of truck trips would be distributed throughout the day and would culminate at different points of the Project site at various businesses. Therefore, no single sensitive receptor would be exposed to emissions from all the truck trips during the day. Given the minimal number of truck trips generated by the Project, concentration of $PM_{2.5}$ emissions from the activity of truck trips in the Project area would not exceed the ambient air quality standards. Therefore, impact of $PM_{2.5}$ emissions from the Project would be less than significant.

> Mitigation Measure AIR-2: To the extent permitted by law, the Uptown Project shall be required to implement Transportation Control Measures (TCMs) as recommended by the BAAQMD. However, the City of Oakland will implement as feasible on the basis that this Project is an infill mixed-used development project that in and of itself supports many Smart Growth Principals. Measures that the City may require the Project to implement, or that are already proposed as part of the Project, include the following:
>
> - *Transit Measures:* (i) Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc. (Effectiveness 0.5 percent - 2 percent of all trips, BAAQMD *CEQA Guidelines*); (ii) Design and locate buildings to facilitate transit access (e.g., locate building entrances near transit stops, eliminate building setbacks, etc.) (Effectiveness 0.1 percent - 0.5 percent of all trips, BAAQMD *CEQA Guidelines*).
> - *Services Measures:* (i) Provide on-site shops and services for employees, such as cafeteria, bank/ATM, dry cleaners, convenience market, etc. (Effectiveness 0.5 percent - 5 percent of work trips, BAAQMD *CEQA Guidelines*); (ii) Provide on-site child care, or contribute to off-site childcare within walking distance. (Effectiveness 0.1 percent - 1 percent of work trips, BAAQMD *CEQA Guidelines*).
> - *Bicycle and Pedestrian Measures:* (i) Provide secure, weather-protected bicycle parking for employees (Effectiveness 0.5 percent - 2 percent of work trips, BAAQMD *CEQA Guidelines*); (ii) Provide safe, direct access for bicyclists to adjacent bicycle routes (Effectiveness 0.5 percent - 2 percent of work trips, BAAQMD *CEQA Guidelines*); (iii) Provide showers and lockers for employees bicycling or walking to work (Effectiveness 0.5 percent - 2 percent of work trips, BAAQMD *CEQA Guidelines*); (iv) Provide secure short-term bicycle parking for retail customers or non-commute trips (Effectiveness 1 percent - 2 percent of non-work trips, BAAQMD *CEQA Guidelines*); (v) Provide direct, safe, attractive pedestrian access from Planning Area to transit stops and adjacent development (Effectiveness 0.5 percent - 1.5 percent of all trips, BAAQMD *CEQA Guidelines*).
>
> Implementation of the measures detailed above would help minimize this impact, but not reduce it to a less-than-significant level. Therefore, Impact AIR-2 will remain significant and unavoidable. (SU)

F. NOISE

This section describes the general characteristics of sound and the categories of audible noise. It then summarizes the regulatory framework related to noise issues at the City, State, and federal levels. Existing sources of noise near the Project site are described. Impacts that may result from the proposed Project are identified and mitigation measures to reduce potential impacts are recommended where appropriate.

1. Setting

This setting section begins with an introduction to several key concepts and terms that are used in evaluating noise. It then explains the various agencies that regulate the noise environment in Oakland and summarizes key standards that are applied to proposed development. This setting section concludes with a description of current noise sources that affect the Project site and the noise conditions that are experienced in the Project vicinity.

a. Characteristics of Sound. To the human ear, sound has two significant characteristics: *pitch* and *loudness*. A specific pitch can be an annoyance, while loudness can affect our ability to hear. Pitch is the number of complete vibrations or cycles per second of a wave that results in the range of tone from high to low. Loudness is the strength of a sound that describes a noisy or quiet environment, and it is measured by the amplitude of the sound wave. Loudness is determined by the intensity of the sound waves combined with the reception characteristics of the human ear. Sound intensity refers to how hard the sound wave strikes an object, which in turn produces the sound’s effect. This characteristic of sound can be precisely measured with instruments.

Noise is usually defined as unwanted sound. Noise consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation or sleep.

Several noise measurement scales exist which are used to describe noise in a particular location. A *decibel* (dB) is a unit of measurement which indicates the relative intensity of a sound. The 0 point on the dB scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Changes of 3.0 dB or less are only perceptible in laboratory environments. Audible increases in noise levels generally refer to a change of 3.0 dB or more, as this level has been found to be barely perceptible to the human ear in outdoor environments. Sound levels in dB are calculated on a logarithmic basis. An increase of 10 dB represents a 10-fold increase in acoustic energy, while 20 dB is 100 times more intense, 30 dB is 1,000 times more intense. Each 10-dB increase in sound level is perceived as approximately a doubling of loudness. Sound intensity is normally measured through the *A-weighted sound level* (dBA). This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Table IV.F-1 shows representative outdoor and indoor noise levels in units of dBA.

As noise spreads from a source, it loses energy so that the farther away the noise receiver is from the noise source, the lower the perceived noise level would be. Geometric spreading causes the sound level to attenuate or be reduced, resulting in a 6-dB reduction in the noise level for each doubling of distance from a single point source of noise to the noise sensitive receptor of concern.

b. Noise Regulatory Framework. The following section summarizes the regulatory framework related to noise, including federal, State, and City of Oakland plans, policies and standards.

Table IV.F-1: Typical A-Weighted Sound Levels

Noise Source	A-Weighted Sound Level in Decibels	Noise Environments	Subjective Evaluations
Near Jet Engine	140	Deafening	128 times as loud
Civil Defense Siren	130	Threshold of Pain	64 times as loud
Hard Rock Band	120	Threshold of Feeling	32 times as loud
Accelerating Motorcycle at a few feet away	110	Very Loud	16 time as loud
Pile Driver; Noisy Urban Street/Heavy City Traffic	100	Very Loud	8 times as loud
Ambulance Siren; Food Blender	95	Very Loud	
Garbage Disposal	90	Very Loud	4 times as loud
Freight Cars; Living Room Music	85	Loud	
Pneumatic Drill; Vacuum Cleaner	80	Loud	2 times as loud
Busy Restaurant	75	Moderately Loud	
Near Freeway Auto Traffic	70	Moderately Loud	
Average Office	60	Moderate	1/2 as loud
Suburban Street	55	Moderate	
Light Traffic; Soft Radio Music in Apartment	50	Quiet	1/4 as loud
Large Transformer	45	Quiet	
Average Residence Without Stereo Playing	40	Faint	1/8 as loud
Soft Whisper	30	Faint	
Rustling Leaves	20	Very Faint	
Human Breathing	10	Very Faint	Threshold of Hearing

Source: Compiled by LSA Associates, Inc., 2002.

(1) U.S. Environmental Protection Agency (EPA). In 1972 Congress enacted the Noise Control Act. This act authorized the EPA to publish descriptive data on the effects of noise and establish levels of sound "requisite to protect the public welfare with an adequate margin of safety." These levels are separated into health (hearing loss levels) and welfare (annoyance levels) as shown in Table IV.F-2. The EPA cautions that these identified levels are not standards because they do not take into account the cost or feasibility of the levels. For protection against hearing loss, 96 percent of the population would be protected if sound levels are less than or equal to an Leq(24) of 70 dB. The "(24)" signifies an Leq duration of 24 hours. The EPA activity and interference guidelines are designed to ensure reliable speech communication at about 5 feet in the outdoor environment. For outdoor and indoor environments, interference with activity and annoyance should not occur if levels do not exceed 55 dBA and 45 dBA, respectively.

Table IV.F-2: Summary of EPA Noise Levels for Protection of Public Health and Welfare with an Adequate Margin of Safety

Effect	Level	Area
Hearing loss	Leq(24) ≤ 70 dB	All areas.
Outdoor activity interference and annoyance	Ldn ≤ 55 dB	Outdoors in residential areas and farms and other outdoor areas where people spend widely varying amounts of time and other places in which quiet is a basis for use.
.	Leq(24) ≤ 55 dB	Outdoor areas where people spend limited amounts of time, such as school yards, playgrounds, etc.
Indoor activity interference and annoyance	Leq ≤ 45 dB	Indoor residential areas.
	Leq(24) ≤ 45 dB	Other indoor areas with human activities such as schools, etc.

Source: U.S. Environmental Protection Agency, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety." March 1974.

The noise effects associated with an outdoor Ldn of 55 dB are summarized in Table IV.F-3. At 55 dB Ldn, 95 percent sentence clarity (intelligibility) may be expected at 3.5 meters, and no community reaction. However, 1 percent of the population may complain about noise at this level and 17 percent may indicate annoyance.

For the purposes of this EIR, the EPA findings provide a more complete understanding of the issue of noise as well as a context in which to evaluate the proposed Uptown Project.

Table IV.F-3: Summary of Human Effects in Areas Exposed to 55 dB CNEL

Type of Effects	Magnitude of Effect
Speech – Indoors	100 percent sentence intelligibility (average) with a 5 dB margin of safety.
Speech – Outdoors	100 percent sentence intelligibility (average) at 0.35 meters. 99 percent sentence intelligibility (average) at 1.0 meters. 95 percent sentence intelligibility (average) at 3.5 meters.
Average Community Reaction	None evident; 7 dB below level of significant complaints and threats of legal action and at least 16 dB below "vigorous action."
Complaints	1 percent dependent on attitude and other non-level related factors.
Annoyance	17 percent dependent on attitude and other non-level related factors.
Attitude Towards Area	Noise essentially the least important of various factors.

Source: U.S. Environmental Protection Agency, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety." March 1974.

(2) State of California. The State of California has established regulations that help prevent adverse impacts to occupants of buildings located near noise sources. Referred to as the "State Noise Insulation Standard," it requires buildings to meet performance standards through design and/or building materials that would offset any noise source in the vicinity of the receptor. State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are found in the California Code of Regulations, Title 24 (known as the Building Standards Administrative Code), Part 2 (known as the California Building Code), Appendix Chapters 12 and 12A. For limiting noise transmitted between adjacent dwelling units, the noise insulation standards specify the extent to which walls, doors, and floor ceiling assemblies must block or absorb sound. For limiting noise from exterior noise sources, the noise insulation standards set an interior standard of 45 dBA DNL in any habitable room with all doors and windows closed. In addition, the standards require preparation of an acoustical analysis demonstrating the manner in which dwelling units have been designed to meet this interior standard, where such units are proposed in an area with exterior noise levels greater than 60 dBA DNL.

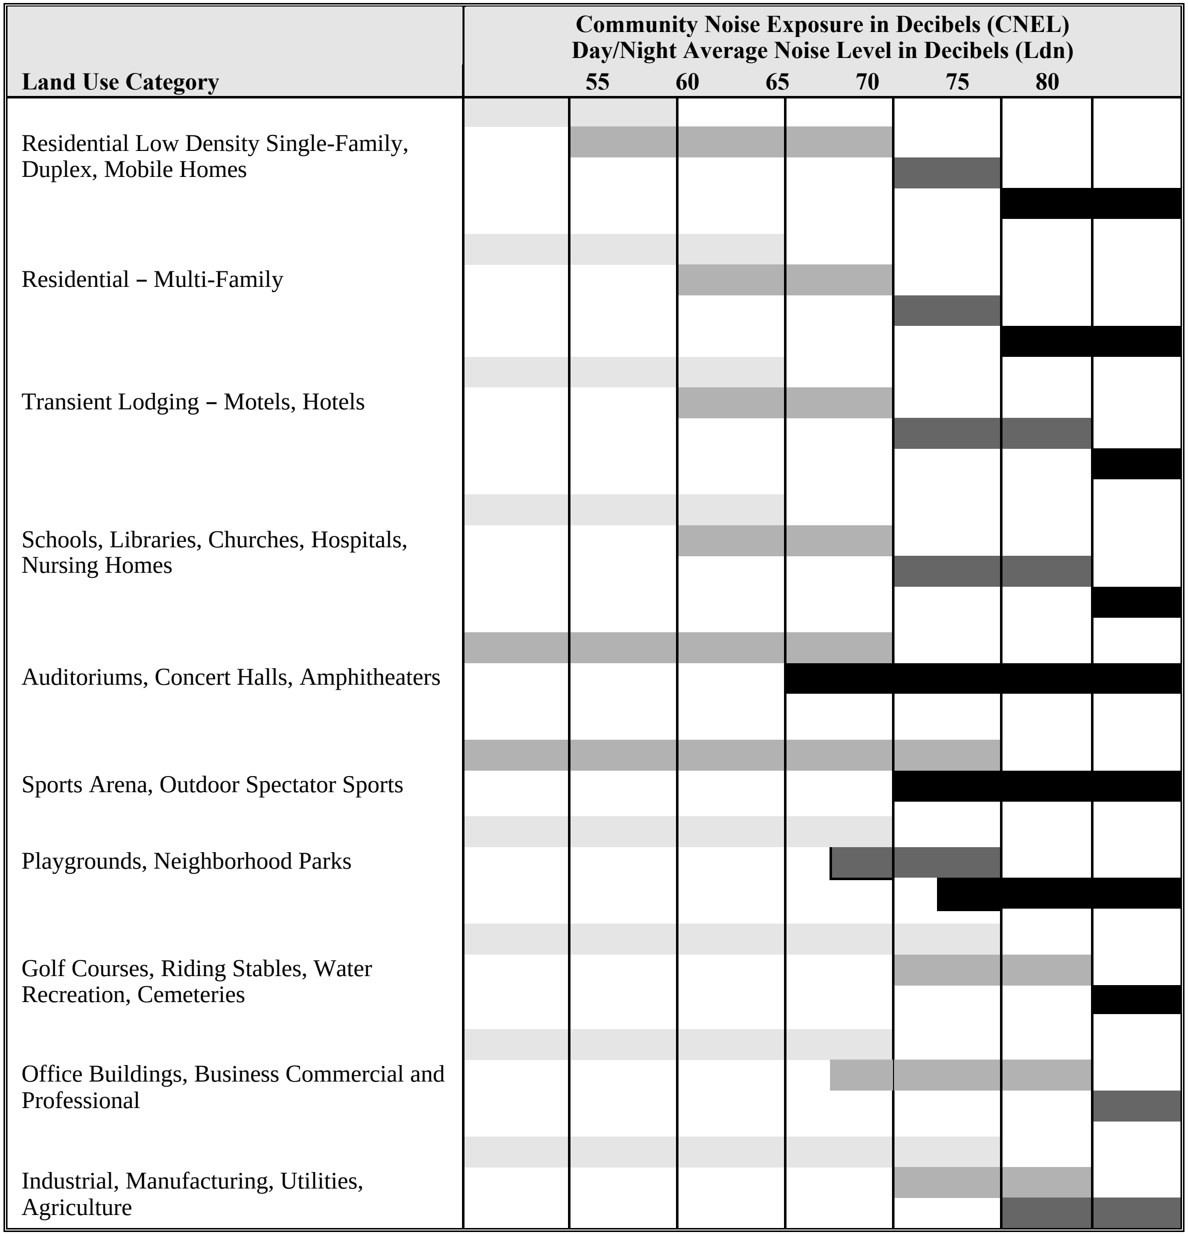
The State has also established land use compatibility guidelines for determining acceptable noise levels for specified land uses, as shown in Table IV.F-4 below.[1] This bar chart also recommends steps to be taken if one of the specified land uses (e.g., a school or church) is proposed for an area exposed to a high noise level (e.g., >85 dB): "Clearly unacceptable. New construction or development should generally not be undertaken."

(3) City of Oakland. The City of Oakland addresses noise in its Noise Element of its General Plan and in a Noise Ordinance.

---

[1] State of California, Governor's Office of Planning and Research, *General Plan Guidelines, 1998* (Appendix A, Figure 2).

Table IV.F-4: Land Use Compatibility Standards for Community Noise Environments



░ NORMALLY ACCEPTABLE
Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

▒ CONDITIONALLY ACCEPTABLE
New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.

▓ NORMALLY UNACCEPTABLE
New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

█ CLEARLY UNACCEPTABLE
New construction or development clearly should not be undertaken.

Source: Modified from State of California General Plan Guidelines, June 1987.

The City of Oakland Noise Ordinance addresses operational noise by establishing the noise standards set forth in Table IV.F-5.[2] For each of these three general land use categories, new development must not expose users to more than the noted levels for more than the noted time periods.

Table IV.F-5: City of Oakland Operational Noise Standards at Receiving Property Line, dBA[a]

Receiving Land Use	Cumulative No. of Minutes in a 1-Hr Period[b]	Maximum Allowable Noise Level (dBA) Daytime 7 a.m.-10 p.m.	 Nighttime 10 p.m.-7 a.m.
Residential and Civic[c]	20 (L_{33})	60	45
	10 ($L_{16.7}$)	65	50
	5 ($L_{8.3}$)	70	55
	1 ($L_{1.7}$)	75	60
	0 (L_{max})	80	65
		Anytime (Daytime or Nighttime)	
Commercial	20 (L_{33})	65	
	10 ($L_{16.7}$)	70	
	5 ($L_{8.3}$)	75	
	1 ($L_{1.7}$)	80	
	0 (L_{max})	85	
Manufacturing, Mining, and Quarrying	20 (L_{33})	70	
	10 ($L_{16.7}$)	75	
	5 ($L_{8.3}$)	80	
	1 ($L_{1.7}$)	85	
	0 (L_{max})	90	

[a] These standards are reduced 5 dBA for simple tone noise, noise consisting primarily of speech or music, or recurring impact noise. If the ambient noise level exceeds these standards, the standard shall be adjusted to equal the ambient noise level.

[b] L_x represents the noise level that is exceeded X percent of a given period. L_{max} is the maximum instantaneous noise level.

[c] Legal residences, schools and childcare facilities, health care or nursing homes, public open spaces, or similarly sensitive land uses.

Source: City of Oakland, 1996b.

The Noise Ordinance also addresses construction noise by establishing the maximum allowable noise levels shown in Table IV.F-6, except if an acoustical analysis is performed and all feasible mitigation measures are imposed (including the standard City of Oakland noise measures adopted by the Oakland City Council on January 16, 2001).[3]

Table IV.F-6: City of Oakland Construction Noise Standards at Receiving Property Line, dBA[a]

Receiving Land Use	Maximum Allowable Noise Level (dBA) Weekdays 7 a.m.-7 p.m.	 Weekends 9 a.m.-8 p.m.
Less Than 10 days		
Residential	80	65
Commercial, Industrial	85	70
More Than 10 Days		
Residential	65	55
Commercial, Industrial	70	60

[a] If the ambient noise level exceeds these standards, the standard shall be adjusted to equal the ambient noise level.

[b] During the hours of 7 p.m. to 7 a.m. on weekdays and 8 p.m. to 9 a.m. on weekends and federal holidays, noise levels received by any land use from construction or demolition shall not exceed the applicable nighttime operational noise level standard.

Source: City of Oakland, 1996b.

The Noise Ordinance also addresses the potential nuisance of persistent construction-related noise[4] and vibrations.[5]

c. Existing Noise Sources. Noise levels in Oakland and their effect on the City's quality of life will revolve around at least five key sources as described below.

(1) Construction Activity. Short-term noise impacts are associated with demolition, excavation, grading, and building construction. Construction-period noise levels are higher than existing noise levels, but eventually cease once construction is complete.

Construction is performed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. The character of the noise generated on each construction site and, therefore, the noise levels surrounding the site, changes as construction progresses through its sequential phases. Despite the variety in the type and size of

[5] Oakland Planning Code Section 17.120.060.

construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table IV.F-7 lists typical construction equipment noise levels recommended for noise impact assessments, based on a distance of 50 feet between the equipment and a noise receptor.

Typical noise levels range up to 91 dBA L_{max} at 50 feet during the noisiest construction phases. The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels because the noisiest construction equipment is earth-moving equipment. Earth moving equipment includes excavating machinery such as backhoes, bulldozers, draglines and front loaders, and earth moving and compacting equipment, which includes compactors, scrapers and graders. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 to 4 minutes at lower power settings.

The City of Oakland requires that all construction vehicles or equipment, fixed or mobile, be equipped with properly operating and maintained mufflers. All operations must comply with the noise ordinance standards, and stockpiling and/or vehicle staging areas must be located as far as practicable from any nearby dwellings.

(2) Stationary Sources. A wide variety of stationary sources also contribute to noise throughout the City. These sources include machinery or equipment that emit noise during operation (e.g., air conditioners, generators, restaurant loudspeakers). Noise associated with certain land uses (e.g., industrial and commercial) could be considered stationary sources if the point for noise generation was stationary and not mobile (e.g., a forklift operated in a certain area of a building or outdoor facility).

(3) Vehicular Traffic. The amount of motor vehicle noise varies according to many factors, such as traffic volumes, vehicle mix (percentage of cars and trucks), average traffic speed, and distance from the observer. Major contributing roadway noise sources in the Project area include Interstate 980 (I-980), Telegraph Avenue, San Pablo Avenue, 14th Street, Thomas L. Berkley Way (20h Street), and other roadways.

The Federal Highway Administration (FHWA) highway traffic noise prediction model (FHWA RD-77-108) was used to evaluate traffic-related noise conditions along roadway links within the Project study area. A typical vehicle mix for urban/suburban areas in California was used in this modeling effort.

(4) Rail Operations. Rail operations are a source for noise within cities with existing rail networks. The City of Oakland contains a functioning rail line that produces noise and groundborne vibration. Activity on the Amtrak rail lines represents a significant source of noise and groundborne vibration in the City. Factors that influence the overall impact of railroad noise on adjacent uses include the distance of the uses from the tracks, surrounding land topography, the intermittent nature of train events, and the absence or presence of sound walls or other barriers between the tracks and adjacent uses. The Project site is not directly adjacent to any railroad tracks and would not be significantly affected by rail operations.

Table IV.F-7: Typical Construction Equipment Noise Levels

Type of Equipment	Range of Maximum Sound Levels Measured (dBA at 15 m [50 feet])	Suggested Maximum Sound Levels for Analysis (dBA at 15 m [50 feet])
Pile Drivers, 12,000 to 18,000 ft-lb/blow	81 to 96	93
Rock Drills	83 to 99	96
Jackhammers	75 to 85	82
Pneumatic Tools	78 to 88	85
Pumps	68 to 80	77
Dozers	85 to 90	88
Tractors	77 to 82	80
Front-End Loaders	86 to 90	88
Hydraulic Backhoe	81 to 90	86
Hydraulic Excavators	81 to 90	86
Graders	79 to 89	86
Air Compressors	76 to 86	86
Trucks	81 to 87	86

Source: Noise Control for Buildings and Manufacturing Plants, Bolt, Beranek & Newman, 1987.

(5) Aircraft Operations. Aircraft overflights also contribute to the ambient noise levels in Oakland. The Metropolitan Oakland International Airport (MOIA) provides a variety of services to commercial aircraft and is planning for expansion through the implementation of its Airport Development Program (ADP). Increased airport operations, changes in the mix of aircraft, and changes in the distribution of different classes of aircraft operations among the runways of MOIA would all be expected to increase aircraft-related noise.

2. Impacts and Mitigation Measures

This section evaluates potential noise impacts associated with the Specific Plan and identifies mitigation measures to address these impacts, as appropriate.

a. Significance Criteria. The Project would have a significant impact on the environment if it would:

- Expose persons to or generate noise levels in excess of standards established in the Oakland general plan or applicable standards of other agencies (e.g., OSHA);
- Violate the City of Oakland Noise Ordinance (Oakland Planning Code Section 17.120.050) regarding operational noise;
- Violate the City of Oakland Noise Ordinance (Oakland Planning Code Section 17.120.050) regarding construction noise, except if an acoustical analysis is performed and all feasible mitigation measures imposed, including the standard City of Oakland noise measures adopted by the Oakland City Council on January 16, 2001:

During the hours of 7 p.m. to 7 a.m. on weekdays and 8 p.m. to 9 a.m. on weekends and federal holidays, noise levels received by any land use from construction or demolition shall not exceed the applicable nighttime operational noise level standard (see previous table);

- Violate the City of Oakland Noise Ordinance (Oakland Planning Code Section 8.18.020) regarding nuisance of persistent construction-related noise;
- Create a vibration which is perceptible without instruments by the average person at or beyond any lot line containing vibration-causing activities not associated with motor vehicles, trains, and temporary construction or demolition work, except activities located within the (a) M-40 zone or (b) M-30 zone more than 400 feet from any legally occupied residential property (Oakland Planning Code Section 17.120.060);
- Generate interior L_{dn} or CNEL greater than 45 dBA for multi-family dwellings, hotels, motels, dormitories and long-term care facilities (may be extended by local legislative action to include single family dwellings) per California Noise Insulation Standards (CCR Part 2, Title 24);
- Result in a 5 dBA permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project;
- Conflict with State Land Use Compatibility Guidelines (Office of Planning and Research, 1998) for all specified land uses for determination of acceptability of noise Source: State of California, Governor's Office of Planning and Research, *General Plan Guidelines, 1998* (Appendix A, Figure 2);
- Be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, and would expose people residing or working in the Project area to excessive noise levels; or
- Be located within the vicinity of a private airstrip, and would expose people residing or working in the Project area to excessive noise levels.

b. Less-than-Significant Noise Impacts. Three noise sources would produce less-than-significant effects on residents and employees at the Project site.

(1) Train Noise. The proposed Project is located approximately one half mile north of the Union Pacific railroad tracks. In addition, the railroad tracks are located on the opposite side of I-880 from the Project. Therefore, while train noise might be noticeable from locations on the Project site, the levels would not be significant.

(2) Aircraft Noise. The proposed Project is located approximately six miles northwest of the Oakland International Airport. Due to the Project's distance from the airport, no significant noise impacts in terms of 24-hour averaged noise level, such as CNEL or L_{dn}, would occur at the Project site. Also, the Project site is not located within the vicinity of a private airstrip.

(3) Vibration Impact. The proposed Project does not include any sources that would generate long-term vibrations that would be perceptible to humans at nearby sensitive receptors. (Impact NOISE-1 below addresses short-term construction period pile driving and the resulting impact.)

c. Significant Noise Impacts. Noise impacts related to three sources would result in significant impacts.

Impact NOISE-1: Noise levels from construction activities may range up to 91 dBA L_{max} at the nearest land uses to the Project site for limited time periods during the duration of construction for certain activities such as pile driving or the use of other heavy equipment. (S)

The transport of workers and construction equipment and materials to the Project site would incrementally increase noise levels on access roads leading to the site. Because workers and construction equipment would use existing routes, noise from passing trucks (87 dBA L_{max} at 50 feet) would be similar to existing truck-generated noise. For this reason, short-term intermittent noise from trucks would be minor when averaged over a longer time period. In addition, noise associated with on-road vehicles is regulated by federal and state governments and is exempted from local government regulations. Therefore, short-term construction-related impacts associated with worker and equipment transport to the proposed Project site would result in a less-than-significant impact on receptors along the access routes leading to the proposed Project site.

However, noise generated during excavation, grading, and building erection on the Project site would result in potential noise impacts on off-site uses and to on-site uses if they were to occupy the site while later phases of construction were continuing. Existing tenants in the Project vicinity may be subject to short-term noise generated by construction equipment and activities on the Project site when construction occurs near the Project boundary.

Construction is performed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These phases would change the character of the noise generated on the Project site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table IV.F-7 lists typical construction equipment noise levels recommended for use in noise impact assessments, based on a distance of 50 feet between the equipment and a noise receptor. Typical construction noise levels vary up to a maximum of 91 dBA L_{max} at 50 feet during the noisiest construction phases. The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels because the noisiest construction equipment is earthmoving equipment. Earthmoving equipment includes excavating machinery such as backhoes, bulldozers, draglines, and front loaders and earthmoving and compacting equipment, which includes compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings.

Construction of the proposed Project is expected to require the use of earthmovers such as bulldozers and scrapers, loaders and graders, water trucks, and pickup trucks. As shown in Table IV.F-7, the typical maximum noise level generated by each earthmover on the proposed Project site is assumed to be 88 dBA L_{max} at 50 feet from the operating earthmover. The maximum noise level generated by water and pickup trucks is approximately 86 dBA L_{max} at 50 feet from these vehicles. Each doubling of the sound sources with equal strength would increase the noise level by 3 dBA. Assuming each piece of construction equipment operates at some distance apart from the other equipment, the worst-case combined noise level at the nearest residences during this phase of construction would be 91 dBA L_{max} at a distance of 50 feet from an active construction area. Pile driving may also be required, which could generate noise levels above 90 dBA L_{max}.

Pile driving may be necessary in the construction of the proposed buildings. Noise associated with pile driving can be a very loud, impulsive sound, resulting from a large hammer that drops on reinforced concrete piles. Individual noise impacts are of short duration (under one second), but the noise is repetitive, occurring about once every two seconds. Pile driving also generates vibration that is perceptible at a distance of 100 feet but would not cause damage to other properties.

Construction of the proposed project will require more than ten days to complete. The City's construction noise thresholds for residential land uses are 65 dBA L_{max} on weekdays, between the hours of 7:00 a.m. and 7:00 p.m., and 55 dBA L_{max} on weekends, between the hours of 9:00 a.m. and 8:00 p.m. For commercial and industrial land uses the construction noise thresholds are 70 dBA L_{max} on weekdays and 60 dBA L_{max} on weekends. These thresholds are shown in Table IV.F-6. The closest land uses to the project area are located at a distance of approximately 50 feet from the project boundary. Therefore, the nearest land uses will be exposed to noise levels of up to 91 dBA L_{max}. This noise level will exceed the City's weekday and weekend noise thresholds for residential, commercial, and industrial land uses even with the implementation of the mitigation measures detailed below. However, due to the short-term nature of this construction-related impact, the City of Oakland considers it a less-than-significant impact if all feasible mitigation measures are imposed as detailed in the above significance criteria.

The following measures shall be implemented during construction of the proposed Project:

Standard Construction Requirements

Mitigation Measure NOISE-1a: Standard construction activities shall be limited to between 7:00 a.m. and 7:00 p.m. Monday through Friday. No construction activities shall be allowed on weekends until after the buildings are enclosed without prior authorization of the Building Services and Planning Divisions of the Community and Economic Development Agency.

Mitigation Measure NOISE-1b: To reduce daytime noise impacts due to construction, to the maximum feasible extent, the City shall require the applicant to develop a site-specific noise reduction program, subject to city review and approval, which includes the following measures:

- Signs shall be posted at the construction site that include permitted construction days and hours, a day and evening contact number for the job site, and a day and evening contact number for the City in the event of problems;
- An on-site complaint and enforcement manager shall be posted to respond to and track complaints;
- A pre-construction meeting shall be held with the job inspectors and the general contractor/on-site Project manager to confirm that noise mitigation and practices are completed prior to the issuance of a building permit (including construction hours, neighborhood notification, posted signs, etc.);
- Equipment and trucks used for Project construction shall utilize the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers,

ducts, engine enclosures, and acoustically attenuating shields or shrouds, wherever feasible);

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for Project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed-air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed-air exhaust shall be used; this muffler can lower noise levels where feasible, which could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible; and
- Stationary noise sources shall be located as far from sensitive receptors as possible, and they shall be muffled and enclosed within temporary sheds, or insulation barriers or other measures shall be incorporated to the extent feasible.

Pile-Driving Requirements and Conditions (to be implemented if pile driving required).

Mitigation Measure NOISE-1c: If pile-driving occurs as part of the Project, it shall be limited to between 8:00 a.m. and 4:00 p.m., Monday through Friday, with no pile driving permitted between 12:30 and 1:30 p.m. No pile driving shall be allowed on Saturdays, Sundays, or holidays.

Mitigation Measure NOISE-1d: To further mitigate potential pile-driving and/or other extreme noise-generating construction impacts, a set of site-specific noise attenuation measures shall be completed under the supervision of a qualified acoustical consultant. This plan shall be submitted for review and approval by the City to ensure that maximum feasible noise attenuation is achieved. These attenuation measures shall include as many of the following control strategies as feasible and shall be implemented prior to any required pile-driving activities:

- Implement “quiet” pile-driving technology, where feasible, in consideration of geotechnical and structural requirements and conditions;
- Erect temporary plywood noise barriers around the entire construction site;
- Utilize noise control blankets on the building structure as it is erected to reduce noise emission from the site;
- Evaluate the feasibility of noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings; and
- Monitor the effectiveness of noise attenuation measures by taking noise measurements.
- A third-party peer review, paid for by the applicant, shall be required to assist the City in evaluating the feasibility and effectiveness of the noise reduction plan submitted by the applicant.
- A special inspection deposit is required to ensure compliance with the noise reduction plan. The amount of deposit shall be determined by the Building Official and the deposit shall be submitted by the project sponsor concurrent with submittal of the noise reduction plan.

Mitigation Measure NOISE-1e: A process with the following components shall be established for responding to and tracking complaints pertaining to pile-driving construction noise:

- A procedure for notifying City Building Division staff and Oakland Police Department;
- A list of telephone numbers (during regular construction hours and off-hours);
- A plan for posting signs on-site pertaining to complaint procedures and who to notify in the event of a problem;
- Designation of a construction complaint manager for the Project; and
- Notification of neighbors within 300 feet of the Project construction area at least 30 days in advance of pile-driving activities.

Construction period impacts would still occur with implementation of the measures detailed above. However, because they would be short-term in duration, the City considers this a less-than-significant impact. (LTS)

Impact NOISE-2: Local traffic will generate long-term noise levels exceeding *Normally Acceptable* and *Conditionally Acceptable* noise levels on the Project site. (S)

The FHWA highway traffic noise prediction model (FHWA RD-77-108) was used to evaluate traffic-related noise conditions in the vicinity of the Project site. The traffic volumes were taken from the traffic report prepared for the Project by Korve Engineering . The resultant noise levels were weighted and summed over a 24-hour period in order to determine the CNEL values. CNEL contours are derived through a series of computerized iterations to isolate the 60, 65, and 70 dBA CNEL contour for traffic noise levels in the Project area. The future traffic noise levels that would occur with and without the Project are shown in Tables IV.F-8 and IV.F-9.

Table IV.F-9 shows that implementation of the proposed Project would result in relatively minor changes in traffic noise levels. The largest increase in traffic related noise would occur on William Street, which would experience a 1.6 dBA increase over the no-build scenario. Since the Project would not result in a significant increase in traffic noise, no mitigation is required for off-site areas.

Table IV.F-9 shows that portions of the project site would be exposed to noise levels between 65 dBA CNEL and 75 dBA CNEL. Such noise levels would conflict with the State's Land Use Compatibility Guidelines, which define noise levels below 65dBA CNEL as *Normally Acceptable* and between a 60 dBA CNEL and 70 dBA CNEL as *Conditionally Acceptable* for multi-family residential uses (see Table IV.F-4). The traffic noise levels predicted adjacent to streets within the Project site are as follows:

- *San Pablo Avenue.* The distance of the Project site property line to the centerline of San Pablo Avenue is approximately 50 feet. The 70 CNEL is estimated to be less than 50 feet[6] from the centerline and the 65 CNEL from between 72 feet and 109 feet from the centerline. As a result, noise levels within portions of the Project site adjacent to San Pablo Avenue will be as high as 70 dBA, which falls within the *Conditionally Acceptable* range for multi-family residential uses and the *Normally Acceptable* range for commercial uses.

---

[6] The traffic noise prediction model cannot predict distances less than 50 feet.

- *Telegraph Avenue.* The distance of the Project site property line to the centerline of Telegraph Avenue ranges from approximately 45 to 50 feet. The 70 CNEL is estimated to encroach into the Project site a maximum of 17 feet. The 65 CNEL is estimated to encroach between 87 and 41 feet (depending on exact location) into the Project site. As a result, noise levels within portions of the Project site adjacent to Telegraph Avenue will be as high as 72 dBA, which falls within the *Normally Unacceptable* range for multi-family residential and the Conditionally Acceptable range for commercial uses.
- *21st Street.* Traffic volumes were not modeled for 21st Street, but the volumes are estimated to result in an ADT of less than 5,000. Based on this estimation and comparison with other similar streets, the noise levels within portions of the Project site adjacent to 21st Street are estimated to be as high as between 60 and 65 dBA, which fall within the *Normally Acceptable* range for multi-family residential and commercial uses.
- *Thomas L. Berkley Way (20th Street)*. The distance of the Project site property line to the centerline of Thomas L. Berkley Way (20th Street) is approximately 40 feet. The 70 CNEL is estimated to be less than 50 feet from the street centerline and the 65 CNEL is estimated to be 63 feet from the centerline. As a result, noise levels within portions of the Project site adjacent to Thomas L. Berkley Way (20th Street) will be as high as 68 dBA, which falls within the *Conditionally Acceptable* range for multi-family residential uses and the *Normally Acceptable* range for commercial and neighborhood park uses.
- *William Street*. The distance of the Project site property line to the centerline of William Street is approximately 25 feet. The 65 CNEL is estimated to be less than 50 feet from the street centerline and the 60 CNEL is estimated to be 69 feet from the centerline. As a result, noise levels within portions of the Project site adjacent to William Street will be as high as 68 dBA, which falls within the *Conditionally Acceptable* range for multi-family residential uses and the *Normally Acceptable* range for commercial and neighborhood park uses.
- *19th Street.* The distance of the Project site property line to the centerline of 19th Street is approximately 30 feet. The 70 CNEL is estimated to be less than 50 feet from the street centerline and the 65 CNEL is estimated to be 56 feet from the centerline. As a result, noise levels within portions of the Project site adjacent to 19th Street will be as high as 69 dBA, which falls within the *Conditionally Acceptable* range for multi-family residential uses and the *Normally Acceptable* range for commercial uses.
- *18th Street.* Noise levels on portions of the site adjacent to 18th Street are not expected to exceed 65 dBA, which falls within the *Normally Conditional* range for multi-family residential and commercial uses.

Standard residential construction in northern California would provide 25 dBA exterior-to-interior noise reduction with windows closed and ensure that interior noise levels within most of the buildings would be reduced to 45 dBA. However, buildings that front onto Telegraph Avenue could be exposed to noise levels as high as 72 dBA. Building façade upgrades will be necessary for these buildings to meet the 45 dBA interior noise standard. Additionally, to ensure that windows can remain closed for prolonged periods of time, an air-conditioning system will be required in all buildings.

The State's Land Use Compatibility Guidelines are used as the bases for determining acceptable noise levels for exterior uses. Noise levels below 65 dBA are considered *Normally Acceptable* for multi-family residential uses and levels below 70 dBA are considered *Normally Acceptable* for commercial and playgrounds or neighborhood parks. Outdoor use areas that may be developed as part of the Uptown Project include patios, balconies and common use areas (e.g., BBQ area, playground, recreation area) associated with the residential units, the neighborhood park, and outdoor eating areas. Outdoor residential use areas that may be included in the final Project design adjacent to any of the street frontages other than 21st or 18th Streets could be exposed to traffic noise levels that exceed 65 dBA and the *Normally Acceptable* range for residential exterior uses. Sound barriers such as walls or berms at an effective height of 6 feet or plexiglass at a height of 5 feet (i.e., to shield balconies and or outdoor patio areas) would provide 5dBA or more in noise reduction for outdoor use areas.

Implementation of the following mitigation measure would ensure that conditionally acceptable noise levels are achieved:

> Mitigation Measure NOISE-2: Once the project design is finalized and the location of specific uses are determined, the project applicant shall have an acoustical analysis prepared that details noise reduction requirements and noise insulation features necessary to achieve acceptable interior and exterior noise levels. The requirements shall be sufficient to achieve a minimum of 45 dBA for all interior building spaces and shall achieve either Normally Acceptable or Conditionally Acceptable ranges for exterior uses according to the applicable land use category as set forth in Table IV.F-4.
>
> Measures to reduce the interior noise levels may include:
>
> - To meet the City's 45 dBA CNEL interior noise standard, building facade upgrades will be required for building located along Telegraph Avenue. All windows facing Telegraph Avenue must have a sound transmission class (STC) of 31 or greater.
> - All of the proposed buildings on the project site shall be designed and constructed with ventilation systems, to achieve the indoor fresh-air ventilation requirements specified in Chapter 35 of the Uniform Building Code, to achieve the 45 dBA CNEL interior noise standard.
>
> Measures to reduce the exterior noise levels may include:
>
> - The inclusion of plexiglass enclosures for outdoor patio and balcony areas at a height of 5 feet (i.e., to shield balconies and or outdoor patio areas) would provide 5dBA or more in noise reduction for outdoor use areas.
>
> Implementation of the above mitigation measure would reduce this impact to a less-than-significant level by achieving, at a minimum, *Conditionally Acceptable* noise levels. (LTS)

Impact NOISE-3: Long-term stationary noise sources on the Project site could potentially generate noise levels in excess of the thresholds set in Section 17.120.050 of the City's Planning Code. (S)

As noise spreads from a source, it loses energy so that the farther away the noise receiver is from the noise source, the lower the perceived noise level would be. Geometric spreading causes the sound level to attenuate, resulting in a six-decibel reduction in the noise level for each doubling of distance from a single point source of noise to the noise receptor.

Mechanical equipment and other on-site sources (e.g., air-conditioning or other mechanical ventilation equipment, delivery loading docks or areas, emergency generators, etc.) from the proposed retail and residential uses could generate noise that would exceed the City's noise standards.

To prevent noise impacts on adjacent land uses, loading docks or loading areas and noise-generating equipment associated with the proposed uses should be located as far as practical from all existing and planned residential properties.

> Mitigation Measure NOISE-3: The following measures are required for the operations of the proposed Project:
>
> - All on-site stationary noise sources shall comply with the standards listed in Section 17.120.050 of the City's Planning Code; and
> - Loading docks or loading areas and noise-generating equipment associated with the retail uses will be located as far as practical from all existing and planned residential properties.
>
> Implementation of the above mitigation measure would reduce the impact to below a level of significance. (LTS)

G. HAZARDS AND HAZARDOUS MATERIALS

This section describes the potential for hazardous materials[1] to affect human health and the environment at the Project site. Several parcels within and adjacent to the vicinity of the Project site have been identified as locations where hazardous materials have been used, stored, and/or released. The potential for current and future workers and residents to be exposed to hazardous materials in soils, groundwater, and building materials is described below. Mitigation measures for the Project have been drafted, where necessary, to reduce potential impacts due to hazardous materials to a less-than-significant level. Abbreviations and acronyms used in this hazards sections are shown in Table IV.G-1.

1. Setting

The following section describes previous environmental investigations of soil and groundwater conditions within the Project site and the regulatory framework that governs hazardous material management and remediation.

a. Previous Environmental Investigations. Dozens of environmental investigations have been performed in the Project site vicinity. The investigations include Phase I environmental site assessments (ESAs), Phase II ESAs, and other investigations. Phase I ESAs are conducted to identify potential contamination issues at a property by inspecting the site and reviewing readily available information, including previous environmental investigations, historical land use records, and regulatory agency information. Phase II ESAs include the collection of soil and/or groundwater samples to investigate potential issues identified during the Phase I ESA process. Depending on the findings of the Phase I and Phase II investigations, other environmental investigations may follow to delineate the extent of contamination identified during previous investigations or to evaluate the effectiveness of remedial actions. Focused investigations may also be conducted when a hazardous material release is identified, such as following removal of an underground petroleum storage tank (UST).

Much of the setting information in this section is summarized from a Draft Environmental Investigation prepared in 2001 for the Project applicant by Harding ESE, Inc.[2] Harding ESE summarized previous environmental investigations for the area and conducted and/or updated Phase I ESAs for Project Blocks 1 through 7. A limited Phase II ESA was also performed for that investigation, which included collection of soil and groundwater samples from six locations at and adjacent to Blocks 1 and 2.

---

[1] The California Health and Safety Code defines a hazardous material as, "...any material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety, or to the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, radioactive materials, and any material which a handler or the administering agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment." (California Health and Safety Code ' 25501).

For this analysis, the information in the Harding ESE investigation was supplemented by review of additional environmental reports to provide information regarding Blocks 8 and 9, and information obtained in investigations completed after the Harding ESE report. Reports relied on for this analysis include:

Subsurface Consultants, Inc., 2001, *Phase I Environmental Site Assessment*, 1961-1975 Telegraph Avenue, Oakland, California, June 7.

Subsurface Consultants Inc. (SCI), 2001, *Phase I Environmental Site Assessment*, 605-609 20th Street, Oakland, California, August 29.

Subsurface Consultants, Inc., 2002, *Phase I Environmental Site Assessment,* Paramount Theater Parking Garage, 2100 and 2150 Telegraph Avenue, Oakland, California, February 27.

Subsurface Consultants, Inc., 2002, Letter Report, *Groundwater Investigation*, Uptown Theatre District, Oakland, California, November 11.

URS, 2002, *2002 Third Quarter Groundwater Monitoring Report*, Former Sears Retail Center #1039, 1901-1911 Telegraph Avenue, Oakland, California, Case ID # STID 1630 for Sears Roebuck & Co, December 12.

Aqua Science Engineers, Inc., 2003, *Report of Soil and Groundwater Assessment*, ASE Job No. 3848, Feldstein Property, 1940 San Pablo Avenue, Oakland, California, February 5.

Subsurface Consultants, Inc., 2003, Letter Report, *Result of Soil Investigation*, 565, 571, and 585 20th Street, Oakland, California, February 28.

A summary of the findings of these investigations is presented in Table IV.G-2.

Most of the hazardous materials concerns identified during the Harding ESE investigation were related to historic land uses that may have used hazardous materials. These land uses included a dry cleaning establishment, several auto repair businesses, vehicle parking lots, a bus depot, a photo finishing business, and other commercial and light industrial land uses. Releases of petroleum hydrocarbons, solvents, and wastes containing heavy metals could have occurred during the periods of time these land uses were present at the Project site. If hazardous materials releases have occurred, construction workers could come into contact with contaminated soils and groundwater during Project construction.

Not all of the potential hazardous material issues at the Project site blocks have been fully investigated. Soil and groundwater analyses have largely focused on Project site Blocks 1 to 6, where initial phases of Project development have been proposed to take place. No Phase II investigations are known to have been conducted at Blocks 7, 8, or 9. Based on historical land uses, there is a chance that petroleum hydrocarbons, pesticides, polynuclear aromatic hydrocarbons (PAHs), heavy metals, and solvents could be encountered in soil and groundwater during redevelopment activities at those blocks. In addition, there are several potential hazardous materials concerns within the other Project site blocks that were identified during Phase I investigations but have not yet been evaluated, due to lack of right-of-entry agreements or other access constraints. Additional investigation will be required to determine if significant hazardous materials releases have occurred at these locations. The impact and mitigation measures subsection of this section provides recommendations for these subsequent investigations.

The Project site has also been affected by releases from underground storage tanks (USTs). USTs from a former gasoline service station were present on Block 4, and have affected groundwater quality on Block 2 and Block 4. Releases from a UST at a bus depot located on Block 7 have also been reported, although remediation at that site has been completed, and residual contamination at that site would not be expected to affect redevelopment. There may be a potential to encounter abandoned USTs during development, such as waste oil tanks from former auto repair facilities, or fuel oil tanks from former commercial and residential land uses.

A regional issue affecting several of the Project site blocks is the presence of chlorinated solvents in groundwater. The primary compound of concern is tetrachloroethylene (PCE). PCE is a manufactured chemical that is widely used for dry cleaning of fabrics and for metal-degreasing. It is also used to make other chemicals and a component of some consumer products. Based on animal experiments, exposure to elevated concentrations of PCE is suspected to cause liver and kidney cancer.[3]

Table IV.G-2: Summary of Previous Environmental Investigation Findings

Blocks[a]	**Current and Historic Land Uses Potentially Associated with Hazardous Materials**	**Summary of Findings**
1 and 2	Garment Factory, Dry Cleaners, Gasoline Service Station, Auto Repair, Machine Shop, Battery Retail Sales, Parking	Underground storage tanks associated with a former gasoline station near the boundary of Block 2 and Block 4 were removed in the late 1980s. Total petroleum hydrocarbons, solvents, and benzene are present in groundwater in this area. During the most recent sampling activity (Fall 2002), benzene in groundwater near the former gasoline station was identified at concentrations up to 11,500 μg/L, above the URL Program Tier 1 residential screening level of 110 μg/L for residential land uses, and above the Tier 1 commercial/industrial screening level of 3,700 μg/L. A soil investigation at 565-585 Telegraph Avenue, in the northern portion of Block 1, identified one location with shallow soils containing petroleum hydrocarbons as diesel at 5,800 mg/kg, petroleum hydrocarbons as motor oil at 5,500 mg/kg, and naphthalene at 37 mg/kg. This appeared to be a limited area of contamination, as other soil samples within 25 feet contained much lower concentrations of contaminants. Soil and groundwater samples from the 1940 San Pablo Avenue property located at the northwest corner of Block 2 were collected and did not contain petroleum hydrocarbons, metals, or volatile organic compounds (including solvents) above health-risk based screening levels. Asbestos-containing materials and lead-based paint are known to be present in structures at the blocks.
3 and 4	Gasoline Station, Auto Repair, Hospital, Photo Finishing, Parking	Underground storage tanks associated with the gasoline station on Block 4 were removed in the late 1980s. Total petroleum hydrocarbons and solvents are present in groundwater. Additional areas of petroleum hydrocarbons, solvents, and/or metals may be present in soils from historic land uses. During the most recent sampling activity (Fall 2002), benzene in groundwater near the former gasoline station was identified at concentrations up to 11,500 μg/L, above the URL Program Tier 1 residential screening level of 110 μg/L for residential land uses, and above the Tier 1 commercial/industrial screening level of 3,700 μg/L. Asbestos-containing materials and lead-based paint are known to be present in structures at the blocks.
5 and 6	Machine Shop, Laboratory, Trucking Company, Parking	Buildings within these blocks have been demolished. Relatively low concentrations of petroleum hydrocarbons have been detected in limited soil sampling. Additional areas of soils affected by petroleum hydrocarbons, solvents, and/or metals may be present from historic land uses in areas that were not accessible for sampling in previous investigations.
7	Tire Service, Bus Depot, Power Substation, Plant Nursery, Parking	No soil or groundwater investigations are known to have been performed at this block. Releases from a former underground storage tank have been reported at the site, but the case has been closed by ACHCS, indicating that no further investigation or remediation is necessary. Soils and/or groundwater affected by petroleum hydrocarbons, pesticides, solvents, polynuclear aromatic hydrocarbons, and/or metals could potentially be present from historic land uses. Based on the age of the buildings, asbestos-containing materials and lead-based paint are suspected to be present.

Table IV.G-2 *continued*

Blocks[a]	**Current and Historic Land Uses Potentially Associated with Hazardous Materials**	**Summary of Findings**
8	Wood and Coal Yard, Parking	No soil or groundwater sampling is known to have been completed at this block. Historical land uses and potential contamination that may have migrated from adjacent current and former gasoline service stations are hazardous materials issues within this block.
9	Cabinet Factory, Auto Repair, Dyeing and Cleaning Facility, Parking	No soil or groundwater sampling is known to have been completed at this block. Historical land uses and potential contamination that may have migrated from adjacent current and former gasoline service stations are hazardous materials issues within this block. Based on the age of the buildings, asbestos-containing materials and lead-based paint are suspected to be present.

[a] Blocks 1-7 have been grouped based on the evaluation in the Harding ESE Environmental Investigation Report.

Source: Baseline Environmental, 2003. Also refer to list of references on page IV.G-2 and -3.

Shallow groundwater in the Project vicinity is not considered a likely potential drinking water source, but the public could potentially be exposed to PCE from groundwater that has evaporated and migrated through the soil into indoor and outdoor air. The City of Oakland Urban Land Redevelopment (ULR) Program has established health risk-based corrective action levels for PCE and other contaminants that are designed to provide screening criteria for cleanup of contaminated sites. The ULR program has established 200 micro grams per liter (μg/L) as a Tier 1 screening level for PCE at residential sites, and 3,300 μg/L at commercial and industrial sites, in locations where groundwater is not a potential drinking water source. The Tier 1 screening levels are designed to be conservative, health-risk based values; sites with contaminant concentrations lower than the Tier 1 screening levels would not be expected to present a health risk to future site users, while sites with concentrations higher than the Tier 1 levels may require additional analysis and/or investigation to determine potential health risks.

Beginning in 1991, the City of Oakland has installed and sampled groundwater monitoring wells in the Project vicinity to delineate the extent of chlorinated solvents in groundwater, and to attempt to determine the source of the contamination. Wells were sampled in 1991, 1994, 1998, 2000, and 2002, and between samplings additional monitoring wells have been installed to provide additional information. Eighteen groundwater monitoring wells have been installed, and during the most recent sampling in 2002, samples were collected from fifteen of those wells.

PCE concentrations have consistently been highest near the western boundary of the Project site blocks, in wells at and near San Pablo Avenue. During the most recent sampling, the highest concentration measured was 710 μg/L at well MW-13, located at the corner of San Pablo Avenue and William Street. Samples from two other wells also contained PCE above the Tier 1 residential screening level of 200 μg/L: MW-11, on 19th Street east of San Pablo Avenue, and MW-17, on San

Pablo Avenue near Jefferson Street.[4] These wells are located adjacent to Project site blocks 1, 2, and 5. Additional evaluation may be necessary to determine potential health effects to future residential site users at these parcels as a result of PCE contamination. None of the samples collected from these wells have contained PCE above the commercial/industrial Tier 1 screening level of 3,300 μg/L.

Trace concentrations of cis-1,2-dichloroethene, a breakdown product of PCE, were identified in two of the samples in 2002, suggesting that some natural biodegradation of the PCE may be occurring.[5] No evidence of vinyl chloride, a more toxic natural breakdown product that can be produced under certain conditions, has been identified at the Project area. Although the overall trend of concentrations in groundwater over time has been toward lower concentrations of PCE, two of the wells sampled in 2002 contained higher concentrations of PCE than in 2000.[6] Additional investigation will likely be necessary to pinpoint the source of the PCE in groundwater and evaluate concentration trends and resulting potential environmental impacts.

b. Regulatory Framework. A large number of federal, State, and local laws and regulations affect the management of hazardous materials. In California, the US Environmental Protection Agency (US EPA) has granted most enforcement authority over Federal hazardous materials regulations to the California Environmental Protection Agency (Cal EPA). In turn, a local agency, Oakland Fire Services Agency (OFSA), has been granted authority by the State to enforce most regulations pertaining to hazardous materials management in the City of Oakland, such as the Hazardous Materials Business Plan Program and permitting for underground storage tanks.

A slightly different regulatory framework exists for oversight over investigation and remediation of sites affected by hazardous materials releases. Oversight can be performed by State agencies, such as the Department of Toxic Substances Control (DTSC), regional agencies, such as the San Francisco Bay Regional Water Quality Control Board (RWQCB), or local agencies such as Alameda County Health Care Services (ACHCS). Oversight of many contaminated sites in Oakland, such as those associated with leaking underground storage tanks, is performed by the Local Oversight Program of ACHCS, under an agreement with RWQCB. DTSC often acts as lead agency for more complex sites, such as those in the State Annual Work Plan program (State superfund sites). At the Project site, ACHCS has performed oversight of leaking underground storage tank cases at Project site blocks 4 and 7 (described above), while the RWQCB has been involved with oversight over groundwater contamination issues in the Project vicinity since 1999. It is expected that RWQCB will continue to be involved with investigation and remediation of hazardous materials issues in the Project area. A more detailed discussion of regulatory agencies and their respective jurisdictions is included as Appendix E of this EIR.

OFSA provides emergency response to hazardous materials incidents in Oakland. ACHCS assists in emergency response by providing a 24-hour emergency vehicle for identification and advice to first responders regarding the hazardous materials present in the event of a fire or an accidental spill.

---

[5] Ibid.

[6] Ibid.

Redevelopment agencies involved in site investigation and remediation of hazardous materials may utilize the Polanco Redevelopment Act (California Health and Safety Code, section 33459, et seq.). The Polanco Act was enacted to encourage the safe reuse of potentially contaminated properties. The Act grants redevelopment agencies substantial discretion and authority in the cleanup process. The powers granted under the Act can allow a redevelopment agency to significantly speed up the investigation and remediation process of potentially contaminated properties, and provides mechanisms for recovery of the costs incurred. Typically, the purchaser of a property would assume potential liability for historical contamination, which can act as a disincentive for redeveloping contaminated properties. Following successful assessment and remediation of a property under the provisions of the Act, developers and future land owners are not liable for future cleanup costs that may be incurred as a result of historic contamination. Liable entities could include previous landowners.

c. Lead and Asbestos in Building Materials. Lead and asbestos are potentially hazardous materials that are often present in buildings constructed prior to the 1980s. They are regulated differently than other hazardous materials issues, in that lead-based paint may be a worker health and safety issue, and asbestos containing materials are considered both a worker health and safety issue and a potential air quality issue. Accordingly the California Department of Occupational Safety and Health (DOSH), and the Bay Area Air Quality Management District (BAAQMD) regulate demolition and renovation of structures containing lead and asbestos. Demolition and renovation of buildings containing lead and asbestos can be performed safely using special techniques to contain lead particles and asbestos fibers, and personal protective equipment to protect workers. Once abated, lead-based paint and asbestos-containing materials may be hazardous wastes.

Prior to 1978, lead compounds were commonly used in interior and exterior paints. Prior to the 1980s, building materials often contained asbestos fibers, which were used to provide strength and fire resistance. Demolition or renovation of structures constructed prior to these dates has the potential to release lead particles and/or asbestos fibers to the air, where they may be inhaled by construction workers and the general public.

A survey of lead and asbestos in building materials was performed on Blocks 1 through 6 in 1999 by Consulting Associates of California.[7] Lead and asbestos were identified on each of the blocks surveyed. Because most of the buildings on other blocks within the Project site were constructed during the same time period as those on Blocks 1 through 6, lead and asbestos are likely present within these areas. Since the survey was conducted, subsequent survey and abatement activities have taken place, and a number of buildings at the Project site have been demolished, including all structures on Blocks 5 and 6. Block 8 is a surface parking lot, with no structures that potentially contain lead or asbestos.

Lead is a suspected human carcinogen, a known teratogen (i.e., it is a known cause of birth defects), and a reproductive toxin. Federal and State regulations govern the renovation and demolition of structures where lead or materials containing lead are present. Loose and peeling lead-based paint must be abated prior to building demolition, is considered a hazardous waste, and must be disposed of accordingly. Construction worker health and safety regulations pertaining to demolition of structures with lead-based paint are promulgated by federal and State agencies.

---

[7] Harding ESE, Inc. 2001, op cit.

Asbestos is a known human carcinogen. Federal, State, and local requirements also govern the removal of asbestos or suspected asbestos-containing materials and the renovation and demolition of structures where asbestos is present. These requirements are maintained by the appropriate federal and State agencies with jurisdiction over hazardous materials and the Bay Area Air Quality Management District (BAAQMD).

2. Impacts and Mitigation Measures

This section outlines hazardous materials impacts that may result from implementation of the proposed Project and recommends mitigation measures, as appropriate. Less-than-significant impacts to human health and the environment are listed first, followed by significant impacts.

a. Significance Criteria. The proposed Project could be considered to result in significant impacts relating to hazardous materials if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within ¼-mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment;
- Be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, and would result in a safety hazard for people residing or working in the Project area;
- Be located within the vicinity of a private airstrip, and would result in a safety hazard for people residing or working in the Project area;
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

b. Less-than-Significant Hazards and Hazardous Materials Impacts. The following discussion describes less-than-significant impacts that would result from the proposed Project:

(1) Routine Transport, Use, or Disposal of Hazardous Materials. Implementation of the proposed Project would result in the development of a mixed-use neighborhood. It is not anticipated that large quantities of hazardous materials would be permanently stored or used within the Project site. Small quantities of similar commercially-available hazardous materials (e.g., paint, maintenance supplies) would be routinely used within the Project site for maintenance and cleaning, and could be used by commercial entities operating within the Project site. However, these materials would not be used in sufficient strength or quantity to create a substantial risk of fire or explosion, or otherwise pose a substantial risk to human or environmental health. Therefore, implementation of the proposed Project would not create a permanent significant hazard to the public or environment through the routine transport, use, or disposal of hazardous materials.

(2) Airport Hazards. The Project site is located approximately 5 miles north of the Metropolitan Oakland International Airport and is not within the airport's land use plan. The Project site is not located within the vicinity of a private airstrip. Therefore, implementation of the proposed Project would not increase the exposure of persons to airport-related hazards.

(3) Emergency Response and Wildland Fires. Implementation of the proposed Project would result in the development of two additional roads within the Project site that would extend from Thomas L. Berkley Way (20th Street) to 19th Street, and from 19th Street to 18th Street, adjacent to the Fox Theater. No roadways would be removed as a result of the proposed Project. The development of additional roadways within the Project site would shorten existing block lengths and enhance vehicular access to and throughout the Project site. Therefore, implementation of the Project site would improve emergency access to the Project site. The Project site is located within an urbanized portion of Oakland, and is not susceptible to wildland fires due to its flat topography and lack of significant vegetation.

c. Significant Hazards and Hazardous Materials Impacts. Implementation of the proposed Project would result in the following five significant impacts. Implementation of recommended mitigation measures would reduce these impacts to a less-than-significant level.

Impact HAZ-1: Development of the Project could expose construction workers and/or the general public to hazardous materials from contaminated soil and groundwater during construction activities. (S)

Environmental investigations have identified portions of the Project site where releases of hazardous materials have affected soils and shallow groundwater. Construction workers could be exposed to contaminants in those materials via inhalation of dust and vapor, direct dermal contact, and/or accidental ingestion. Dust from contaminated soils could also drift outside the immediate construction area and adversely affect nearby workers and residents.

Further investigation is required to evaluate issues that have not been fully addressed within the Project area due to lack of access or other constraints. A list of the Project site blocks on which further investigation is recommended is presented on Table IV.G-3.

Previously unknown contamination may also be encountered during Project development. Environmental investigations conducted at the Project site, including future investigations that may be completed after preparation of this EIR, are based on available historical land use information, such as aerial photographs, fire insurance maps, and evidence of historical hazardous material use apparent during site inspections. Because hazardous material records were not required to be maintained during much of the history of the Project site, hazardous materials that may have been used, stored, or disposed of in areas outside of the areas of concern identified during previous environmental investigations may be encountered. If significant releases of hazardous materials are discovered during environmental investigation and/or construction activities, additional investigation,

Table IV.G-3: Summary of Recommended Further Subsurface Investigations

Block	Historic Land Uses Potentially Associated With Hazardous Materials	Contaminants of Concern
3 and 4	Former Gasoline Service Station, Photo Developer	Petroleum hydrocarbons, solvents, metals
5 and 6	Former Machine Works, Trucking Company, and Sign Painting Shop	Petroleum hydrocarbons, solvents, metals
7	Power Substation, Plant Nursery, Tire Service	Petroleum hydrocarbons, solvents, polynuclear aromatic hydrocarbons, pesticides, metals
8	Wood and Coal Yard, Adjoining Gasoline Service Stations, Parking	Petroleum hydrocarbons, metals, solvents and other volatile and semi-volatile organic compounds
9	Cabinet Factory, Auto Repair, Dyeing and Cleaning Facility, Adjoining Gasoline Service Stations, Parking	Petroleum hydrocarbons, metals, solvents and other volatile and semi-volatile organic compounds

Source: Harding ESE, 2001.

remediation, and/or coordination with regulatory agencies may be required prior to redevelopment of the blocks.

Implementation of the following three-part mitigation measure would reduce this impact to a less-than-significant level. The first part of the measure would require further investigation of potential hazardous materials issues identified in previous environmental reports. The second part would require implementation of construction worker health and safety measures. The third part would require the safe management of excavated soils and groundwater in accordance with applicable laws and regulations.

> Mitigation Measure HAZ-1a: Prior to issuing any grading, demolition or building permits for the proposed Project affecting Project site Blocks 3 through 9, an environmental investigation shall be conducted at the site by a qualified environmental professional. The environmental investigation shall implement appropriate sampling recommendations presented in previously conducted Phase I site assessment(s) prepared for the Project site, as summarized in Table IV.G-3, in order to adequately characterize subsurface conditions of the site. Environmental investigation workplans shall be submitted to the City of Oakland and RWQCB for review and approval. Information from the environmental investigation shall be used to develop and implement site-specific health and safety plans for construction workers and best management practices (e.g., dust control, storm water runoff control, etc.) appropriate to protect the general public.
>
> Mitigation Measure HAZ-1b: Prior to issuing any grading, demolition, or building permit for the proposed Project, a site-specific Health and Safety Plan (HSP) shall be prepared by a qualified industrial hygienist. At a minimum, the HSP shall summarize information collected in environmental investigations for the Project site, including soil and groundwater quality data; establish soil and groundwater mitigation and control specifications for grading and construction activities, including health and safety provisions for monitoring exposure to

construction workers; provide procedures to be undertaken in the event that previously unreported contamination is discovered; incorporate construction safety measures for excavation activities; establish procedures for the safe storage and use of hazardous materials at the Project site, if necessary; provide emergency response procedures; and designate personnel responsible for implementation of the Plan. The HSP shall be designed to prevent potential exposures to construction workers above established OSHA Permissible Exposure Limits. The Plan shall be submitted to the City of Oakland for review and approval.

Mitigation Measure HAZ-1c: Prior to issuing any grading, demolition, or building permit for the proposed Project, a Soil and Groundwater Management Plan (Plan) shall be prepared. The Plan shall include procedures for managing soils and groundwater removed from the site to ensure that any excavated soils and/or dewatered groundwater with contaminants are stored, managed, and disposed of safely, in accordance with applicable regulations. The Plan will incorporate notification and dust mitigation requirements of the BAAQMD (including Title 17, CCR Section 93105). Dewatering procedures will incorporate regulatory requirements for groundwater discharge to storm or sanitary sewers, as outlined in Mitigation Measure HYD-3. The Plan shall be submitted to the City of Oakland and RWQCB for review and approval and shall be implemented throughout all phases of Project development. (LTS)

Impact HAZ-2: Development of blocks with soil and/or groundwater contamination could expose future residents and workers to potentially hazardous concentrations of contaminants. (S)

The chlorinated solvent tetrachloroethylene (PCE) has been identified in groundwater near Blocks 1, 2, and 5 at concentrations above ULR Program Tier 1 screening levels for residential land uses. Benzene has been detected in groundwater near Blocks 2 and 4 at concentrations above Tier 1 residential and commercial screening levels. Other contaminants may potentially be discovered in soils and/or groundwater at other locations within the Project site above screening levels, based on historical land uses identified in previous environmental investigations.

The presence of contaminants above Tier 1 screening levels does not necessarily mean that the Project will result in health risks to future residents and workers. The screening levels were established using very conservative assumptions. However, exceedance of the screening levels indicates that additional analysis will be necessary to properly evaluate exposures to future site users, determine the potential for health risks, and establish and implement measures to reduce these risks to a less-than-significant level.

A previous human health risk assessment (HHRA) for the Project vicinity performed in 2001 concluded that known levels of contaminants in groundwater do not pose a risk to future site users under a residential land use scenario where groundwater is not a source of drinking water.[8] This HHRA should be updated using the most current groundwater information available and include site-specific details for construction of the proposed Project. Should there be a potential for health risks, administrative and engineering controls may be required to reduce these risks to a less-than-significant level.

---

[8] Chaney, Walton, & McCall/The Ellington Group, 2001, Shallow Groundwater Monitoring Assessment; Uptown Theater District, Oakland, CA, April 1.

The following two-part mitigation measure will reduce potential health risks to future site users to a less-than significant level. The first part would eliminate potential exposures to known hazards by prohibiting use of shallow groundwater at the Project site, therefore eliminating exposures, and requiring that any on-going dewatering activities take place under the Soil and Groundwater Management Plan (implemented as Mitigation Measure HAZ-1c). The second part would require that current health risk assessment documents be updated to incorporate the most recent investigation results and site-specific details regarding Project construction.

> Mitigation Measure HAZ-2a: Covenants, codes, and restrictions for the proposed Project shall strictly prohibit the use of groundwater at the Project site for drinking, irrigation, or industrial purposes. Any dewatering activities required at the Project site following construction activities shall be required to be carried out under the Soil and Groundwater Management Plan prepared for the Project (Mitigation Measure HAZ-1c).
>
> Mitigation Measure HAZ-2b: Prior to issuing any permits for construction within the Project site, a Human Health Risk Assessment (HHRA) shall be conducted and/or updated by a qualified environmental professional. This HHRA shall employ methodology from the *City of Oakland Urban Land Redevelopment: Guidance Document*[9] for the Oakland Risk Based Corrective Action (RBCA) program to evaluate potential health risks from petroleum hydrocarbons, metals, solvents, and other volatile organic compounds in soils and groundwater. Depending on the findings of the HHRA, recommendations may be made for administrative or engineering controls to minimize public exposure to hazardous materials, if warranted. These controls could potentially include vapor barriers for building foundations, encapsulation of the site with building foundations and paved parking surfaces to prevent exposure to soils, and implementation of an Operations and Maintenance Plan to insure prescribed controls are implemented and maintained. The controls shall ensure that any potential added health risks to future site users are reduced to a cumulative risk of less than 1×10^{-5} (a calculated risk of 1 in 100,000 persons exposed) for carcinogens and a cumulative hazard index of 1.0. The HHRA shall be submitted to the City of Oakland and RWQCB for review and approval. (LTS)

Impact HAZ-3: Improper use or transport of hazardous materials during construction activities could result in releases affecting construction workers and the general public. (S)

Specific construction activities that would occur as part of Project implementation are anticipated to involve the use and transport of hazardous materials. These materials could include contaminated soil and/or groundwater, former underground storage tanks, building demolition debris containing hazardous materials, and fuels, oils, and other chemicals typically used during the construction period. Removal, relocation, or transportation of hazardous materials could result in accidental releases or spills and associated health risks to workers, the public, and environment. Implementation of the following mitigation measure would reduce this impact to a less-than-significant level.

> Mitigation Measure HAZ-3**:** The implementation of Mitigation Measure HAZ-1b would require a Site Safety Plan/Soil and Groundwater Management Plan (Plan). The Plan will establish procedures for the safe storage and use of hazardous materials at the Project site, if

---

[9] City of Oakland Urban Land Redevelopment Program, 2000, Guidance Document, Oakland RBCA Program, January 1.

necessary; provide emergency response procedures; and designate personnel responsible for implementation of the Plan. No other mitigation is required. (LTS)

Impact HAZ-4: Demolition of buildings that contain lead-based paint and asbestos-containing building materials would release airborne lead and asbestos particles, which may adversely affect construction workers and the public. (S)

Based on previous surveys and the age of the buildings at the Project site, asbestos-containing building materials and lead-based paint are likely to be encountered during Project site demolition activities. The demolition of structures containing asbestos and/or lead-based paint could expose residents and workers to asbestos fibers and lead-based paint dust. Implementation of existing abatement and worker health and safety regulations, as outlined in the mitigation measure below, would reduce those risks to a less-than-significant level.

> Mitigation Measure HAZ-4: All asbestos-containing materials shall be abated by a certified asbestos abatement contractor in accordance with construction worker health and safety regulations and the regulations and notification requirements of the Bay Area Air Quality Management District (BAAQMD) (29 CFR 1926.1101; 40 CFR 61 and 152; Title 8 CCR Section 1529; BAAQMD Regulation 11, Rule 2). The removal and disposal of lead-based paint within the Project site shall be completed in accordance with federal and State construction worker health and safety regulations (29 CFR, Part 1926.62; Title 8, CCR Section 532.1; CDHS Training, Certification and Workpractices Rule). (LTS)

Impact HAZ-5: Development of the Project could result in hazardous emissions or the handling of hazardous materials, substances, or waste within ¼-mile of a proposed school. (S)

Although no schools are currently located within ¼-mile of the Project site, an arts magnet school has been proposed at the Fox Theater, located adjacent to the Project site. Development of the Project will require the handling of hazardous materials during construction (see Impact HAZ-3, above). Construction activities could also potentially involve the excavation of contaminated soils, which, in the absence of dust control, could potentially migrate and affect a nearby school site.

Section 17213 of the State Education Code requires that a prospective school site be reviewed to determine that the site is not a current or former hazardous waste disposal site, a hazardous substance release site, or the site of hazardous substance pipelines. This section also requires consultation with local hazardous materials agencies and air quality districts to ensure that no sites within ¼-mile that handle or emit hazardous substances would potentially endanger future students or workers at the prospective school site.

The Department of Toxic Substances Control's (DTSC) Schools Property Evaluation and Cleanup Division is responsible for implementing regulations to assess, investigate and remediate proposed school property sites. All proposed school sites that will receive State funding for acquisition or construction are required to go through a rigorous environmental review and cleanup process under DTSC's oversight. DTSC requires that a Preliminary Environmental Assessment (PEA) be prepared to provide basic information for determining if there has been a release of hazardous material at the site, or if there may be present at the site a naturally-occurring hazardous material that presents a risk to human health or the environment.

Mitigation Measure HAZ-5: Implementation of existing regulatory requirements for school siting, and preparation and implementation of a Site Safety Plan/Soil and Groundwater Management Plan (Mitigation Measure HAZ-1b) and lead and asbestos regulations (Mitigation Measure HAZ-4) would reduce this impact to a less-than-significant level. No additional mitigation is required. (LTS)

H. UTILITIES AND INFRASTRUCTURE

This section evaluates the effects of the Uptown Mixed Use Project on infrastructure and utilities. Potential impacts to infrastructure and utilities that would result from implementation of the proposed Project are identified, and mitigation measures are recommended, as appropriate.

1. Setting

This analysis examines the following infrastructure and utility systems: water supply, wastewater, stormwater, solid waste, energy, and telecommunications. The utilities analyzed here were selected on the basis of discussions with a variety of public officials, utility systems staff, and Project stakeholders.

a. Water. The following discussion provides background information on the City's water supplies, treatment facilities, and distribution system.

(1) Water Supply. Potable water is provided to the Project site, the City of Oakland, and approximately 1.3 million people throughout portions of Alameda and Contra Costa Counties by the East Bay Municipal Utility District (EBMUD). EBMUD obtains approximately 95 percent of its water from the Mokelumne River, and transports it through pipe aqueducts to temporary storage reservoirs in the East Bay hills. EBMUD has water rights and facilities to divert up to a daily maximum of 325 million gallons per day (mgd) from the Mokelumne River.[1] However, this allocation may be constrained by: upstream water use by prior water right holders; downstream water use and other downstream obligations, including protection of public trust resources; drought, or less-than-normal rainfall for more than a year; and emergency outage.

In addition, EBMUD has been recycling water at its main wastewater treatment facility since the early 1970s. Recycled water is suitable for land uses that do not require potable water sources, such as golf courses, some agricultural areas, and industrial uses. Incentives used by EBMUD to encourage customers to utilize recycled water include rate discounts on recycled water and low-interest loans used to retrofit buildings so that they can accommodate recycled water.

The East Bayshore Water Project, which would provide up to 2.3 mgd of recycled water to residents in Alameda, Albany, Berkeley, Emeryville, and Oakland, is currently in the planning stage. The project would involve the construction of new treatment and disinfection facilities at the EBMUD Main Wastewater Treatment Plant. The service area of the East Bayshore Water Project, which is anticipated to be completed prior to 2010, would include the Project site and its surroundings. In January 2002, the City adopted a dual plumbing ordinance, which requires new development to use recycled water provided by EBMUD, and to install a dual plumbing systems if recycled water is anticipated to be available.

Average daily water demand within the EBMUD service area was 211 mgd in 2002 (the most recent full year for which data are available).[2] Demand is projected to increase to 257 mgd by 2010 and 277

---

[1] East Bay Municipal Utility District, 2001. *Urban Water Management Plan 2000*. February.

[2] East Bay Municipal Utility District, 2003. *Annual Report 2001-2002*.

mgd by 2020.[3] As of 2001, EBMUD's water supply was insufficient to meet customer needs in multiple year droughts, even taking into account the implementation of water conservation and recycling programs.[4]

(2) Water Treatment Facilities. There are six water treatment plants in the EBMUD water supply and distribution system. Combined, the six plants have a treatment capacity of over 375 mgd. The Orinda Water Treatment Plant, which supplies water to Downtown Oakland and the Project site, has a peak treatment capacity of 200 mgd. At the Orinda Water Treatment Plant, water is subjected to coagulation, filtration, and disinfection prior to being distributed to the public.

(3) Distribution Pipelines. The Project site is located within EBMUD's Central Pressure Zone, which provides water service to customers within an elevation range of 0 to 100 feet. EBMUD owns and operates distribution pipelines under all of the streets within and in the vicinity of the Project site.[5] Typically, required pipeline relocations and extensions, in addition to other water distribution infrastructure improvements, are made at the expense of the Project applicant in consultation with EBMUD's New Business Office.

The Project site is served by 8-inch water lines along San Pablo Avenue and Telegraph Avenue. These lines, and associated minor water line connections, are anticipated to have an available capacity of over 5,000 gallons per minute (gpm). The City Fire Department maintains minimum flow standards for pipelines serving residential and commercial uses. The minimum flow standard for lines serving residential uses is 2,500 gpm; the minimum flow standard for lines serving commercial uses is 4,500 gpm.[6]

b. Wastewater. Wastewater collected by interceptors in the EBMUD service area flows to the Main Wastewater Treatment Plant (MWWTP), which is located in Oakland near the eastern entrance of the San Francisco-Oakland Bay Bridge. The MWWTP provides both primary and secondary treatment of wastewater. Primary treatment involves the removal of floating materials, oils and greases, sand and silt, and organic solids sufficiently heavy to settle in water. Secondary treatment involves the removal of suspended organic and chemical impurities. The MWWTP has a primary treatment capacity of 415 mgd and a secondary treatment capacity of 168 mgd. The average annual daily flow into the MWWTP is approximately 77 mgd, representing 46 percent of the plant's secondary treatment capacity.[7] Treated effluent is disinfected, dechlorinated, and discharged 1 mile west of the Oakland shoreline into San Francisco Bay.

Sanitary sewer service to the Project site is provided by the City via pipelines on: Thomas L. Berkley Way (20th Street); 19th Street; William Street; 18th Street; and Telegraph Avenue. The current

[7] East Bay Municipal Utility District, 2001. op. cit.

capacity of these pipelines is 1.35 mgd.[8] The current average wastewater flow within these pipelines is 6,970 gpd; peak wastewater flow is approximately 23,698 gpd.[9]

c. Stormwater. The City of Oakland, including the Project site, is served by stormwater infrastructure that is owned and maintained by the City. Drainage within the Project site is provided by a local collection system that includes the following components:

- Catch basins at 18th Street and Telegraph Avenue that drain to a 27-inch storm drain under Telegraph Avenue;
- Catch basins at 19th Street and Telegraph Avenue that drain to a 30-inch storm drain under Telegraph Avenue;
- Catch basins at William Street and Telegraph Avenue that drain to a 30-inch storm drain under Telegraph Avenue;
- Catch basins at Thomas L. Berkley Way (20th Street) and Telegraph Avenue that drain to a 30-inch storm drain under Telegraph Avenue; and
- Catch basins at Thomas L. Berkley Way (20th Street) and Telegraph Avenue that drain to a 15-inch storm drain under Thomas L Berkley Way (20th Street).

The storm drains within the Project site (listed above) combine at the intersection of Thomas L. Berkley Way (20th Street) and Telegraph Avenue to feed a large storm drain that extends under Telegraph Avenue and 21st Street to an outfall on Lake Merritt. This large storm drain ranges in size from 40 inches to 72 inches.

The Project site is covered with impervious surfaces, resulting in a high rate of runoff generation per unit of surface area. Runoff from the Project site generally drains to the north and east; as described above, runoff from the Project site is deposited in Lake Merritt, and ultimately flows to San Francisco Bay. Drains and pipes that currently serve the Project site can adequately accommodate existing stormwater runoff. There is no record of storm drainage problems within or around the Project site.[10]

d. Solid Waste. Solid waste and yard trimmings within the City of Oakland are collected by Waste Management of Alameda County. These materials are taken to the Davis Street Transfer Center in San Leandro. The Transfer Center, which has a maximum allowable capacity of 5,600 tons of waste per day, received an average of 3,028 tons per day in 2001.[11] The facility can process up to 320 tons (per day) of concrete, asphalt, dirt, bricks, wood, and metal. After undergoing processing, waste from the Transfer Station is delivered to the Altamount Landfill in eastern Alameda County. The landfill comprises approximately 1,528 acres and is anticipated to have sufficient capacity to operate until 2050.

[8] Khalili, Amin, 2003. Korve Engineering. Personal communication with LSA Associates, Inc. July 24.

[9] Ibid.

[10] Toothman, Robert, 2003. Korve Engineering. Personal communication with LSA Associates, Inc. August 28.

[11] Kaufman, Debra, 2003. Alameda County Waste Management Authority. Personal communication with LSA Associates, Inc. July 14.

In 1989, the California Legislature enacted the California Integrated Waste Management Act (AB 939), which requires the diversion of waste materials from landfills in order to preserve the decreasing capacity of landfills. Cities and counties in California were required to divert 25 percent of solid waste by 1995, and 50 percent of solid waste by the year 2000. AB 939 further requires every city and county to prepare two documents demonstrating how the mandated rates of diversion will be achieved. The *Source Reduction and Recycling Element* describes the chief source of the jurisdiction's waste, the existing diversion programs, and current rates of waste diversion and new or expanded diversion programs. The *Household Hazardous Waste Element* describes each jurisdiction's responsibility in ensuring that household hazardous wastes are not mixed with non-hazardous solid wastes and subsequently deposited at a landfill. Oakland's Source Reduction and Recycling Element and its Household Hazardous Waste Element were approved in 1991 by the California Integrated Waste Management Board.[12]

The City provides curbside recycling to Downtown Oakland and the Project site. Curbside recycling includes the following materials: glass, aluminum and tin, motor oil, cardboard, magazines and newsprint, and plastic. Recyclable materials are delivered to the Davis Street Transfer Center where they are processed.

Oakland Municipal Code Chapter 15.34 requires building permit applications for new construction, demolition, or alterations and additions (with a valuation of $50,000 or greater) to be accompanied by an approved Waste Reduction and Recycling Plan (WRRP). The WRRP is required to document the ways that the applicant will reduce the quantity of construction and demolition debris disposed at landfills by 50 percent or more. The City will not approve a building permit for a project until the WRRP is approved.

e. Energy. The Pacific Gas & Electric Company (PG&E) provides electricity and natural gas service to Downtown Oakland and the Project site. Most of Oakland's electrical power is delivered via 12-kilovolt (kV) transmission lines from PG&E Substation L. Substation L receives 155 kV and distributes power to upper downtown Oakland and West Oakland. Local electric and gas distribution lines are located within the Project site.

f. Telecommunications. SBC Communications (SBC) provides residential and commercial telephone service within Downtown Oakland and the Project site. SBC also provides or hosts a variety of other telecommunications services, including Digital Subscriber Lines (DSL), Internet Service Provider (ISP), web hosting, virtual private networking, and wireless/cellular and paging services.

The California Public Utilities Commission requires that SBC anticipate and serve new growth. To meet this requirement, SBC continually upgrades its facilities and infrastructure, adding new facilities and technology to remain in conformance with California Public Utilities Commission tariffs and regulations and to serve customer demand in the City.

Additions to the City's infrastructure and proposals for development would result in a need for expansion or changes to SBC's infrastructure, which would involve suitable siting for equipment place-

---

[12] California Integrated Waste Management Board, 2002. *Waste Stream Information Profiles.* Website: www.ciwmb.ca.gov/profiles/.

ment. Suitable sites must meet requirements for the physical transmission of telecommunication services and conform to the City's guidelines. SBC also works with the City to ensure that construction of new facilities does not interfere with any new or newly-paved streets.

2. Impacts and Mitigation Measures

This section discusses potential impacts to infrastructure and utility systems that could result from implementation of the proposed Project. The section begins with the criteria of significance, which establish the thresholds used to determine whether an impact is significant. The latter part of this section presents the impacts associated with the proposed Project and identifies mitigation measures, if appropriate. Less-than-significant impacts to infrastructure and utilities are listed first, followed by significant impacts. Stormwater and storm drain-related impacts are discussed in Section IV.C, Hydrology and Water Quality.

a. Significance Criteria. The proposed Project would have a significant impact on the City's infrastructure and utility systems if it would:

- Exceed wastewater treatment requirements of the San Francisco Bay Regional Water Quality Control Board;
- Require or result in construction of new storm water drainage facilities or expansion of existing facilities, construction of which could cause significant environmental effects;
- Exceed water supplies available to serve the Project from existing entitlements and resources, and require or result in construction of water facilities or expansion of existing facilities, construction of which could cause significant environmental effects;
- Result in a determination by the wastewater treatment provider which serves or may serve the Project that it does not have adequate capacity to serve the Project's projected demand in addition to the providers' existing commitments and require or result in construction of new wastewater treatment facilities or expansion of existing facilities, construction of which could cause significant environmental effects;
- Be served by a landfill with insufficient permitted capacity to accommodate the Project's solid waste disposal needs and require or result in construction of landfill facilities or expansion of existing facilities, construction of which could cause significant environmental effects;
- Violate applicable federal, State, and local statutes and regulations related to solid waste;
- Violate applicable federal, State and local statutes and regulations relating to energy standards; or
- Result in a determination by the energy provider which serves or may serve the Project that it does not have adequate capacity to serve the Project's projected demand in addition to the providers' existing commitments and require or result in construction of new energy facilities or expansion of existing facilities, construction of which could cause significant environmental effects.

b. Less-than-Significant Utilities and Infrastructure Impacts. The following discussion describes less-than-significant impacts to infrastructure and utilities systems that would result from implementation of the proposed Project.

(1) Water. The proposed Project would require water for a variety of uses, including household uses, commercial uses, and irrigation of the proposed 25,000 square-foot park. Based upon anticipated uses within the Project site, implementation of the proposed Project would result in an average daily demand for water of 329,000 gpd (120,085,000 gallons per year).[13] The anticipated daily water demand that would result from implementation of the proposed Project represents approximately 0.2 percent of average daily water demand within the EBMUD service area. The proposed Project would be outfitted with water-conserving fixtures, as required by the Uniform Building Code, and would incorporate dual plumbing systems, to take advantage of available recycled water supplies. Private, water-consuming lawns would not be developed as part of the proposed Project. Therefore, the proposed Project, which represents an efficient use of water, would not require the construction of new water supply facilities. EBMUD representatives have given a preliminary indication that they can serve this Project's water demand, and the EBMUD Board will confirm that determination by the end of September 2003.

Anticipated daily water demand that would result from implementation of the proposed Project represents 0.2 percent of the treatment capacity of the EBMUD water supply and distribution system. Sufficient water treatment capacity exists within the EBMUD system to accommodate water demand generated by the proposed Project. Therefore, implementation of the proposed Project would not require expansion of the existing water treatment system.

The average daily water demand associated with the proposed Project would be approximately 228 gallons per minute, or approximately 4 percent of available water line capacity.[14] Sufficient capacity exists to accommodate this increased demand, although select lines may need to be improved depending upon their age and condition. Line improvements would be made during the Project construction period and are not anticipated to result in significant environmental impacts.

Requirements for minimum water flow (for the purpose of fighting fires) at project sites in the City are based on negotiations with the Oakland Fire Department. Typically, fire flow requirements are 2,500 gpm for residential uses, and 3,500 gpm for commercial uses. As noted in subsection a(3), Distribution Pipelines, water lines that serve the Project site are anticipated to have an available capacity of over 5,000 gpm. Based on the anticipated capacity of water lines serving the Project site, and correspondence with EBMUD, it is expected that minimum water flow would be available within the Project site without a major upgrade of water lines.[15]

(2) Wastewater. Implementation of the proposed Project would result in the generation of approximately 280,000 gpd of wastewater.[16] Wastewater generated by the proposed Project represents less than 0.2 percent of the MWWTP's secondary treatment capacity. This wastewater would be accommodated by the MWWTP, which is currently operating at 46 percent of its secondary treatment capacity. Therefore, wastewater generated by the proposed Project would be subject to both primary and secondary treatment and would not violate the wastewater treatment requirements of the San Francisco Bay Regional Water Quality Control Board. The wastewater lines that serve the

---

[13] Khalili, Amin, 2003. Korve Engineering. Personal communication with LSA Associates, Inc. July 24.

[14] Ibid.

[15] Toothman, Robert, 2003. Korve Engineering. Personal communication with LSA Associates, Inc. September 2.

[16] Ibid.

Project site have a capacity of 1.35 mgd based on average existing wastewater flow (6,970 gpd), and could accommodate the increase in flow that would result from the proposed Project.[17] Public Works Agency staff have indicated that as part of the final public improvement plans for the Project, the conveyance system will be evaluated to confirm what repairs, if any, will be incorporated into the final public improvement plans and specifications. Therefore, implementation of the proposed Project would not require the construction of new wastewater treatment or transport facilities.

(3) Stormwater. Implementation of the proposed Project would not alter drainage patterns within the Project site; after the conclusion of Project construction, runoff from the Project site would drain to the north and east, as occurs under existing conditions.

The proposed Project includes the development of an approximately 25,000 square foot public park, which would include turf areas, tree and shrub plantings, and minimal hardscape. In addition, trees in tree wells would be installed throughout the Project site. Because the Project site is currently covered by impervious surfaces, development of the park and tree wells (as part of Project implementation) would reduce the amount of impervious surfaces within the Project site. Implementation of the proposed Project would result in the development of pervious surfaces over approximately 5.5 percent of the Project site.

The total amount of runoff from a site is directly proportional to the coverage of the site by impervious surfaces; thus, any decrease in the coverage of a site by impervious surfaces would result in an overall decrease in both peak runoff volume and total runoff volume. Therefore, implementation of the proposed Project, which would introduce pervious greenscape features into the Project site, would reduce the amount of runoff from the Project site. Because stormwater infrastructure that currently serves the Project site can accommodate existing flows, and no records have been found of any storm drainage problems in or around the Project site, implementation of the proposed Project would not require the construction of new storm drain facilities or the expansion of existing facilities.

(4) Solid Waste. The proposed Project would be designed and developed in accordance with State and local solid waste regulations (federal solid waste regulations do not apply to the proposed Project). Proposed buildings would be outfitted with designated areas for drop-off of recyclable material, and recycling receptacles would be installed throughout the Project site, including in the open space area. In addition, the Project applicant would prepare a WRRP, consistent with the Oakland Municipal Code. Implementation of the WRRP would ensure that the quantity of construction and demolition waste generated by the proposed Project would be reduced by at least 50 percent, and would not substantially affect the remaining capacity of the Davis Street Transfer Station or the Altamount Landfill.

According to the California Integrated Waste Management Board, the average resident in Alameda County generates 1.4 pounds per day of solid waste; the average employee generates 5.1 pounds of waste per day.[18] Although solid waste generation rates can vary substantially by geographic locality, type of industry, or type of residential unit, these County-wide average waste generation rates can be used to approximate the amount of waste that would be generated by the proposed Project. Based on

---

[17] Ibid.

[18] California Integrated Waste Management Board, 2003. Profile for Alameda County. Website: www.ciwmb.ca.gov/Profiles/County/CoProfile1.asp

these generation rates, the anticipated 3,266 persons that would live within the Project site and the 182 persons that would be employed within the Project site as a result of Project implementation would generate approximately 5,500 pounds of waste per day and 2,007,719 pounds of waste per year. As noted previously in this section, the Davis Street Transfer Center has a maximum capacity of 5,600 tons of waste per day. The increase in waste generation resulting from the proposed Project represents less than 0.1 percent of the total capacity of the Davis Street Transfer Center. The anticipated life of the Altamount Landfill would not be reduced by implementation of the proposed Project.

(5) Energy and Telecommunications. The proposed Project would include energy-saving appliances, as required by the Uniform Building Code, and would be in conformance with all existing energy regulations. New construction would take place in or immediately adjacent to developed areas currently served by electricity, gas, and telecommunications lines. Connecting new construction to existing lines would involve relatively minor improvements, such as connections to existing distribution mains. The increase in demand generated by the proposed Project would not exceed the planned or existing energy supply, according to a PG&E representative.[19]

c. Significant Utilities and Infrastructure Impacts. The proposed Project would not result in significant impacts to infrastructure and utilities.

---

[19] Chew, Rodney, 2003. Industrial Power Engineer, Pacific Gas and Electric Company. Personal communication with LSA Associates, Inc. June 18.

I. HISTORIC ARCHITECTURAL, ARCHAEOLOGICAL AND PALEONTOLOGICAL RESOURCES

The following sections describe the baseline and project conditions for historic architectural, archaeological and paleontological resources within or adjacent to the Uptown Mixed-Use Project site. The purpose of this section is to: 1) describe the baseline conditions for historic architectural resources, archaeological resources, and paleontological resources within the Uptown Mixed Use Project area and its surroundings; 2) describe the legal significance of identified historic architectural, archaeological, and paleontological resources within the Project area; and 3) identify potentially-significant impacts to such resources that may result from Project implementation, and recommend mitigation to reduce impact significance.

Historic architectural resources consist of existing buildings, structures, or objects that are historically significant at the local, State, or national level. These resources may display their significance for an association with an important person or notable events in American history; or, these resources may be significant for their expression of a certain type or style of construction or architectural craftsmanship. Generally, any building, structure, or object 50 years or older may be identified as a historic architectural resource.

Archaeological resources can consist of any remains of human activity, although usually only those resources 50 years or older are formally documented. Archaeological resources usually occur as sites, which are the concentrated, geographically-defined material remains that result from a specific human activity, event, or occupation, or combination thereof. Archaeological resources can also occur as features, or minor components, of larger archaeological site (e.g., a trash pit associated with the remains of a former 19th century boarding house).

Paleontological resources consist of fossils and their immediate surroundings. Historic architectural and archaeological resources are often referred to as cultural resources.

1. Cultural Resources Setting

This section presents the results of the cultural resources, including historic architectural and archaeological resources, analysis conducted for the Project area. The following sections provide: 1) the methods of the analysis; and 2) a Project area setting, including a brief overview of the history of Oakland and the Project area, a summary and map of potential historic resources within and adjacent to the Project area, an overview of the area's archaeological sensitivity, and a review of the laws, codes, and regulations applicable to cultural resources in Oakland.

a. Methods. Background research for this cultural resources analysis included a records search, literature review, and consultation with historical and Native American organizations. This research was conducted to identify cultural resources or cultural resource studies within or adjacent to the Project area, and to prepare the archaeological, ethnographic, and historical setting of the Project area.

(1) Records Search. A records search (#02-890) was completed on May 16, 2003 at the Northwest Information Center (NWIC) of the California Historical Resources Information System, Sonoma State University, Rohnert Park, California. The NWIC is an affiliate of the California Office of Historic Preservation and is the official state repository of cultural resources reports and records for a 16-county area, including Alameda County. The cultural resource inventories reviewed by LSA included:

- *California Inventory of Historic Resources;*[1]
- *Five Views: An Ethnic Historic Site Survey for California;*[2]
- *California Historical Landmarks;*[3]
- *California Points of Historical Interest;*[4] and
- *Directory of Properties in the Historic Property Data File for Alameda County*.[5, 6]

(2) Literature Review. LSA reviewed prehistoric, ethnographic, and historical overviews and local planning documents for information about the Project area. City planning documents included the *Historic Preservation Element of the Oakland General Plan*[7] and the architectural resource forms and listings in the *Uptown Project Area Historic Resources.*[8]

(3) Consultation. The California Native American Heritage Commission (NAHC) was requested, in a letter on May 19, 2003, to review their sacred lands file to determine if Native American cultural resources are within the Project area, and to provide a list of Native American individuals or groups that may have knowledge about such resources or concerns about the Project area. Ms. Debbie Pilas-Treadway, Environmental Specialist III, responded in a faxed letter of May 30, 2003, that the NAHC did not identify any Native American cultural resources within or adjacent to the study areas.

Historical organizations were contacted to solicit any concerns they may have about cultural resources in the Project area. The following list identifies the organizations contacted and the responses received:

- Oakland Heritage Alliance, contacted by letter on May 19, 2003.

  Ms. Naomi Schiff, member of the Board of Directors of the Oakland Heritage Alliance, called on Friday, May 23, 2003. Ms. Schiff expressed concern about the effects of the size and nature of the proposed Project on nearby historic resources. She urged the consideration of Project alternatives to incorporate some of the existing buildings proposed for demolition.

- City of Oakland Landmarks Preservation Advisory Board, contacted by letter on May 19, 2003.

  No response received as of June 28, 2003.

- City of Oakland Planning Department, Oakland Cultural Heritage Survey (OCHS), contacted by letter on May 19, 2003 and in person on June 17, 2003.

  On June 17, 2003, Betty Marvin, Planner III, of the Planning Department provided background historical information and OCHS resource forms for historic resources within and adjacent to the Project area.

b. Prehistory and Ethnography. The Oakland area was probably settled by native Californians between 12,000 and 6,000 years ago.[9] Subsequently, Penutian peoples entered central California around 4,500 years ago, and were firmly settled around San Francisco and Monterey Bays by 1,500 years ago. The descendants of these native groups prefer to be called Ohlone,[10] although they are often referred to by the name of their linguistic group, Costanoan. Oakland is located within the territory of a people who spoke *Chochenyo* and occupied a large area of the East Bay. *Chochenyo* was one of eight Costanoan languages.[11]

The Ohlone economy was based on fishing, gathering, and hunting, with the land and waters providing a diversity of resources including acorns, various seeds, salmon, deer, rabbits, insects, and quail. The Ohlone, like many other Native American groups in the Bay Area, likely lived in conical tule thatch houses.[12,13,14,15]

Politically, the Costanoans were organized into groups called tribelets. A tribelet constituted a sovereign entity that held a defined territory and exercised control over its resources. A tribelet was also a unit of linguistic and ethnic differentiation.[16]

Intensive Hispanic exploration of the Bay Area began in the late eighteenth century, and radically transformed the Ohlone culture. When European settlers moved into northern California, they established the mission system and exposed the Ohlone to diseases to which they had no immunity.

[16] Ibid.

Mission records indicate that the *Chochenyo* speakers moved from the Oakland area to Mission San Jose.[17] Following the secularization of the missions in 1834, native people in the Bay Area moved to ranchos, where they worked as manual laborers.[18]

c. Historical Setting. The Project area lies entirely within the *Rancho San Antonio* land grant. This rancho was originally granted to Luis Maria Peralta on August 3, 1820 for his service to the Spanish government. His 43,000-acre rancho included what are now the cities of Oakland, Berkeley, Alameda, and parts of San Leandro and Piedmont. Peralta's land grant was confirmed after Mexico's independence from Spain in 1822, and this title was honored when California entered the Union by treaty in 1848. Despite this acknowledged title, squatters moved in to use the vast amounts of Peralta's undeveloped land. Cattle were stolen and slaughtered, and trees were removed by squatters and people travelling to and from the gold fields.[19]

In 1850, Andrew Moon, Horace W. Carpentier, and Edson Adams built a house on Peralta's property at the foot of Broadway, near the banks of an estuary. This house site was in what is now Jack London Square. Vicente Peralta attempted to legally evict the group, but eventually relented and allowed them to lease the land. Instead of complying with the terms of their lease, Moon, Carpentier, and Adams hired Julius Kellersberger, a Swiss engineer, to survey the land and lay out the town that became Oakland. The area was encompassed by Fallon, Market, First, and Fourteenth streets. The City of Oakland was incorporated in 1852, and officially recognized by the state by 1854.[20]

Oakland grew around its waterfront, with development limited only by the available modes of transportation. Steam ferry service to San Francisco was established in 1850, and by 1869 the first horse-car followed a route from the estuary up Telegraph Avenue to 40th Street. On November 8, 1869, the transcontinental railroad's first west bound trip rolled through Oakland along Central Pacific tracks, which terminated at the new 7th Street station. By 1891, Oakland's first electric street car ran along Broadway to the city of Berkeley.[21]

The devastation of the 1906 earthquake and fire in San Francisco prompted the development of new residential areas in Oakland to accommodate displaced San Francisco residents. Older neighborhoods became more densely populated as new apartment buildings and related growth became part of Oakland's residential fabric. The increase in population also increased demand for retail goods, and shopping districts expanded throughout the next decade to meet this demand. These shopping areas served a large population, as shoppers traveled to Oakland by streetcar to take advantage of the new establishments.[22]

[22] Woodbridge, Sally, 1984. Historical and Architectural Resources. In Oakland Central District Development Program, pp. 11-12. On file at the Northwest Information Center, Sonoma State University, Rohnert Park, California.

Throughout the 20th century, commercial enterprises and industrial development, particularly the Port of Oakland and the Oakland Municipal Airport, played a vital role in Oakland's growth. During World War II, the Port provided land and facilities to the Army and Navy. Oakland became the largest shipping center on the West Coast by 1943, and within two decades was the largest container terminal on the West Coast. As suburbs grew outward during the 1950s, the inner core of the City, around which activity used to revolve, began to decline as residents and resources left for the outlying areas. The perception of Oakland, as with many large cities during the 1960s and 1970s, was that of a neglected urban core with high unemployment, racial tension, and reduced economic opportunity.[23] This trend began to reverse in the 1980s as reinvestment and redevelopment helped to invigorate the City's image and prospects. In 1995, California's "Golden Triangle," which included Oakland, San Jose and San Francisco, was named by *Fortune Magazine* as the best place to do business in the United States.[24]

d. Project-Specific Historical Setting. The City of Oakland mostly developed south of the Project area until new modes of transportation prompted growth north of "Old Oakland." What became San Pablo and Telegraph Avenues remained dirt roads until the 1850s, with the present day Project area located far north of downtown. However, the roads served as important thoroughfares and contributed to the economic and institutional functioning of the growing city. After 1869, when a new City Hall was built at the intersection of Broadway, San Pablo, and Telegraph Avenues, Oakland's main commercial district also moved north to encompass parts of the Project area.

The Project area consisted of estates, small farms, and homesteads until the 1870s, when residential neighborhoods began to develop north of downtown Oakland. The original blocks between Telegraph and San Pablo Avenues were the Campbell Tract between 18th and 19th streets; the Hogan Tract between 19th and Thomas L. Berkley Way (20th) streets; and the Boardman Tract between Thomas L. Berkley Way (20th) and 21st streets. The parcels within the Project area to the east of Telegraph Avenue on Thomas L. Berkley Way (20th) and 22nd streets (Project Blocks #8 and #9) were in Wilcox Place.[25] In 1869, a horse-car line began operating from the waterfront up Broadway to Telegraph Avenue. The route then proceeded up Telegraph Avenue to 36th Street.

The growth of suburbs was accelerated following the opening of the horse-car line in 1869. By the late 1800s, downtown Oakland covered the area between Broadway and Washington, and 7th and 14th Streets, and included many new commercial buildings.[26]

The Project area remained mostly residential with a mixture of small-scale commercial uses until the 1910s, when a growing population led to increased consumer demand. By the late 1930s, a variety of businesses occupied the Project area south from William Street, including a pants factory, furniture stores, bicycle shops, a dance studio, markets, candy shops, jewelry stores, and other establishments. The area north of William Street continued to be predominantly residential. Today, the Project area consists mostly of commercial uses, parking facilities, and empty lots.

---

[23] Bagwell, Beth, 1982, op. cit.

[24] Oakland History Room of the Oakland Public Library, op. cit.

[25] City of Oakland Assessor's Office. City Tax Assessment Block Books, 1876/77-1910. Oakland, California.

[26] Woodbridge, Sally, 1984, op. cit.

e. Historic Architectural Resources Within and Adjacent to the Project Area. The records search at the NWIC indicated that no cultural resource studies have been previously conducted within the Project area, and no recorded prehistoric or historical archaeological sites are within or adjacent to the Project area. Five studies on file at the NWIC have been conducted within 1,200 feet of the Project area (NWIC reference numbers S-11154; S-12957; S-16863; S-18536; and S-24996). One prehistoric burial and one isolated sewer valve box dating to the latter half of the 20th century were identified within 1,500 feet of the Project area.

The entire Project area has been surveyed for historic architectural resources by the OCHS,[27] though the report is not on file at the NWIC. The documentation for this survey was acquired from the OCHS; significance ratings for individual properties and districts are based on a graduated system[28] set forth in the *Historic Preservation Element of the Oakland General Plan* (HPE).

The following sections identify historic architectural archaeological resources within or adjacent to the Project area.[29]

(1) Historic Architectural Resources Within the Project Area. Five individual historic architectural properties and a portion of one historic district are within the Project area. OCHS documentation indicates that one of the five buildings (the Great Western Power Company Building) is listed on the City of Oakland's Local Register of Historical Resources (Local Register), and the remainder are Potential Designated Historic Properties (PDHPs)[30] as defined by the HPE. The historic district (19th and San Pablo Commercial District) is identified by OCHS as an Area of Secondary Importance (ASI), and includes three of these five buildings as contributors. These five buildings, as well as others within the Project that are not eligible for listing in the Local Register or that do not qualify as PDHPs, are summarized in Table IV.I-1. Figure IV.I-1 is a map showing the locations of historical resources and PDHPs within the Project site. The five properties and one district within the Project area that are listed in the Local Register or identified as PDHPs are:

---

[27] City of Oakland Planning Department, Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

[28] OCHS Ratings: A = Property of Highest Importance; B = Major Importance; C = Secondary Importance; D = Minor Importance; E = Of No Particular Importance; F or * = Unrated. Altered and post-1945 properties that could receive a higher rating under some contingency (e.g., if restored, when older, or if additional information is provided) receive a dual rating, with a small letter indicating the potential rating.

District Status: 1 = Property is within an Area of Primary Importance (API); 2 = Property is within an Area of Secondary Importance (ASI); 3 = not in an API or an ASI. Contributory status within an API or ASI is indicated by a plus sign (+); noncontributory status is indicated by a minus sign (-). A property that is a potential contributor if restored is indicated by an asterisk (*). For example, Dc2+ describes a property of Minor Importance, contributory to an ASI, and that could be of Secondary Importance if restored.

Properties with at least a potential "C" rating or potentially contributing to an ASI (2*) meet the broadest definition of historic in the Preservation Element of the Oakland General Plan and are called "Potential Designated Historic Properties" or "PDHPs." Properties with ratings of A, B, 1+, or 1*, along with all "Designated Historic Properties" (e.g., Landmarks, Preservation Study List, National Register) are classified as Oakland's "Local Register of Historic Resources" for environmental review purposes.

[29] This information was acquired from published local, state, and national historic resource inventories and registers. Please see the source codes in the cultural resources table for property-specific source information.

[30] PDHPs may be eligible for Designated Historic Property status (if a property is designated, a property is considered a historical resource for the purposes of CEQA) if they: 1) have an existing or contingency rating of "A," "B," or "C" in the OCHS; or 2) have been determined to contribute or potentially contribute to an Area of Primary or Secondary Importance.

Table IV.I-1: Historic Architectural Resources Within Project Area

No.	Street Address		Description	Date	NRHP Code[a]	Local Code[b]	Historical Resource[c]	PDHP[d]	Source[e]

Figure IV.I-1: Historic Architectural Resources and PDHPs

8x11 B&W

- *518-520 Thomas L. Berkley Way (20th Street), the Great Western Power Plant*

  This building, also formerly known as the Navlet's Florist and Nursery, has a "B" rating from the OCHS and is on the Preservation Study List. It is considered a historical resource for the purposes of CEQA. This building is shown as reference #1 on Figure IV.I-1.

  Built in 1924 for the Great Western Power Company as a power and steam heat plant, the Great Western Power Company Substation operated as PG&E Substation M into the 1950s, and was converted from industrial to commercial use in 1960. Designed by Ashley & Evers, who also designed the nearby Capwell's (now Sears) and Oakland Floral Depot buildings, the Beaux Arts-derivative building retains its massive arched façade, overscaled classical detailing, and a 150-foot smokestack that exemplifies the beautification of utilitarian structure by the City Beautiful movement of the early 20th century.[31]

Great Western Power Company Building

- *1958-60 San Pablo Avenue*[32]

  This building has a "Dc" rating from OCHS and is a contributor to an ASI. It is a contributor to the 19th and San Pablo Commercial District, most of which lies north-west of the Project area. The building at 1958-60 San Pablo Avenue is not considered a historical resource for the purposes of CEQA, but it does meet the definition of a PDHP. This building is shown as reference #16 on Figure IV.I-1.

1958-60 San Pablo Avenue

---

[31] City of Oakland Planning Department, Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

[32] 1958-60 San Pablo Avenue, the Snyder-Olmstead Building, is an example of 19th century vernacular-Italianate commercial architecture, built between 1889 and 1893 for Andrew Jackson Snyder, an noted Oakland businessman.

- *1966-68 San Pablo Avenue*[33]

  This building has a "C" rating from OCHS and is a contributor to the 19th and San Pablo Commercial District. The building at 1966-68 San Pablo Avenue is not considered a historical resource for the purposes of CEQA, but it does meet the definition of a PDHP. This building is shown as reference #17 on Figure IV.I-1.

- *1972 San Pablo Avenue*[34]

  This building, formerly known as the James Rankin Plumbing Shop, has a "C" rating from OCHS and is a contributor to the 19th and San Pablo Commercial District. The building at 1972 San Pablo Avenue is not considered a historical resource for the purposes of CEQA, but it does meet the definition of a PDHP. This building is shown as reference #18 on Figure IV.I-1.

1966-68 San Pablo Avenue

1966-68 San Pablo Avenue

---

[33] 1966-68 San Pablo Avenue, the Olmstead Building, is an example of falsefront Italianate commercial architecture, built between 1900 and 1902 for physician Theo Olmstead.

[34] 1972 San Pablo Avenue, the Muller tailor-Rankin plumbing Building, is an example of falsefront Italianate commercial architecture, built between 1883 and 1884 for tailor John Muller. Later, in the 1920s, plumbing contractor James Rankin acquired the building.

- *1998 San Pablo Avenue*[35]

  This building has a "Dc" rating from OCHS, and, although located within the 19th and San Pablo Commercial District, it is not a district contributor. The building at 1998 San Pablo Avenue is not considered a historical resource for the purposes of CEQA, but it does meet the definition of a PDHP. This building is shown as reference #19 on Figure IV.I-1.

1998 San Pablo Avenue

- *19th and San Pablo Commercial District*

  The Project area includes a portion of the 19th and San Pablo Commercial District, although most of the district lies northwest and outside of the Project area. Please see the description of the 19th and San Pablo Commercial District in the following section for more information. This district is shown as reference #49 on Figure IV.I-1.

A portion of the 19th and San Pablo Commercial District

(2) Historical Architectural Resources Adjacent to the Project Area. Architectural resources adjacent to the Project area consist of individual historic architectural properties and historic districts. These properties are summarized in Table IV.I-2 and shown relative to the Project area in Figure IV.I-1. The summary is based on resource listings from the OCHS and the *Directory of Properties in the Historic Property Data File for Alameda County*.[36]

Three potential historic districts (two Areas of Primary Importance [API] and one Area of Secondary Importance [ASI]) front streets that border the Project area. These districts are the 19th and San Pablo Commercial District (ASI), the Cathedral District (API), and the Uptown Shopping/Entertainment District (API). These districts are briefly summarized below based on OCHS documentation.

---

[35] 1998 San Pablo Avenue, the White Log Tavern/Coffee Shop Building, is an example of a 1930s theme restaurant, built between 1930 and 1931 for the White Cabin Lunch Company.

- *19th and San Pablo Commercial District (ASI)*

  The 19th and San Pablo Commercial District is a Victorian/late 19th, early 20th century commercial district consisting of 12 buildings on all or part of twelve blocks in the Central Oakland neighborhood. Most of the district lies northwest and outside of the Project area. It includes early 20th century commercial, Italianate commercial, and Beaux Arts-derivative buildings. The dates of contributing buildings range from the 1870s to the 1940s. Currently, the surrounding areas consist of commercial, residential, and transportation uses. Three of the four buildings identified as PDHPs within the Project area (1958-60 San Pablo Avenue, 1966-68 San Pablo Avenue, and 1972 San Pablo Avenue) are contributors to this district. The 19th and San Pablo Commercial District is listed as an ASI by the OCHS.[37]

- *Cathedral District (API)*

  The bulk of the Cathedral District consists of one and two story family residences built between 1872 and 1916. This district lies to the northeast of the Project area. Architectural styles represented in this district include Italianate, Stick, Shingle, Queen Anne, Colonial Revival, and Arts and Crafts. The Cathedral District was recorded by the OCHS as part of the Central District Survey in 1983. At that time, it contained 38 contributing buildings and four noncontributing; four have since been demolished. The Project area does not contain any contributing buildings of the Cathedral District.[38]

- *Uptown Shopping/Entertainment District (API)*

  The Uptown Shopping/Entertainment District consists mainly of brownstone and terra cotta loft buildings from the 1920s, and Art Deco terra cotta buildings from the 1930s. During this time the area developed as a luxury shopping and entertainment center. There are several especially distinctive buildings within the Uptown Shopping/Entertainment District, including the Capwell and I. Magnin department stores, the Floral Depot, and the Fox and Paramount Theaters.[39] None of these buildings, nor any other contributors to the district, are within the Project area.

f. Archaeological Sensitivity. A preliminary sensitivity assessment was conducted for the Project area to determine the likelihood of Project activities encountering potentially-significant subsurface archaeological deposits. To determine prehistoric archaeological sensitivity, the Project area's environmental setting and the locations of nearby archaeological sites were reviewed. For historical archaeological sensitivity, previous historical research (including information from Sanborn fire insurance maps) was used to identify the general types of economic activities that occurred within the Project area. This historical information was used to predict the type and nature of archaeological remains that may be present within the Project area.

Based on background research, the Project area has a low-to-moderate likelihood of containing prehistoric archaeological deposits, and a high likelihood of containing historical archaeological deposits.

---

[37] City of Oakland Planning Department, Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

[38] Ibid.

[39] Ibid.

(1) Prehistoric Archaeological Sensitivity. Greater uptown Oakland is situated in a setting that offered early inhabitants a nearby diversity of rich ecological communities from which to gather plant and animal resources. Prehistoric archaeological sites have been recorded in the vicinity of the Project area. Prehistoric archaeological site CA-ALA-22, near the corner of 13th Street and Broadway, yielded a burial during the construction of a building foundation.

Several Ohlone villages in the vicinity of the Project area were still inhabited prior to the Peralta land grant. One village was near the current intersection of Telegraph and Claremont Avenues, while another was noted in the Trestle Glen area, originally referred to as Indian Gulch. A third was on the grounds of Holy Names College.[40] The Project area is located near the historic San Francisco Bay margins, which were known for supporting a diversity of plant and animal resources. The proximity of the Bay margins indicates that the Project area was probably used by people in prehistoric times for food procurement, and, possibly, habitation. Although historical use and development of the Project area most likely disturbed those prehistoric archaeological sites on the surface, it is possible that buried deposits exist at depths that were not impacted by past activities.

(2) Historical Archaeological Sensitivity. The Project area is in an area of high sensitivity for historical archaeological deposits. The Project area was part of the *Rancho San Antonio* land grant, and remained rural until the 1870s. Neighborhoods began to develop at that time as the City expanded outwards, and the area remained primarily residential until the 1910s. A transition in uses from predominantly residential to a mixture of industrial and commercial occurred from the 1910s to the 1930s. Today, the study area is primarily business and parking use with little housing.

Documentary research indicates that historical archaeological deposits within the Project area will most likely include evidence of residential, industrial, and commercial land use. Such deposits may be associated with businesses and homes between the 1870s and 1930s. These deposits can include backfilled privies, wells, discrete trash pits, or structural remains linked to the documented growth of Oakland and the shift in land use, economic focus, and day-to-day activities in the Project area. These deposits may contain important information about Oakland's formative periods, particularly the development of the City's residential neighborhoods and the growth of local commercial establishments as Oakland became a leading regional city. In addition, research indicates that the east side of San Pablo Avenue between 19th and 20th Streets was a Chinese neighborhood during the 1870s, and archaeological deposits that may exist from this period have the potential to provide information about an ethnic group's assimilation by a dominant American culture, and the degree to which tradition lifeways were maintained or modified.[41]

g. Regulatory Context. The California Environmental Quality Act (CEQA) requires that a Project's effects on historical resources be considered if the Project involves funding or approval from public agencies. A property may be considered a historical resource under CEQA in four ways:

- the property is listed in or determined eligible for listing in the California Register of Historical Resources (California Register);
- the property is listed in a Local Register;[42]

---

[40] Beth Bagwell, 1982. op. cit.

[41] Beth Bagwell, 1982, op. cit., p. 87.

[42] State of California, Public Resources Code §5020.1(k).

- the property is identified as significant in a historical resource survey[43] unless a preponderance of the evidence demonstrates that it is not historically or culturally significant; or
- the property is determined by the lead agency to be significant in light of the whole record and substantial evidence.

(1) California Register of Historical Resources. The California Register provides a means for determining which properties are to be considered historical resources for the purposes of CEQA review. A property that is determined eligible for listing is afforded the same protection as one that is formally listed. A property may be eligible for listing in the California Register if it:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; or
- Is associated with the lives of persons important in our past; or
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possess high artistic values; or
- Has yielded, or has the potential to yield, information important in prehistory or history.

(2) City of Oakland Local Register Listings. The Public Resources Code Section 5020.1(k) defines a local register as a list of resources designated or recognized as historically significant pursuant to a local resolution or ordinance. In 1998, the Oakland City Council amended the HPE first drafted in 1994. The HPE established a ratings system for use in designating locally-significant resources, which built on the system developed by the OCHS. The HPE also established the following policy with respect to historical resources under CEQA:

- <u>Policy 3.8</u> For the purposes of environmental review under CEQA, the following properties will constitute the City of Oakland's Local Register:

    1) All "Designated Historic Properties;"

    2) Those "Potential Designated Historic Properties" that have an existing rating of "A" or "B" or are located within an "Area of Primary Importance;"

    3) Until complete implementation of Action 2.1.2 (Redesignation), the "Local Register" will also include the following designated properties: Oakland Landmarks, S-7 Preservation Combining Zone properties, and Preservation Study List properties.

The HPE includes other policies that seek to encourage the preservation of Oakland's significant historic resources within the context of balanced development and growth. These policies are presented below.

- <u>Policy 3.1</u>: (Avoid or Minimize Adverse Historic Preservation Impacts Related to Discretionary City Actions) The City will make all reasonable efforts to avoid or minimize adverse effects on the Character-Defining Elements of existing or Potential Designated Historic Properties which could result from private or public projects requiring discretionary actions.

---

[43] The survey must meet the requirements listed in §5024.1(g) of the Public Resources Code.

- Policy 3.4: (City Acquisition for Historic Preservation Where Necessary) Where all other means of preservation have been exhausted, the City will consider acquiring, by eminent domain if necessary, existing or Potential Designated Historic Properties, or portions thereof, in order to preserve them. Such acquisition may be in fee, as conservation easements, or a combination thereof.
- Policy 3.5: (Historic Preservation and Discretionary Permit Approvals) For any project involving the complete demolition of Heritage Properties or Potential Designated Historic Properties requiring discretionary City permits, the City will make a finding that: 1) the design quality of the proposed Project is at least equal to that of the original structure and is compatible with the character of the neighborhood; or 2) the public benefits of the proposed Project outweigh the benefit of retaining the original structure; or 3) the existing design is undistinguished and does not warrant retention and the proposed design is compatible with the character of the neighborhood.
- Policy 3.7: (Property Relocation Rather than Demolition) As a condition of approval for all discretionary projects involving demolition of existing or Potential Designated Historic Properties, the City will normally require that reasonable efforts be made to relocate the properties to an acceptable site.

(3) Historical Resources Survey. A property is presumed to be a historical resource for the purposes of CEQA if it is identified as significant in a historical resources survey,[44] unless a preponderance of evidence demonstrates that the property is not a historical resource.

(4) Lead Agency Determination. Under CEQA, a lead agency may determine that a property is a historical resource even if the property is not listed on or determined eligible for listing on the California Register, not included in a local register, or not identified as significant in a historical resources survey.[45]

2. Paleontological Resources Setting

This section presents the results of a paleontological resources analysis conducted for the Project. The following sections provide: 1) the methods of the analysis; 2) a brief description of the Project area's geological and paleontological setting; and 3) a paleontological resource sensitivity assessment for the Project area.

a. Methods. The paleontological resources analysis consisted of: 1) a fossil locality search conducted by staff at the Museum of Paleontology at the University of California, Berkeley (UCMP) on June 17, 2003, to identify paleontological resources within or adjacent to the Project area; and 2) a review of literature on file at LSA to determine the geological and paleontological history of the Project area.

b. Geological and Paleontological Setting. Geologically, the Project area consists of Quaternary alluvium. This alluvium, although geologically young, contains a number of fossil bearing units.[46] Between the Project area and San Francisco Bay to the west, the alluvium gets progressively younger

---

[44] The survey must meet the requirements of PRC §5024.1(g).

[45] CEQA Guidelines §15064.5(a).

and much of the earth above sea level is made up of artificial fill. The Hayward Fault, approximately 2.5 miles east of the Project area, runs northwest to southeast along an area where Mesozoic rocks of the Franciscan Complex rise up to form the Oakland Hills. Deposits within the Project area comprise the following geological units:

- **Artificial Fill.** Artificial fill is unconsolidated earth brought to the Bay margins to expand the amount of developable land above sea level. It is unlikely that this earth will contain significant fossils.
- **Younger Quaternary Alluvium.**[47] These deposits overlie the Pleistocene alluvium and Merritt sands in the Bay Area. Older portions of this stratum are bedded medium-to-fine-grained sand, and are found within and adjacent to the Project site. These alluvial deposits may contain modern vertebrate and invertebrate fossils.[48]
- **Merritt Sands.**[49] These Pleistocene sands underlie the Project area as well as most of downtown Oakland and Alameda. As described in flatland deposit maps, these Eolian deposits are generally loose and measure roughly 50 feet thick in Oakland.[50,51] The Merritt sands may contain paleontological resources.
- **Older Quaternary Alluvium.** The majority of earth in and around Oakland consists of alluvial sedimentary deposits ranging in age from Late Pleistocene to earliest Holocene. The oldest alluvium[52,53] contains vertebrate[54] and invertebrate[55] fossils. Fossils that may be found in this alluvium include bison, mammoth, ground sloths, saber-toothed cats, dire wolves, and rodents.[56,57] These alluvial deposits are found northeast, east, and southeast of the Project site, and underlie the Merritt Sands within the Project area.

- **Franciscan Formation.**[58] This formation underlies the Project area at great depth and will not be encountered by Project activities.

c. Paleontological Sensitivity Assessment. The Project site lies on Eolian Merritt sands underlain by Quaternary alluvium.[59] The older alluvium deposits, made up of Plio-Pleistocene sediments, are known to bear vertebrate fossils.[60] The fossil locality search conducted at the UCMP indicated that no known fossil localities occur within or adjacent to the Project area. There are, however, 12 vertebrate fossil localities within 5 miles of the Project site. All of these localities are Quaternary in age. Vertebrate fossils recovered from these sites include mammoths, mastodons, ground sloths, bison, camels, and cave bears. Deposits of this age can also contain fossils of bear, saber-toothed cats, rhinoceroses, rodents, mustelids, birds, reptiles, and amphibians. Such localities are considered significant, nonrenewable paleontological resources. Since the geological deposits within the Project area are similar to those that contain these significant resources, the Project area is sensitive for paleontological resources.

3. Impacts and Mitigation Measures

Implementation of the proposed Project has the potential to significantly impact cultural resources. Impact avoidance is the first and most desirable option, but this is not always feasible in a densely-built and populated urban area such as downtown Oakland. If avoidance is not feasible, mitigation measures may be implemented that will, in several cases, offset these impacts or reduce them to a less-than-significant level (e.g., impacts HIST-2 and HIST-3). Other impacts would remain significant and unavoidable, even with the implementation of the recommended mitigation measures (e.g., impacts HIST-6 and HIST-7).

a. Criteria of Significance. The following criteria of significance are based on the CEQA guidelines and the HPE. The proposed Project would have a significant effect on the environment if it would:

- Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines §15064.5. Specifically, substantial adverse changes include physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the historical resource would be "materially impaired." The significance of a historical resource is "materially impaired" when a project demolishes or materially alters, in an adverse manner, those physical characteristics of the resource that convey its historical significance and that justify its inclusion on, or eligibility for inclusion on, a historical resource list (including the California Register of Historical Resources, a local register, and historical resources survey forms[61] (DPR Form 523));
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5;

[59] Wagner, D., E. Bortugno, and R. McJunkin, 1990, op. cit.

[60] Savage, D., 1951, op. cit.

[61] Anything, particularly over 45 years old, can be recorded on a DPR 523.

- Directly or indirectly destroy a unique paleontological resource or site, or unique geologic feature; or
- Disturb any human remains, including those interred outside of formal cemeteries.

b. Paleontological and Historic Architectural and Archaeological Resource Impacts. Project activities that have the potential to significantly impact paleontological and cultural resources include: 1) soil excavation and grading for semi-subterranean parking facilities and building utilities; 2) demolition of existing buildings; 3) construction of new buildings; and 4) enhancement of lighting and streetscape features on street frontages around the Project area. These Project activities will occur in or along numbered Block areas #1-8 as shown on the Project location map.

Potentially-significant impacts to paleontological and cultural resources that may occur as a result of Project implementation are discussed below. Mitigation measures are then recommended to reduce impact significance, where possible, to less-than-significant levels.

(1) Grading and Excavation Related Impacts. Construction of the proposed Project would require soil excavation and grading for building foundations, utilities, and semi-subterranean parking facilities. These activities could potentially impact both paleontological and cultural resources as described below.

Impact HIST-1: Ground disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could adversely impact paleontological resources. (S)

The sediments that underlie the Project area have a high sensitivity for the occurrence of significant, nonrenewable paleontological resources.[62] Excavation could inadvertently damage such resources and result in a significant adverse impact.[63]

> Mitigation Measure HIST-1a: A paleontological resources monitoring plan should be developed in consultation with a qualified paleontologist prior to Project-related ground-disturbing activities. This monitoring plan should incorporate the findings of Project-specific geotechnical investigations to identify the location and depth of deposits that have a high likelihood of containing paleontological resources and that may be encountered by Project activities. This information will indicate the depth of overlying non-sensitive soils (i.e., artificial fill and prior disturbance) within the Project area to allow a more effective determination of where paleontological monitoring is appropriate.
>
> Mitigation Measure HIST-1b: A qualified paleontologist should monitor all ground-disturbing activity that occurs at depths within the Project area determined to be sensitive in the paleonto-

---

[62] The Society of Vertebrate Paleontology has identified vertebrate fossils, their taphonomic and associated environmental indicators, and fossiliferous deposits as significant, nonrenewable paleontological resources. Botanical and invertebrate fossils and assemblages may also be considered as significant. For further information, please refer to: Conformable Impact Mitigation Guidelines Committee, 1995. Assessment and Mitigation of Adverse Impacts to Nonrenewable Paleontological Resources: Standard Guidelines. *Society of Vertebrate Paleontology News Bulletin* 163:22-27.

[63] CEQA Guidelines, Appendix G(V).

logical monitoring plan. Monitoring should continue until, in the paleontologist's opinion, significant, nonrenewable paleontological resources are unlikely to occur.

In the event that paleontological resources are encountered during excavation, all work within 50 feet of the find shall be redirected until the monitor has evaluated the situation and provided recommendations for the protection of, or mitigation of adverse effects to, significant paleontological resources. Mitigation for impacts to significant paleontological resources shall include thorough documentation of the find and its immediate context to recover scientifically-valuable information. Upon completion of paleontological monitoring, a monitoring report shall be prepared. This scope of this report shall be approved by the City, but at a minimum the report will document the methods, results, and recommendations of the monitoring paleontologist. (LTS)

Impact HIST-2: Ground disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could adversely impact cultural resources. (S)

Native Americans are known to have occupied and used the Project area vicinity, and in the historical American period residential and commercial use of all portions of the Project area was intensive and varied. These activities may have resulted in unidentified archaeological deposits that may qualify as historical or unique archaeological resources under CEQA. Project-related ground-disturbing activities may potentially disturb these deposits, which may result in a significant adverse effect to historical or archaeological resources under CEQA. Mitigation measures can reduce these effects to less-than-significant levels.

Mitigation Measure HIST-2: A qualified archaeologist[64] shall monitor all ground-disturbing activities in the Project area until, in the archaeologist's opinion, a depth has been reached at which potentially-significant archaeological deposits are unlikely to occur.

Should an archaeological deposit be encountered by Project activities, the monitor shall be empowered to halt construction in the vicinity of the find. Construction activities shall be redirected and a qualified archaeologist shall: 1) evaluate the archaeological deposit to determine if it meets the CEQA definition of a historical or archaeological resource; and 2) make recommendations about the treatment of the deposit, as warranted. If the deposit does not meet the CEQA definition of a historical or archaeological resource, then no further study or protection of the deposit is necessary. If the deposit does meet the CEQA definition of a historical or archaeological resource, then it shall be avoided by Project activities. If avoidance is not feasible, then effects to the deposit shall be mitigated through a data recovery strategy developed by the evaluating archaeologist. Mitigation of impacts to significant archaeological deposits through data recovery will recover scientifically-valuable information. This mitigation may include, but is not limited to, a thorough recording of the resource on DPR Form 523 records, or archaeological excavation. If archaeological excavation is the only feasible method of data recovery, then such excavation shall conform to the provisions of CEQA Guidelines §15126.4(b)(3)(C).

---

[64] "Qualified" is defined as meeting the professional standards established by the Secretary of the Interior. These standards can be found at: http://www2.cr.nps.gov/laws/ProfQual83.htm.

> Upon completion of such archaeological monitoring, evaluation, or data recovery mitigation, the archaeologist should prepare a report documenting the methods, results, and recommendations of the investigation, and submit this report to the NWIC. (LTS)

Impact HIST-3: Ground-disturbing activities for the construction of subterranean parking structures, building foundations, and underground sewer and utility facilities could disturb human remains, including those interred outside of formal cemeteries. (S)

> Mitigation Measure HIST-3: Should human remains be encountered by Project activities, construction activities shall be halted and the County Coroner notified immediately. If the human remains are of Native American origin, the Coroner must notify the Native American Heritage Commission (NAHC) within 24 hours of this identification, and a qualified archaeologist should be contacted to evaluate the situation. The NAHC will identify a Native American Most Likely Descendent (MLD) to inspect the site and provide recommendations for the proper treatment of the remains and associated grave goods. The archaeologist shall recover scientifically-valuable information, as appropriate and in accordance with the recommendations of the MLD. Upon completion of such analysis, as appropriate, the archaeologist shall prepare a report documenting the methods and results of the investigation. This report shall be submitted to the NWIC. (LTS)

(2) Building Demolition and New Building Construction. As shown in Table IV.I-1 and Figure IV.I-1, there are a total of 22 historic architectural resources (including portions of the 19th and San Pablo Commercial District) located within the Project site. All of the buildings located within Blocks 1 through 7 are proposed for demolition, with the possible exception of the Great Western Power Company Building. The Project applicant is considering three Project variants involving the Great Western Power Plant Building:

- **Demolition** of the Great Western Power Company Building (Variant 1);
- **Partial demolition** of the Great Western Power Company Building (Variant 2); or
- **Preservation** of the Great Western Power Company Building (Variant 3).

The impacts associated with these three different scenarios are discussed below. Resource #12 (see Figure 1), Kwik Way Drive-In/Giant Burger on Block 9 may also be demolished if Block 9 is selected to accommodate the relocation of the Sears Auto Center. This resource is not considered significant because it does not meet the criteria in subsection 1(g), Regulatory Context.

Of the 22 historic architectural resources within the Project site, the six resources listed below have the potential to be considered historical resources pursuant to CEQA.

- *518-520 Thomas L. Berkley Way (20th Street), the Great Western Power Plant (Local Register)*
- *1958-60 San Pablo Avenue, Snyder-Olmstead Building (PDHP)*
- *1966-68 San Pablo Avenue, Olmstead Building (PDHP)*
- *1972 San Pablo Avenue, Muller Tailor-Rankin plumbing shop (PDHP)*

- *1998 San Pablo Avenue, White Cabin Lunch Company (PDHP)*
- *19th and San Pablo Commercial District (ASI)*

OCHS documentation indicates that one of the five buildings (the Great Western Power Company Building) is listed on the City of Oakland's Local Register, and the remainder are Potential Designated Historic Properties (PDHPs). The historic district (19th and San Pablo Commercial District) is identified by Oakland Cultural Heritage Survey (OCHS) as an Area of Secondary Importance (ASI), and includes four of these five buildings as contributors.

Chapter III, Project Description, provides a detailed description of the new buildings proposed to be constructed within the Project area.

Impacts to Historic Buildings. The Project's potential impacts on the five buildings identified as potential historic resources are described below.

As noted above, the Great Western Power Company Building could be subject to one of the following three treatments as part of the proposed Project: 1) demolition; 2) partial demolition (i.e., preservation of portions of the building); and 3) full preservation (and possible reuse). Each of these actions would result in a different environmental impact. Therefore, implementation of the proposed Project would result in one of the following impacts.

Impact statements followed by a variant number (in italics) would occur only as a result of implementation of that variant. Impact statements followed by no variant number would result from implementation of the proposed Project, irrespective of which variant is ultimately implemented.

Impact HIST-4a *(Variant 1: Demolition; Variant 2: Partial Demolition)*: The proposed Project may result in full or partial demolition of the Great Western Power Company Building, which is a local historical resource. (S)

The Great Western Power Company Substation and Steam Heat Plant is considered a historical resource. The demolition of this building, or portions of this building, located at 518-520 Thomas L. Berkley Way (20th Street), would eliminate this resource and thus constitute a significant adverse impact.

The Great Western Power Plant Building has been recorded on DPR 523 forms. In 1983 it was evaluated by the OCHS as eligible for listing on the National Register; the OCHS updated this evaluation record in 2000. It is rated "B+2+" by the OCHS, is listed in the Local Register, and is on the City's Preservation Study List. The building appears to be eligible for listing on the National Register under Criterion A and the California Register under Criterion A, for its associations with the Great Western Power Company, originally based in Oakland and, prior to its absorption by Pacific Gas & Electric Company, one of Northern California's three major early 20th century power companies. It also appears eligible for the National Register under Criterion C and the California Register under Criterion C, for its architectural significance as one of Oakland's best examples of an early 20th century power station.[65]

---

[65] City of Oakland Planning Department, Oakland Cultural Resources Survey, 2000, op. cit.

Implementation of the following mitigation measure would minimize this impact as much as feasible. However, because the demolition of all or portions of a historical resource represents an irreversible change to the historical resource, this impact would remain significant and unavoidable, even after mitigation. Implementation of Variant 2 (partial demolition), would preserve portions of the Great Western Power Company Building and would fulfill many of the objectives of the following mitigation measure. Nevertheless, the implementation of Variant 2, which accomplishes more than Variant 1 in regard to the preservation of significant architectural features of the Great Western Power Company Building, would still result in a significant unavoidable impact to the building, because it may still result in material impairment. Without more specific plans about how the demolition would affect the resource, this impact remains significant and unavoidable.

> Mitigation Measure HIST-4a *(Variant 1 and 2)*: The following measures shall be implemented to preserve information about the resource for further study:
>
> - Record the Great Western Power Company Building in accordance with the procedures of the Historical American Buildings Survey (HABS) through measured drawings, written histories, and large-format photographs;
> - Prepare a history of the Great Western Power Company Building that incorporates oral history, documentary research, and architectural information;
> - Prepare a brochure, regarding the building's historical association with one of three major early 20th century northern California power companies, to be made available at local libraries and museums;
> - If full demolition of the building occurs, salvage architectural elements from the building, including hardware, doors, paneling, fixtures, and equipment, and incorporate these elements into new construction; and
> - Curate all materials, notes, and reports at the OHR, and submit copies to the NWIC.

Even with extensive documentation, however, the demolition of the building or portions of the building would result in the loss of a historic resource that is associated with significant historical events and is an example of outstanding design and function. Therefore, the demolition or partial demolition of the building would remain a significant and unavoidable impact. (SU)

Impact HIST-4b *(Variant 3: Preservation)*: Modification and reuse of the Great Western Power Company Building could adversely affect a historical resource. (S)

As described above, the Great Western Power Company Substation and Steam Heat Plant is rated “B+2+” by the OCHS, is listed in the Local Register, is on the City’s Preservation Study List, and is considered a historical resource. Modifications of the Great Western Power Company Building, as part of adaptive reuse of the building, could adversely affect the architectural qualities that distinguish it as historically significant. Although the following mitigation measure may reduce this impact to a less-than-significant level, it cannot be determined with certainty at this time because there are no specific building plans for Block 7. Therefore, the impact remains significant and unavoidable because it is not known to what degree, if any, material impairment would occur.

Mitigation Measure HIST-4b *(Variant 3)*: Any modifications to the exterior of the building that may be proposed as part of its preservation and reuse shall be developed in consultation with staff at the Planning Department and a qualified historic preservation architect to determine an appropriate treatment strategy. In the event that this measure is determined feasible and is implemented, Mitigation Measure HIST-5 shall also be implemented to ensure that development on the adjacent properties does not adversely impact the building's integrity. (SU)

Impact HIST-5 *(Variant 3)*: Site clearance within the Project area adjacent to the Great Western Power Company Building could adversely impact a historical resource. (S)

If the Great Western Power Company Building is preserved as part of Variant 3, the building may be indirectly affected by the Project due to alteration of the setting of the building and its immediate surroundings. The Great Western Power Company Building is significant from an architectural perspective partly because it reflects the City Beautiful Movement in the United States, which promoted the beautification of common utilitarian structures.[66] One objective of the City Beautiful Movement was to focus on buildings in heavily urbanized settings so that beautification would result in the most striking aesthetic effect for the greatest number of people. The removal of the building's surroundings on the portion of Block 7 fronting Thomas L. Berkeley Way (20th Street) as part of implementation of the proposed Project would materially impair the Great Western Power Company Building's ability to convey its historical significance and association with the City Beautiful Movement. Implementation of the following mitigation measure would reduce this impact to a less-than-significant level.

Mitigation Measure HIST-5 *(Variant 3)*: The following two-part mitigation measure shall be implemented:

- The building's urban setting on the portion of Block 7 fronting Thomas L. Berkeley Way (20th Street) shall be documented prior to Project implementation. At a minimum, this documentation shall include panoramic streetscape photographs and an interpretive display that shall provide an overview of the former urban context and describe how this context contributed to the building's significance. This information shall be presented in an on-site display at the preserved Great Western Power Company Building to enable a viewer to easily associate the former setting with the existing building (i.e., panoramic streetscape photographs to show the building within the former street frontage). Upon completion of this documentation, a copy of all notes, photographs, and analysis shall be archived at the OHR and submitted to the NWIC.
- The City shall ensure that the designs for new adjacent buildings are evaluated[67] with respect to minimizing setting impacts on the historic resource. Project buildings adjacent to the Great Western Power Company Building shall be designed in a manner that minimizes inappropriate differences in mass and scale, if feasible. For example, designs could call for adjacent buildings to step-up to the height of the tallest Project element north of 20th Street,

---

[66] City of Oakland Planning Department, Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

[67] National Park Service, 1983. "Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Preservation of Historic Buildings." Website: http://www2.cr.nps.gov/tps/standguide/preserve/preserve_setting.htm

> thereby reducing a potentially abrupt contrast between new buildings and the two-story Great Western Power Company Building. If the designs for the adjacent buildings follow the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Preservation of Historic Buildings, then the Project will have a less-than-significant impact, pursuant to CEQA §15064.5(b)(3). (LTS)

However, if it is not feasible to minimize material impairment of the resource, then the impact would remain significant and unavoidable. (SU)

Impact HIST-6: Site clearance within the Project area could adversely impact four Potential Designated Historic Properties (PDHPs) in the Project area. (LTS)

Four buildings identified as PDHPs are proposed for demolition within the Project area:

- *1958-60 San Pablo Avenue, Snyder-Olmstead Building*
- *1966-68 San Pablo Avenue, Olmstead Building*
- *1972 San Pablo Avenue, Muller Tailor-Rankin plumbing shop*
- *1998 San Pablo Avenue, White Cabin Lunch Company*

These four buildings currently do not meet the definition of historical resources for the purposes of CEQA. As established in the HPE, effects to a PDHP may be considered significant under CEQA if the PDHP is included in Oakland's Local Register prior to demolition (e.g., by becoming a Designated Historic Property).[68] Policy 3.7 of the HPE (Property Relocation Rather Than Demolition) recommends that reasonable efforts be made to relocate threatened PDHPs to an acceptable site, if feasible. The Project applicant is willing to publish advertisements in local newspapers to notify the public of the buildings' availability for relocation. Action 3.7.1 of the HPE cites public notification as one means by which the "reasonable efforts" standard may be met.

If relocation is not feasible, the demolition of these buildings would constitute an adverse impact, but such an impact would not be considered a significant impact under CEQA. As currently specified by the HPE, PDHPs do not warrant the regulatory protections that are applied to Designated Historic Properties. Implementation of the following mitigation measure would minimize this less-than-significant impact through the preservation of information for future study.

> Mitigation Measure HIST-6: If the relocation of the PDHPs proposed for demolition on the Project site is not feasible, the buildings shall be documented at a level of detail commensurate with their local importance. At a minimum, this effort shall include photo-documentation, as well as local oral history about the past uses and occupants of the buildings. This documentation shall be planned in consultation with OCHS in order to: 1) identify those qualities that support and justify the property's local significance; and 2) efficiently record and disseminate

---

[68] As defined in the HPE, PDHPs may be eligible for designation as Designated Historic Properties, which includes Landmarks, Preservation Districts, or Heritage Properties, a less exclusive designation. Heritage Property listings replace the Preservation Study List, which is defined by the Oakland Zoning Regulation Section 17.102.060 as "a study list of facilities under serious study . . . for possible landmark designation . . . or for other appropriate actions." For the purposes of CEQA, Policy 3.8 of the HPE states that all Designated Historic Properties are considered listings on Oakland's local register. These local register properties are considered historical resources as defined by PRC 5020.1(k).

such information in a way that most effectively offsets the loss of such buildings. At the completion of this documentation, all notes, photographs, and analysis shall be archived at the OHR, and a complete copy shall be submitted to the NWIC. (LTS)

Impacts to Historic Districts. The 19th and San Pablo Commercial District is not considered a historical resource under CEQA. For the purposes of CEQA, the proposed Project will not cause a significant adverse impact to the 19th and San Pablo Commercial District.

However, for the purposes of CEQA, the 19th and San Pablo Commercial District could be impacted by the proposed Project if: 1) the district is elevated to Preservation District status (a type of Designated Historic Property); and 2) the four PDHPs identified in Impact HIST-5 are demolished. However, this impact would be less than significant because the remaining majority of contributing properties would still retain enough of the district's character-defining elements to convey its historical significance. Buildings remaining after Project implementation will include the Hotel Arcade, the Hanifin Block, and the Dalziel Block. These remaining buildings include all of the district's primary contributors (the Hotel Royal, Hotel Arcade, and the Hanifin Block), which will continue to retain the district's major character defining elements that reflect turn-of-the-century commercial development in Oakland. These buildings represent styles that include Italianate, Beaux Arts-derived, and Classical Revival. They maintain the grandness of scale and ornamentation that characterize what the OCHS described as the "visually distinctive/turn-of-the-century commercial district." The retention of these distinctive buildings allows the district to continue to convey the historical significance of late 19th, early 20th century commerce in Oakland.

Impact HIST-7: Project demolition and construction could adversely impact the setting of the 19th and San Pablo Commercial District. (S)

If the 19th and San Pablo Commercial District receives a Preservation District designation, the Project may result in a significant impact to the district's setting. However, OCHS documentation indicates that the district's integrity of setting has been diminished by surrounding uses that "differ in use and visual coherence" from the district's contributing buildings.[69] Therefore, the Project's effects on the setting of the 19th and San Pablo Commercial District would not significantly impair the district's integrity.

Mitigation Measure HIST-7**:** No mitigation measure is necessary to address the less-than-significant impact. (LTS)

Impact HIST-8: Project demolition and construction could result in a significant cumulative impact on the 19th and San Pablo Commercial District. (S)

The demolition of the four PDHPs identified in Impact HIST-5 may result in a significant cumulative impact when considered with other projects that causing related impacts. The Thomas L. Berkley Square Project, located across Thomas L. Berkley Way (20th Street) from Project Block #1, proposes the demolition of two contributing properties of the 19th and San Pablo Commercial District (the Hotel Royal Building and the California Peanut Company Building). The impact of the Uptown Mixed-Use Project, while incremental when considered alone, will contribute to a cumulatively

---

[69] Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

significant impact when considered with the impacts of the Thomas L. Berkley Square Project. If both projects are implemented as proposed, six of nine contributing buildings of the 19th and San Pablo Commercial District will be demolished. This would result in a significant, unavoidable cumulative impact to the 19th and San Pablo Commercial District.

> Mitigation Measure HIST-8: The City shall inform the applicant for the Thomas L. Berkley Square Project of the potential cumulative impact prior to the implementation of the Uptown Mixed-Use Project. The City shall consult with both project applicants to establish a fair division of responsibility to fund mitigation measures to preserve information about the 19th and San Pablo Commercial District for future study. These mitigation measures shall include the following:
>
> - Record the 19th and San Pablo Commercial District in accordance with the procedures of HABS through measured drawings, written histories, and large-format photographs;
> - Prepare a history of the 19th and San Pablo Commercial District that incorporates oral history, documentary research, and architectural information;
> - Prepare a brochure, regarding the district's historical association with turn-of-the-century Oakland commerce, to be made available at local libraries and museums;
> - Salvage architectural elements from the buildings proposed for demolition, including hardware, doors, paneling, fixtures, and equipment, and incorporate these elements into new construction; and
> - Curate all materials, notes, and reports at the OHR, and submit copies to the NWIC.
>
> Even with extensive documentation, however, a cumulative impact will result from the demolition of 66 percent of the 19th and San Pablo Commercial District's contributing buildings. This loss of contributing buildings will materially affect the district's ability to convey its historical significance, which will result in a significant, unavoidable cumulative impact. (SU)

Impact HIST-9: Site clearance within the Project area could adversely impact historic architectural buildings inventoried by the OCHS. (LTS)

Sixteen buildings inventoried by the OCHS[70] are proposed for demolition within the Project area (see Figure 1, buildings #2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 20, and 21). These 16 buildings are not listed in the Local Register, do not have the potential to be listed, and do not meet any other criteria for consideration as historical resources, as defined by CEQA §21084.1.

Because these 16 buildings are not considered historical resources for the purposes of CEQA, their demolition will not result in a significant adverse effect.

> Mitigation Measure HIST-9: No mitigation measure is necessary to address the less-than-significant impact. (LTS)

Impact HIST-10: The construction of Project buildings could adversely impact historic architectural resources adjacent to the Project area. (LTS)

---

[70] Oakland Cultural Heritage Survey, 2000, 1983-85, and 1994-95, op. cit.

Several Local Register buildings are located across the streets and in areas adjacent to the Project area. These buildings include the Italianate Hanifin and Dalziel Blocks and the Classical Revival Hotel Arcade/San Pablo across San Pablo Avenue from the proposed five-story buildings in Project area Blocks 1 and 2. Local Register buildings across Telegraph Avenue from Blocks 3 and 4 of the Project area include the Oakland Floral Depot and Capwell's, both designed by architects Ashley & Evers. Located across 20th Street from Block 1 of the proposed Project are the Arts and Crafts Hotel Royal and the Beaux Arts-derivative California Peanut Company-Oakland Post Building, both listed on the Local Register. The Paramount Theater and the I. Magnin Company Building, both Local Register properties, are adjacent to Block 8.

These architectural resources listed on the Local Register generally retain their integrity of location, design, materials, workmanship, and association from their period of significance. The integrity of setting and feeling to their period of significance, however, has been compromised by subsequent contrasting development that has resulted in a varied mix of urban uses. The proposed Project, partly consisting of five-story buildings, would not result in an adverse effect to those elements that would render them eligible for the California Register. No adverse effect would occur because the integrity of setting and association of the Local Register resources has already been compromised.

Of greater effect, however, would be the construction of the 19-22 story tower on Block 7. This building would alter the viewshed of the YMCA Building and those buildings in the Cathedral Historic District across 21st Street. However, construction of the tower at this location would not alter the characteristics that define their California Register significance.[71]

> Mitigation Measure HIST-10: No mitigation measure is necessary to address the less-than-significant impact. (LTS)

Impact HIST-11: The proposed Project could impact the setting of the Fox Oakland Theater. (LTS)

The Fox Oakland Theater is rated by the OCHS as A1+, listed on the National Register, and designated as a City Landmark.[72] The Fox Oakland Theater is a primary contributor to a potential Uptown Shopping/Entertainment historic district,[73] and the focus of numerous historic preservation activities since the mid-1970s. The proposed Project has the potential to affect this historic property.

---

[71] The Cathedral District is noted for a range of architectural styles from 1868-1915, some of which include examples of buildings modified following the 1906 earthquake and fire in San Francisco. The district also included a distinctive church, St. Francis de Sales Cathedral, which was demolished in 1993. The YMCA Building is significant for its architectural expressiveness and composition, as well as for its association with an important community institution and a notable local architect, William Charles Hays.

[72] The Fox Oakland Theatre was designed by Weeks & Day and Maury Diggs and completed in 1927-28. It is a turreted and crenellated Hindu-Deco movie palace with wraparound store and office wings, clad in brown brick and exuberant polychrome tile. It is a primary contributor to a potential Uptown historic district whose themes are luxury shopping and entertainment and Art Deco architecture of the 1920s and 1930s (with the remainder of the district located on the east side of Telegraph Avenue and along Broadway from 17th to 21st Streets) (OCHS, 2000).

[73] City of Oakland Planning Department, Oakland Cultural Resources Survey, 2000, 1983-85, and 1994-95, op. cit.

The area around the Fox Oakland Theater has been significantly altered since it was constructed in the late 1920s. The area experienced its heyday in the following decade, when its surroundings grew to include the Paramount Theater, Capwell's, the Oakland Floral Depot Building, and a variety of commercial enterprises, none of which are over four stories in height. The tower and façade of the Fox Oakland Theater, with the Floral Depot across Telegraph Avenue and the Capwell's store up the street, dominated the uptown landscape.

Since that time, several buildings have been demolished and others have been remodeled so that they no longer reflect their period of significance. A number of parking structures and lots have also been constructed. There have, however, been no multi-story buildings constructed within the Project area, but many have been developed nearby, and those have significantly altered the skyline. The theater retains its integrity of location, design, materials, workmanship, and feeling to a remarkable degree, although its integrity of setting and association has been compromised.[74]

Although the proposed Project would alter the immediate surroundings of the Fox Oakland Theater, the new construction would represent a less-than-significant effect because of the previous compromises in setting and association.

> Mitigation Measure HIST-11: No mitigation measure is necessary to address this less-than-significant impact. (LTS)

Impact HIST-12: The proposed Project could impact the operations of the Fox Oakland Theater and, therefore, indirectly impact its architectural qualities. (LTS)

The future viability of the Fox Oakland Theater as a performing arts facility that retains the architectural integrity of its interior depends upon many elements; providing sufficient space behind the theater to accommodate a loading area and other possible uses is one. The Friends of the Fox Theater have expressed concern that if insufficient space is provided between the theater and Project elements, the ability of the Fox Oakland to operate as a viable performance arts venue may be affected. Were this limitation to lead to a different use of the Fox Oakland Theater that requires architectural modification or interior alterations, or to disinvestment and gradual physical decline, such change could impact the building's character-defining elements and could result in a "substantial adverse change" in the theater's ability to convey its historical significance.

The City's existing regulations require a separate and thorough analysis of any physical modifications to designated landmarks. Such modifications are not being proposed as part of this project. Therefore, sufficient space (50 feet) has been reserved behind the Fox Oakland Theater so that it can continue to function as a performing arts venue. Volume III of the Fox Theater Master Plan presents five alternatives that provide for rehabilitation of the theater. Each alternative provides a reserve space of approximately 40 feet behind the building.[75] Thus, the 50 feet of reserve space proposed as part of the Project would be sufficient to allow the building to re-establish operation as a theater.

---

[74] Although no criteria were noted in the nomination, the Fox Oakland was determined eligible for the National Register, evidently under Criterion A, for its association with the film industry and as the largest movie theatre in Oakland at the time, and Criterion C, for its Art Deco-Hindu architectural significance, and as one of the last remaining Art Deco buildings in downtown Oakland.

[75] Hardy Holzman Pfeiffer Associates, LLP, 2001. *Fox Theater Master Plan*. May 30.

Mitigation Measure HIST-12: No mitigation measures is necessary for this less-than-significant impact. (LTS)

(3) Streetscape Improvements. Significant improvements and modifications to the area's streetscape are proposed as part of the Project. These improvements could adversely impact historical resources as described below.

Impact HIST-13: The enhancement of streetscape features and lighting on streets fronting the Project area may impact historical resources, including elements of the Uptown Shopping/ Entertainment Historic District and the Fox Oakland Theater. (S)

> Mitigation Measure HIST-13: Prior to Project initiation, the plan for the enhancement of street features and lighting on Telegraph Avenue shall be reviewed by planning staff to ensure that it conforms to the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Preservation of Historic Buildings.*[76] Conformance with these guidelines will ensure that these improvements are compatible with nearby historical resources, and will mitigate potential Project effects to less-than-significant levels.[77] (LTS)

[77] CEQA §15064.5(b)(3).

J. AESTHETIC RESOURCES

This section evaluates the effects of the Uptown Mixed Use Project on visual and aesthetic resources in the vicinity of the Project site. This analysis also considers the proposed Project's consistency with applicable visual resource-related policies.

This section is based on: 1) field surveys of the Project site that were conducted in May and June 2003; 2) a review of data provided by the City and Project applicant, including aerial photographs, site plans, and planning documents related to Downtown Oakland; and 3) visual simulations that show "before" and "after" representations of the proposed Project.[1] Visual simulations, which are based on schematic drawings of the proposed Project, were prepared for six representative public vantage points in the vicinity of the Project site. The visual simulations are intended to convey a realistic impression of the Project in terms of proposed building location, scale and massing. However, because the architectural details of the proposed structures have not been finalized, the simulations do not portray the actual architectural design of the proposed Project.

1. Setting

The following section includes a description of the visual quality of the Project site and its surroundings, and views in the vicinity of the site.

a. Local Context. Physical development in the Uptown District is characterized by low- to medium-rise attached buildings with little or no setback from the street. Building heights generally range from one story to 11 stories. At its peak in the 1920s and 1930s, the Uptown District was a thriving commercial neighborhood with a concentration of luxury shopping and entertainment uses. The visual remnants of this era include the Fox and the Paramount Theaters, two landmark 1920s-era movie palaces, and the Capwells (now Sears) and I. Magnin's department stores. During the years after World War II, the Uptown District, along with other portions of Downtown Oakland, experienced a period of disinvestment whose manifestations included a decline in population and commercial revenue. Existing land uses within the Project site include a predominance of parking lots and vacant buildings that do not foster an active urban pedestrian environment. The existing development pattern in the District, which is less dense and contains a higher percentage of underutilized properties than surrounding neighborhoods, also contributes to a sense of discontinuity between the site and surrounding areas.

b. Visual Character of the Site. Please refer to Section IV.A, Land Use, for a description of the physical characteristics of the blocks within the Project site and Section IV.I, Historic Architectural, Archaeological and Paleontological Resources, for a description of the historic buildings within the Project site. The Project site comprises large amounts of surface parking as well as a mixture of commercial buildings that range in height from one to four stories. The relatively flat urbanized site includes little vegetation with the exception of trees located along several streets, and landscape improvements within the San Pablo Avenue median.

Figures IV.J-1a through IV.J-1f illustrate the visual character of the Project site. Because much of the Project site is dominated by surface parking and vacant lots, the visual character of the site is defined in large part by the buildings around it. High-visibility buildings that frame the Project site include

---

[1] Environmental Vision, 2003. *Conceptual Visual Simulations*. July 21.

the Paramount Theater and Sears Department Store to the east (see Figure IV.J-1a), the Fox Oakland Theater immediately to the east of Block 6 (see Figure IV.J-1b), Downtown skyscrapers to the south (see Figure IV.J-1f), the senior residential complex to the west of Block 1, and the multi-story YMCA and apartment complex on the north side of 21st Street.

The Great Western Power Plant (formerly Navlet's Florist and Nursery), with its associated smokestack, is a major landmark within the Project site, and dominates views of the northern portion of the Project site (see Figure IV.J-1b). Views along Thomas L. Berkley Way (20th Street) and San Pablo Avenue are typified by one and four-story street-front mixed use buildings that generally appear to be smaller in scale than surrounding buildings (see Figure IV.J-1b). The western and northern portions of the Project site have a decidedly more commercial visual character than the south and east portions of the site, on which parking uses predominate.

c. Views From the Vicinity of the Project Site. The Project site is visible from a number of public view corridors and vantage points in Downtown Oakland. The site is not visible in its entirety from a single, ground level vantage point because of its large size (approximately 15 acres), flat topography, and surrounding high-rise buildings. Telegraph Avenue and San Pablo Avenue, two major urban thoroughfares, afford close and medium-range views of portions of the site. The following discussion provides a brief description of public corridors with views of the Project site. None of the public streets in the near vicinity of the Project site have been designated as State or local scenic routes. Figures IV.J-1a through IV.J-1f present photographs of the Project site taken from representative public vantage points. Figure IV.J-2 shows the location of each viewpoint.

(1) Views From the East. Telegraph Avenue, a major north-south arterial, borders the Project site on the east. Figures IV.J-1a and IV.J-1b show views of the Project site from Telegraph Avenue. As depicted in these photos, the existing structures located along Telegraph Avenue reflect a range of building scales and architectural character. Southwest views from Telegraph Avenue near Grand Avenue include a tall three-story stone church built in the early 1900s and the seven-story brick YMCA building located at the corner of 22nd Street (see Figure IV.J-1b). These views also encompass the one-story buildings and surface parking located on the Project site, as well as the historic art deco-style Fox Theater; modern high-rise buildings are visible in the background. Views along Broadway include a variety of older and modern buildings ranging from tall single story to high-rise; vintage light fixtures and deciduous canopy trees that line the street (see Figure IV.J-1c) also define visual character east of the Project site.

(2) Views From the North. A mixture of building types and land uses, including a variety of residences, are located to the north of the Project site. Views to the northwest and east from 21st Street near Telegraph Avenue include small scale, Victorian-era residences in addition to the high-rise YMCA and an apartment building to the west. Views into the Project site from the north are dominated by the Pacific Gas and Electric Substation (see Figure IV.J-1d) and the commercial uses along the north side of Thomas L. Berkley Way (20th Street).

(3) Views From the West. San Pablo Avenue is a major north-south thoroughfare bordering a portion of the Project site on the west. Views along the San Pablo Avenue corridor include low to moderate-rise mixed use buildings in the vicinity of the Project site and taller commercial buildings and parking garages in the vicinity of the Civic Center (see Figure IV.J-1d).

8x11 B&W

Figure IV.J-1f: Visual Character Photographs

8x11 B&W

Figure IV.J-2: Photo Viewpoint Locations

8x11 B&W

(4) Views From the South. The Civic Center district, centered around the historic City Hall building located on Frank Ogawa Plaza, is located south of the Project site. This district is characterized by a range of building heights and mix of modern and older architectural styles (see Figure IV.J-1f). The area surrounding Frank Ogawa Plaza displays a coherent architectural character and strong pedestrian scale (see Figure IV.J-1f).

2. Applicable Policies

The main documents that are applicable to aesthetics and visual quality within and around the Project site are the Land Use and Transportation Element and the Open Space, Conservation, and Recreation Element of the City of Oakland General Plan, and the Oakland Planning Code. Applicable visual resources policies are listed below.

a. Land Use and Transportation Element. The Land Use and Transportation Element (LUTE) is intended to guide the development of "clean and attractive neighborhoods rich in character and diversity, each with its own distinctive identity, yet well-integrated into a cohesive urban fabric."

> Objective D2. Enhance the visual quality of downtown by preserving and improving existing housing stock and encouraging new high quality development.
>
> > Policy D2.1. Downtown development should be visually interesting, harmonize with its surroundings, respect and enhance important views in and out of the downtown, and contribute to an attractive skyline.
>
> Objective D3. Create a pedestrian-friendly downtown.
>
> > Policy D3.1. Pedestrian-friendly commercial areas should be promoted.
> >
> > Policy D3.2. New parking facilities for cars and bicycles should be incorporated into the design of any project in a manner that encourages and promotes safe pedestrian activity.
>
> Objective D5. Enhance the safety and perception of safety downtown at all hours.

b. Open Space, Conservation, and Recreation Element. One of the major components of the Open Space, Conservation, and Recreation Element (OSCAR) is the protection of visual and open space resources in Oakland.

> Policy OS-10.1. View Protection. Protect the character of existing scenic views in Oakland, paying particular attention to a) views of the Oakland Hills from the flatlands; b) views of downtown and lake Merritt; c) views of the shoreline; and d) panoramic views from hillside locations.
>
> Policy OS-10.3. Underutilized Visual Resources. Enhance Oakland's underutilized visual resources including the waterfront, creeks, San Leandro Bay, architecturally significant buildings or landmarks, and major thoroughfares.

Policy OS-11.1. Access to Downtown Open Space. Provide better access to attractive, sunlit open spaces for persons working or living in downtown Oakland. The development of rooftop gardens is encouraged, especially on parking garages.

Policy OS-11.2. New Civic Open Space. Create new civic open spaces at BART Stations, in neighborhood commercial areas, on parking garages, and in other areas where high-intensity redevelopment is proposed.

Policy OS-11.3. Public Art Requirements. Continue to require public art as part of new buildings or facilities. Consider expanding the requirement.

c. Oakland Planning Code. The design of new projects in Oakland is subject to the following performance criteria that are utilized as part of the City's design review process.

Section 17.136.070. Design Review Criteria. Except as different criteria are prescribed elsewhere in the zoning regulations, design review approval may be granted only if the proposal conforms to all of the following criteria, as well as to any and all other applicable design review criteria:

A. For Residential Facilities

1. That the proposed design will create a building or set of buildings that are well related to the surrounding area in their setting, scale, bulk, height, materials, and textures;

2. That the proposed design will protect, preserve, or enhance desirable neighborhood characteristics;

3. That the proposed design will be sensitive to the topography and landscape;

4. That, if situated on a hill, the design and massing of the proposed building relates to the grade of the hill; and

5. That the proposed design conforms in all significant respects with the Oakland Comprehensive Plan and with any applicable district plan or development control map which has been adopted by the City Council.

B. For Nonresidential Facilities and Signs

1. That the proposal will help achieve or maintain a group of facilities which are well related to one another and which, when taken together, will result in a well-composed design, with consideration given to site, landscape, bulk, height, arrangement, texture, materials, colors, and appurtenances; the relation of these factors to other facilities in the vicinity; and the relation of the proposal to the total setting as seen from key points in the surrounding area. Only elements of design which have some significant relationship to outside appearance shall be considered, except as otherwise provided in Section 17.102.030;

2. That the proposed design will be of a quality and character which harmonizes with, and serves to protect the value of, private and public investments in the area;

3. That the proposed design conforms in all significant respects with the Oakland Comprehensive Plan and with any applicable district plan or development control map which has been adopted by the City Council.

2. Impacts and Mitigation Measures

This section analyzes impacts related to aesthetic resources that could result from implementation of the proposed Project. The subsection begins with the criteria of significance, which establish the thresholds for determining whether an impact is significant. The latter part of this section presents the impacts associated with the proposed Project. Mitigation measures are recommended, as appropriate. Shadow and shade-related impacts are discussed in Section IV.L., Shade and Shadow.

a. Criteria of Significance. Implementation of the proposed Project would have a significant effect on aesthetic resources if it would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of the site and its surroundings;
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area; or
- Require an exception (variance) to the policies and regulations in the General Plan, Planning Code, or Uniform Building Code, and the exception causes a fundamental conflict with policies and regulations in the General Plan, Planning Code, and Uniform Building Code addressing the provision of adequate light related to appropriate uses.

b. Less-than-Significant Aesthetic Resources Impacts. The following discussion describes the less-than-significant impacts to aesthetic resources that would result from implementation of the proposed Project.

(1) Scenic Vistas. The Project site is generally flat and contains views of Downtown Oakland and surrounding high-rise buildings. Views to the East Bay Hills from the Project site and surrounding public viewpoints are limited by high-rise buildings east and north of the Project site. No views of San Francisco Bay are available from the Project site. Although views from the site extend to Downtown Oakland and surrounding urban development, these views are not identified as vistas or resources in the General Plan, or by regulatory agencies with jurisdiction over the Project site

(2) Visual Character. Because of the predominance of surface and vacant lots within the Project site, the site has an empty visual character that contrasts with the more active commercial districts to the east of the Project site along Telegraph Avenue and Broadway. The perception that the site is largely vacant, coupled with the perception that the Uptown District is unsafe, have combined to result in a lack of pedestrian activity, especially after daytime working hours. The lack of pedestrian activity has adversely impacted the aesthetic character of the Project site.

Implementation of the proposed Project would result in the development of mixed uses within the Project site. Proposed buildings are of a scale and form that are similar to buildings in more vibrant urban neighborhoods adjacent to the Uptown District. The proposed Project would develop parcels within the Project site that are currently vacant or occupied by surface parking and would introduce a permanent residential population. This resident and employee population would increase activity within and around the Project site, and would increase the visual appeal of this portion of the Uptown District. In addition, proposed streetscape improvements, and development of the 25,000 square foot park would enhance visual quality within the Project site, which contains few “soft” landscape elements.

(3) Aesthetic Resources Policies. The proposed Project is generally consistent with applicable visual resources policies in the General Plan. The proposed Project would result in the development of a mixed use Project on an infill site that is currently characterized by surface parking and vacant lots, and underutilized buildings. By creating a more unified streetscape, without gaps created by parking lots between buildings, the proposed Project would result in a more visually comfortable pedestrian environment than currently exists within the Project site.

The proposed buildings, which would range from four to 19 stories, would be similar in height to other buildings in Downtown Oakland south of the Project site. The consistency of the proposed Project with policies protecting historic architectural resources is discussed in Section IV.I, Historic Architectural, Archaeological and Paleontological Resources.

The proposed Project would undergo design review prior to final Project approval; during this time, the Project design could be subject to refinement to ensure compatibility with the Design Review Criteria listed earlier in this section. Based on preliminary plans, it is anticipated that there would be no major conflicts between the proposed design of the Project and the Design Review Criteria. Design of the proposed Project is further addressed in Impact AES-1, below. In addition, it is anticipated that adequate lighting would be developed within the Project site. Refer to Impact AES-2, below, for a discussion of adverse Project-related impacts related to lighting.

c. Significant Aesthetic Resources Impacts. The following discussion describes significant impacts to aesthetic resources that would result from implementation of the proposed Project.

Impact AES-1: The proposed Project would alter the intrinsic architectural character of the Project site and its surroundings. (S)

The changes in visual character of the site as seen from six key public viewpoints are shown in Figures IV.J-3 through IV.J-8. As shown in these simulations, the Project would represent a substantial increase in the amount of visible building mass and street frontage seen on the site. The approximate amount of proposed building street frontage is summarized in Table IV.J-1.

The proposed Project would be highly visible from some locations along public streets and view corridors within the downtown. Visual simulations showing the proposed Project’s scale, massing and

Table IV.J-1: Proposed Building Street Frontage (Approximate)[a]

	Block 1 (Feet)	Block 2 (Feet)	Block 3 (Feet)	Block 4 (Feet)	Block 5 (Feet)	Block 6 (Feet)	Block 7 (Feet)
Telegraph Avenue			145	170			195
San Pablo Avenue	120	150			225		
21st Street							400
TLB Way (20th Street)[b]	330		250				240
William Street	330	265	250	400			
19th Street		220		400	200	90	
18th Street					200	90	
Total Frontage	**780**	**635**	**645**	**970**	**625**	**180**	**835**

Source: Environmental Vision, 2003.

conceptual appearance as seen from six representative public viewing locations are presented as Figures IV.J-3 through IV.J-8.

Figures IV.J-3 and IV.J-4 present "before" and "after" views of the Project site from locations along Telegraph Avenue. As shown in the Figure IV.J-3 simulation, when looking southeast from Telegraph Avenue near 22nd Street, the proposed 19-story building located on Block 7 would appear prominently in the foreground. In relationship to the nearby seven-story brick YMCA and three-story stone church buildings, the height of the new tower could appear somewhat incongruous or overbearing. Beyond this new highrise, the proposed 12-story building located on Block 3, and the five-story building on Block 4 would appear to step down toward the Fox Theater, demarcated by the red vertical marquis sign, seen in the distance. As seen from this Telegraph Avenue vantage point, the proposed Project would not substantially block views of the Fox Theater.

As seen from Telegraph Avenue near 17th Street, the five-story building on Block 4 would be seen beyond the Fox Theater which appears prominently in the foreground. New development on Blocks 3 and 7 would step up to the north, away from Fox Theater. The proposed buildings on Blocks 3, 4, and 7 would contribute to a more continuous streetwall along the west side of Telegraph Avenue. In this respect, the proposed Project would strengthen urban streetscape character and the pedestrian environment along Telegraph Avenue in the Project vicinity. The height of the Block 7 proposed tower would be noticeably taller than surrounding buildings and could appear somewhat out of scale in relationship to the heights of nearby existing and proposed buildings.

Figure IV.J-5 presents a "before" and "after" view of the Project site as seen from Thomas L. Berkley Way (20th Street) near Franklin Street. The simulation also shows the Thomas L. Berkley Square Mixed Use Project. which would be seen in the distance, immediately to the right of the Sears building. From here, the proposed Project would introduce a new prominent highrise building to the west of Broadway, on Block 7. As shown in the simulation, the new building would appear as a backdrop to the historic, art deco-era Magnin's building. The new tower would obstruct the view of the Great Western Power Plant smokestack which is currently available from this location.

Figures IV.J-6 and IV.J-7 present "before" and "after" views of the proposed Project site from locations along San Pablo Avenue. Both simulations illustrate the appearance of the proposed Project on Blocks 1, 2, and 5. The Figure IV.J-7 simulation, a view looking east from San Pablo Avenue at Castro Street, shows the Thomas L. Berkley Square Mixed Use Project in the foreground on the left side of the image. As shown in the simulations, the proposed buildings on Blocks 1, 2 and 5 would create a more continuous streetwall along the east side of San Pablo Avenue. In this respect the Project would strengthen urban streetscape character and the pedestrian environment within the

back of Figure IV.J-8

Project vicinity. The height of the proposed Block 5 tower would be noticeably taller than surrounding buildings and could appear somewhat out of scale in relationship to the heights of nearby existing and proposed buildings.

Figure IV.J-8, a" before" and "after" view of the Project site from Frank Ogawa Plaza, shows the proposed residential tower on Block 5. As seen from this location, the Block 5 structure would partially enclose views to the north seen from Frank Ogawa Plaza. Views toward the new building would encompass the open plaza area and would be framed by existing buildings that adjoin the plaza. The Project design was still in the development stages at the time this analysis was completed; as a result, details of the building's articulation were not available. However, in order to ensure the final design does not result in significant visual impacts, the five-part mitigation measure set forth below shall be implemented.

> Mitigation Measure AES-1: The following measures shall be incorporated into the final Project design:
>
> - Create streetscape vitality and enhance the pedestrian experience through detailed treatment of building facades, including entryways, fenestration, and signage, and through the use of carefully chosen building materials, texture, and color.
> - Design of building facades shall include sufficient articulation and detail to avoid the appearance of blank walls or box-like forms.
> - Exterior materials utilized in construction of new buildings, as well as site and landscape improvements, shall be high quality and shall be selected for both their enduring aesthetic quality and for their long term durability.
> - Ensure that the architectural and landscape treatment of the proposed parking structure promotes human scale and pedestrian activity.
> - Detailed designs for the public park shall be developed. The design shall emphasize the public nature of the space and pedestrian comfort. The plaza design shall consider sun/shade patterns during mid-day hours throughout the year. The plaza design shall be sensitively integrated with the streetscape. (LTS)

Impact AES-2: The proposed development would provide additional sources of nighttime lighting in the downtown. (S)

The proposed Project would include new sources of light in Downtown Oakland. In addition, during daylight hours pedestrians and motorists could experience some degree of glare due to light reflecting off the new building facades.

Exterior lighting would be provided at entrances for each of the proposed new buildings. Lighting would also be installed within the public park area. In addition, the Project would introduce nighttime lighting associated with approximately 2,000 new residences. Because the Project includes uses which are similar to those currently found in Downtown, it is anticipated that the lighting proposed as part of the Project would generally be compatible with lighting currently located in the vicinity of the Project site. It is also anticipated that Project-related lighting would not substantially adversely alter the nighttime visual character of the downtown.

The specific layout of the proposed exterior lighting design for the development including fixture types would be subject to the City's design review process. In order to reduce potential light and glare-related impacts to a less-than-significant level, the following two-part mitigation measure shall be incorporated during final Project design.

> Mitigation Measure AES-2a: The specific reflective properties of Project building materials shall be assessed by the City during Design Review as part of the Project's Development Standards, Procedures and Guidelines. Design review shall ensure that the use of reflective exterior materials is minimized and that proposed reflective material would not create additional daytime or nighttime glare.
>
> Mitigation Measure AES-2b: Specific lighting proposals shall be reviewed and approved by the City prior to installation. This review shall ensure that any outdoor night lighting for the Project is down shielded and would not create additional nighttime glare. (LTS)

K. WIND

This section evaluates the effects of the Uptown Mixed Use Project on wind patterns in the Uptown District. Potential wind-related impacts that would result from implementation of the proposed Project are identified, and mitigation measures are recommended, as appropriate. This section is adapted from a Wind Impact Evaluation published on July 7, 2003.[1]

1. Setting

The following section describes the conditions that affect wind in urbanized settings, and existing wind patterns and characteristics in Oakland and the vicinity of the Project site.

a. Building Aerodynamics. Ground-level wind acceleration in urban areas is heavily influenced by building exposure, massing, and orientation. Exposure is a measure of the extent that a building extends above surrounding structures into the wind stream. A building that is surrounded by taller buildings is not likely to substantially accelerate wind speeds at ground level; however, a small building could cause acceleration if it is freestanding and exposed.

Massing, which is the physical bulk of a structure, determines how much wind is intercepted by a given structure and whether building-generated wind accelerations occur above-ground or at ground level. In general, slab-shaped buildings (i.e., buildings with long, flat fronts or sides) have the greatest potential to increase wind acceleration. Buildings with unusual shapes, rounded faces, or substantial set-backs tend to have a lesser effect on wind speed. In general, buildings with more complex massing typically have a smaller effect on ground-level wind acceleration. In addition, buildings with intricate articulation, or buildings that are surrounded by street furniture, large-scale artwork, or landscaping, can reduce overall wind speeds.

Building orientation (i.e., the direction a building faces) determines how much wind a structure intercepts. In general, a building that is oriented with its wide access against the prevailing wind direction will have a greater impact on ground-level winds than a building oriented with its long access parallel to the prevailing wind direction.

b. Wind Characteristics of the Project Site and Alameda/Oakland. The Project site contains a mixture of land uses, including surface parking, multi-story parking structures and one to three-story buildings. Taller buildings surround the Project site on the south and east; building heights to the west and north of the Project site are similar to existing building heights within the Project site.

The former Alameda Naval Air Station, which is located approximately 4 miles southwest of the Project site, provides the closest source of long-term wind data. Wind data collected over the last 23 years show that westerly winds are the most frequent and strongest winds during all seasons. Westerly winds are most common during the spring and summer months when sea breezes predominate. Southeasterly winds, which are the second most common directional winds at the Alameda Naval Air Station, are typically associated with winter storms. While southeasterly winds are not associated with the highest average wind speed, they are likely to produce the *highest* wind speed in a given year.

---

[1] Ballanti, Donald, 2003. *Wind Impact Evaluation for the Forest City Uptown Mixed-Use Project, Oakland*. July 7.

Calm winds occur approximately 10 percent of the time. The average annual wind speed at Alameda Naval Air Station is approximately 8.6 miles an hour; because downtown Oakland is located inland from the San Francisco Bay shoreline and is protected from Bay winds by structures, average wind speed at the Project site is less than the average wind speed at Alameda Naval Air Station.

2. Impacts and Mitigation Measures

This subsection analyzes impacts related to wind that could result from implementation of the proposed Project. The subsection begins with the criteria of significance, which establish the thresholds for determining whether an impact is significant. The latter part of this subsection presents the impacts associated with the proposed Project.

a. Criteria of Significance. CEQA does not contain specific thresholds of significance for the evaluation of wind-related impacts. In addition, neither the State nor the City of Oakland have established standards or criteria for the evaluation of wind impacts.[2] Based on pedestrian comfort considerations, implementation of the proposed Project would result in a significant wind-related impact if:

- It results in the occurrence at least one time per year of winds greater than 36 miles per hour (mph).

b. Less-than-Significant Wind Impacts. Blocks 1, 2, 4, and 6 would contain a series of five-story buildings which would be approximately 65 feet high. Buildings within these blocks would be arranged around courtyards, which are generally oriented along northwest/southeast axes. No buildings within these blocks would have continuous building faces oriented perpendicular to west and southeast winds. In addition, because buildings on these blocks would be partially sheltered by structures surrounding the Project site, they are not anticipated to generate substantial adverse wind impacts.

Block 3 would contain a 12-story building that would be approximately 156 feet high (an intermediate height in relation to the proposed five-story buildings to the south and west, and the proposed 19-story building to the north). The long axis of the Block 3 building would be aligned with Telegraph Avenue, and would not be exposed to prevailing west or southeasterly winds. Therefore, the proposed Block 3 building is not anticipated to result in significant adverse wind effects. Block 8 or Block 9 is proposed as the relocation site for the Sears Auto Center. The relocated Sears Auto Center would be a one-story building and would not result in adverse wind effects. In addition, the proposed three-story building on Block 7 is similar in height to surrounding buildings and would be immediately adjacent to a 19-story building. Therefore, the proposed Block 3 three-story building is not anticipated to significantly increase wind speeds within or in the vicinity of the Project site.

The proposed courtyards, public park, and north/south streets would be sheltered from prevailing winds by low-rise portions of the Project. Landscaping proposed for these areas would also mitigate the adverse effects of high winds.

c. Significant Wind Impacts. The following discussion describes one significant wind impact associated with the proposed Project:

---

[2] This criterion of significance is maintained by the City of San Francisco for significant wind impacts, and is similarly appropriate for the City of Oakland.

Impact WIND-1: Construction of 19-story buildings on Blocks 5 and 7 could result in wind speeds of over 36 mph. (S)

The 19-story building proposed for Block 5 would be oriented along a north/northwest, south/southeast alignment. Because the long face of the building would be exposed to prevailing winds, the building could substantially increase wind speeds along San Pablo Avenue and along its north and south side. Similarly, the 19-story building proposed on Block 7 would be oriented along a north/northeast, south/southwest alignment, and would intercept westerly winds. Therefore, the building could substantially increase wind speeds along its west, north, and south sides. Wind speeds could be reduced depending upon building design and associated landscaping.

Implementation of the following two-part mitigation measure would reduce the proposed Project's wind-associated impacts to a less-than-significant level.

> Mitigation Measure WIND-1a: The final design of the high-rise buildings on Blocks 5 and 7 shall be in accordance with one or more of the following design guidelines. In addition, as part of the design review process for these high-rise buildings, a qualified wind consultant shall ensure the Project is designed in accordance with these guidelines:
>
> - Align long axis of each building along a northwest-southeast alignment to reduce exposure of the wide faces of the building to westerly or southeasterly winds.
> - West or southeasterly building faces shall be articulated and modulated through the use of architectural devices such as surface articulation; variation; variation of planes, wall surfaces, and heights; and the placement of setbacks and other similar features.
> - Utilize properly-located landscaping that mitigates high winds. Porous materials (e.g., vegetation, hedges, screens, latticework, perforated metal), which offer superior wind shelter compared to solid surfaces, shall be used.
> - Avoid narrow gaps between buildings where westerly or southeasterly winds could be accelerated; or
> - Avoid breezeways or notches at the upwind corners of the building.
>
> Mitigation Measure WIND-1b: A qualified wind consultant shall review and evaluate the final design of the high-rise buildings on Blocks 5 and 7, and shall determine whether incorporated design features would reduce wind impacts to a less-than-significant level. If the wind consultant determines that these design features would reduce wind impacts to a less-than-significant level (i.e., less than 36 mph), no further mitigation would be required. If the wind consultant determines that significant adverse wind impacts could occur, models of the proposed Blocks 5 and 7 buildings shall be subject to wind tunnel testing to determine if the buildings would result in uncomfortable or hazardous winds. The wind consultant shall work with the Project architect to develop further building design modifications that would reduce wind impacts to a less-than-significant level (i.e., standard of less than 36 mph). (LTS)

L. SHADE AND SHADOW

This section evaluates the effects of the Uptown Mixed Use Project on shade and shadow in the vicinity of the Project site. This analysis is adapted from shadow pattern simulations prepared for the proposed Project by Environmental Vision.[1] Shadow pattern simulations were prepared for the following dates: June 21 (the summer solstice, when the sun is at its highest point in the sky); December 21 (the winter solstice, when the sun is at the lowest point in the sky); and March 21 and September 21 (the spring and fall equinoxes, respectively, when day and night are of approximately equal length). Simulations were prepared for three times during each day: 9:00 a.m.; 12:00 p.m. (noon); and 3:00 p.m.

1. Setting

The following discussion describes existing shadow conditions within the Project site on the four dates for which shadow pattern simulations were prepared. The shadow simulations assume sunny conditions, and do not take into account overcast or foggy conditions, which are common during the summer and during stormy periods in the winter. Shadow generation within the Project site is generally limited by the presence of surface parking lots and the lack of buildings exceeding three stories.

June 21. On June 21, shadows cast by buildings within the Project site are typically limited to the confines of the site. During the morning (9:00 a.m.) and afternoon (3:00 p.m.), shadows from buildings within the Project site extend slightly into San Pablo Avenue and Telegraph Avenue, respectively (see Figure IV.L-1 and Figure IV.L-9). The Pacific Gas and Electric (PG&E) Substation, adjacent to Thomas L. Berkley Way (20th Street) and 21st Street, is partially covered by shadow during the morning hours. Shadow coverage of areas surrounding the Project site by buildings within the Project site is minimal during the noon hour on June 21 (see Figure IV.L-6).

December 21. On December 21, the shortest day of the year, shadows are widespread within and around the Project site during the morning (9:00 a.m.) and late afternoon (3:00 p.m.) hours (see Figure IV.L-2 and Figure IV.L-10). At these times, the sun is seen near the horizon and areas without shadows are typically those that are immediately adjacent to open space areas and surface parking lots. During noon on December 21, the sun shines above from a southerly direction; during this time, buildings within the Project site cast shadows to the north. The most prominent shadows generated by buildings within the Project site are associated with the multi-story parking garage between William Street and 19th Street, and the commercial buildings along the south side of Thomas L. Berkley Way (20th Street) and the east side of San Pablo Avenue (see Figure IV.L-6). The building most affected by these shadows is the PG&E Substation.

March 21/September 21. Shadows generated by buildings are similar on March 21 and September 21, when the sun shines at a moderate angle at noon. Shadows generated on March 21 in the morning extend to the northwest, compared to morning shadows on September 21, which extend only slightly to the northwest. However, the extent of shadows on these two dates is similar. Morning shadows on these dates generated from buildings within the Project site are

generally confined to the Project site itself; some shadow spillover occurs onto the PG&E Substation, San Pablo Avenue, and Thomas L. Berkley Way (20th Street) (see Figure IV.L-2 and Figure IV.L-3). Shadows produced by buildings within the Project site are relatively constrained during the noon hour on March 21 and September 21 (see Figure IV.L-6 and Figure IV.L-8). Shadows produced around 3:00 p.m. on these days extend into 22nd Street, Telegraph Avenue, 21st Street and Thomas L. Berkley Way (20th Street).

2. Impacts and Mitigation Measures

This section analyzes impacts related to shade and shadow that could result from implementation of the proposed Project. The subsection begins with the criteria of significance, which establish the thresholds for determining whether an impact is significant. The latter part of this section presents the impacts associated with the proposed Project. Mitigation measures are recommended, as appropriate.

a. Criteria of Significance. Implementation of the proposed Project would have a significant effect on visual and aesthetic resources if it would:

- Introduce landscape that would now or in the future cast shadow on existing solar collectors (in conflict with California Public Resource Code Section 25980-25986);
- Cast shadow that substantially impairs the function of a building using passive solar heat collection, solar collectors for hot water heating, or photovoltaic solar collectors;
- Cast shadow that substantially impairs the beneficial use of any public or quasi-public park, lawn, garden, or open space; or
- Cast shadow on a historic resource, as defined by CEQA Section 15064.5(a), such that it would substantially diminish/impair its eligibility for listing in the National Register of Historic Places, California Register of Historical Resources, or in a local register of historical resources or a historical resource survey as defined by the Public Resource Code.

b. Less-than-Significant Shade and Shadow Impacts. The following discussion describes the less-than-significant shade and shadow-related impacts that could result from implementation of the proposed Project.

(1) New Shadows Generated by the Proposed Project. Implementation of the proposed Project would result in buildings that are taller and more massive than buildings currently within the Project site. As depicted in Figures IV.A-1 through IV.L-12, these buildings would cast new shadows on buildings, streets, and parking lots surrounding the Project site.

On June 21 (and generally in late spring and early summer), during the morning (9:00 a.m.) and afternoon (3:00 p.m.), new shadows created by the proposed Project would extend west across San Pablo Avenue into predominantly commercial areas, and east over the office building within the southeast quadrant of the intersection of 21st Street and Telegraph Avenue. The extreme western edge of the Paramount Theater could be affected by afternoon shadow from the proposed student housing tower in Block 3. However, shadow coverage of the Paramount Theater would be relatively small on June 21.

Shadows generated by the proposed Project during December 21 would be the most extensive that could occur as a result of Project development. Morning (9:00 a.m.) shadows would extend northwestward across Interstate 980 into predominantly residential and commercial areas. Morning shadow would also cover the multi-story apartment complex immediately to the north of Block 7. Shadows at 3:00 p.m. would extend northeastward across a wide swath of downtown Oakland, including over the Paramount Theater. Morning and afternoon shadows during fall and spring resulting from the structures proposed as part of the Project would reach west almost to Martin Luther King Jr. Way (through predominantly residential areas) and east through retail and office uses fronting Telegraph Avenue.

(2) Solar Collectors and Photovoltaic Cells. A drive-through survey of the Project site vicinity, and an inspection of air photos identified no solar collectors or photovoltaic (PV) cells that would be substantially affected by shadow resulting from buildings or landscaping proposed as part of the Project.

(3) Historic Resources. The development of structures proposed as part of the Project would cast shade on portions or all of the Great Western Power Plant (formerly known as the Navlet's Florist and Nursery) for the majority of the year, with the exception of late afternoons in the spring and fall. However, under existing conditions, the Great Western Power Plant is already under shadow during mornings in the winter, spring, and fall, and afternoons during the winter. The Great Western Power Plant is characterized by a massive arched façade, overscaled classical detailing, and concrete construction. The façade does not contain complex detailing or color schemes that would be obscured by shade. In addition, there is no landscaping around the building (related to the historic integrity of the structure) that would be adversely affected by an increase in shadow. The major architectural features that make the Great Western Power Plant eligible for Designated Historic Property status would not be compromised by shade cast on the building by the proposed Project.

In addition, although mid-winter shadows generated by the proposed Project would affect other historic buildings in the Uptown District, including the Paramount Theater, these shadows would not occur throughout the year and would not substantially degrade the historic integrity of historic buildings in the vicinity of the Project site. Buildings in areas affected by new Project-related shadow are already subject to shadows cast by existing high-rise buildings in Downtown Oakland. New shadow would not be cast on the Fox Theater.

(4) Parks and Open Space. New shadow created by the proposed Project would not substantially impair the beneficial use of any public or quasi-public park, lawn, garden, or open space area. The public park located north of the Project site, within the northeast quadrant of the intersection of 21st Street and San Pablo Avenue would not be subject to shadow cast by the proposed Project. In addition, the proposed 25,000 square foot park within the Project site would not be substantially adversely affected by shade cast by Project structures. The park would be mostly or wholly shade-free during the majority of the year, including during most afternoons in the summer, spring, and fall. It is anticipated that shade cast by the Project structures on the proposed park would not adversely affect enjoyment of the park; due to the availability of afternoon sunlight within the park, it is expected that the park will provide an appealing place for outdoor activity.

c. Significant Shade and Shadow Impacts. Implementation of the proposed Project would not result in significant shade and shadow-related impacts.

OAKLAND GENERAL PLAN LAND USE AND TRANSPORTATION ELEMENT EIR SUMMARY

OAKLAND GENERAL PLAN LAND USE AND TRANSPORTATION ELEMENT

Draft Environmental Impact Report

October 31, 1997

ER No. 97-18
State Clearinghouse No. 97062089

Prepared for:
City of Oakland
Community and Economic Development Agency

ESA Environmental Science Associates

SUMMARY

A. PROJECT DESCRIPTION

The project is the update of the Land Use and Transportation Element of the Oakland General Plan. The Element combines the State-mandated Land Use Element and Circulation Element into a single integrated document. It replaces the 1980 Land Use Element and the 1974 Circulation Element of the Oakland General Plan and updates the Land Use and Circulation sections of the Oakland Policy Plan. In addition to updating the City's Land Use and Transportation Diagram, the Element introduces new strategies, policies, and priorities for Oakland's development and enhancement during the next two decades.

B. ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Potential environmental impacts of the project are summarized in Table S-1 at the end of this chapter. This table lists impacts and mitigation measures in three major categories: significant impacts that would remain significant even with mitigation; significant impacts that can be mitigated to a level of less-than-significant; and impacts that would not be significant. For each significant impact, the table includes a summary of mitigation measure(s), followed by a column that indicates whether the impact would be mitigated to a less-than-significant level. Please refer to Chapter III for a complete discussion of each impact and associated mitigation.

As stated in Table S-1 and in Chapter III, the Land Use and Transportation Element would result in significant, unavoidable impacts in regard to transportation, public services, air quality, noise, wind, and consistency with adopted plans and policies.

C. ALTERNATIVES

Chapter IV of this EIR analyzes three separate alternatives to the Land Use and Transportation Element: the "No Project" alternative, which would leave the existing 1980 General Plan in place; the "Alternative Designations" alternative, which considers the choices that were presented but not selected for the various sites analyzed during the Element update; and the "Environmentally Superior" alternative, which identifies lower levels of development in those areas with environmental constraints, including the hills, and requires mitigation of the adverse impacts identified in this EIR to the point where they would be less than significant.

TABLE S-1
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
A. SIGNIFICANT UNAVOIDABLE IMPACTS		
B. Transportation		
B.1: Development pursuant to the updated Land Use and Transportation Element would result in the degradation of the level of service on several roadway segments.	**B.1:** Implement roadway improvements and transit improvements to reduce congestion on arterial roadways.	SU
D. Public Services		
D.6-2: Development consistent with the proposed Land Use and Transportation Element would result in higher levels of population in areas where fire fighting and evacuation constraints presently exist. These constraints include narrow street widths, insufficient turning radii, steep slopes, distant fire stations, and an emergency water supply that is vulnerable to disruption in the event of an earthquake or power failure.	**D.6-2:** Proceed with construction of a fire station in the North Oakland Hills to reduce the identified service deficiency in this area, to reduce response times, and to minimize the risk of catastrophic wildfire.	SU
E. Air Quality		
E.1: Implementation of the proposed Land Use and Transportation Element would not be consistent with population and VMT assumptions used in air quality planning, and would result in increased regional emissions of criteria air pollutants.	**E.1:** To the extent permitted by law, large new development within the City shall be required to implement Transportation Control Measures (TCMs) as recommended by the Bay Area Air Quality Management District (listed under Mitigation Measure E.6).	SU

SU = Significant and Unavoidable

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
A. SIGNIFICANT UNAVOIDABLE IMPACTS		
E.6: Cumulative development of projects in the Downtown Showcase District would result in long-term traffic increases and associated air pollutant emissions, which would adversely affect regional air quality.	**E.6:** The the extent permitted by law, downtown projects should be required to implement Transportation Control Measures (TCMs) to reduce mobile source emissions. Many of these measures already would be part of the downtown projects due to the proximity of these projects to existing local and regional transit facilities and existing limitations on parking availability.	SU
E.10: Cumulative development of projects in the Coliseum Showcase District would result in traffic increases and associated air pollutant emissions, which would adversely affect regional air quality.	**E.10:** Implement Mitigation Measure E.6.	SU
L. Noise		
L.8: Development of the downtown projects would generate short-term increases in noise and vibration due to construction.	**L.8:** The City shall require the project sponsors to implement noise control techniques to minimize disturbance to adjacent or nearby sensitive noise receptors during project construction.	SU
L.11: Construction of projects in the Coliseum Showcase District would generate short-term increases in noise and vibration, and potential noise increases would be the same as described under Impact L.8 above for the Downtown Showcase District.	**L.11:** The City shall require the project sponsors to implement noise control techniques to minimize disturbance to adjacent or nearby sensitive noise receptors during project construction.	SU

SU = Significant and Unavoidable.

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
A. SIGNIFICANT UNAVOIDABLE IMPACTS		
N. <u>Wind</u>		
N.1: Adoption of the Element could result in development that would change wind speeds at locations in the Downtown Showcase District.	**N.1:** The City shall require the project sponsors to incorporate specific design elements in the final siting and designs for the high rises that could reduce ground-level winds within the Downtown Showcase District.	SU
O. <u>Consistency with Adopted Plans and Policies</u>		
O.3: The proposed Land Use and Transportation Element would be consistent with regional policies and programs except for the Clean Air Plan.	**O.3:** Implement Mitigation Measures E.1 and E.6.	SU

SU = Significant and Unavoidable

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
A. **Land Use**		
A.1: Implementation of the proposed Land Use and Transportation Element would alter the Oakland General Plan land use classifications, changing the densities that are allowed in various residential designations and restructuring the commercial and industrial designations to reflect a broader range of industry and business than anticipated in the 1980 Plan. Development consistent with the new definitions could result in a broader range of commercial and industrial uses in some areas.	**A.1a:** Establish performance based standards which designate appropriate levels of noise, odors, light/glare, traffic volumes, or other such characteristics for industrial activities located near commercial or residential areas. **A.1b:** Develop "performance" zoning regulations which permit industrial and commercial uses based upon their compatibility with other adjacent or nearby land uses. **A.1c:** Develop strategies to mitigate conflicts associated with live/ work and home occupation uses. **A.1d:** During the revision of the zoning ordinance and map, develop zoning district definitions and map boundaries to protect enclaves of lower density residential development that may be designated for more inclusive density categories on the Land Use and Transportation Diagram. Use the General Plan Strategy Diagram as a means of making these determinations. **A.1e:** During the revision of the zoning ordinance, develop a one acre minimum lot size zoning district. Consistent with the recommendations of the OSCAR Element, apply this district to appropriate areas of the Oakland Hills as a means of maintaining and enhancing neighborhood character.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
A.2: Land Use Diagram changes could facilitate the redevelopment of large parts of the City, including military bases, transit corridors, the Coliseum area, the Estuary shoreline, and Downtown. Implementation of the proposed Land Use and Transportation Element would change the allowable land uses in a number of locations within the City. Subsequent zoning changes could result in designations that are inconsistent with the existing uses. Zoning changes consistent with the proposed Element could render some uses non-conforming.	**A.2a:** Establish design requirements for large-scale commercial development that requires adequate buffers from residential uses. Use of open space, recreation space, or transit installations as buffers should be encouraged. **A.2b:** Develop distinct definitions for home occupation, live/work and work/live operations; define appropriate locations for these activities and performance criteria for their establishment; and create permitting procedures and fees that facilitate the establishment of those activities which meet the performance criteria. **A.2c:** Ensure that structures and sites are designed in an attractive manner which harmonizes with or enhances the visual appearance of the surrounding environment by preparing and adopting industrial and commercial development guidelines. **A.2d:** Establish performance-based standards which designate appropriate levels of noise, odors, light/glare, traffic volumes, or other such characteristics for industrial activities located near commercial or residential areas. **A.2e:** Develop performance zoning regulations which permit industrial and commercial uses based upon their compatibility with other adjacent or nearby uses.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	A.2f: Develop an incentive program to encourage the relocation of non-conforming industrial/ commercial businesses or residential uses to more appropriate locations in the City.	
B. Transportation and Circulation		
B.3: Development of Downtown Showcase District projects would result in degradation of intersection levels of service.	**B.3:** The impacts at the intersection of 12th Street and Brush Street can be mitigated by increasing the cycle length to 120 seconds.	LS
B.4: Development of the Coliseum Showcase District projects would result in degradation of intersection levels of services.	**B.4a:** Install a traffic signal at the intersection of 66th Avenue and I-880 southbound ramps and restripe the lanes of the southbound off-ramp. This intersection meets the Caltrans peak hour signal warrants under PM peak hour conditions. **B.4b:** Install a traffic signal at the intersection of 66th Avenue and I-880 northbound ramps. This intersection meets the Caltrans peak hour signal warrants under PM peak hour conditions. **B.4c:** Install a traffic signal at the intersection of 66th Avenue and Oakport Street and widen Oakport Street to provide a through and turn lane in each direction. This intersection meets the Caltrans peak hour signal warrants under PM peak hour conditions.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	B.4d: Widen the northbound approach at the High Street and Coliseum Way intersection to provide an additional left-turn lane or restripe the eastbound approach to provide double left-turn lanes and a shared through/right-turn lane. This intersection may be subject to changes in traffic patterns as a result of the current studies being conducted to reconfigure the High Street and 42 Street intersection. The identified mitigation measure should be implemented only after the reconfiguration of the High Street and 42nd Street intersection is approved.	
C. Population, Housing, and Employment		
C.1: The Land Use and Transportation Element would alter the amount of land available for new employment uses, increasing the acreage in some categories and decreasing it in others. A net increase in employment development potential would be created through policies and land use designations, including the promotion of redevelopment on over 1,100 acres at three military bases (OKNH, FISCO, and OAB) and 6,500 acres in the Coliseum Area. While the land supply for commercial development would not change significantly, the policy emphasis on Downtown and corridor redevelopment, coupled with airport and harbor expansion and a number of specific developments "in the pipeline," would result in substantially higher employment in the retail, service, and government sectors. Projected employment will be significantly higher than the quantity anticipated by ABAG, creating a demand for new housing and increasing Oakland's jobs:housing ratio.	**C.2:** The City should maintain a data base of vacant and underutilized parcels in a form that is accessible to all departments. The City should assist developers of affordable and market rate housing in locating appropriate sites for their developments and identifying potential neighborhood concerns.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
D. Public Services		
D.1-2: Increased water demand would require localized improvements to the water delivery system and could require the addition of new infrastructure such as pumps and storage facilities in areas where major redevelopment or new development is proposed. These areas include the military bases, Downtown, the waterfront, transit station areas and transit corridors.	**D.1-2:** Review major new development proposals to determine projected water, wastewater, and storm drainage loads compared with available water, sewer, and storm drain capacity. Where appropriate, determine appropriate capital improvement requirements, fiscal impacts, and funding sources prior to project approval.	LS
D.2-2: Increased sanitary sewer flows would require localized improvements to the sewage collection system and could require the addition of new laterals and collection mains and upgraded pumps, lift stations, and other wastewater infrastructure. This impact would be most pronounced in areas where major redevelopment or new development is proposed, including the military bases, Downtown, along the waterfront, around transit stations and along transit corridors.	**D.2-2:** Review major new development proposals to determine projected water, wastewater, and storm drainage loads compared with available water, sewer, and storm drain capacity. Where appropriate, determine appropriate capital improvement requirements, fiscal impacts, and funding sources prior to project approval.	LS
D.3-2: The proposed Land Use and Transportation Element would allow continued buildout of hill area subdivisions and additional development of vacant land in the Oakland Hills, an area with acknowledged drainage problems.	**D.3-2a:** Review major new development proposals to determine projected water, wastewater, and storm drainage loads compared with available water, sewer, and storm drain capacity. Where appropriate, determine appropriate capital improvement requirements, fiscal impacts, and funding sources prior to project approval.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	D.3-2b: Require major new developments to include a combination of on-site and off-site drainage improvements to ensure that such projects do not create downstream erosion or flood hazards, or adversely impact the City's ability to manage stormwater runoff. **D.3-2c:** Address hill area drainage needs and develop additional drainage policies in the updated Safety Element. **D.3-2d:** Prepare a comprehensive study of hill area drainage needs and identify policies, programs, and capital improvements to address these needs in the future.	
D.4-1: New development consistent with the proposed Land Use and Transportation Element would increase the demand for solid waste services. Because of the higher population and employment forecasts contained in the Element, demand would increase at a faster rate than it would under the current General Plan.	**D.4-1a:** Continue to implement programs that reduce the amount of solid waste generated in the City by encouraging recycling, composting, and other activities consistent with the City's Source Reduction and Recycling Element. **D.4-1b:** Support solid waste collection, recycling, and disposal rates that are sufficient to cover the cost of adequate, efficient service delivery. **D.4-1c:** Establish guidelines and incentives for the recycling of construction and demolition debris and the use of recycled concrete and other recycled products in the construction of new buildings, roads, and infrastructure.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
D.5-1: Development consistent with the proposed Land Use and Transportation Element would result in higher levels of population and employment, thereby increasing the demand for police services. The need for staff, facilities, and equipment would increase in the Downtown, waterfront, military base, and transit corridor neighborhoods.	**D.5-1a:** In reviewing major land use or policy decisions, consider the availability of police and fire protection services, park and recreation services, schools, and library services in the affected areas, as well as the impact of the project on current service levels. **D.5-1b:** Develop target ratios of police officers and firefighters to population for annual budgeting purposes. These ratios should be used to assess the feasibility and merits of service fees on new development which finance additional police officers and fire fighters. **D.5-1c:** Increase police foot patrols and cruisers in high visibility downtown areas and locate funding sources to support them. **D.5-1d:** Analyze the distribution of services provided by the public and privately operated civic and institutional uses, identify underserved areas of the City and increase services in those areas. **D.5-1e:** Solicit comments from the Oakland Police and Fire Departments on major new development proposals to ensure that law enforcement and fire protection impacts are appropriately addressed and mitigated.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
D.6-1: Development consistent with the proposed Land Use and Transportation Element would result in higher levels of population and employment, thereby increasing the demand for fire protection and emergency medical services. The need for staff, facilities, and equipment would increase in the Downtown, waterfront, military base, transit corridor and other residential neighborhoods as redevelopment occurred.	**D.6-1a:** In reviewing major land use or policy decisions, consider the availability of police and fire protection services, park and recreation services, schools, and library services in the affected areas, as well as the impact of the project on current service levels. **D.6-1b:** Develop target ratios of police officers and firefighters to population for annual budgeting purposes. These ratios should be used to assess the feasibility and merits of service fees on new development which finance additional police officers and fire fighters. **D.6-1c:** Retain the existing Fire Stations at all three military bases to facilitate the provision of adequate public services to users of these sites as well as to surrounding properties. **D.6-1d:** Solicit comments from the Oakland Police and Fire departments on major new development proposals to ensure that law enforcement and fire protection impacts are appropriately addressed and mitigated during project planning and design.	LS
D.7-1: Development consistent with the proposed Land Use and Transportation Element could increase the number of students served by the Oakland Unified School District (OUSD). The greatest impacts would be Downtown and in the Waterfront area.	**D.7-1a:** Mitigation measures available to the School District to reduce overcrowding include: 1) reassigning students among district schools to account for changing population and new development; 2) continuation and expansion of year-round school;	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	3) more efficient use of underutilized and/or abandoned school facilities; 4) addition of portable classrooms; and 5) the busing of students to less crowded schools. If these measures do not reduce overcrowding, OUSD may have to expand existing schools or construct new schools. All of these measures would require varying amounts of funding. If current sources of funding including the City of Oakland school mitigation fees, increases in property taxes and sales tax revenues, and increases in state funding are insufficient to pay for the cost of these mitigating overcrowding, the OUSD should formulate and implement specific measures to raise additional funds. Funding sources which may be considered by OUSD include: 1) adjustments of school mitigation fees on commercial and residential development; 2) the creation of special assessment or Mello Roos districts or annexation to a Community Facilities District; 3) sale of surplus OUSD property; and	

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	4) any other funding mechanisms available to the OUSD by state law or local ordinances, including those measures identified in the OUSD's 1996 Developer Fee Justification Study. **D.7-1b:** In reviewing major land use or policy decisions, the City will consider the availability of police and fire protection services, park and recreational services, schools, and library services in the affected areas and the impact of the project on the current service levels. **D.7-1c:** Support the School District's efforts to use local bond issues and voter approved assessment districts as a means of providing adequate school facilities. **D.7-1d:** Where feasible and appropriate, encourage the inclusion of child care centers in major residential and commercial developments near transit centers, community centers, and schools. **D.7-1e:** Continue to assist the Oakland Unified School District in securing all of the fees, grants, and other financial resources possible. **D.7-1f:** Work with the School District to coordinate land use and school facility planning and continue efforts by the City to collect impact fees and monitor the school capacity impacts of new development.	

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	D.7-1g: The Office of Parks and Recreation, Real Estate Division of the Office of Public Works, and the Oakland Unified School District should assess the use of City and school-owned parcels for use as civic, institutional, or recreational facilities.	
	D.7-1h: Support state and federal legislation to promote affordable, safe, high-quality child care, including children with special needs.	
D.8-1: Development consistent with the proposed Land Use and Transportation Element could result in an increased number of patrons at the Main and branch libraries. The greatest impacts would be in the South Hills, where there are presently no library facilities; along the waterfront, where there are no library facilities; and along the transit corridors, where libraries generally exist but are too small to meet projected patronage requirements.	**D.8-1:** In reviewing major land use or policy decisions, consider the availability of police and fire protection services, park and recreation services, schools, and library services in the affected areas, as well as the impact of the project on current service levels.	LS
E. <u>Air Quality</u>		
E.4: Proposed General Plan map changes to allow a mix of commercial and residential uses (Urban Residential, Neighborhood Center Commercial, and Community Commercial designations) could result in odor nuisance problems at residential receptors.	**E.4:** Where residential development would be located above commercial uses, parking garages, or any other uses with a potential to generate odors, the odor-generating use should be properly vented (e.g., located on rooftops) and designed (e.g., equipped with afterburners) so as to minimize the potential for nuisance odor problems.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
E.5: Construction activities associated with downtown projects in the Downtown Showcase District would generate dust (including the respirable fraction known as PM_{10}) and combustion emissions.	**E.5a:** The following Basic Control Measures shall be implemented at all construction sites: • Water all active construction areas at least twice daily. • Cover all trucks hauling soil, sand, and other loose debris *or* require all trucks to maintain at least two feet of freeboard. • Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites. • Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. • Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets. **E.5b:** The following enhanced control measures shall be implemented at all construction sites when more than four acres are under construction at any one time: • Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more). • Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles (dirt, sand, etc.) • Limit traffic speeds on unpaved roads to 15 mph.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
	• Install sandbags or other erosion control measures to prevent silt runoff to public roadways. • Replant vegetation in disturbed areas as quickly as possible. **E.5c:** BAAQMD dust control measures would be implemented by contractors of future development projects as outlined in BAAQMD *CEQA Guidelines* (1996) or any subsequent applicable BAAQMD updates. They are as follows: • Any stationary motor sources (such as generators and compressors) to be located within 100 feet of any residence or school (sensitive receptors) would be equipped with a supplementary pollution control system on its exhaust as required by Bay Area Air Quality Management District (BAAQMD) and California Air Resources Board (CARB). • To minimize construction equipment emissions, low- NOx tune-ups should be performed on all construction equipment. Contractors should be required to utilize equipment with recent (within 30 days) low- NOx tune-ups to minimize NOx emissions. This would apply to all diesel-powered equipment greater than 50 horsepower and periodic tune-ups (every 90 days) would be required for equipment used continuously for construction of a specific development.	

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
E.9: E.9: Construction activities associated with projects in the Coliseum Showcase District would generate dust (including the respirable fraction known as PM_{10}) and combustion emissions.	**E.9:** Implement Mitigation Measures E.5a, E.5b, and E.5c.	LS
F. Visual and Aesthetic Conditions		
F.2: The Land Use and Transportation Element encourages high-rise development in Downtown Oakland. Such development could potentially block views, cast shadows, appear visually incongruous with adjacent low-rise development, and block views of the City skyline from surrounding neighborhoods.	**F.2a:** Develop guidelines or a "step back" ordinance for height and bulk for new development projects in the downtown area. Projects should be encouraged to be designed at pedestrian-scale on the street-side, with high towers or strong vertical elements stepping back from the street. **F.2b:** Analyze the desired height of downtown office development and develop zoning regulations that support the preferred skyline design. **F.2c:** Define view corridors and, based upon these views, designate appropriate height limits and other requirements. Views of Lake Merritt, the Estuary, and architecturally or historically significant buildings should be considered.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
F.3: The Land Use and Transportation Element would set in place policies and land use designations that encourage mid-rise, pedestrian-scale mixed use development along approximately 20 miles of transit-oriented corridors within the City. Although existing General Plan designations and zoning already permit this scale and mix of development in most instances, the policy emphasis on these areas could create additional momentum for development. Development of the scale proposed by the Plan would generally have positive visual impacts but could interrupt views and create the potential for architecturally incompatible development.	**F.3a:** Develop standard design guidelines for all Neighborhood Commercial areas that require continuous or nearly continuous storefronts located along the front yard setback, promote small scale commercial activities rather than large scale establishments at the ground level, restrict front yard parking lots and driveways, require small scale pedestrian-oriented signage, have a relatively low height limit, and promote the development of pedestrian friendly amenities at the street level. The standard design guidelines may be expanded to capture the unique or desired character of certain areas. **F.3b:** Ensure that structures and sites are designed in an attractive manner which harmonizes with or enhances the visual appearance of the surrounding environment by preparing and adopting industrial and commercial design guidelines. **F.3c:** Develop design guidelines for parking facilities of all types.	LS
G. <u>Cultural and Historic Resources</u>		
G.2: Excavation of development sites consistent with the Land Use and Transportation Element could unearth archaeological resources. Some of these remains could have scientific or cultural importance.	**G.2:** Establish criteria and interdepartmental referral procedures for determining when discretionary City approval of ground-disturbing activities should be subject to special conditions to safeguard potential archaeological resources.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
G.3: Many of the City's historic resources are located Downtown and along transit corridors. Higher density uses are proposed in these areas and redevelopment is encouraged. This could have direct impacts by increasing the pressure to remove or demolish older buildings, including some historic structures.	**G.3a:** Amend the Zoning Regulations text to incorporate the new preservation regulations and incentives.	LS
	G.3b: Develop and adopt design guidelines for Landmarks and Preservation Districts.	
L. Noise		
L.3: Proposed General Plan map changes to allow a mix of commercial and residential uses (Urban Residential, Neighborhood Center Commercial, and Community Commercial designations) could pose noise compatibility problems between residential and commercial uses.	**L.3a:** Establish design requirements for large-scale commercial development that requires adequate buffers from residential uses. Use of open space, recreation space, or transit installations as buffers should be encouraged.	LS
	L.3b: Mixed residential/ non-residential neighborhoods should be rezoned after determining which should be used for residential, mixed, or non-residential uses. Some of the factors that should be considered when rezoning mixed use areas include the future intentions of the existing residents or businesses, natural features, or health hazards.	

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
L.4: Proposed General Plan map changes to allow higher residential densities could pose noise compatibility problems between future residential development and existing, lower density residential uses within the same land use category.	**L.4:** Where high density residential development would be located adjacent to existing lower density residential development, new development shall be designed to minimize noise impacts on any existing residential uses due to increased traffic on local roadways and increased parking activities.	LS
L.5: Proposed General Plan map changes to allow live-work and other forms of housing in transitional industrial areas could pose future noise compatibility problems.	**L.5a:** The City should develop distinct definitions for home occupation, live/work and work/live operations; define appropriate locations for these activities and performance criteria for their establishment; and create permitting procedures and fees that facilitate the establishment of those activities which meet the performance criteria. **L.5b:** Avoid proliferation of existing incompatible uses by eliminating, through appropriate rezoning actions, pockets of residential zoning within predominantly industrial areas. **L.5c:** Establish performance-based standards which designate appropriate levels of noise, odors, light/glare, traffic volumes, or other such characteristics for industrial activities located near commercial or residential areas. **L.5d:** Develop performance zoning regulations which permit industrial and commercial uses based upon their compatibility with other adjacent or nearby uses.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. SIGNIFICANT BUT MITIGABLE IMPACTS		
L.7: Implementation of the proposed Land Use and Transportation Element could result in future transportation improvements that could create or aggravate noise compatibility problems with sensitive receptors.	**L.7:** Future transit improvements shall be designed sufficiently so that future noise levels along these streets can be adequately estimated and considered in the design of future residential or other noise-sensitive developments.	LS
M. Hazardous Materials		
M.5: Remediation efforts at an identified hazardous waste site could expose workers and the public to hazardous substances.	**M.5:** Hazards to construction workers and the general public during demolition and construction shall be mitigated by the preparation and implementation of site-specific health and safety plans, as recommended by the Occupational Safety and Health Administration.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
A.3: Implementation of the Land Use and Transportation Element would place a greater emphasis on mixed use development and would require development of mixed use zoning designations. The emphasis on mixed use development could create a greater likelihood for conflicting uses within projects or between projects and adjacent sites.	None required.	LS
A.4: Implementation of the proposed Land Use and Transportation Element could result in future transportation improvements that could have land use impacts.	None required.	LS
B. <u>Transportation and Circulation</u>		
B.2: Development that would occur under the Land Use and Transportation Element would increase transit demand.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
C. Population, Housing, and Employment		
C.1: The Land Use and Transportation Element would increase housing capacity in Oakland by providing greater allowances for higher density housing in commercial areas than those that already exist and by reclassifying several transit corridors for urban-density housing. Additionally, the Plan reflects emerging plans and development proposals for housing Downtown, at Oak Knoll Naval Hospital, along the Oakland Estuary, and at several BART Stations. The increase in land supply, coupled with specific development projects, are projected to result in a higher number of households in Oakland by the Plan's horizon year of 2015.	None required.	LS
C.3: The Land Use and Transportation Element would redesignate approximately 45 acres on the Land Use Diagram from residential use to "Housing-Business Mix." Although the intent of this designation is to acknowledge the existing pattern and create areas where residential and industrial uses can co-exist harmoniously, rezoning consistent with the General Plan could lead to further encroachment of industrial uses in these areas. This could lead to a loss of housing stock in some locations.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
D. Public Services		
D.1-1: Development consistent with the proposed Land Use and Transportation Element would result in an increase in water demand.	None required.	LS
D.2-1: Development consistent with the proposed Land Use and Transportation Element would result in an increase in flows to the regional wastewater treatment plant.	None required.	LS
D.3-1: Implementation of the proposed Land Use and Transportation Element would result in increased development activity Downtown, along transit corridors and around transit stations, along the waterfront, near the Coliseum, and on former military bases. Since these areas are already developed, the increased amount of impervious surface would be marginal and the amount and rate of runoff would not change significantly. The quality of runoff could be impacted by construction, soil disruption, and by the change in land uses in redevelopment areas. However, the shift would generally be away from manufacturing to more service-oriented industry and commerce.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
D.9-1: Development consistent with the proposed Land Use and Transportation Element would increase the demand for park services, particularly in areas targeted for reuse and intensification. All of these areas, including Downtown, the waterfront, the transit stations and corridors, and the military bases, are located in areas that are already deficient in local-serving parkland. Further development would place even greater demands on the limited park acreage in these neighborhoods, unless additional park area was provided.	None required.	LS
E. Air Quality		
E.2: The proposed Land Use and Transportation Element would be consistent with *Clean Air Plan* Transportation Control Measures (TCMs).	None required.	LS
E.3: Implementation of the proposed Land Use and Transportation Element would result in traffic increases along roadways in the City which could result in localized air quality impacts.	None required.	LS
E.7: Cumulative development of projects in the Downtown Showcase District would result in traffic increases that could result in long-term, localized air quality impacts.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
E.8: Cumulative development of downtown projects would result in increased stationary source emissions associated with heating and electricity consumption.	None required.	LS
E.11: Cumulative development of projects in the Coliseum Showcase District would result in traffic increases that could result in localized air quality impacts.	None required.	LS
E.12: Cumulative development of Coliseum projects would result in increased stationary source emissions associated with heating and electricity consumption or other uses.	None required.	LS
F. Visual and Aesthetic Conditions		
F.1: Development consistent with the Future Land Use Diagram could degrade or destroy existing scenic resources in the City, including hillsides, ridges, canyons, trees and riparian areas. However, adoption of the Element alone would not increase the potential for impacts. Existing policies in the OSCAR Element provide general mitigation of visual impacts.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
G. Cultural and Historic Resources		
G.1: Excavation of development sites consistent with the Land Use and Transportation Element could unearth paleontologic remains. Some of these remains could have scientific importance. However, adoption of the proposed Element would not significantly affect these resources.	None required.	LS
G.4: Increased development and more intense development in areas with high concentrations of older structures could have indirect impacts on these structures by changing their context and setting. Even if left intact, the integrity of older buildings could be compromised as larger, modern buildings are erected on adjoining properties.	None required.	LS
G.5: The Element's emphasis on adaptive re-use and live-work development could result in alteration of older buildings and historic structures in a manner that is architecturally incompatible with the structure.	None required.	LS
H. Vegetation and Wildlife		
H.1: Development consistent with the Land Use and Transportation Element could damage or remove potential habitat for special status species on undeveloped parcels within the City, particularly at the military bases, along the Estuary, and at Leona Quarry.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
H.2: Development consistent with the Land Use and Transportation Element could trigger impacts on adjacent lands designated for Resource Conservation. Greater levels of noise, traffic, lighting, urban runoff, and human activity on lands adjacent to waterfront parks could reduce the value of these areas as wildlife habitat.	None required.	LS
H.3: Development consistent with the Land Use and Transportation Element could affect the habitat of certain special status plants and result in the loss of special status plant species, and could result in the loss of mature trees on new development sites.	None required.	LS
I. Hydrology and Water Quality		
I.1: Implementation of the proposed Land Use and Transportation Element would result in increased development activity at various locations throughout the City, including locations adjacent to creeks and waterways, which could result in water quality impacts during construction.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
I.2: Implementation of the proposed Land Use and Transportation Element would result in increased development activity that could alter drainage patterns, could increase impermeable surfaces leading to increased volume of runoff, and could potentially affect quality of stormwater runoff. However, since the areas proposed for the greatest change are already developed with similar uses, the changes in runoff patterns, volume and quality would be negligible.	None required.	LS
J. Energy		
J.1: Development consistent with the Land Use and Transportation Element would result in a marginal increase in energy consumption.	None required.	LS
K. Geology and Seismicity		
K.1: Adoption of the Plan could result in development on existing soil conditions at various locations throughout the City that could cause structural damage to new and existing buildings unless properly constructed.	None required.	LS
K.2: Adoption of the Plan could result in development of many areas that are subject to geologic hazards including steep slopes, high erosion potential, and landsliding and mudsliding.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
K.3: Adoption of the Plan would result in development that requires grading and earthmoving activities. Grading during construction of individual projects in hillside areas could increase the potential for erosion. This could cause clogging of local culverts, decrease downstream channel capacity, and degrade water quality.	None required.	LS
K.4: In the event of an earthquake, damage from surface fault rupture could affect structures, foundations, and underground utilities that could be developed as a result of Plan adoption.	None required.	LS
K.5: In the event of an earthquake, damage from strong ground shaking or ground failure (liquefaction, densification, or landsliding) could affect structures, foundations, and underground utilities that could be developed as a result of Plan adoption. Human injury and life also could be risked.	None required.	LS
L. Noise		
L.1: Implementation of the proposed Land Use and Transportation Element would increase noise levels along streets throughout the City.	None required.	LS
L.2: Proposed General Plan map changes would redesignate some segments of major transportation corridors from commercial to urban density residential uses, which could pose noise compatibility problems for residential uses.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
L.6: Proposed General Plan map changes could allow development of light manufacturing, wholesale, business, commercial or mixed uses in areas designated for "Housing Business Mix," posing potential future noise compatibility problems.	None required.	LS
L.10: Future cumulative noise levels along downtown streets could increase to levels that are considered conditionally acceptable for retail commercial, office, and residential uses.	None required.	LS
L.12: Development of projects in the Coliseum Showcase District would result in noise increases along local roadways serving the proposed project.	None required.	LS
L.13: Depending on proximity of future development to I-880 and selected roadways in the Coliseum area, noise levels could be conditionally acceptable for retail commercial or office uses.	None required.	LS
M. <u>Hazardous Materials</u>		
M.1: Proposed land use changes for the Central Business District, Military Bases, Coliseum Area, and BART Transit Villages include a change to mixed uses that may allow housing as well as commercial operations that may use of hazardous materials. In addition, land use changes within the transit corridors would allow commercial land uses transitioning to urban residential uses.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
M.2: Adoption of the proposed Land Use and Transportation Element could encourage new business and expansion of existing businesses within the areas designated for change, with associated potential increases in the quantities of hazardous substances used, stored and transported, increasing the potential for accidents or spills and increasing the potential for exposure to workers, the public and the environment.	None required.	LS
M.3: Adoption of the proposed Land Use and Transportation Element would increase the potential for demolition and renovation activities within the areas designated for change. Many of these buildings could contain hazardous building materials and demolition or renovation could result in exposure to hazardous building materials, such as asbestos, lead, mercury or PCBs, with associated public health concerns.	None required.	LS
M.4: Adoption of the proposed Land Use and Transportation Element would increase the potential for construction activities within the areas designated for change, which could increase the likelihood of encountering contaminated soil or groundwater and potentially expose workers and the community to hazardous substances.	None required.	LS
O. Consistency with Adopted Plans and Policies		
O.1: The proposed Land Use and Transportation Element would be consistent with federal policies and programs.	None required.	LS

LS = Less than Significant

TABLE S-1 (Continued)
SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Significant Impact	Mitigation Measures	Significance After Mitigation
B. LESS THAN SIGNIFICANT IMPACTS		
O.2: The proposed Land Use and Transportation Element would be consistent with state policies and programs.	None required.	LS
O.4: The proposed Land Use and Transportation Element would be consistent with the policies and programs of adjacent jurisdictions.	None required.	LS

LS = Less than Significant

APPENDIX B
ASSESSOR'S PARCEL NUMBERS AND OWNERSHIP

Table 1: Existing Uses, Housing Units and Employment – Block Project 1[a]

Assessor's Parcel Number (APN)	Owner[a]	Use[b]	Occupancy Status[c]	Parcel Size in Square Feet[a]	Building Size in Square Feet[a]	Estimated Employment[d]
008-0644-015-00 through 017	Forest City	Vacant lot	Vacant	10,560	0	0
008-0644-018-00 through 019	Oakland Redevelopment Agency	Vacant lot	Vacant	4,840	0	0
008-0644-020-00 through 021	Feldstein, Kenneth D.	Commercial – Residential Hotel (Single Room Occupancy, 18 units) and Bar	Occupied Vacant	7,473	9,803 (18 units)	0
008-0644-022-00	Oakland Redevelopment Agency	Commercial - Ground Floor Residence - Second Floor (1 unit)	Vacant Vacant	2,875	3,160 (0 units)	0
008-0644-023-00	Schwyhart, WR	Commercial - Ground Floor Residence - Second Floor (2 units)	Vacant Vacant	5,060	3,863 (0 units)	0
008-0644-024-00	Oakland Redevelopment Agency	Commercial – Restaurant	Occupied	1,813	449	3
008-0644-045-01	Oakland Redevelopment Agency	Commercial – Office and associated surface parking	Occupied	8,500	3,400	7
008-0644-031-00 through 033	Oakland Redevelopment Agency	Commercial - Office and associated surface parking	Occupied	5,667	1,971	5
008-0644-034-00 through 035	Oakland Redevelopment Agency	Commercial – Office and associated parking	Occupied	3,966	1,621	4

[a] The assessor's parcel numbers for project Block 1, begin at 008-0643-010-00 at the southeast corner of the block and increase numerically counter-clockwise, with the exception of lot 45, which falls between lots 24 and 32.

Notes:

/a/ 'X' in first column indicates updated assumptions compared to original 11/21/00 Cumulative Scenario. 'XX' indicates updated assumptions for Uptown Project EIR, May 2003.

/b/ Codes indicate change since 12/02 Scenario for West Oakland Redevelopment Project EIR. C = change in number of units and/or number of households. N = new project added to list. T = change in time period assumed for development and occupancy.

/c/ Households equal units multiplied by an assumed vacancy factor.

/d/ Status as of the end of 2002: 1 = completed; 2 = under construction; 3 = approved; 4 = affordable housing project in predevelopment; 5 = other projects in predevelopment; 6 = in planning or part of existing plan; 7 = other housing opportunity site.

/e/ Housing Opportunity Sites are those identified in Oakland's Draft Housing Element (September 2002). The numbers (e.g., DT-11) are those used in Housing Element tables.

/f/ YWCA housing for CCAC students, Perkins Residential Care housing for people with Alzheimer's, and UC Berkeley student housing are treated as group quarters in the growth scenario.

/g/ The total units completed during 2000 were 293 for Acorn Parcels 1, 2, and 3, and 71 for Bayporte Village, replacing 480 and 196 original units, respectively, that were removed by 2000.

/h/ Includes additional housing units and households in the downtown and rest of Oakland Central (OC) planning district as well as along the channel in TAZ 537 (SA).

APPENDIX D
POPULATION AND DEMOGRAPHIC DATA

CUMULATIVE GROWTH SCENARIO FOR OAKLAND AS PREPARED FOR USE IN THE *UPTOWN PROJECT EIR*

This appendix describes the cumulative growth scenario used for environmental impact analysis purposes in the *Uptown Project EIR*. The scenario provides the future cumulative development context for Oakland, identified in terms of future employment, households, and population. Use of the scenario for analyzing the project's environmental impacts ensures that those impacts are appropriately considered as part of the cumulative context of future citywide and regional growth and development.

The need for developing the cumulative growth scenario is explained below, followed by a description of the approach and the chronology of scenario development and updates. Then, the updated cumulative scenario for Oakland used in this EIR is summarized, followed by comparisons with projections from the Association of Bay Area Governments (ABAG). The specifics of the scenario for downtown Oakland areas surrounding the Uptown Project are summarized next. The assumptions for growth in the rest of Alameda County and Bay Area region are then identified.

NEED FOR THE CUMULATIVE GROWTH SCENARIO

The cumulative growth scenario for Oakland was developed primarily for use in the cumulative transportation analyses in Oakland EIRs. The growth scenario was originally prepared in 2000 after analyses indicated that the growth projections from ABAG as incorporated into the Alameda County Congestion Management Agency (CMA) travel demand model did not reflect the level of growth and development occurring in Oakland. Those projections also did not reflect the locations of growth for future development projects under construction, approved, proposed, and reasonably foreseeable for Oakland. Since the cumulative growth scenario for Oakland was originally developed, it continues to be updated and refined as needed for EIR analyses and planning efforts, and to incorporate newly released 2000 Census data and new projections series from ABAG. The cumulative growth scenario is now used to review and provide input for new ABAG projections and for updates to the land use database in the CMA travel model.

As of this EIR, the cumulative growth scenario for Oakland is now very similar to the most recent ABAG projections incorporated into the CMA travel model as updated in May 2003. However, Oakland's cumulative growth scenario continues to be used in EIR analyses and planning efforts as it provides more specificity about growth and development occurring in Oakland and can be updated as needed for EIR and planning purposes.

FORECAST-BASED APPROACH THAT INCORPORATES FORESEEABLE FUTURE DEVELOPMENT PROJECTS

The cumulative growth scenario for Oakland was developed using a forecast-based approach, *i.e.*, an approach based on regional forecasts of economic activity and demographic trends. The cumulative growth scenario also considers recent and anticipated future development projects in Oakland as well as other changes in land use, employment, and population. Development projects and other changes are identified and updated based on input from City of Oakland and Port of Oakland staffs and on analysis of economic, demographic, and real estate market data and trends. Anticipated future development projects are identified and updated to include approved, proposed, and potential development projects reasonably foreseeable over the next 20 to 25 years.

The growth that could be accommodated by recent and expected future development projects and other changes in land use, employment, and population is evaluated within the context of regional economic and demographic trends and projections. The ABAG projections provide the reference for citywide and county totals for future years. The list of development projects and other changes provide the ability to relate individual projects to the citywide context. The locations of specific projects and development sites allow for refinements in the allocation of growth to subareas and traffic analysis zones (TAZs) within the city. Transportation analyses using the CMA's travel model require inputs at the TAZ level.

CHRONOLOGY OF SCENARIO DEVELOPMENT

The cumulative growth scenario for Oakland was originally prepared and continues to be updated by Hausrath Economics Group (HEG), working closely with City of Oakland staff. The scenario was first completed in November 2000. Since that time, the scenario has been updated and refined for different parts of the City as needed for EIR analyses and planning efforts. It also has been updated to incorporate newly released 2000 Census data and new projections from ABAG. The following identifies the different updates that were completed prior to the scenario developed for this EIR:

- June 2001, updated scenario for *Metroport Project EIR*, focusing on updates in the Oakland Airport/Coliseum area;
- August 2001, updated scenario for *Leona Quarry Project EIR*, focusing on the area surrounding the Leona Quarry project;
- January 2002, updated scenario for *Oakland Army Base (OARB) Redevelopment Project EIR*, focusing on updates in the harbor and OARB redevelopment project area and adjacent parts of West Oakland;
- September 2002, 2000 Census data is incorporated into the land use database, along with future demographic factors consistent with the 2000 Census data, as provided by ABAG *Projections 2002*;

- September 2002, updated scenario for *Central City East (CCE) Redevelopment Project EIR*, focusing on updates in East Oakland, within and surrounding the redevelopment project area;
- Early December 2002, updated scenario for *Jack London Square Redevelopment Project EIR*, focusing on updates in the Jack London District of downtown Oakland including Jack London Square;
- Later December 2002, updated scenario for *West Oakland Redevelopment Project EIR*, focusing on updates in West Oakland, and parts of North Oakland within the redevelopment project area, and in adjacent blocks;
- Early February 2003, updated scenario for *Coliseum Gardens Project EIR*, focusing on the project and surrounding Coliseum BART station area; and
- January/February 2003, updated scenario to incorporate ABAG *Projections 2002* and to provide land use inputs for the CMA travel model update.

The updated cumulative growth scenario prepared for this EIR as of June 9, 2003, incorporates and builds on all of the updates listed above. In addition, for this EIR, changes were made to the citywide land use database to incorporate the Uptown Project as currently proposed and updated assumptions for other development in downtown Oakland areas surrounding the project.

UPDATED CUMULATIVE GROWTH SCENARIO FOR OAKLAND

Cumulative Growth Scenario for *Uptown Project EIR*

The cumulative growth scenario for Oakland identifies employment, households, and population. Employment is disaggregated into four types: service, retail, manufacturing, and other, as required for use in the Alameda County CMA travel model. The projections are allocated to the large number of traffic analysis zones identified throughout the city.[1] Future scenarios are developed for the years 2010 and 2025, consistent with the analysis years in the travel model. The cumulative growth scenario for Oakland includes a 2000 base year scenario, consistent with recently released 2000 Census data, although the CMA model does not include year 2000.

The Updated Cumulative Growth Scenario for Oakland prepared for the *Uptown Project EIR* is summarized in Table 1 (on next page). The scenario includes the Uptown Project.

Following the approach described earlier, analysis to develop the cumulative growth scenario for Oakland evaluated how the amount and type of growth represented by future development projects identified by the City and Port compared to the ABAG projections for Oakland. Other changes in land use, employment, and population also were accounted for. Other additions to employment and population included those resulting from increased occupancies of existing

---

[1] The traffic analysis zones (TAZs) are Census Tracts or subdivisions of Census Tracts identified for transportation analysis purposes and used in the CMA travel demand model.

TABLE 1
UPDATED CUMULATIVE GROWTH SCENARIO
FOR OAKLAND, AS OF JUNE 2003

	2000 /a/	2010	2025	Growth, 2000-2025
Households	150,790	158,910	169,010	+18,220
Household Population /b/	392,310	417,120	434,560	+42,250
Total Population /b/	399,480	425,550	443,200	+43,720
Employed Residents /b/	174,740	194,040	225,680	+50,940
Total Employment	185,160	215,050	247,500	+62,340
Manufacturing	17,810	18,470	20,120	+2,310
Other /c/	74,040	84,400	93,500	+19,460
Retail	23,720	27,440	30,700	+6,980
Service	69,590	84,740	103,180	+33,590

/a/ Households, household population, total population, and employed residents are from the 2000 Census.

/b/ Projections for 2010 and 2025 incorporate changes in demographic characteristics of the population in the existing housing stock in Oakland as evidenced in persons per household and employed persons per household factors from ABAG *Projections 2002*. The demographic characteristics of residents of new housing to be built in Oakland by 2010 and 2025 are based on those same ABAG factors or are estimated using special factors that better reflect the anticipated population in new housing, for TAZs with little or no housing in 2000 of the types being built (as the ABAG factors are based on the existing population in 2000).

/c/ Includes employment in finance, insurance, real estate (FIRE); government; construction; transportation, communications, and utilities (TCU); wholesale; and agriculture and mining.

Source: Hausrath Economics Group based on approach and methodology described in this appendix.

buildings, the re-leasing of space vacated by existing businesses and government activities relocating to newly developed projects, the renovation of space that had previously sat vacant, and the conversion of space in existing buildings to new and more intensive uses. Reductions in employment and population included changes as a result of base closures, displacements by development projects, and the movement of some types of businesses out of the area due to increasing rents and land values as well as other factors. In addition, the cumulative growth scenario also incorporates changes in demographic characteristics of the population in the City's existing housing stock, consistent with the ABAG projections.

Comparison with CMA/ABAG Projections

The Updated Cumulative Growth Scenario for Oakland is compared in Table 2 with the ABAG projections for Oakland as incorporated into the Alameda County CMA Travel Model for use in

EIR transportation analyses. The ABAG *Projections 2002* series provides the basis for the numbers in the CMA model at the time of the analysis for this EIR.[2]

The cumulative growth scenario for Oakland compares to the CMA/ABAG projections (*Projections 2002*) as follows:

- **Employment**: The economic activity and employment growth to be accommodated by identified major development projects and other anticipated changes in land use and employment are estimated to slightly exceed the employment growth for Oakland reflected in the CMA/ABAG projections for both the short term (2010) and the longer term (2025) futures. In 2025, the cumulative growth scenario includes about one percent more total employment in Oakland than anticipated by the CMA/ABAG projections.

- **Housing and Households**: Housing built in Oakland since the 2000 Census, housing currently under development in Oakland, and housing anticipated to be developed in the future will accommodate household growth similar to that reflected in the CMA/ABAG projections. Thus, total households in Oakland in 2025 are essentially the same for the cumulative growth scenario and the CMA/ABAG projections. The cumulative growth scenario expects somewhat more housing development in the near future, so that total households by 2010 are a little higher under the cumulative scenario compared to the CMA/ABAG projections.

- **Population**: Although housing and household growth are similar, the cumulative growth scenario shows slightly lower population growth in Oakland compared to the CMA/ABAG projections. The difference occurs because the cumulative growth scenario incorporates the demographic characteristics of new residents in the types of new housing being built in Oakland, in addition to existing population characteristics and overall demographic trends as reflected in the CMA/ABAG projections. Compared to overall population demographics, new households in the types of higher-density, new housing being built in Oakland, are generally smaller than average (fewer persons per household) and include proportionally more adults, many of whom are employed (more employed residents per household). Thus, by 2025, total household population in Oakland under the cumulative growth scenario is about two percent lower than under the CMA/ABAG projections, due to the specific demographic assumptions used for residents of the new housing. By incorporating specific demographic assumptions for residents in new housing along with the characteristics of residents in the existing housing stock and overall regional demographic

---

[2] The recently updated Alameda County CMA model incorporating ABAG *Projections 2002* was released on May 14, 2003. In June 2003, ABAG released *Projections 2003: A Smart Growth Forecast*. Future updates to the CMA travel model to incorporate these newest ABAG projections are expected to occur in early- to mid-2004.

TABLE 2
CUMULATIVE GROWTH SCENARIO FOR *UPTOWN PROJECT EIR* AND CMA/ABAG PROJECTIONS FOR OAKLAND

	2000	2010	2025	Growth 2000-2025
Employment				
Cumulative Growth Scenario /a/	185,160	215,050	247,500	+62,340
CMA/ABAG *Projections 2002* /b/	-	213,820	245,060	+59,900
Households				
Cumulative Growth Scenario /a/	150,790	158,910	169,010	+18,220
CMA/ABAG *Projections 2002* /b/	-	158,130	169,080	+18,290
Population				
Cumulative Growth Scenario /a/				
Household Population /c/	392,310	418,120	435,560	+43,250
Total Population	399,480	425,550	443,200	+43,720
CMA/ABAG *Projections 2002* /b/				
Household Population	-	418,420	442,370	+50,060
Total Population	-	-	-	-
Employed Residents				
Cumulative Growth Scenario /a/	174,740	194,040	225,680	+50,940
CMA/ABAG *Projections 2002* /b/	-	186,080	217,040	+42,300

/a/ Updated Cumulative Growth Scenario developed for *Uptown Project EIR*, prepared as of June 9, 2003 by Hausrath Economics Group, as described in this appendix.

/b/ ABAG *Projections 2002*, as included in the updated Alameda County CMA travel demand model released May 14, 2003. The CMA model does not include year 2000. Growth 2000-2025 for the CMA/ABAG *Projections 2002* is calculated using 2000 as shown in the table for the Cumulative Growth Scenario.

/c/ Household population shown here for 2010 and 2025 includes the 1,000 students to reside in the student housing proposed for the Uptown Project. However, in the summaries of the growth scenario in other tables in this appendix, the students are counted as group quarters population and included in total population, but not household population. As the CMA/ABAG projections used in the CMA travel model do not include group quarters population or total population (combining household population and group quarters population), the student population is included with household population in this table so that the population analyzed in the transportation analysis can be compared with the CMA/ABAG projections. (The student population for the Uptown project was combined with household population for use in the CMA travel model as the model is not set up to separately accept group quarters population.)

Source: Hausrath Economics Group based on sources identified above, and as described further in this appendix.

trends, the methodology for the cumulative growth scenario builds on the ABAG projections to provide more locally-specific data.

- **Employed Residents**: The cumulative growth scenario anticipates somewhat more employed residents in Oakland compared to the CMA/ABAG projections, for two main reasons. First, Census data incorporated into the cumulative growth scenario show about three percent more employed residents in Oakland in 2000, compared to the ABAG projections (*P2002*), which were prepared before release of employed resident data from the 2000 Census. The higher number of employed residents in Oakland in 2000 (based on the 2000 Census data) also are included in future year totals for employed residents under the cumulative scenario. Second, the cumulative growth scenario incorporates the demographic characteristics of new residents in the types of new housing being built in Oakland, which generally include proportionally more residents who work, compared to demographic characteristics for the population overall (also see discussion under population above). Thus, by 2025, the cumulative growth scenario includes about four percent more employed residents in Oakland than anticipated by the CMA/ABAG projections.

The cumulative analysis in this EIR assumes the Updated Cumulative Growth Scenario for Oakland. This approach ensures that the cumulative effects of all locally anticipated growth and development can be evaluated within the EIR analysis period. This approach for cumulative analyses in Oakland EIRs was discussed with and accepted by the Alameda County CMA.

DOWNTOWN OAKLAND AREAS SURROUNDING THE UPTOWN PROJECT

Attention was given to the cumulative growth scenario for traffic analysis zones (TAZs) in downtown Oakland areas, surrounding the Uptown Project. Growth and change in these areas are of particular interest for the cumulative traffic analysis. Analysis was done to review and update the projections for the surrounding area for use in the cumulative analyses for this EIR. The data for employment, households, and population for the surrounding area were summarized from prior growth scenarios, and evaluated and updated in light of recent changes in land uses and activities in the area, and of development projects and other anticipated changes identified by the City of Oakland and Hausrath Economics Group, at the time of this analysis. With these inputs, updated projections for the surrounding downtown area were developed for 2010 and 2025 for use in this EIR.

The updated growth scenario for the surrounding downtown area, including the project, is summarized in Table 3 (on the next page). The table shows numbers for Downtown Oakland (from Grand Avenue on the north to the Estuary on the south) and for the larger Oakland Central area including downtown and extending further to the north (to I-580 on the north and the Estuary on the south). A map showing the boundaries of these areas is included at the end of this appendix (see Figure 1). The surrounding downtown area includes the rest of the Uptown district outside the project area as well as the following subareas or districts of downtown Oakland: the Kaiser Center area, City Center area, Old Oakland, Chinatown, the County Bldgs/MetroCenter/Laney area, and the Jack London District. Given the project's location at the northern end of downtown, parts of the larger Oakland Central area extending further to the north and east of the project also are relevant. The areas to the north and east include the Valdez area, Telegraph-Northgate area, Summit Medical area, Broadway Auto Row, and Adams Point.

TABLE 3
CUMULATIVE GROWTH SCENARIO FOR DOWNTOWN OAKLAND/OAKLAND CENTRAL AREAS, INCLUDING THE PROJECT

	2000	2010	2025	Change 2000-2025
Downtown Oakland /a/				
Jobs	65,160	81,100	89,540	+24,380
Households	7,740	11,830	15,100	+7,360
Population	14,680	25,490	31,000	+16,320
Employed Residents	6,310	11,970	16,550	+10,240
Oakland Central /b/				
Jobs	78,640	95,130	103,990	+25,350
Households	18,040	22,710	27,360	+9,320
Population	32,190	44,650	52,510	+20,320
Employed Residents	16,370	23,240	30,510	+14,140

NOTE: The map in Figure 1 (at the end of this appendix) identifies Downtown Oakland and the larger Oakland Central area (including downtown).

/a/ Bounded by Grand Avenue, Lake Merritt and the Channel, Oakland Estuary, and I-980 and Brush St.
/b/ Bounded by I-580, Lake Merritt and the Channel, Oakland Estuary, and I-980 and Brush St.

Source: *Cumulative Growth Scenario for Uptown Project EIR*, 6/9/03; City of Oakland; Hausrath Economics Group.

The following summarizes the growth and change anticipated in the surrounding Downtown/Oakland Central area, as reflected in the cumulative growth scenario in Table 3. Employment and population for the Uptown Project are described in a separate appendix in this EIR.

- **Employment Growth in Surrounding Downtown/Oakland Central Area:** Substantial employment is projected for downtown Oakland in the future. Growth of office employment is anticipated for both private sector and government office activities. Office growth is expected in major development projects as well as through ongoing renovations and conversions of older building space. Retail, hotel, service, cultural, and entertainment uses and activities also are anticipated to grow in downtown Oakland and to support employment growth there. Within the downtown area, the largest amounts of employment growth are expected in the City Center area, followed by employment growth in the Kaiser Center area, and by growth in the Jack London District. Employment growth also is projected for the Uptown District outside the project area, focused around the Broadway Corridor.

- **Household and Population Growth in Surrounding Downtown/Oakland Central Area:** Substantial growth of households and population also is expected in downtown Oakland. Higher-density housing development is projected to continue in infill projects on selected sites and in new downtown neighborhoods. A large amount of new housing development is already underway downtown. In addition to the Uptown Project, the larger amounts of new housing development are expected to continue to occur in the Jack London District, Old Oakland, the Valdez and Telegraph-Northgate areas (to the north of Grand Avenue), on infill sites in and around City Center, and in areas along the Channel linking Lake Merritt to the Estuary. Downtown/Oakland Central population growth also reflects changing demographic characteristics of the population in the existing housing stock, as reflected in demographic trends projected by ABAG. Overall, population is projected to double in the downtown Oakland area (Grand Avenue to the Estuary) by 2025, and to increase by over 60 percent and over 20,000 new residents in the larger Oakland Central area including downtown and areas to the north of Grand Avenue (I-580 to the Estuary).

Tables presented at the end of this appendix provide a more detailed version of the estimates and projections for the surrounding Downtown/Oakland Central area, and more background on assumptions. Table 4 (parts a. through f.) presents estimates and projections for all of the traffic analysis zones (TAZs) in downtown Oakland and the larger Oakland Central area. The data and projections include the growth associated with the project. (The subareas and TAZs within the Downtown/Oakland Central area are identified on the maps in Figures 1 and 2 at the end of this appendix.) Tables 5 and 6 list the development projects identified for the surrounding Downtown/Oakland Central area by the City of Oakland and Port of Oakland staffs. The lists include major projects under construction, approved and proposed projects, as well as potential projects under consideration and anticipated to be developed by 2025. In most cases, the project assumptions identified on the lists describe the new development; they do not identify existing uses and activities on development sites that would be removed for development, although the latter are accounted for in the cumulative growth scenario.

The projects on the lists for the Downtown/Oakland Central area all "fit" within the updated cumulative growth scenario summarized herein and used for the cumulative transportation analysis in this EIR. As explained earlier in this appendix, the scenario also includes other changes in land use and in employment and population besides those associated with development of projects on the lists. Thus, the lists alone do not equate to the changes over time in the growth scenario.

The amounts of employment, household, and population growth reflected by the growth scenario, and those represented by the projects on the lists, are more important than the specific projects identified. It is to be expected that the projects on the lists will change over time, and some will be added while others will be deleted. The lists reflect the best information at the time of the analysis. The growth scenario itself can remain valid as changes occur over time in the specifics of the development projects anticipated for the surrounding area.

GROWTH IN THE REST OF ALAMEDA COUNTY AND BAY AREA REGION

The growth scenario used for the cumulative transportation analysis for this EIR assumes growth in employment, households, and population as projected by ABAG *Projections 2002* and included in the recently updated CMA travel demand model for the rest of Alameda County and the Bay Area region outside of Oakland.[3]

---

[3] As a part of this EIR, consultation was undertaken with the nearby City of Alameda to confirm that use of the recently updated CMA/ABAG land use/growth projections included in the updated CMA travel model would adequately capture anticipated growth, and that the City did not have an alternative scenario that should be used instead. City of Alameda staff confirmed the use of the CMA/ABAG projections and reported that the ABAG projections for Alameda are high and include more growth than anticipated locally. (Contact with Andrew Thomas, City of Alameda Planning Department on June 5, 2003.)

```

```
Changes made to the default values for Land Use Trip Percentages

Changes made to the default values for Operations

The operational emission year changed from 2004 to 2005.
The double counting internal work trip limit changed from  to 26.4.
The double counting shopping trip limit changed from  to 13.2.
The double counting other trip limit changed from  to 1280.4.
The travel mode environment settings changed from  both to: none

APPENDIX H
HAZARDOUS MATERIALS REGULATORY AGENCIES

Regulatory Agency Framework for Hazardous Materials
Uptown Mixed-Use Project EIR

As noted in Section IV.G., Hazards and Hazardous Materials, Federal, State, regional, and local agencies are involved in the regulation of hazardous materials. A description of agency jurisdiction is summarized below. Because the regulatory framework for hazardous materials developed incrementally over time, some overlap exists in agency jurisdiction and responsibilities listed below.

(a) Environmental Protection Agency (USEPA). The United States Environmental Protection Agency (USEPA) is responsible for enforcement and implementation of federal laws and regulations pertaining to hazardous materials. The federal regulations are primarily codified in Title 40 of the Federal Code of Regulations (40 CFR). The legislation is outlined in the Resource Conservation and Recovery Act of 1976 (RCRA); the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA); and the Superfund Amendments and Reauthorization Act (SARA). These laws and associated regulations include specific requirements for facilities that generate, use, store, treat, and/or dispose of hazardous materials. The USEPA provides oversight and supervision for federal Superfund investigation/remediation projects, evaluates remediation technologies, and develops hazardous materials disposal restrictions and treatment standards.

(b) State Agencies. The roles of five State agencies are described below.

Department of Toxic Substances Control (DTSC). In California, the California EPA (CalEPA), Department of Toxic Substances Control (DTSC) is authorized by the USEPA to enforce and implement federal hazardous materials laws and regulations. Most State hazardous materials regulations are contained in Title 22 of the California Code of Regulations (CCR). DTSC provides cleanup and action levels for subsurface contamination; these levels are equal to or more restrictive than federal levels. DTSC acts as the lead agency for some soil and groundwater cleanup projects, although in Oakland most authority for contaminated sites has been ceded to local agencies. DTSC has also developed land disposal restrictions and treatment standards for hazardous waste disposal in California.

Air Resources Board (ARB). The California Toxic "Hot Spots" Information and Assessment Act of 1987 requires that industry provide information to the public on emissions of toxic air contaminants and their impact on public health. The Act requires that the ARB and local air quality districts inventory sources of over 200 toxic air contaminants, identify high priority emission sources, and prepare a health risk assessment for each of these priority sources. Industry-wide health risk assessments are in the process of being prepared for three common priority sources: auto body shops, dry cleaners, and gasoline service stations.

State Water Resources Control Board (SWRCB). The SWRCB issues regulations on how to implement Underground Storage Tank (UST) programs. It also allocates monies to eligible parties who request reimbursement of funds to clean up soil and groundwater pollution from UST leaks.

California Office of Emergency Services (OES). The OES State Warning Point compiles statistics on hazardous materials spills and releases, and acts as the Governor's 911 Dispatch Center, dispatching other regional, State, and federal agencies to the scene, if necessary, for spills and releases. The State Warning Point, under federal SARA Title III requirements must be notified as soon as possible after a spill or release.

(c) Regional Agencies. Two regional agencies oversee hazardous materials and are described below.

Regional Water Quality Control Board (RWQCB). The City of Oakland is located within the jurisdiction of the San Francisco Bay RWQCB. The RWQCB is authorized by the Porter-Cologne Water Quality Act of 1969 to protect the waters of the State. RWQCB can act as lead agency to provide oversight for sites where the quality of groundwater or surface waters are threatened and can approve site closure. The RWQCB also responds if, in an emergency, surface and groundwater is impacted.

Bay Area Air Quality Management District (BAAQMD). The BAAQMD is the regional enforcement agency for ARB regulations. This regional agency regulates point source air pollutants, including businesses such as metal platers and auto body shops, as well as mobile sources (e.g., autombiles). BAAQMD staff also respond to odor and asbestos complaints from City staff or the general public.

(d) Local Agencies. Three local agencies play a role in planning for and regulating hazardous materials.

Oakland Fire Services Agency (OFSA). As a Certified Unified Program Agency (CUPA), the Hazardous Materials Unit is responsible for enforcing most of the hazardous materials regulations within the City of Oakland, including regulations related to underground and aboveground storage tanks, hazardous waste generation, and Hazardous Materials Business Plans. OFSA is also responsible for inspections of businesses in the CUPA program, and acts as first responder to hazardous materials incidents in the City of Oakland.

Alameda County Health Care Services (ACHCS). ACHCS provides assistance to OFSA and other first-responders by providing a emergency vehicle for identification and advice to first responders regarding the hazardous materials present in the event of a fire or an accidental spill. Through its Local Oversight Program, ACHCS also acts as an oversight agency for remediation of some sites, including sites where releases from underground storage tanks have occurred.

City of Oakland Public Works Agency (OPWA). Although not directly responsible for the enforcement of hazardous materials regulations, OPWA's Environmental Services Division is responsible for several programs related to hazardous materials and public safety. This division is responsible for managing and implementing recycling programs as mandated by the County and the State, and for monitoring the Franchise Agreement for Solid Waste and Yard Waste Collection and Disposal Services. The division is also responsible for environmental site assessments for City-owned property, the Clean Water Program, the Watershed Improvement Program, and the Clean Creek Campaign including restoration projects on public property and adopt-a-creek volunteer programs. The Environmental Services Division also works on a wide range of environmental policy issues including air quality, water quality, and dioxin elimination.

APPENDIX A-2
RESOLUTIONS AUTHORIZING AB 436 (PUBLIC RESOURCES CODE SECTION 21159.25)

OAKLAND CITY COUNCIL

RESOLUTION NO. 76630 **C.M.S.**

INTRODUCED BY COUNCILMEMBER ____________________

RESOLUTION AUTHORIZING IMPLEMENTATION OF AB 436 (ENCOURAGING IN-FILL DEVELOPMENT WITHIN FOUR AREAS OF DOWNTOWN OAKLAND THROUGH STREAMLINED ENVIRONMENTALREVIEW) AND FINDING THAT CITY OF OAKLAND POLICIES ARE CONSISTENT WITH COMPACT DEVELOPMENT PRINCIPALS

WHEREAS, the California State Legislature approved Assembly Bill 436 ("AB 436) in September, 2001 and the Governor approved the legislation on October 10, 2001; and

WHEREAS, AB 436 expressly authorizes the City of Oakland to use a focused environmental impact report ("Focused EIR")under the provisions of the California Environmental Quality Act ("CEQA") for projects within four geographic districts located in the central downtown that consist of multiple-family residential development or for residential and commercial mixed use projects with not more than twenty-five percent of the total floor area of the project used for retail space, if certain conditions are met; and

WHEREAS, pursuant to AB 436, the Oakland City Council must vote to authorize the implementation of the practice of using Focused EIRs and further determine that the City's General Plan, zoning ordinance and any other related policies and programs are consistent with the compact development principals set forth in the legislation; and

WHEREAS, AB 436 sets forth an additional condition requiring the City of Oakland to submit a draft set of findings to the State Office of Planning and Research ("OPR") determining that the Oakland General Plan, zoning ordinance and related policies and programs are consistent with the principals that encourage compact development; and

WHEREAS, on October 26, 2001, City staff submitted a proposed set of findings to the OPR for their review and consideration; and

WHEREAS, this item came before the Oakland City Council Community and Economic Development Committee on December 4, 2001 and before the full City Council on December 11, 2001 and the City Council heard public testimony about implementing AB 436. **Now, Therefore, Be It**

RESOLVED: That, the City Council, as the final decision-making body of the lead agency, finds and determines, prior to taking action on the implementation of AB 436, that the legislation expressly excludes the City Council's affirmative vote on this resolution and related determination by the Council from the definition of "project" for the purposes of CEQA.

FURTHER RESOLVED: That, the City Council, having heard, considered and weighed all the evidence in the record presented about AB 436 and being fully informed of the provisions of the legislation, hereby authorizes the implementation of AB 436.

FURTHER RESOLVED: That, as a part of the City Council's authorization to implement the use of Focused EIRs for the four housing target areas within central downtown Oakland, the City Council finds and determines that the Oakland General Plan, zoning ordinance and related policies and programs are consistent with the compact development principals set forth in AB 436, as detailed in Exhibit A, attached hereto and incorporated herein by reference.

FURTHER RESOLVED: That, the City Council further authorizes the Planning Commission, in its sole discretion, to conduct a public hearing on its intent to use AB 436 for a specific project. If the Planning Commission provides such a hearing and thereafter adopts a Notice of Intent to Use AB 436 for a specific project, the Planning Commission's decision to use AB 436 shall be deemed to be administratively final.

FURTHER RESOLVED: That, the City Council finds and determines that this Resolution is exempt from CEQA and the Environmental Review Officer is directed to cause to be filed a Notice of Exemption with the Alameda County Clerk and the State OPR on the basis that this Resolution is not considered a "project" under CEQA.

FURTHER RESOLVED: That, the custodians and locations of the documents or other materials which constitute the record of proceedings upon which the City Council's decision is based are respectively: (a) Community & Economic Development Agency, Planning & Zoning Division, 250 Frank H. Ogawa Plaza, 3rd floor, Oakland CA.; and (b) Office of the City Clerk, 1 Frank H. Ogawa Plaza, 1st floor, Oakland, CA.

FURTHER RESOLVED: That, the recitals contained in this resolution are true and correct and are an integral part of the City Council's decision.

In Council, Oakland, California, DEC 1 8, 2001

PASSED BY THE FOLLOWING VOTE:

AYES- 6 Chang, Mayne, Reid, Spees, Wan and De la Fuente

City Clerk and Clerk of the
Council of the City of
Oakland, California

EXHIBIT A

City Council Findings Determining that the Oakland General Plan, Zoning Ordinance and Related Policies are Consistent with the Principals that Encourage Compact Development Pursuant to AB 436

I. Promotes efficient transportation systems:

- *Transit-oriented development should be encouraged at existing or proposed transit nodes, defined by the convergence of two or more modes of public transit such as BART, bus, shuttle service, light rail or electric trolley, ferry, and inter-city or commuter rail (Land Use and Transportation Element (LUTE) Transportation Policy T2.1). (Neighborhood Policy N8.1)* The implementation of AB436 would help to implement this policy, particularly for those developments which are within a quarter mile from key downtown public transit nodes (12th Street, 19th Street, Lake Merritt BART stations, AC Transit main trunk lines along San Pablo, Telegraph and Broadway and the Oakland AMTRAK Station).

- *Transit-oriented developments should be pedestrian oriented, encourage night and day time use, provide the neighborhood with needed goods and services, contain a mix of land uses, and be designed to be compatible with the character of surrounding neighborhoods (LUTE Transportation Policy T2.2)* The City has strongly encouraged mixed use development and ground floor retail and services uses in an effort to create more pedestrian activity and to serve both existing and new residents.

- *Promote neighborhood-serving commercial development within one-quarter to one-half mile of established transit routes and nodes. (LUTE Transportation Policy T2.3).* AB 436 would directly encourage this policy by providing a more streamlined development review process within this transit radius.

- *The City should encourage and promote use of public transit in Oakland by expediting the movement of and access to transit vehicles on designated "transit streets" as shown on the Transportation Plan (LUTE Transportation Policy T3.6).* The City has worked with AC Transit to assure that San Pablo Avenue is a main transit thoroughfare for buses; has actively pursued redevelopment and more intensive development around BART stations; and has required shuttle service from major office developments to downtown BART stations and has actively promoted appropriate transit stops and other facilities along major transit corridors.

- *Housing in the downtown should be encouraged in identifiable districts, within walking distance of the 12th Street, 19th Street, City Center, and Lake Merritt BART stations to encourage transit use, and in other locations where compatible with surrounding uses (LUTE Downtown Policy D10.2).* The four areas where AB436 would apply are within close proximity of the 12th Street and 19th Street and Lake Merritt BART stations.

- *Pedestrian-friendly commercial areas should be promoted (Downtown Policy D3.1).* Adding housing in the four target areas identified in AB436 will help enhance the existing and growing commercial areas in the Central Business District by creating and increasing a residential population within walking distance of downtown's retail and commercial businesses.

E & E-1

II. Promotes economic growth:

- *Activities and amenities that encourage pedestrian traffic during the work week, as well as evenings and weekends should be promoted (LUTE Downtown Policy D5.1).* The creation of additional housing in the four target areas will add a residential population that will increase pedestrian traffic in the downtown both during the work week, as these residents are travelling to and from BART stations or places of employment, and during the weekends and evenings.

- *Construction on vacant land or to replace surface parking lots should be encouraged throughout the downtown, where possible (LUTE Downtown Policy D6.1).* Many of the potential infill development sites within the four clusters are presently surface parking lots.

- *Downtown residents should have access to goods and services to meet their daily and long-term needs within the downtown area (LUTE Downtown Policy D9.2)* Mixed use developments will encourage goods and services in close proximity to the new housing projects.

- *Housing in the downtown should be encouraged as a vital component of a 24-hour community presence (LUTE Downtown Policy D10.1).* The incorporation of housing within the downtown will further this policy of a 24 hour community.

- *Retail uses should be focused on "nodes" of activity, characterized by geographic clusters of concentrated commercial activity, along corridors that can be accessed through many modes of transportation. (LUTE Industry and Commerce Policy C3.3).* This policy will be attained by encouraging groundfloor retail and services uses within mixed use or housing developments.

- *Mixed use developments should be encouraged in the downtown for such purposes as to promote its diverse character, provide for needed goods and services, support local art and culture and give incentive to reuse existing vacant or underutilized structures. (LUTE Downtown Policy D11.1)*

- *Mixed use development should be allowed in commercial areas, where the residential component is compatible with the desired function of the area. (LUTE Downtown Policy D11.2)*

III. Promotes affordable housing:

- *Housing in the downtown should not be geared toward any one housing market, but rather should be promoted for a range of incomes, ownership options, household types, household sizes, and needs. (LUTE Downtown Policy D10.4)*

- *The City encourages local non-profit organizations, affordable housing proponents, the business community, the real estate industry, and other local policy makers to join efforts to advocate for the provision of affordable housing in communities throughout the Bay Area region (LUTE Neighborhood Policy N4.2).*

- *The Oakland Redevelopment Agency has adopted a policy of using twenty five percent of increment funds received for affordable housing developments.*

IV. Promotes energy efficiency:

- *The City Council has established a Sustainable Development Initiative Program (December, 1998), that calls for a range of strategies focusing on the "3 E's): environment, economy and equity. Among the specific objectives of this program is the implementation of Sustainable Design Guidelines for new construction. Energy efficiency and renewable energy are cornerstones of these guidelines. These guidelines apply throughout the entire lifecycle of a building from pre-design through operation.*

V. Promotes an appropriate balance of jobs and housing:

- *The Oakland Sustainable Initiative Program, described above, also includes the objective of attracting higher density, mixed use developments near transit and jobs.*

VI. Protects the environment:

- *Downtown development should be visually interesting, harmonize with its surroundings, respect and enhance important views in and of the downtown, respect the character, history, and pedestrian-orientation of the downtown, and contribute to an attractive skyline (LUTE Downtown Policy D2.1)*
- *Infill housing that protects surrounding development and the streetscape should be encouraged in the downtown to strengthen and or create distinct districts. (LUTE Downtown Policy D10.6)*
- *The City has adopted local guidelines and procedures pursuant to the California Environmental Quality Act (CEQA), has specific tree protection requirements and creek protection requirements.*

VII. Protects open space:

- *The City has established criteria for urban park acquisition, including land in areas with dense concentrations of people, especially children, and land in areas with large concentrations of workers and pedestrians (General Plan Open Space and Recreation (OSCAR) Element, Open Space Policy 2.5)*
- *Allow street closures as a way of creating new parks, plazas, and garden sites in urban neighborhoods. (OSCAR Open Space Policy 2.6)*
- *Continue to require new multi-family development to provide useable open space for its residents (OSCAR Open Space Policy 4.1)*
- *Adoption of new urban open space standards for the central downtown area (S-17 zone) in order to provide certainty and incentives for the provision of quality useable open space most appropriate to high density, downtown housing (Oakland City Ordinance No. 12343).*

VIII. Protects agricultural use:

- *Although agricultural uses are not activities that currently operate within the central downtown area of Oakland, there are specific policies pertaining to community gardens (Open Space Policy OS 2.3) and a city-wide Community Garden Program through the Department of Parks and Recreation. In addition, as has been advocated by many environmental and open space organizations throughout the Bay Area region during the past decade, accommodating higher densities within existing developed areas and encouraging infill development may serve to preserve and protect agricultural uses in the outlying areas of urban areas.*

APPENDIX A-3
NOTICE OF PREPARATION

Notice of Preparation
of an
Environmental Impact Report
for the **Uptown Mixed-Use Project** and
Notice of Intent to use Assembly Bill AB 436[1] for this EIR

The Oakland Community and Economic Development Agency, Planning and Zoning Division, is preparing an Environmental Impact Report (EIR) for the Uptown Mixed-Use project described below. We are requesting comments on the scope and content of this EIR. We have prepared an environmental Initial Study that identifies areas of probable environmental effects. These probable environmental effects are summarized below. The Initial Study is available at the City of Oakland Planning Division, 250 Frank Ogawa Plaza, Suite 3330, Oakland, CA or by contacting Patricia McGowan at 510-238-3063, or pmcgowan@oaklandnet.com.

A Notice of Preparation was issued in the fall of 2000 for a different project on this site. That project is no longer under consideration; it was withdrawn and an EIR was not prepared. This current Notice of Preparation is announcing the preparation of an EIR for a new project on the Uptown site.

The EIR to be prepared for this project may be a Focused EIR as authorized by State of California Public Resources Code Section 21159.25 (formerly referred to as Assembly Bill 436) and authorized by the Oakland City Council. Pursuant to Section 21159.25, focused EIR's may be prepared for projects located in specified areas of downtown Oakland (including the Uptown area) and where the proposed project consists of multiple-family residential development, or residential and retail mixed-use development where less than 25% of the total floor area of the project will be used for retail. In such an EIR, no discussion is required for alternatives to the project, cumulative impacts of the project or the growth inducing impacts of the project. The EIR which was prepared and certified for the Land Use and Transportation Element of the Oakland General Plan will be used as one of the bases for environmental documentation. The City finds that all the applicable criteria of Section 21159.25 of the State of California Public Resources Code apply to the use of a focused EIR for this project. CEQA provides a 30-day comment period related to the scope and content of the EIR. Such comments are requested by March 28, 2003.

A Scoping Session Public Hearing with the Oakland Planning Commission is scheduled for March 19, 2003 at 6:30 pm, in Hearing Room 1 of Oakland City Hall, 1 Frank Ogawa Plaza, Oakland, CA. The Scoping Session with the Planning Commission will be not only to receive comments about the content of the EIR for the project but also will be a public hearing on the intent to use Public Resources Code Section 21159.25 (formerly referred to as AB 436) for the preparation of an EIR for this project. The Planning Commission may make a determination on the intent to use Public Resources Code Section 21159.25 for this EIR.

Please provide comments at the Scoping Session described above, or send your comments on the scope of the Focused EIR by March 28, 2003. Your comments or questions should be directed to Patricia McGowan, City of Oakland Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612, phone (510) 238-3063, fax (510) 238-6538, e-mail pmcgowan@oaklandnet.com. Please reference case number ER 03-0007 in your response.

---

[1] Assembly Bill 436 was incorporated into the State of California Public Resources Code in Section 21159.25.

The City of Oakland is the Lead Agency for the project, which means that the City is the public agency with the greatest responsibility for approving the project. The City is sending this notice to Responsible Agencies and other interested parties. Responsible Agencies are those public agencies besides the City of Oakland that may also have a role in approving or carrying out the project. Responsible Agencies will need to use the EIR that the City is preparing when considering approvals related to the project.

When the Draft EIR is published, it will be sent to all Responsible Agencies and to others who respond to this Notice of Preparation or who otherwise indicate that they would like to receive a copy.

PROJECT TITLE: Uptown Mixed Use Project

PROJECT LOCATION: The project is proposed on a nine-block 15-acre site located in the Uptown area of downtown Oakland, CA. Blocks 1 through 6 are generally bounded by Thomas L. Berkley Way (20th Street) on the north, Telegraph Avenue on the east, 18th Street on the south, and San Pablo Avenue on the west. (The Fox Theater, which is located on the east side of Block 6, is not a part of the proposed project.) Blocks 7 and 8 are located on the north side of Thomas L. Berkley Way (20th Street), east and west of Telegraph Avenue. Block 9 is located on the southeastern corner of Telegraph Avenue and 22nd Street, approximately two blocks north of the other eight blocks. The project site contains numerous parcels, containing a mixture of buildings, surface parking lots and a parking structure available for public parking.

Figure 1 shows the location of the proposed project. Figure 2 shows the project site on an aerial photograph.

PROJECT SPONSOR: Forest City Residential West, Inc.

PROJECT DESCRIPTION: The preliminary project description, submitted in February, 2003, proposes to redevelop a nine-block area in Downtown Oakland with the following mix of uses:

- approximately 1,500 to 1,700 residential units (including apartments, condominiums, student and faculty housing). Twenty percent (20%) of the rental apartments, excluding the condominiums, student and faculty housing, will be affordable to households earning 50% or less of the area's median income (AMI). An additional 5% of the rental housing will be affordable to households earning 120% or less of the AMI.

- approximately 40,000 to 50,000 square feet of commercial, retail, and service uses;

- a 25,000 square-foot new public park; and

- approximately 1,700 to 2,000 parking spaces (located predominantly in parking structures).

A description of the project's preliminary development concept for each block is provided below. This scenario could change slightly as the project is refined. Refer to Figures 1 and 2 for the location of the subject blocks.

On Blocks 1-6, approximately 1,100 residential units are proposed in six multi-story buildings, with associated residential parking and a 25,000 square foot public park. The residential units are proposed in five-story buildings atop a parking podium along with one 19-story high rise located in Block 5 along San Pablo Avenue. The project also proposes approximately 22,000 square feet of pedestrian-oriented retail, commercial, or service uses on the ground floor of the proposed buildings fronting onto

Telegraph Avenue. Parking is proposed within and below the project buildings providing approximately 1,200 parking spaces for use primarily by the residential tenants of the project and retail customers. The proposed project also includes the construction of two new streets within Blocks 1-6, in a north-south direction between 18th St. and Thomas L.Berkley Way (20th Street), as shown on Figure 1.

On Block 7, a high rise building approximately 19 to 22-stories, containing student housing is proposed along with low-rise buildings, likely 3-stories, containing faculty housing. The student housing will contain approximately 1,000 beds (which equates to approximately 365 residential units[2]) plus approximately 50 residential units of faculty housing. Also proposed on Block 7 is approximately 11,000 sf retail space, and 550 parking spaces (for residents and retail customers) to be located in a parking garage, contained either within or adjacent to the residential buildings proposed on this block.

Block 8 is an alternate site for relocation of the Sears Auto Center. (See description below.)

Block 9 is proposed as the relocation site for the Sears Auto Center that is currently located at 1901 Telegraph Avenue, on Block 4. Currently, a fast-food hamburger restaurant ("Giant Burger") occupies the site. Block 9 would contain approximately 10,000sf of retail space auto center and approximately 50 parking spaces.

In addition to the project features described above, enhanced lighting and streetscape improvements are proposed along the street frontages of the project area. The City of Oakland will be undertaking streetscape improvements along Telegraph Avenue within the project site.

A Variant of the project that will be analyzed in the EIR is the construction of 10-story buildings on Blocks 3 and 4 instead of 5-story buildings. The building on Block 3 would be approximately 130 feet in height and contain approximately 200 residential units and approximately 7,500 square feet of commercial retail space on the ground floor. The building on Block 4 would be approximately 130 feet in height and contain approximately 200 residential units and up to 20,000 square feet of commercial retail space on the ground floor. Each building would also have a two-level subterranean parking structure of approximately 250 and 270 spaces, respectively.

The proposed project will require discretionary permits which may include, but are not limited to, a Major Conditional Use Permit, Design Review, Planned Unit Development, Subdivision Maps to combine parcels, subdivide parcels or create condominiums, if such are proposed, and actions by the Redevelopment Agency such as Disposition and Development Agreements. Such permits will be considered by the Planning Commission, City Council and Board of the Oakland Redevelopment Agency, as appropriate.

The project sponsor proposes to start construction immediately upon receiving project approval on Blocks 1 and 2 for occupancy by 2006. The project sponsor anticipates that the rest of the project will follow immediately in phases with completion by 2010.

The project site may contain hazardous waste sites listed under Government Code Section 65962.5.

PROBABLE ENVIRONMENTAL EFFECTS: It is anticipated that the proposed project may have environmental effects in the following areas: transportation/traffic, air quality, noise, visual/aesthetic impacts, cultural resources, hazardous materials, hydrology/water quality, land use and planning, population and housing, utilities and service systems, and mandatory findings of significance.

---

[2] 2.75 beds equates to one residential unit.

ENVIRONMENTAL EFFECTS NOT LIKELY TO REQUIRE FURTHER ANALYSIS: An environmental Initial Study was prepared and it was determined that the following potential environmental effects of the proposed project would be less than significant or have not impact and will not be further studied in the EIR: agricultural resources, biological resources, geology and soils, mineral resources, public services, recreation and energy.

DATE AND LOCATION FOR SUBMITTING COMMENTS ON THE SCOPE OF THE EIR: Please send your comments on the scope of the Focused EIR **by March 28, 2003**. Your comments or questions should be directed to Patricia McGowan, City of Oakland Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612, phone (510) 238-3063, fax (510) 238-6538, e-mail pmcgowan@oaklandnet.com. Please reference case number ER 03-0007 in your response.

Re: Notice of Preparation for the Uptown Mixed Use Development Project draft Environmental Impact Report
SCH Number 2000052070

Dear Ms. McGowan:

Regional Water Quality Control Board (Regional Board) staff have reviewed the Notice of Preparation (NOP) for the Uptown Redevelopment Project drat *Draft Environmental Impact Report* (DEIR). The DEIR will evaluate the potential environmental impacts that might reasonably be anticipated to result from the proposed action, which includes the redevelopment of a nine block area in Downtown Oakland with a mixture of housing, commercial uses, retail uses, service uses, and a new public park. Regional Board staff have the following comment on the NOP for the DEIR.

Comment 1
Initial Study and Environmental Review Checklist, Section VIII, Hydrology and Water Quality, page 23.
The discussion of stormwater impacts in this section is incomplete. Most of the discussion on page 23 is related to minimizing stormwater impacts related to construction of the projects. The discussion of potential water quality impacts in the DEIR should be expanded to include a discussion of Alameda County's National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges. Under the terms of the NPDES permit, post-construction best management practices (BMPs) at new development and significant redevelopment projects are to meet the maximum extant practicable (MEP) definition of treatment specified in the Clean Water Act (CWA). Alameda County is implementing the current NDPES permit for discharges of stormwater under the *Alameda Countywide Clean Water Program, Stormwater Management Plan* (SMP) (EOA, Inc., February 1997). New Development and Construction Goals are discussed in Section 7 of the SMP. These goals include the following:

- Incorporate stormwater quality controls into the planning and permitting of new development/significant redevelopment projects;
- Continue to promote implementation of the *Regional Board Staff Recommendations for New and Redevelopment Controls for Stormwater Programs.*

Tables 2 and 4 of the *Regional Board Staff Recommendations for New and Redevelopment Controls for Stormwater Programs* states that residential and commercial projects with greater than five acres of directly coupled impervious area are to implement Tier 3 post-construction stormwater best management practices (BMPs). Tier 3 BMPs are to be treatment controls that are based on performance goals, including a reduction by 80 percent of the annual total suspended solid loadings expected from the site in its developed condition. Appropriate Tier 3 controls are specified as: wet ponds; constructed wetlands; swales and vegetated filter strips; extended detention basins; and sand filters.

The Alameda County NDPES permit was re-issued on February 19, 2003. New development and significant redevelopment Projects that are constructed after February of 2005 will be required to comply with the numeric standards for post-construction stormwater BMPs in the re-issued permit. Treatment BMPs are to be constructed that incorporate, at a minimum, the following hydraulic sizing design criteria to treat stormwater runoff. As appropriate for each criterion, local rainfall data are to be used or appropriately analyzed for the design of the BMPs.

Volume Hydraulic Design Basis: Treatment BMPs whose primary mode of action depends on volume capacity, such as detention/retention units or infiltration structures, shall be designed to treat stormwater runoff equal to:

1. the maximized stormwater quality capture volume for the area, based on historical rainfall records, determined using the formula and volume capture coefficients set forth in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998*), pages 175-178 (e.g., approximately the 85th percentile 24-hour storm runoff event); or
2. the volume of annual runoff required to achieve 80 percent or more capture, determined in accordance with the methodology set forth in Appendix D of the *California Stormwater Best Management Practices Handbook*, (1993), using local rainfall data.

Flow Hydraulic Design Basis: Treatment BMPs whose primary mode of action depends on flow capacity, such as swales, sand filters, or wetlands, shall be sized to treat:

1. *10% of the 50-year peak flow rate; or*
2. *the flow of runoff produced by a rain event equal to at least two times the 85th percentile hourly rainfall intensity for the applicable area, based on historical records of hourly rainfall depths; or*
3. the flow of runoff resulting from a rain event equal to at least 0.2 inches per hour intensity.

Regional Board staff strongly encourage the use of landscape-based stormwater treatment measures, such as biofilters and vegetated swales, to manage runoff from the project sites. Since landscape-based stormwater treatment measures require that some of the site surface area be set aside for their construction, the proper sizing and placement of these features should be evaluated early in the design process to facilitate incorporation of the features into the site landscaping. Regional Board staff discourage the use of inlet filter devices for stormwater management. Filtration systems require a maintenance program that is adequate to maintain the functional integrity of the systems and to ensure that improperly maintained filtration devices do not themselves become sources of stormwater contaminants or fail to function. Regional Board staff have observed problems with the use of inlet filter inserts, since these devices require high levels of maintenance and are easily clogged by leaves or other commonly occurring debris, rendering them ineffective. Research conducted by the California Department of Transportation has demonstrated that inlet filters can be clogged by a single storm event. The study found that these devices required maintenance before and after storm events as small as 0.1 inch of rain. In addition, trash, debris, and sediment in the catchment had a significant impact on the frequency of maintenance. Therefore, adequate maintenance of inlet filters to provide MEP water quality treatment would be prohibitively expensive and impractically time consuming.

Regional Board staff recommend that the City refer to *Start at the Source*, a design guidance manual for storm water quality protection, for a fuller discussion of the selection of stormwater management practices. This manual provides innovative procedures for designing structures, parking lots, drainage systems, and landscaping to mitigate the impacts of stormwater runoff on receiving waters. This manual may be obtained from most cities' planning departments, or by contacting the San Francisco Estuary Project (510-622-2465).

If you have any questions, please contact me at (510) 622-5680 or by e-mail at bkw@rb2.swrcb.ca.gov.

Sincerely,

Brian Wines

Re: Notice of Preparation – Uptown Mixed-Use Project
Case Number ER 03-0007

Dear Ms. McGowan:

Thank you for the opportunity to comment regarding the Notice of Preparation for the Uptown Mixed-Use Project. The City of Alameda is pleased that the City of Oakland is continuing to enjoy economic growth and vitality. Below are listed some specific information that the City of Alameda would like addressed in the Draft Environmental Impact Report:

A. Vehicular Traffic. As we have noted in other recent Environmental Impact Reports, Oakland and Alameda share a common interest regarding the potential impacts of new projects on the existing street network connecting both the two cities and the interstate highway system. Please include the intersections and crossings included in Attachment A. Many of these intersections were identified as important to inter-city traffic flow by both the City of Oakland and the City of Alameda staff in a series of joint meetings.

B. Transit and Non-Motorized Transportation. In addition to the consideration of the impact of this project on vehicular traffic, please include a detailed discussion of existing and planned conditions for the following list:

   1. Public Transit: BART, AC Transit are regional mass transit programs that Oakland shares with Alameda and the rest of the Bay Area. Please give a detailed analysis on the existing and planned conditions on these services.
   2. Bicycle Facilities. The size and scale of the proposed project could have direct impacts on bicycle facilities in both Oakland and Alameda. Please give a detailed analysis on the existing and planned conditions of this resource by this project.
   3. Pedestrian Facilities. As stated in correspondence from your office dated January 30, 2003; we understand that the City of Oakland will be utilizing a thorough and meaningful analysis of the potential impacts and possible mitigation measures of this project on Oakland's pedestrian-orientated areas, including Chinatown, a densely populated, pedestrian-centered neighborhood directly linked to Alameda by the Webster/Posey Tubes.

RE: **Scope of EIR for Uptown Mixed-Use Project (ER 03-0007)**

Dear Ms. McGowan:

Friends of the Oakland Fox, Inc. is a public benefit non-profit corporation that advocates and supports the historic preservation of the Fox Oakland Theater and its use as a live entertainment venue. Our primary concerns are the potential impacts of the proposed Uptown Mixed-Use Project on the long term viability of the Fox Oakland Theater Building. These potential impacts need to be thoroughly analyzed in several different ways. Therefore, we offer the following comments concerning the content of the EIR that will be prepared for the proposed project:

Ownership and development of the Fox Oakland. Although the City currently owns the property, no decision has been made as to its eventual disposition. Frequently the City has indicated a desire to find a private developer to take on development of the property. Currently it is considering plans that would reopen the theater on an interim basis with limited use and continued City ownership; however this is considered to be a step – a very important step – in what will be a multi-year effort to restore and reuse the entire facility and determine its ultimate disposition. Therefore, the EIR must look at the long term viability of the entire facility, NOT as a city-owned project, NOT as a private development, but as a functioning performing arts facility that can accommodate an audience of up to 3,000 plus office and commercial spaces that will have a variety of uses.

Space behind the Fox Oakland. The Master Plan Report prepared for the City in 2000 by HHPA looked at five alternatives for reusing the Fox Oakland Theater Building. Each included reserving space for a loading area at the rear of the stage and constructing additional facilities, possibly including commercial space. The HHPA report suggested about 40' for the loading area/additional facilities, 6' for a sidewalk, and 15' to 20' for a pedestrian walkway. While FOOF has no reason to dispute any of these dimensions, we believe all three were meant to be illustrative rather than based on specific programming needs. Therefore, FOOF believes the EIR should carefully analyze the impact of any part of the Uptown Mixed-Use Project that comes within about 75' of the back wall of the Fox Oakland Theater and determine whether its construction and/or operation could have an adverse effect on the long term viability of the Fox Oakland. If, as has been shown on various site plans, the proposed project will be built to about 40' behind the theater, FOOF requests that specific plans and programming for the theater's addition be completed in order to justify that specific distance. Any other distances, less than about 75' should also be carefully and clearly justified in the EIR.

New uses behind the Fox Oakland. The proposed project refers to the 0.90 acre parcel behind the Fox Oakland as "Block 6." Currently Block 6 is used as a surface parking lot. Its proposed use is 140 residential units and parking spaces in a 5-story building. Compatibility between the proposed new use on Block 6 and the loading activity and/or commercial activity at the rear of the Fox Oakland must be considered in the EIR. It must be assumed that loading activities could occur at all hours of the night, especially after the close of a show at the Fox Oakland. It should also be assumed that the new commercial space could house a night club or similar late night activity. And it must be acknowledged that the Oakland Ice Center has late night and early morning activities. All of these activities could be severely impacted by the adjacent residential uses proposed for Block unless adequate mitigations can be incorporated into the proposed project. The design of the wall that faces the Fox Oakland must also be considered. Will there be any openings? Will it be a monolithic 5-story tall wall? What will it be made of? The importance of careful analysis of each of these questions in the EIR is underscored by the fact that Block 6 is shown as part of the first phase of construction.

Parking. The Initial Study indicates that the project will cause a loss of approximately 1,700 parking spaces that are currently available to the public. This sounds like a very significant impact. The EIR must include an analysis of what impact this will have on the long-term viability of the 3,000-seat Fox Oakland Theater as well as the existing Paramount Theatre of the Arts, Black Box Theater, Sweet's Ballroom, Oakland Ice Cente and the proposed Arts & Entertainment District. Proposed mitigations should be dramatic innovative, and effective or it is highly unlikely they will work.

Alternative uses for Block 6. Although AB 436 does not require study of alternatives to the entire project, FOOF believes that the EIR must study alternate uses on Block 6. To mitigate compatibility problems noted above, the EIR should study relocating to Block 6 the public park currently proposed on Block 1 or the parking structure currently proposed for Block 7. It appears 140 units of residential could be constructed on either of those blocks. To leave 75' clear behind the theater, the EIR look at relocating the street currentl proposed between Blocks 5 and 6, and moving everything on Block 6 to the west (toward Block 5). To mitigate some of the public parking shortage created by the proposed projec the EIR should study construction of a public parking structure on Block 6 in place of the 140 units of proposed housing.

Thank you very much for allowing us this opportunity to comment on the scope of the EIR for the proposed Uptown Mixed-Use Project.

Sincerely,

Patricia Dedekian

Dear Ms. McGowan:

UPTOWN MIXED USE PROJECT – NOTICE OF PREPARATION

Thank you for including the California Department of Transportation (Department) in the early stages of the environmental review process for the Uptown Mixed Use project. The following comments are based on the Notice of Preparation.

Traffic Analysis
Please ensure that the information detailed below is provided in the Traffic Study to ensure a thorough assessment of project-related impacts to State roadway facilities. We encourage the City of Oakland to coordinate preparation of the study with our office, and we would appreciate the opportunity to review the scope of work. Please see the Department's "*Guide for the Preparation of Traffic Impact Studies*" at the following website for more information:
http://www.dot.ca.gov/hq/traffops/developserv/operationalsystems/reports/tisguide.pdf

1. Project-related trip generation, distribution, and assignment; the assumptions and methodologies used to develop this information should be detailed in the study.

2. Average Daily Traffic, AM and PM peak hour volumes and level of service (LOS) on all significantly affected streets and highways, including crossroads and controlled intersections for existing, existing plus project, cumulative and cumulative plus project scenarios. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future, that would affect study area roadways and intersections. The analysis should clearly identify the project's contribution to area traffic and degradation of existing and cumulative levels of service.

3. Schematic illustration of traffic conditions including the project site and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane configurations, for the scenarios described above.

4. Mitigation should be identified for any roadway mainline section or intersection with insufficient capacity to maintain an acceptable LOS with the addition of project-related and/or cumulative traffic.

The project's fair share contribution, and financing, scheduling, implementation responsibilities and lead agency monitoring should also be fully discussed for all proposed mitigation measures.

5. Special attention should be given to the following trip-reducing measures:
   - Providing transit information to all future residents, employees and patrons of the proposed project,
   - Coordinating with AC transit to increase transit services by expanding routes and emphasizing express service to regional rail stations, and by providing bus shelters with seating at any future bus pullouts, and
   - Encouraging bicycle- and pedestrian-friendly project design.

6. While the 2000 Highway Capacity Manual (HCM) may not be the preferred level of service methodology, it should still be used for analyzing impacts to state facilities where previous analysis employing alternative methodologies has identified impacts. The residual level of service, assuming mitigation has been implemented, should also be analyzed with HCM 2000.

Please send two copies each of the Traffic Study, including Technical Appendices, and the environmental document, to the address below as soon as they are available.

Patricia Maurice, Associate Transportation Planner
Office of Transit and Community Planning, Mail Station 6E
California DOT, District 4

Oakland, CA 94612-3717

Right of Way
Work that encroaches onto the State right-of-way (ROW) requires an encroachment permit that is issued by the Department. To apply, a completed encroachment permit application, environmental documentation, and five (5) sets of plans, clearly indicating State ROW, must be submitted to the address below. Traffic-related mitigation measures will be incorporated into the construction plans during the encroachment permit process.

Sean Nozzari, District Office Chief
Office of Permits
California DOT, District 4

Subject: Uptown Mixed Use Project

Dear Ms. McGowan:

The Bay Area Air Quality Management District (District) has received your agency's Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Uptown Mixed Use Project. The project proposes the development of residential and commercial uses within a nine-block area of Downtown Oakland. Buildout of the proposed project would include the development of up to 1,700 residential units, 50,000 square feet of commercial space, 2,000 parking spaces and a 25,000 square foot public park.

District staff agree with the NOP's conclusion that the DEIR should analyze the project's potential impacts upon air quality. The Bay Area is currently a non-attainment area for federal and state ambient air quality standards for ground level ozone and state standards for particulate matter. The air quality standards are set at levels to protect public health and welfare. Toxic air contaminants are also an area of serious concern in the Bay Area. Any project which exposes sensitive receptors or the general public to substantial levels of criteria air pollutants or toxic air contaminants would be deemed to have a significant impact and would need to be properly mitigated. As general background for readers, the DEIR should discuss the health effects of air pollution, and it should provide quantitative summaries of the region's attainment status with regard to ambient air quality standards and the contribution of mobile and stationary sources to air pollution emissions.

As part of the Regional Agencies Smart Growth Strategy/Regional Livability Footprint Project, Alameda County residents recently expressed a strong preference for more infill and mixed use development that provides a range of travel options. We believe that through land use decisions that support transit, walking and cycling, Bay Area cities can help to reduce the rate of increase in vehicle miles traveled and improve local and regional air quality. In many ways, this project fulfills these goals by redeveloping a variety of land uses on urban in-fill sites near transit, and we commend the City for these efforts.

District staff support the smart growth approach the City has taken with this project. As with all major projects, the DEIR should analyze the potential impacts on air quality from project construction and project operation at buildout. If significant air quality impacts are identified, the DEIR must include all feasible

939 ELLIS STREET • SAN FRANCISCO CALIFORNIA 94109 • 415.771.6000 • www.baaqmd.gov

mitigation measures to reduce the air quality impacts. We suggest that the City do as much as possible to reduce vehicle trips associated with the project. Motor vehicles constitute the largest source of air pollution in the Bay Area; therefore, we have a strong interest in promoting alternative modes of transportation. The project site is located in a transit-rich part of Oakland within walking distance of a number of AC Transit lines, BART, and the Oakland Greyhound bus depot. The DEIR should identify strategies to strengthen linkages between the project site and these mass transit nodes. In addition, the City can maximize the benefits of the project's location by incorporating as many appropriate transportation demand management (TDM) measures as possible, including: reduced or shared parking; transit subsidies such as the Commuter Check program for employees; and bicycle/pedestrian facilities and access. These measures promote transportation alternatives to the single-occupant vehicle which help to mitigate air quality impacts.

The DEIR should also evaluate potential nuisance impacts, such as odors and dust that could result from project implementation. Odors and dust may not necessarily cause physical harm, but can still be unpleasant and can motivate citizen complaints. While the Initial Study states that the project will not create objectionable odors affecting a substantial number of people, the DEIR should consider the potential nuisance impacts that adjacent land uses might have on future residents and other new sensitive receptors in the project area. Air quality problems arise when sources of air pollution and sensitive receptors are located near one another. Particulate matter (PM) is a pollutant of concern for both nuisance and health-related reasons. PM larger than ten microns is more likely to be a public nuisance than a serious health hazard. On the other hand, research has demonstrated a correlation between high levels of fine PM and increased mortality rates and high incidences of chronic respiratory illness. The DEIR should evaluate potential impacts and propose appropriate mitigation measures.

The Initial Study indicates that parking lots, auto repair facilities and other commercial operations currently exist at the site and may have the potential to release hazardous materials or contaminated soil during the demolition and excavation phase of project construction. The remediation of petroleum-contaminated soil can have air quality ramifications and may be subject to District regulations. Such activities require careful mitigation planning and may require prior approval from the District. For more information on District regulations regarding demolition and soil remediation, please contact our Compliance and Enforcement Division at (415) 749-4762.

For more details on our agency's guidance regarding environmental review, we recommend that the City refer to the *BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans (1999)*. The document provides information on best practices for assessing and mitigating air quality impacts related to projects and plans, including construction emissions, land use/design measures, project operations, motor vehicles, nuisance impacts and more. If you do not already have a copy of our guidelines, we recommend that you obtain a copy by calling our Public Information Division at (415) 749-4900 or downloading the online version from the District's web site at http://www.baaqmd.gov/planning/plntrns/ceqaguid.htm.

If you have any questions regarding these comments, please contact Suzanne Bourguignon, Environmental Planner, at (415) 749-5093.

Sincerely,

William C. Norton

RE: **Scope of EIR for Uptown Mixed-Use Project (ER 03-0007)**

Dear Ms. McGowan:

Oakland Heritage Alliance appreciates the opportunity to address the scope of environmental reviews for the Uptown Project

We believe that the project will have major impacts upon historic or culturally valuable buildings and uses. We believe it is important as well as legally required that the City study the project's impact upon the buildings and areas listed below, and any other adjoining areas that are recognized or potential historic or cultural resources.

In some cases, we urge that alternate schemes be studied. Although full alternatives for the entire project may not be required under the provisions of the focused EIR called for in AB 436, some partial alternatives should be considered in order to have less negative impact upon the historic and cultural resources. Impacts upon historic or cultural resources are not exempt from study under the focused EIR structure, as you know. Parcel indications are from a map entitled *Uptown Residential Project EIR project location and regional location,* LSA/Mclarand, Vasquez & Partners, Inc., 2002. This map shows somewhat different areas than a March 1, 2003 map recently acquired, called *Uptown Program Area Concept Plan*/MVE & Partners, KenKay Associates, Calthorpe Associates.

1. **Fox Oakland Theater, adjoining parcels 6 and 4:** please consider alternative treatments to allow greater space behind the building and review relative impacts of uses adjoining it. a) There is some question as to whether 40 feet is sufficient, or whether 65 feet or more should be allowed for. Please review the master plan commissioned by the city. b) Is there enough public access parking allowed for theater users of the future? Please study alternate parking schemes. c) Will there be any conflict of use with housing nearby? Please study ways to reduce such conflicts of use. d) Will truck access be unimpeded should the theater come back into use as a live venue? Please provide information on the implications of different width allowances behind the Fox. e) Does planned open space support the entertainment use of the building? Please consider alternate locations for public open spaces.

2. **Nineteenth-century buildings on San Pablo between William and Thomas Berkley Way, in parcel 1.** Please study alternatives that retain these buildings and the adjoining barbecue restaurant at the corner. These small but interesting buildings can provide visual transi-

Office: 1418 Lakeside Drive, Oakland • (510) 763-9218 Voice/Fax
Mail: P. O. Box 12425 Oakland, California 94604
E-mail: info@oaklandheritage.org Web Site: www.oaklandheritage.org

tion into the project, integrate it better into existing streetscapes and encourage the creative reuse of historic buildings just outside the project area. New residents will appreciate these remnants of their neighborhood's past, and because of their relatively small footprint, it should be possible to include them in the site plan.

3. **Early twentieth-century auto repair garages on Thomas Berkley Way, parcel 1.** Please consider an alternative scheme that reuses one or more of these buildings to provide architectural interest and variety on the street. Review the historic records on these buildings and interview owners to find out whether there are historic elements or cultural resources that should be studied. (We believe that the Revelli building has been in that family since the 1930s.)

4. **Navlet's building and the adjoining buildings to the west of it, parcel 7.** Please study an alternative or several alternatives to retain the buildings on the north side of Thomas Berkley Way. In particular, study alternative locations for parking, and review impacts on the northern edge of the block upon the adjoining partly residential neighborhoods at 21st Street and north. Consider avoiding the isolation of Navlet's as a last remnant specimen building squeezed between two large new buildings. The relationship between the Navlet's building and its proposed new neighbors has the potential for great awkwardness. Study the possibility of retaining buildings to the west.

5. **Former California Art Supply building.** This building, just across from parcel 5, could be an interesting visual resource and provide some food and beverage, entertainment, or other retail services to patrons of the ice skating rink. Review historic records on the building.

6. **Impacts on buildings across Telegraph from parcels 3 and 4:** This is the building group formerly known as Newberry's and the Oakland Floral Depot, currently home to a small theater and some arts businesses. Streetscape changes and the design of buildings or open areas in parcels 3 and 4 may have visual impacts upon this valuable historic resource and upon public access for its tenants. Please address these issues in the review. A lot of street trees, bulbouts and other street changes seem to be indicated; the study should address their potential to obscure views of these nationally known art deco terra cotta buildings. Perhaps this block should be treated differently to make best use of the distinctive architecture.

7. **Impacts on buildings across San Pablo from parcels 1 and 2:** Italianate Victorian buildings including the former Friedman's Appliances and adjoining building to its south are valuable historic buildings. How the proposed project relates to this historic streetscape may make a difference in whether San Pablo becomes a viable neighborhood street or remains a dividing thoroughfare. Again, review an alternative that retains extant buildings at the corner of parcel 1, and review the height and bulk and articulation of street facades of proposed new buildings on parcels 1 and 2.

8. **Giant Burger, former Kwik Way, parcel 9.** This example of "googie" architecture is a small and perhaps frivolous-looking building, but it represents a characteristic California style and enriches the area with its drive-in style. Sometimes it seems to be associated with the uptown project as a location for elements jettisoned from the proposed project area. Include a

variant, which retains it. It lends character and is a remnant of the pre-freeway era when Telegraph and San Pablo were the main arteries leading north.

9. **Potential demolition of contributors to potential uptown historic district, at 19th between Telegraph and Broadway, across from the Fox Theater and diagonally across from parcel 4.** Please show site plans without this demolition. This is not within the project area itself; but is across the 19th St. intersection from it. Demolition is likely to endanger the possibility of designating an uptown district of historic buildings and contributors, by interrupting the historic building area and rendering it discontinuous. (It would also remove at least seven extant businesses that contribute property tax and business tax and sales tax to the city.) We oppose promoting such a destructive plan.

10. **Impacts upon the long-established Broadway retail frontage.** Study the possibility of reopening the BART access through Sears, as this would help to maintain the connection with this former Capwell's building's main entryways on Broadway. Study how the added retail on Telegraph can be structured to avoid killing businesses on Broadway.

11. **Entertainment district.** Include a section on fostering the uptown entertainment district. Study the relationships between the project and the surrounding venues such as: Oakland Ice Center, Black Box Theater, Sweet's Ballroom, Fox and Paramount Theaters, local nightclubs present and future. Study variants to the project that will enhance this long-planned reawakened entertainment district. Investigate ways to foster connections between the venues and related service businesses. Discuss how to avoid conflicts of use such as have arisen in the south of Market area in San Francisco, and how the parking shortages might be addressed.

* * * *

We also have a general question—please explain what the EIR does and does not cover. Maps furnished have shown several different areas and parcels. We assume and request confirmation that for areas within the "Concept Plan" or "Project Location" maps referenced above, any project not specifically studied in this EIR will be further studied on a project-by-project basis as later phases are proposed. Several large buildings are indicated, some of which would displace existing buildings. These must be individually reviewed in later studies, unless fully studied under this EIR.

We appreciate the opportunity to comment and look forward to seeing an informative report.

Sincerely,

Naomi Schiff

Naomi Schiff,
Vice-President, Preservation Action
Oakland Heritage Alliance

CALIFORNIA, INC.
SAN FRANCISCO OFFICE

Community Meeting Announcement

You are invited to learn more about
the **Oakland Uptown Project**

Forest City Residential West invites you to attend a meeting to hear a presentation about the **Oakland Uptown Project** and participate in a design workshop. The Meeting will be held on:

Wednesday, March 12, 2003
6:30 – 9:00 p.m.
Preservation Park – Nile Hall
668- 13th Street
Oakland, CA
(Enter from Martin Luther King, Jr. Way- Nile Hall is on your right)

Project Location: Generally between 18th and 20th Streets and Telegraph and San Pablo Avenues (see map on reverse side).

Project Description: The proposed project consists of residential and retail space. It will include approximately 770 apartments, 270 condos, 1000 beds of student housing, and 30,000 s.f. of neighborhood serving retail. The development of the apartments, condos and retail space will proceed concurrently with the development of student housing and the streetscape improvements on Telegraph Avenue. Forest City Residential West will also be working with the City Staff to focus the efforts of the Façade Improvement Program on the businesses in the immediate vicinity of the Project.

Brownfield Grant: City Staff will give a report on the status of the Oakland Redevelopment Agency's Application to the U.S. EPA for an Assessment and Clean-Up Grant for the Uptown Project. The Agency's Proposal is available for review at: 250 Frank Ogawa Plaza, Suite 5313, Oakland, CA 94612. For information about the Grant contact: Jens Hillmer, City of Oakland Community and Economic Development Agency, phone (510) 238-3317, e-mail: jhhillmer@oaklandnet.com.

The City has initiated work to prepare an Environmental Impact Report on this Project. If you have questions about the environmental review process or project status, contact: Patricia McGowan, City of Oakland Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612, phone (510) 238-3063, fax (510) 238-6538, e-mail: pmcgowan@oaklandnet.com. Please reference case ER 03-0007 in your response.

For more information about this project, please contact Susan Smartt at Forest City Residential West by phone at (415)836-5980, e-mail: ssmartt@forestcity-sf.com.

SUBJECT: Comments on the Notice of Preparation for a Environmental Impact Report (EIR) for the Uptown Mixed-Use Project and Notice of Intent to use Assembly Bill 436 for this EIR in the City of Oakland (Case Number ER03-0007)

Dear Ms. McGowan:

Thank you for the opportunity to comment on the Notice of Preparation (NOP) for a Environmental Impact Report (EIR) for the Uptown Mixed-Use Project. The proposed project is located on a nine-block 15-acre site located in the Uptown area of downtown Oakland. Blocks 1 through 6 are bounded by 20th Street on the north, Telegraph Avenue on the east, 18th Street on the south, and San Pablo Avenue on the west. Blocks 7 and 8 are located on the north side of 20th Street, east and west of Telegraph Avenue. Block 9 is located on the southeastern corner of Telegraph Avenue and 22nd Street. The project will consist of 1,500 to 1,700 residential units, 40,000 to 50,000 square feet of commercial, retail, and service uses, and a 25,000 square foot park.

The ACCMA respectfully submits the following comments:

- The City of Oakland adopted Resolution No. 69475 on November 19, 1992 establishing guidelines for reviewing the impacts of local land use decisions consistent with the Alameda County Congestion Management Program (CMP). Based on our review of the NOP, the proposed project appears to generate at least 100 p.m. peak hour trips over existing conditions. If this is the case, the CMP Land Use Analysis Program requires the City to conduct a traffic analysis of the project using the Countywide Transportation Demand Model for Year 2005 conditions. Please note the following paragraph as it discusses the responsibility for modeling.

- The Countywide Model is currently updated to Projections 2000 for base years 2005 and 2025. The updated model with Projections 2002 and analysis years 2010 and 2025 will be available on April 9, 2003. It is recommended that this version of the model be used. The CMA Board amended the CMP on March 26th, 1998 so that local jurisdictions are now responsible for conducting the model runs themselves or through a consultant. The Countywide model is available to the local jurisdictions for this purpose. The City of Oakland and the ACCMA have signed a Countywide Model Agreement on March 22, 1999. The City would be required to submit a letter agreement to use the model for this project.

- Potential impacts of the project on the Metropolitan Transportation System (MTS) need to be addressed. (See 2001 CMP Figures E-2 and E-3 and Figure 2). The DEIR should address all potential impacts of the project on the MTS roadway and transit systems. These include I-880, I-980, SR 24, I-580, Broadway, Brush Street, Castro Street, Grand Avenue, Martin Luther King Jr. Way, San Pablo Avenue, and Telegraph Avenue as well as BART and AC Transit. Potential impacts of the project must be addressed for 2005 (or 2010 depending on which version of the model is used) and 2025 conditions. Please note that the ACCMA does not have a policy for determining a threshold of significance. Rather, it is expected that professional judgment will be applied to determine project level impacts.

- The CMA requests that there be a discussion on the proposed funding sources of the transportation mitigation measures identified in the environmental documentation. The CMP establishes a Capital Improvement Program (See 2001 CMP, Chapter 7) that assigns priorities for funding roadway and transit projects throughout Alameda County. The improvements called for in the DEIR should be consistent with the CMP CIP. Given the limited resources at the state and federal levels, it would be speculative to assume funding of an improvement unless it is consistent with the project funding priorities established in the Capital Improvement Program (CIP) of the CMP, the federal Transportation Improvement Program (TIP), or the adopted Regional Transportation Plan (RTP). Therefore, we are requesting that the environmental documentation include a financial program for all roadway and transit improvements.

- The adequacy of any project mitigation measures should be discussed. On February 25, 1993 the CMA Board adopted three criteria for evaluating the adequacy of DEIR project mitigation measures:

- Project mitigation measures must be adequate to sustain CMP service standards for roadways and transit;
- Project mitigation measures must be fully funded to be considered adequate;
- Project mitigation measures that rely on state or federal funds directed by or influenced by the CMA must be consistent with the project funding priorities established in the Capital Improvement Program (CIP) section of the CMP or the Regional Transportation Plan (RTP).

It would be helpful to indicate in the DEIR the adequacy of proposed mitigation measures relative to these criteria. In particular, the DEIR should detail when proposed roadway or transit route improvements are expected to be completed, how they will be funded, and what would be the effect on LOS if only the funded portions of these projects were assumed to be built prior to project completion.

- Potential impacts of the project on CMP transit levels of service must be analyzed. (See 2001 CMP, Chapter 4). Transit service standards are 15-30 minute headways for bus service and 3.75-15 minute headways for BART during peak hours. The DEIR should address the issue of transit funding as a mitigation measure in the context of the CMA's policies as discussed above.

- The DEIR should consider demand-related strategies that are designed to reduce the need for new roadway facilities over the long term and to make the most efficient use of existing facilities (see 2001 CMP, Chapter 5). The DEIR could consider the use of TDM measures, in conjunction with roadway and transit improvements, as a means of attaining acceptable levels of service. Whenever possible, mechanisms that encourage ridesharing, flextime, transit, bicycling, telecommuting and other means of reducing peak hour traffic trips should be considered. Street layout and design strategies would foster pedestrian and bicycle connections and transit-friendly site design should also be considered. The Site Design Guidelines Checklist may be useful during the review of the development proposal. A copy of the checklist is enclosed.

- The Alameda Countywide Bicycle Plan was approved by the ACCMA Board on June 28, 2001. The DEIR should consider opportunities to promote countywide bicycle routes identified in the Plan through the project development review process.

- For projects adjacent to state roadway facilities, the analysis should address noise impacts of the project. If the analysis finds an impact, then mitigation measures (i.e., soundwalls) should be incorporated as part of the conditions of approval of the proposed project. It should not be assumed that federal or state funding is available.

Thank you for the opportunity to comment on this Notice of Preparation. Please do not hesitate to contact me at 510/836-2560 ext. 13 if you require additional information.

Sincerely,

Beth Walukas
Senior Transportation Planner

Design Strategies Checklist
for the
Transportation Demand Management Element
of the
Alameda County CMP

The Transportation Demand Management Element included in the 1995 Congestion Management Program requires each jurisdiction to comply with the "Required Program". This requirement can be satisfied in three ways: 1) adoption of "Design Strategies for encouraging alternatives to auto use through local development review" prepared by ABAG and the Bay Area Quality Management District; 2) adoption of new design guidelines that meet the individual needs of the local jurisdictions and the intent of the goals of the TDM Element or 3) evidence that existing policies and programs meet the intent of the goals of the TDM Element.

For those jurisdictions that have chosen to satisfy this requirement by Option 2 or 3 the following checklist has been prepared. In order to insure consistency and equity throughout the County, this checklist identifies the components of a design strategy that should be included in a local program to meet the minimum CMP conformity requirements. The required components are highlighted in bold type and are shown at the beginning of each section. A jurisdiction must answer Yes to each of the required components to be considered consistent with the CMP. Each jurisdiction will be asked to annually certify that it is complying with the TDM Element. Local jurisdictions will not be asked to submit the back-up information to the CMA justifying its response; however it should be available at the request of the public or neighboring jurisdictions.

Questions regarding optional program components are also included. You are encouraged but not required to answer these questions. ACTAC and the TDM Task Force felt that it might be useful to include additional strategies that could be considered for implementation by each jurisdiction.

CHECKLIST

Bicycle Facilities

Goal: To develop and implement design strategies that foster the development of a countywide bicycle program that incorporates a wide range of bicycle facilities to reduce vehicle trips and promote bicycle use for commuting, shopping and school activities. (Note: examples of facilities are bike paths, lanes or racks.)

Note: Bold type face and ➔ indicate those components that must be included the "Required Program" in order to be found in compliance with the Congestion Management Program.

Local Responsibilities:

➔1a. In order to achieve the above goal, does your jurisdiction have design strategies or adopted policies that include the following:

➔1a.1 that provide a system of bicycle facilities that connect residential and/or non-residential development to other major activity centers?
Yes No

1a.2 bicycle facilities that provide access to transit?
Yes No

1a.3 that provide for construction of bicycle facilities needed to fill gaps, (i.e. gap closure), not provided through the development review process?
Yes No

1a.4 that consider bicycle safety such as safe crossing of busy arterials or along bike trails?
Yes No

1a.5 .that provide for bicycle storage and bicycle parking for (A) multi-family residential and/or (B) non-residential developments?
Yes No

➔1b. How does your jurisdiction implement these strategies? Please identify.
Zoning ordinance
Design Review
Standard Conditions of Approval
Capital Improvement Program
Specific Plan
Other

Pedestrian Facilities

Goal: To develop and implement design strategies that reduce vehicle trips and foster walking for commuting, shopping and school activities.

Local Responsibilities

➔2a. In order to achieve the above goal, does your jurisdiction have design strategies or adopted policies that incorporate the following:

➔2a.1 that provide reasonably direct, convenient, accessible and safe pedestrian connections to major activity centers, transit stops or hubs parks/open space and other pedestrian facilities?
Yes No

Note: Bold type face and ➔ indicate those components that must be included the "Required Program" in order to be found in compliance with the Congestion Management Program.

→2a.2 that provide for construction of pedestrian paths needed to fill gaps, (i.e. gap closure), not provided through the development process?

Yes No

2a.3 that include safety elements such as convenient crossing at arterials?

Yes No

2a.4 that provide for amenities such as lighting, street trees, trash receptacles that promote walking?

Yes No

2a.5 that encourage uses on the first floor that are pedestrian oriented, entrances that are conveniently accessible from the sidewalk or transit stops or other strategies that promote pedestrian activities in commercial areas?

Yes No

→2b. How does your jurisdiction implement these strategies? Please identify.

Zoning ordinance
Design Review, such as ADA Accessibility Design Standards
Standard Conditions of Approval
Capital Improvement Program
Specific Plan
Other

Transit

Goal: To develop and implement design strategies in cooperation with the appropriate transit agencies that reduce vehicle trips and foster the use of transit for commuting, shopping and school activities.

Local Responsibilities

3a. In order to achieve the above goal, does your jurisdiction have design strategies or adopted policies that include the following:

→3a.1 provide for the location of transit stops that minimize access time, facilitate intermodal transfers, and promote reasonably direct, accessible, convenient and safe connections to residential uses and major activity centers?

Yes No

Note: Bold type face and → indicate those components that must be included the "Required Program" in order to be found in compliance with the Congestion Management Program.

➔3a.2 provide for transit stops that have shelters or benches, trash receptacles, street trees or other street furniture that promote transit use?

Yes No

➔3a.3 that include a process for including transit operators in development review?

Yes No

3a.4 provide for directional signage for transit stations and/or stops?

Yes No

3a.5 that include specifications for pavement width, bus pads or pavement structure, length of bus stops, and turning radii that accommodates bus transit?

Yes No

➔3.b How does your jurisdiction implement these strategies? Please identify.
Zoning ordinance
Design Review
Standard Conditions of Approval
Capital Improvement Program
Specific Plan
Other

Carpools and Vanpools

Goal: To develop and implement design strategies that reduce the overall number of vehicle trips and foster carpool and vanpool use.

Local Responsibilities:

4a. In order to achieve the above goal, does your jurisdiction have design strategies or adopted policies that include the following:

4a.1 For publicly owned parking garages or lots, are there preferential parking spaces and/or charges for carpools or vanpools?

Yes No

4a.2 that provide for convenient or preferential parking for carpools and vanpools in non-residential developments?

Yes No

Note: Bold type face and ➔ indicate those components that must be included the "Required Program" in order to be found in compliance with the Congestion Management Program.

4.b How does your jurisdiction implement these strategies? Please identify.
Zoning ordinance
Design Review
Standard Conditions of Approval
Capital Improvement Program
Specific Plan
Other

Park and Ride

Goal: To develop design strategies that reduce the overall number of vehicle trips and provide park and ride lots at strategic locations.

Local Responsibilities:
5a. In order to achieve the above goal, does your jurisdiction have design strategies or adopted policies that include the following:

5a.1 promote park and ride lots that are located near freeways or major transit hubs?

Yes No

5a.2 a process that provides input to Caltrans to insure HOV by-pass at metered freeway ramps?

Yes No

5b. How does your jurisdiction implement these strategies? Please identify.
Zoning ordinance
Design Review
Standard Conditions of Approval
Capital Improvement Program
Specific Plan
Other

Note: Bold type face and ➔ indicate those components that must be included the "Required Program" in order to be found in compliance with the Congestion Management Program.

Re: EIR Scoping Comments on Uptown Mixed-Use Project

Dear Ms. McGown:

The proposed Uptown Mixed-Use Project has the potential to revitalize downtown Oakland and benefit the environment by providing new housing in a manner that limits sprawl and fosters environmentally beneficial modes of transportation such as walking, bicycling, and riding public transit. It also has the potential to be a tragically wasted opportunity if it fails to take full advantage of the site's proximity to a major employment center and the highest concentration of public transit in the East Bay.

Because the Uptown Project is in one of the best locations in the entire Bay Area for creating a significant amount of new housing close to major employment centers and to a wealth of public transit, the stated purposes of the project should include:

- maximizing the amount of housing created for all income levels,
- maximizing the percentage of trips taken by modes other than the automobile, and
- minimizing the dependence of residents, workers, and shoppers in the area on the automobile.

To minimize the potential adverse effects of the project on energy consumption, air pollution, and greenhouse gas emissions and to maximize ridership on public transit, the EIR should include consideration of an aggressive strategy to minimize automobile ownership and use. Examples of components of such a strategy that the EIR should evaluate include:

- separate the cost of parking from the cost of housing and of leasing commercial space;
- eliminate any minimum parking requirements, especially for types of housing that typically have below average automobile ownership rates, including affordable housing, student housing, and rental housing;
- impose a transit impact fee to help upgrade transit facilities and services in the vicinity of the project;
- car sharing programs;

- provide comprehensive and up-to-date transit information to all residents and workers;
- require shared parking by different uses;
- design building to encourage walking and to create an attractive pedestrian environment; and
- provide attractive bus shelters and prominent, attractive pedestrian routes to City Center and to BART stations.

When evaluating the parking that is proposed to be included in the project, evaluate how the provision of parking affects the bulk of buildings, the pedestrian experience, and the amount of housing, retail or office space that can be provided. Also evaluate how parking supply affects individuals' transportation decisions, including whether abundant parking would tend to encourage residents to work and shop at locations other than downtown Oakland.

The EIR should not characterize any potential parking "shortfall" as in itself an adverse effect on the environment. Although parking supply can have an indirect effect on the environment by affecting people's transportation decisions, parking supply in and of itself is a social effect rather than a direct effect on the physical environment. In this respect, the EIR should take the approach that San Francisco takes. Enclosed is an excerpt from a recent mitigated negative declaration prepared for a large residential project in the Rincon Hill neighborhood close to downtown San Francisco. The "neg dec" points out that parking supply is not a direct effect on the environment and describes how a parking "shortage" can have beneficial effects by reducing the amount of driving that occurs. The Uptown area, because of its proximity to employment and public transit, shares many of the attributes of the Rincon Hill project, so it would be appropriate for Oakland to analyze parking impacts in a similar manner.

Thank you for your consideration of these comments.

Sincerely,

Christopher Pederson

Enclosure

Enclosure to letter from Christopher Pederson.

EXHIBIT A
APPEAL: Case No. 2002.0446E: 40 – 50 Lansing Street
Preliminary Mitigated Negative Declaration published on October 19, 2002

PLANNING DEPARTMENT RESPONSE TO CONCERNS

INTRODUCTION

An environmental evaluation application (2002.0446E) was filed on behalf of Lambert Development on April 25, 2002, for a proposal at 40-50 Lansing Street on Assessor's Block 3749, Lot 011. The proposed project involves the construction of a 155,000 gsf, 8-story residential building containing 81 dwelling units with 81 off-street parking spaces on 2 below-grade garage levels and the demolition of the existing 56,250 gsf, 3-story light-industrial building. The site is located at 40-50 Lansing Street, in the Rincon Hill area. The 20,205 sf site fronts on Guy Place and Lansing Street, between First and Second Streets. Two on-street loading spaces are planned; one on Guy Place and one on Lansing Street. The site is within a RC-4 (Residential Commercial Combined, High Density) zoning district, the Rincon Hill Special Use Subdistrict and an 84-X height and bulk district. The project would require variances from the following provisions of the Planning Code: freight loading; dwelling unit exposure; and from the Rincon Hill Special Use District, a Conditional Use authorization for 1) construction of a structure in an R District over 40 feet tall and 2) allowing lot coverage greater than 80 percent on a sloping lot.

A Preliminary Mitigated Negative Declaration (PMND) analyzing the potential environmental effects of the proposed project was published on October 19, 2002. An appeal of the PMND was filed on November 08, 2002, by Clifford Roth, Paula Roth, Patrick M. Malone, Kenneth Morrison, and Denyse Gross. The concerns listed below are summarized or cited from the appeal letter, a copy of which is included within this appeal packet.

CONCERNS RAISED AND PLANNING DEPARTMENT RESPONSES

Concerns raised in the appeal letter are cited below, followed by the Department's responses. Where possible, concerns or similar topics have been combined.

Concern #1 – "Construction Traffic"

"The Construction itself would have a significant effect on the environment and will result in consistent and regular blocking of the one street that provides the only access to the neighborhood. For at least nine of the 14-months, in which the project will optimistically be completed, this small alley-like street will be subject to heavy truck traffic, which will be queued up and down the alley-like Guy and Lansing Streets. Unlike the assertion in the PNMD, traffic will not be able to "maneuver around queued trucks." There is no room to do so. Further, it is likely that both sides of the "U" will be simultaneously blocked with trucks and construction equipment for a majority of the duration of the project. This will result in a significant effect on neighbors and others, due not only to the impossibility of meaningful ingress and egress to their properties but because of extremely unsafe conditions that will be caused by the construction project.

This problem has already been encountered in conjunction with the construction across the street from the Guy/Lansing neighborhood on First Street and related construction on other nearby streets. Construction crews have in the recent past closed or blocked Guy and Lansing Streets completely and sent traffic dangerously careening around the tight turns of the U-shaped streets in the wrong direction. A project of this size, right in the middle of the "U," can only exacerbate the danger of this situation."

(see next page)

The PMND does mention the Sailor's Union Hall in the context of the varied architectural style of the vicinity on p. 13 of the PMND. The PMND also identifies that the proposed project would be taller than the adjacent buildings in the project area, however, it would not have a substantial, demonstrable negative aesthetic effect.

Concern #5 – Parking

"The narrow U-shaped street is already significantly impacted by traffic and illegal parking. The PNMD does not adequately address these problems. Although numerous attempts by residents have been made, the police powers in this city refuse to adequately enforce illegal parking in the Guy-Lansing neighborhood, by towing illegally parked vehicles. The effect of having so many additional residences and the incumbent significant competition for and reduction of parking spaces will worsen the illegal parking problems."

"Moreover, the incredible and unacceptable inconvenience for residents of the neighborhood of both increased traffic and illegal parking is significant."

Response #5

As discussed in the PMND, the project will be providing 83 off-street parking spaces as a part of the project. The projected unmet demand for parking would be about 26 spaces.

Under California Public Resources Code Section 21060.5, "environment" means "the physical conditions which exist within the area which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, noise, and objects of historic or aesthetic significance." Parking supply is not considered to be a part of the permanent physical environment in San Francisco. Parking conditions are not a static condition, as parking supply/demand varies from day to night, from day to day, month to month, etc. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel. Therefore, parking deficits are considered to be social effects, rather than impacts on the physical environment as defined by CEQA.

Parking deficits may be associated with secondary physical environmental impacts, such as increased traffic congestion at intersections, air quality, or noise effects caused by congestion. However, as noted above, in the experience of San Francisco transportation planners, the absence of a ready supply of parking spaces combined with available alternatives to auto travel (e.g., transit service, taxis, bicycles or travel by foot) and relatively dense patterns of urban development, may induce drivers to seek and find alternative parking facilities, shift to other modes of travel, or change their overall travel habits. Any such resulting shifts to transit service, in particular, would also be in keeping with the City's "Transit First" policy.

Additionally, regarding potential secondary effects, cars circling and looking for a parking space in areas of limited parking supply is typically a temporary condition, often offset by a reduction in vehicle trips due to others who are aware of constrained parking conditions in a given area. Hence, any secondary environmental impacts which may result from a shortfall in parking in the vicinity of the proposed project would likely be minor.

Thus, a parking shortage is not considered to be a permanent condition and is also not considered to be a physical environmental impact even though it is understood to be an inconvenience to drivers. The creation of, or an increase in, parking demand resulting from a proposed project that cannot be met by existing or proposed parking facilities would not itself be considered a significant environmental effect under CEQA. In the absence of such physical environmental impacts, CEQA does not require environmental documents to propose mitigation measures solely because a project is expected to generate parking shortfalls.

Recognizing the potential traffic impedance of illegally double-parked vehicles on Guy Place or Lansing Street, the Improvement Measure below has been incorporated in the amended PMND (page 36):

IM-2. Double-Parking

In order to further avoid illegal double-parking in front of the project, the project sponsor shall notify the tenants and owners in the building that double-parking on Guy Place or Lansing Street, for deliveries to any project tenant, is prohibited. It is the responsibility of the Department of Parking and Traffic (DPT) to enforce parking violations. The project sponsor is not responsible for parking violations. Restriction from double-parking would be added as a written addendum to the tenant leases. The project sponsor will be required to verify that this restriction is communicated to all potential delivery or suppliers, with additional instructions for these suppliers to use the Guy Place on-street loading space in the standard business communications of tenants and owners. The project sponsor shall post a clearly marked sign instructing patrons that double-parking is expressly forbidden on Guy Place or Lansing Street.

Concern #6 – Life Safety

"The most significant effect of illegal parking is the impossibility for large or small emergency vehicles to get full access to the Guy-Lansing neighborhood, with extremely dangerous and potentially deadly consequences. Thus, the proposed project could significantly interfere with emergency response plans and produces a significant fire hazard. It is incumbent on the Department to fully examine these significant effects of the proposed development."

Response #6

As stated on page 28 of the PMND, "San Francisco ensures fire safety primarily through provisions of the Building Code and the Fire Code. Existing and new buildings are required to meet standards contained in these codes. In addition, the final building plans for any new residential project greater than two units are reviewed by the San Francisco Fire Department (as well as the Department of Building Inspection), in order to ensure conformance with these provisions. The proposed project would conform to these standards, which (depending on the building type) may also include development of an emergency procedure manual and an exit drill plan. In this way, potential fire hazards (including those associated with hydrant water pressure and emergency access) would be mitigated during the permit review process."

Concern #7 – Loading

"Finally, the estimate of only four extra deliveries per day by private delivery companies is laughable. In appellants' building on only 33 units, there are many more deliveries than that."

Response #7

Average and peak hour (10:00 a.m. to 1:00 p.m.) loading demand were calculated using calculations set forth in the *Interim Transportation Impact Analysis Guidelines for Environmental Review* (January 2000). The Daily Truck Trip Generation of *Appendix H* of the *Guidelines* gives four service trips per day.

Re: Scope of EIR for Uptown Mixed Use Project (ER 03-0007)

Dear Ms. McGowan:

The following comments are primarily directed to the project as presented at the public meeting on March 12 at which the "Concept Plan" was presented. It was emphatically stated, more than once, that the project was limited to parcels #1 through #7. However, there could be some confusion because parcels #8 and #9 are also delineated on the site plan attached to the NOP.

This project can light the fire for a 24-hour downtown. But only if the plan for the site recognizes that the area along Telegraph is designated an entertainment district. It needs to be so configured that residents have quiet enjoyment of their homes even when Telegraph lights up. With great resources like the Fox and the Floral Depot (a future blues club?) the site plan must encourage and enhance the district's development as a regional entertainment destination.

An alternative needs to be studied that recognizes this housing project is to be built in an entertainment district. AB 436 does not preclude the study of alternatives and, in this case, to gain public approval, some rather simple changes to the plan need to be evaluated. One of the most common conflicts the planning commission deals with occurs when restaurants or bars in residential neighborhoods want to add live entertainment. This district is where they should be welcomed. The following alternative does not materially change the number of housing units or amount of open space but relocates it so as to avoid such conflicts.

To avoid a thousand words, I have shown my proposed changes on an attached copy of the UPTOWN PROGRAM AREA CONCEPT PLAN.

Ⓐ Public open space. Think Zocalo as in Oaxaca. Okay, there is not a cathedral at one end, only a Hindu Temple, with Islamic overtones, the FOX. This would be a great outdoor room because besides the FOX to the south, the Floral Depot is to the east, attractive new student housing and Navlet's to the north, and on the west, there is a wide pedestrian path in front of cafes, restaurants, record and book stores and a market hall in the new retail/loft building. This space would allow people to sit and have a cup of coffee with the vista of extraordinary buildings like the Floral Depot and the Fox. It is a festival space where musicians could perform and students hang out. People parking in the garage to the north would walk through it to see performances at the Fox. And those huge crowds that now go to the Paramount would have someplace to go before and after the show.

A competition for the park's design would create wide public interest in the district.

JOYCE ROY 258 MATHER STREET, OAKLAND, CALIFORNIA 94611
VOX: (510) 655-7508 FAX: (510) 594-0963 EMAIL: joyceroy@earthlink.net

Ⓑ These buildings stand between the Zocalo/Entertainment District and the residential area. They create a buffer between the housing and livelier activities along Telegraph. They should be as high, or better still, higher than the residential buildings.

The ground floor would have the kind of businesses that support nightlife as well as neighborhood needs. There could be family housing on the west side of the building but on the Zocalo side, the floors above the retail should be flexible loft spaces to accommodate uses such as dance studios, health clubs professional offices or even residents who enjoy the excitement of lively street life at night.

Development of this whole uptown area would be greatly accelerated if these two blocks with the park and these buildings would be built first. Presently the blight of these two blocks discourages investment in properties like the city owned Fox.

Ⓒ This housing replaces the park that was proposed for this site. The rationale for this location of the park was to create a park both for the resident's use and the general public. In my opinion it will serve neither. It would not be a pleasant sunny space in the day since it is located on the north side surrounded on east, south & west by 6/7 story buildings. It will not feel safe at night because there is little foot traffic on 20th Street. Which is also why it does not make sense as a "public" space. Where would the "public" come from? It has the feel of a gated park without a gate.

As the housing appears to be designed around interior courts, there will be private outdoor space for the residents. What is needed is a real public space that will be used by the public as well as the residents, day and night. A space that gives this entertainment district its sense of place just as Frank Ogawa Plaza does for civic life and City Center does for offices, hence the Zocalo proposal.

Ⓓ Interesting cities have a diversity of old and new— history is woven into their fabric. Unfortunately, the project area itself has few historic structures. Their rarity means it is of even greater importance to preserve them. Incorporating historic properties into a project is one way to keep a project from looking like a project.

Navlet's would make a great small theatre.

The Queen Anne storefronts at San Pablo & 20th Street would, with some restoration, be a distinctive restaurant or/and the corner pub.

The former Kwik Way, now Giant Burger, in parcel #9 is an excellent example of the 50/60s style known as Googie architecture. It would be a great contributor to the entertainment district and appreciated by the nearby students.

Thanks for the opportunity to comment. Hopefully these suggestions will contribute to the success of the Uptown Development.

Sincerely,

Joyce Roy

Patricia McGowan, Planner IV
City of Oakland Planning Division
250 Frank H. Ogawa Plaza, Suite 3330
Oakland, CA 94612

Dear Ms. McGowan:

Re: Notice of Preparation/Environmental Impact Report - Uptown Mixed-Use Project

East Bay Municipal Utility District (EBMUD) appreciates this opportunity to comment on the Notice of Preparation of an Environmental Impact Report (EIR) for the Uptown Mixed-Use Project. EBMUD acknowledges the Notice of Intent to use California Public Resources Code Section 21159.25 (Assembly Bill AB 436) for this Focused EIR in Oakland. EBMUD has the following comments regarding water service, water conservation, water recycling and wastewater.

WATER SERVICE

Pursuant to Sections 10910-10915 of the California Water Code, the proposed project meets the threshold requirements for an assessment of water supply because the entire scope of this mixed-use project would demand an amount of water greater than the amount of water required by a 500 dwelling-unit project. The City of Oakland (City) should contact the District and request a Water Supply Assessment (WSA). Please be aware that the WSA can take up to 90 days to complete from the day on which the request is received.

The proposed project is located within EBMUD's Central Pressure Zone (G0A) that provides water service to customers within an elevation range of 0 to 100 feet. EBMUD owns and operates distribution pipelines in all of the streets within the project area (see enclosed drawing). These pipelines are necessary to provide continuous service to EBMUD customers in the area. If modifications to the streets occur that require pipeline relocation, the relocation costs would be at the project sponsor's expense. Main extensions and/or offsite improvements, also at the project sponsor's expense, may be required depending on metering requirements by EBMUD and fire flow requirements set by the local fire department. When the development plans are finalized, the project sponsor should contact the EBMUD's New Business Office and request a water service estimate to determine costs, conditions and options for providing water service to the proposed project. Engineering and installation of new and relocated mains often require substantial lead time, which should be provided for in the project sponsor's development schedule.

375 ELEVENTH STREET . OAKLAND . CA 94607-4240 . (510) 835-3000

EBMUD will not install pipeline in contaminated soil that must be handled as a hazardous waste, or that may be hazardous to the health and safety of construction or maintenance personnel wearing Level D personal protective equipment. EBMUD will require a legally sufficient, complete and specific written remedial plan establishing the methodology, planning and design of all necessary systems for the removal, treatment, and disposal of all identified soil and/or water contaminants. EBMUD will not design the installation of pipelines until such time as remediation plans are received and reviewed and will not install pipelines until remediation has been carried out.

WATER CONSERVATION

Due to EBMUD's limited water supply, all customers should plan for shortages in time of drought. The Uptown Mixed-Use Project presents an opportunity to incorporate many water conservation measures to help mitigate the impacts of additional water demands on EBMUD's finite water supply. EBMUD requests that water conservation measures for both internal and external use be incorporated in the design and construction of the proposed project. EBMUD staff would appreciate the opportunity to meet with the City and Port of Oakland to review water conservation programs and best management practices applicable to the proposed project.

The EIR should provide a detailed description of practices consistent with the City water use efficiency ordinances, Oakland Sustainability Program, State law, and EBMUD service regulations. The proposed project must conform with the Oakland Water Efficient Landscape Requirements, Article 10, Chapter 7 of the Municipal Code, and if not enforced by the City, the project would fall under the jurisdiction of Assembly Bill 325 Statewide Model Water Efficient Landscape Ordinance (Division 2, Title 23, California Code of Regulations, Chapter 2.7, Sections 490-495).

WASTEWATER

EBMUD's Main Wastewater Treatment Plant is anticipated to have adequate dry weather capacity to treat the proposed wastewater flow from this project, provided this wastewater meets the standards of EBMUD's Source Control Division. However, the City of Oakland's Infiltration/Inflow (I/I) Correction Program set a maximum allowable peak wastewater flow from each subbasin within the City and EBMUD agreed to design and construct wet weather conveyance and treatment facilities to accommodate these flows. EBMUD prohibits discharge of wastewater flows above the allocated peak flow for a subbasin because conveyance and treatment capacity for wet weather flows may be adversely impacted by flows above this agreed limit. The project sponsor for this project needs to confirm with the City of Oakland Public Works Department that there is available capacity within the subbasin flow allocation and that it has not been allocated to other developments. The projected peak wet weather wastewater flows from this project need to be determined to assess the available capacity within the subbasin and confirmation included in the EIR. Suggested language to include in the EIR is as follows: "The

City of Oakland Public Works Department has confirmed that there is available wastewater capacity within Subbasin *(insert subbasin number here)* for this project."

In general, the project should address the replacement or rehabilitation of the existing sanitary sewer collection system to prevent an increase in I/I. Please include a provision to control or reduce the amount of I/I in the environmental documentation for this project. The main concern is the increase in total wet weather flows, which could have an adverse impact if the flows are greater than the maximum allowable flows from this subbasin.

WATER RECYCLING

EBMUD's Policy 73 requires that customers use non-potable water for non-domestic purposes when it is of adequate quality and quantity, available at reasonable cost, not detrimental to public health and not injurious to plant life, fish and wildlife to offset demand on EBMUD's limited potable water supply. In January 2002, the City of Oakland adopted a dual plumbing ordinance, requiring new developments within the City to use recycled water provided by EBMUD and install dual plumbing systems for appropriate recycled water uses if recycled water will be available. The Uptown Mixed-Use Project is located within the service area boundary of EBMUD's East Bayshore Recycled Water Project. EBMUD anticipates recycled water delivery to the project area within the next ten years and recommends that the project sponsor install dual plumbing systems for use of recycled water at the public park and for other landscape irrigation purposes throughout the project area.

If you have any questions, please contact Marie Valmores, Senior Civil Engineer, Water Service Planning at (510) 287-1084.

Sincerely,

WILLIAM R. KIRKPATRICK
Manager of Water Distribution Planning

Notes:
/a/ 'X' in first column indicates updated assumptions compared to original 11/21/00 Cumulative Scenario. 'XX' indicates updated assumptions for Uptown Project EIR, May 2003.
/b/ Codes indicate change made for CMA/ABAG P2002 inputs, since 12/02 Scenario for West Oakland Redevelopment Project EIR. C = change in number of units and/or number of households. N = new project added to list. T = change in time period assumed for development and occupancy.
/c/ Households equal units multiplied by an assumed vacancy factor.
/d/ Status as of the end of 2002: 1 = completed; 2 = under construction; 3 = approved; 4 = affordable housing project in predevelopment; 5 = other projects in predevelopment; 6 = in planning or part of existing plan; 7 = other housing opportunity site.
/e/ Housing Opportunity Sites are those identified in Oakland's Draft Housing Element (September 2002). The numbers (e.g., DT-11) are those used in Housing Element tables.
/f/ YWCA housing for CCAC students, Perkins Residential Care housing for people with Alzheimer's, and UC Berkeley student housing are treated as group quarters in the growth scenario.
/g/ The total units completed during 2000 were 293 for Acorn Parcels 1, 2, and 3, and 71 for Bayporte Village, replacing 480 and 196 original units, respectively, that were removed by 2000.
/h/ Includes additional housing units and households in the downtown and rest of Oakland Central (OC) planning district as well as along the channel in TAZ 537 (SA).

BACKGROUND FOR ESTIMATES OF POPULATION AND EMPLOYMENT FOR THE UPTOWN PROJECT

Estimates of population and employment for the proposed Uptown Project were prepared by Hausrath Economics Group (HEG), based on the project description provided by the project developer. This paper presents the estimates of population and employment and provides background on the approach and assumptions upon which they are based.

PROJECT POPULATION AND EMPLOYMENT ESTIMATES

The population and employment estimates for the proposed Uptown Project are summarized in Table 1. The estimates reflect a long-term, stabilized situation after the project is built and occupied. The estimates assume the mix of housing types proposed for development, as well as the assumption that 25 percent of the apartment units would be affordable housing. For the cumulative transportation analysis, the total project is assumed to be built and occupied by 2010 (the interim analysis year).

TABLE 1
POPULATION AND EMPLOYMENT ESTIMATES
FOR PROPOSED UPTOWN PROJECT

Type	Units	Households/ Occup. Units	Total Residents	Employed Residents	Sq. Ft. Space	Estimated Employment
Apartments	1,000	965	1,737	1,249		
Condominiums	270	260	481	355		
Student / Faculty Housing						
Student Beds	1,000	1,000	1,000	333		
Faculty Units	50	50	100	65		
TOTAL POPULATION			**3,318**	**2,002**		
Retail / Commercial					43,000	119
Residential Support					-	63
TOTAL EMPLOYMENT						**182**

PROJECT DESCRIPTION

The proposed project description assumed for estimating population and employment is shown in Table 2. The table identifies traffic analysis zones (TAZs) so that population and employment can be summarized for TAZs as needed for the transportation analysis. (The project occurs in three TAZs used in the Alameda County Congestion Management Agency (CMA) travel demand model.)

TABLE 2
PROPOSED UPTOWN PROJECT DESCRIPTION

TAZ /a/	Block Bldg /b/	Phase	Stories	Units Number	Units Type	Retail/Comm'l Square Feet
70	1	1	5	190	Apts.	-
70	2	1	5	190	Apts.	-
70	6	1	5	145	Apts.	-
70	3	2	12	250	Apts.	7,500
70	4	2	5	225	Apts.	14,500
	Subtotal			1,000	Apts.	22,000
70	5	3	19	270	Condos	-

BACKGROUND FOR POPULATION ESTIMATES

Data and information considered in developing the population estimates include both those specific to the local area and to the types of housing to be developed, and those reflecting larger citywide and regional demographic patterns and trends. The estimating process progressed from types of housing units to households, households to population, and population to employed population.[1] The background that follows is presented in that same sequence.

---

[1] Employed population is required for the transportation analysis as input to the CMA travel model.

Housing Types

The following identify the mix of unit types identified for the project by the project developer.

- Apartments

30%	Studios	560 sq. ft.
30%	1-bdrm./1-bath	750 sq. ft.
35%	2-bdrm./2-bath	1,130 sq. ft.
5%	3-bdrm./3-bath	1,300 sq. ft.

There could be some townhomes or live/work units developed; these are assumed to fit within the square footages above.

The apartments are proposed to include the following mix of housing affordability:

20%	affordable to very-low-income households earning up to 50% of area median income (AMI)
5%	affordable to moderate-income households earning up to 120% of area median income (AMI)
75%	market-rate units

The same, overall mix of types and sizes of apartment units is assumed to apply for the units in each of the affordability categories.

- Condominiums

The unit mix for the condominium development is still uncertain. For the purposes of estimating population, the following mix is assumed:

50%	1-bdrm./1-bath	750 sq. ft.
50%	2-bdrm./2-bath	1,130 sq. ft.

All condominium units are assumed to be offered at market-rate prices.

- Student/Faculty Housing

1,000 beds of student housing. Higher-rise development is anticipated.

50 units for faculty and/or graduate students. Two-bedroom units are assumed, and are likely to be developed as lower-rise, townhomes.

Application of the above assumptions for housing types provides the estimates of residential development by type and size of housing that are shown in Table 3 (see columns on left of table).

Households/Occupied Units

The number of households to occupy the new apartment and condominium units reflects the number of occupied housing units, assuming that there will be some vacancy of units over time. Average, long-term housing vacancy of four percent is assumed for the market-rate apartments and the condominiums, and a vacancy of two percent is assumed for the affordable apartment units. These assumptions are consistent with those used for other new housing in Oakland in the cumulative growth scenario. For comparison, the 2000 Census shows an overall average vacancy for housing in Oakland of 4.3 percent. As the student/faculty housing is assumed to provide badly-needed housing for a growing student body and faculty, no vacancy is assumed.

The estimates of households and occupied units for the project are shown in Table 3. The vacancy assumptions apply to the subtotals and totals shown. They do not apply precisely for every unit type/size category because of the need to produce household estimates in rounded, whole numbers.

Population

Population to reside in the apartment and condominium units was estimated using average household sizes (ratios of persons per household) assumed reasonable for the project based on consideration of the characteristics of the new housing to be built and its appeal to housing consumers in the marketplace.

Both the project's downtown location and the types of higher-density housing to be built are anticipated to attract households with a high proportion of working adults. The project's location offers a downtown setting with proximity to workplaces in downtown Oakland and good transit/transportation accessibility to places of work throughout the region, particularly those in downtown San Francisco and elsewhere in Oakland, Berkeley, and the Inner East Bay. The higher-density, urban product types are anticipated to appeal particularly to adult households including couples, single people, and households of unrelated individuals.

The ratios of persons per household were estimated drawing from a number of sources and relevant project examples and experience, including census data, data and projections from the Association of Bay Area Governments (ABAG), in-house data and information for comparable types of new housing developments, and focus group research done for new downtown housing as part of other efforts. Consideration was also given to the possibility that some townhomes or live/work units may be built, and could have slightly more persons per household than apartment and condominium units.

Except for the studio units, persons per household ratios for the affordable, apartment units assume that the number of persons equals bedrooms plus one, for the housing to be affordable to very-low-income households, as is often the approach used to estimate population in affordable

NOTE: Population estimates reflect the possibility that some townhomes or live/work units may be built, within the square footages identified above. Population estimates do not assume units devoted to senior housing.

/a/ Forest City Residential West, May 23, 2003.
/b/ Assumes long-term, average vacancy of approximately four percent for market rate housing and two percent for affordable housing consistent with citywide data. No vacancy is assumed for the student / faculty housing.
/c/ Estimates by Hausrath Economics Group considering Census data, in-house data and information for new housing developments, and data and projections from Association of Bay Area Governments (ABAG) *Projections 2002*. Persons per household for affordable housing assume number of persons equals bedrooms plus one for very low income households, as applicable.

Source: Hausrath Economics Group

housing. Average household sizes for units affordable to moderate-income households were assumed to be smaller, on average, than household sizes for units affordable to very-low-income households, but larger than household sizes for market-rate units of comparable square footages. Population for the student housing is based on the number of beds. Population for the faculty/graduate student housing is assumed to include two persons per unit.

The estimated ratios of persons per household assumed for each type and size of housing are shown in Table 3. Overall, household sizes for the project are estimated to average 1.8 persons per household for the apartment units and 1.85 persons per household for the condominiums.

Employed Residents

The number of employed residents was estimated for the project, considering the share of residents likely to be employed. Several factors were considered, including the characteristics of the new housing and relevant demographic factors and trends.

First, the high proportion of working adults expected to reside in the project indicates that a high percentage of residents would be employed. Second, demographic trends in evidence at the national, state, and regional levels show the aging of the population over time, largely reflecting the aging of the large, baby-boom generation. In the Bay Area, the population of working-age adults is projected to increase in the future as is the population of older adults. Associated with the aging of the population, people are projected to work longer. The high cost of living in the Bay Area, expected changes in the Social Security system, and a healthy regional economy over the longer term will encourage workers to postpone retirement. The regional projections show increases in labor force participation rates in the future, and increases in the region's labor force. Associated with the aging of the population and with increasing labor force participation, a larger percentage of the population is projected to be employed in the future.

The factors considered reasonable for estimating employed residents for the project are shown in Table 3. The shares of employed residents were estimated based on the considerations above, drawing from a number of sources including Census data, ABAG projections, and relevant examples and experience from other projects and other HEG analyses. The average, overall shares of project population that are assumed to be employed are estimated to approximate 72 percent for the apartment units and 74 percent for the condominiums. The percentages are estimated to vary by size of unit as shown.[2] The percentage of the student population assumed to be employed is one-third, based on 2000 Census data for Census Tracts in the vicinity of the U.C. Berkeley campus that include large shares of student population. The percentage for the faculty/graduate student housing is estimated at 65 percent.

---

[2] In general, the smaller the unit, the higher the percentage of employed residents, as the person or persons employed and earning income will represent a higher percentage of the people residing in the unit. The ratios used allow for some households with no workers (such as households with retired persons) although only few of such households are anticipated in the project, and no units are assumed to be devoted specifically to senior housing.

BACKGROUND FOR EMPLOYMENT ESTIMATES

Employment was estimated for the project based on employment density assumptions for the types of space to be built and the types of uses anticipated to occupy the space. The employment density assumptions are consistent with those used for the cumulative growth scenario for Oakland.

Employment of 94 jobs was estimated for the 33,000 square feet of ground-floor retail/commercial space proposed for the project, assuming an average density of 350 square feet per employee, as shown in Table 4. That average employment density reflects a mix of smaller-scale eating and drinking and neighborhood retail and service uses. In addition, 25 jobs are assumed for the relocated Sears Auto Center that is part of the project.

There also will be some on-site employment associated with the management and maintenance of the new housing. Based on the developer's experience with comparable types of projects and on estimates for the student housing, 33 residential-support jobs are estimated to be associated with the apartments and condominiums and 30 jobs with the student/faculty housing.

Overall, on-site employment in the project is estimated at 182 jobs, as shown in Table 4.

TABLE 4
EMPLOYMENT ESTIMATES FOR PROPOSED UPTOWN PROJECT

TAZ	Block/Bldg	Use	Space	Employment

NET CHANGES IN POPULATION AND EMPLOYMENT

Net changes in population and employment as a result of development of the Uptown Project were calculated by subtracting the estimates of existing population and employment in the project area from the estimates for the completed Uptown Project.

Existing Uses

Estimates of population and employment for existing uses in the project area are summarized in Table 5.[3] The population estimates for residential uses are based on 2000 Census block data and Alameda County Assessor's records. The situation in 2003 could be a little different from that in 2000, although the data still appear reasonable. Employment in the project area was estimated based on land and building space information from the City of Oakland and Alameda County Assessor's records, field work in the area, and estimated employment densities. Employment estimates for Census Tracts and traffic zones in the area from ABAG and Oakland's cumulative land use database, provided totals for the larger Uptown area of downtown that were useful in estimating and evaluating employment for the project area.

Net Changes

Net changes in population and employment as a result of development of the Uptown Project are shown in Table 6. Population in the project area would increase by 3,266 residents as a result of the large amount of new housing to be built in the Uptown Project. Employment in the project area would be lower by 66 jobs under the project compared to employment currently estimated for the project area.

Comments on Treatment of Student Housing

Household and population estimates for the Uptown Project count the 1,000 beds of student housing as group quarters, similar to a student dormitory. The student housing is shown separately in Table 6 as is the student population; they are not included in the counts of housing units, households, or household population. Total population for the project includes both the student population and the household population in the apartments, condominiums, and faculty housing in the project.

To distinguish the student population from the population in the apartment and condominium units, citywide totals for Oakland, as presented in summary tables, include the students as group quarters population, similar to the treatment in Table 6. However, the only way to include the student population in the CMA travel model for transportation analysis purposes, is to combine the students with household population. The CMA travel model is not set up to separately accept group quarters population (and the CMA/ABAG projections developed for use in the model do

---

[3] The estimates of population and employment for existing uses were developed by Hausrath Economics Group for the purpose of estimating base year conditions in the project area and identifying net changes in population and employment as needed for the cumulative growth scenario and land use database used for transportation analysis for this EIR. Available data and information were used as much as possible. In-depth field work and investigations of individual properties were not done as a part of this effort.

TABLE 6
NET CHANGES IN POPULATION AND EMPLOYMENT FOR PROPOSED UPTOWN PROJECT

	Residential Uses							
	Housing Units	**Households**	**Household Population**	**Student Beds**	**Stud. / Group Population**	**Total Population**	**Employed Residents**	**Employment**
Existing Conditions	33	26	47	-	5	52	14	248
Uptown Project	1,320	1,274	2,318	1,000	1,000	3,318	2,002	182
Net Change	+ 1,287	+ 1,248	+ 2,271	+ 1,000	+ 995	+ 3,266	+ 1,988	- 66
With Alternative Treatment of Student Housing as Households and Household Population								
Existing Conditions	33	26	47	-	5	52	14	248
Uptown Project	1,720	1,674	3,318	-	-	3,318	2,002	182
Net Change	+ 1,687	+ 1,648	+ 3,271	-	- 5	+ 3,266	+ 1,988	- 66

NOTE: For most purposes, the student population is identified as group quarters population, as shown in the top part of this table. However, the student population was included as households and household population for transportation modeling purposes (as shown in the lower part of this table) as the CMA travel model does not include group quarters population or total population. Under either approach, the population growth for the project is the same.

Source: Hausrath Economics Group, based on the approach and assumptions described in this appendix.

not include group quarters population or total population). Thus, the student housing and student population were included as households and household population in data inputs for the travel model.

The alternative estimates in the bottom part of Table 6 include the student housing as households and household population, similar to the other new housing in the project and as was done for the travel model runs. The 1,000 beds of student housing are assumed to be provided in 400 housing units that could include a mix of units for one to four students each. The 400 units would be occupied by 400 households with a total household population of 1,000 residents/students. Total population is the same under both this and the former approach.

COMBINED NOTICE OF AVAILABILITY OF THE DRAFT ENVIRONMENTAL IMPACT REPORT AND NOTICE OF PUBLIC HEARINGS ON THE UPTOWN MIXED-USE PROJECT

PROJECT TITLE: Uptown Mixed-Use Project
CASE NO: ER03-0007
PROJECT SPONSOR: Uptown Partners, LLC c/o Forest City Residential West

PROJECT LOCATION: The project site is located on a nine block, 15-acre site in the Uptown District of the City of Oakland, California. Blocks 1-6 are generally bounded by Thomas L. Berkley Way (20th Street) on the north, Telegraph Avenue on the east, 18th Street on the south, and San Pablo Avenue on the west. The Fox Theater is not a part of the project site. Blocks 7 and 8 are located on the north side of Thomas L. Berkley Way (20th Street); Block 7 is west of Telegraph Avenue and Block 8 is east of Telegraph Avenue. Block 9 is located on the southeastern corner of Telegraph Avenue and 22nd Street.

BRIEF DESCRIPTION OF PROJECT: The proposed project entails the construction of approximately 1000 apartments and 270 condominiums; 1,050 student beds/faculty units; 43,000 square feet of commercial space; 1,959 parking spaces; and a 25,000 square foot public park.

ENVIRONMENTAL REVIEW: Based on the preliminary project description, it was determined that the project may have significant environmental impacts. A focused **Draft Environmental Impact Report** (DEIR) was then prepared for the above project, under the requirements of the California Environmental Quality Act (CEQA), pursuant to Public Resources Code Section 21159.25 . The DEIR analyzes potentially significant impacts in the following environmental categories: land use plans and policies; population, employment, and housing; hydrology and flooding; transportation, circulation, and parking; air quality; noise; hazardous materials; infrastructure and utilities; paleontological and cultural resources; visual and aesthetic resources/shade and shadow analysis; and wind. Copies of this document are available for review or distribution to interested parties at no charge at the Community and Economic Development Agency, Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612, Monday through Friday, 8:30 a.m. to 5:00 p.m.

PUBLIC HEARINGS: The Oakland Landmark Preservation Advisory Board will conduct a public hearing on the project on October 6, 2003, at 4:00 p.m. in Hearing Room 1, City Hall, One City Hall Plaza. The Oakland City Planning Commission will conduct a public hearing on the DEIR and the zoning permits for the project on October 15, 2003, at 6:30 p.m. in Hearing Room 1, City Hall, One City Hall Plaza. Public comments are invited on the DEIR and the zoning permits for the project. Comments on the DEIR should focus on the sufficiency of the DEIR in discussing possible impacts on the environment, ways in which adverse effects might be minimized, and alternatives to the project in light of the EIR's purpose to provide useful and accurate information about such factors.

Comments may be made at the public hearing described above, or in writing. There is no fee for commenting, and all comments received will be considered by the City prior to finalizing the EIR and making a decision on the project. Written comments on the DEIR and the zoning permits should be sent to the attention of **Lynn Warner, Planner IV, City of Oakland Community and Economic Development Agency, Planning Division, 250 Frank H. Ogawa Plaza, Suite 3330, Oakland, CA 94612**, no later than 4:00 p.m. on Monday, November 3, 2003. If you challenge the environmental document or any discretionary permits in court you may be limited to raising only those issues raised at the City Planning Commission public hearing described above, or in written correspondence received by the Community and Economic Development Agency on or prior to November 3, 2003. The Planning Commission will consider certification of a Final Environmental Impact Report (FEIR) for the project and render a decision on the zoning permits for the project at a later meeting date to be determined. For further information, please call Lynn Warner, at (510) 238-3941.

Claudia Cappio
Director of Planning and Zoning
Date: September 19, 2003

Notes:
/a/ 'X' in first column indicates updated assumptions compared to original 11/21/00 Cumulative Scenario. 'XX' indicates updated assumptions for Uptown Project EIR, May 2003.
/b/ Codes indicate change made for CMA/ABAG P2002 inputs, since 12/02 Scenario for West Oakland Redevelopment Project EIR. C = change in number of units and/or number of households. N = new project added to list. T = change in time period assumed for development and occupancy.
/c/ Households equal units multiplied by an assumed vacancy factor.
/d/ Status as of the end of 2002: 1 = completed; 2 = under construction; 3 = approved; 4 = affordable housing project in predevelopment; 5 = other projects in predevelopment; 6 = in planning or part of existing plan; 7 = other housing opportunity site.
/e/ Housing Opportunity Sites are those identified in Oakland's Draft Housing Element (September 2002). The numbers (e.g., DT-11) are those used in Housing Element tables.
/f/ YWCA housing for CCAC students, Perkins Residential Care housing for people with Alzheimer's, and UC Berkeley student housing are treated as group quarters in the growth scenario.
/g/ The total units completed during 2000 were 293 for Acorn Parcels 1, 2, and 3, and 71 for Bayporte Village, replacing 480 and 196 original units, respectively, that were removed by 2000.
/h/ Includes additional housing units and households in the downtown and rest of Oakland Central (OC) planning district as well as along the channel in TAZ 537 (SA).
